The path, after crossing wood and field, entered the road at the field's corner which adjoined the orchard hedge. Partly in the field and partly in the orchard there was a large pond which gave the farm its name; it was shallow on Dare's side, but became deeper towards the centre, till, below a high bank in the field, it seemed to form a deep and even dangerous pool. The hedge between the field and the orchard came down to the water of the pond at either end; the interval was filled up by a wire fence, effectually preventing animals from wading through.

The field-path led within a few yards of the pond. As I approached the water I heard sounds of splashing, and concluded that some cattle had gone down to drink. But on arriving at the summit of the bank above the pit I saw a dripping human figure clinging to the wire fence. The water reached half-way between his waist and shoulders, but his condition, so far as I could make out in the gathering darkness, was that of a person who had been in over his head.

'I 've fallen in,' he cried, catching sight of me.

That fact seemed evident—unless, indeed, he had attempted suicide. The more immediate question was to get him out.

'You can't get out this side,' I shouted back; 'at least, not easily. It 's very deep. Can you get through the fence? The water is quite shallow on the farther side.'

He took my hint at once, and although handicapped by his precarious footing and his dripping clothes, his movements seemed to indicate a strong and active man. I hurried down the path and to the road, then through the orchard gate close by. By the time I reached the bank of the pond he had just struggled through the fence, and was already wading towards the shore. A minute later he stood by me on the bank.

He was a well-built man of four or five and thirty, dark, with a short beard, and also with the accent of an educated man.

'A most unpleasant ending to my walk,' he said. 'I came from Willchester this afternoon for exercise. In passing through that field I saw the pond, and, looking closer, thought I noticed an uncommon little plant growing half-way down the bank. My foot slipped as I tried to reach it, and I found myself over the head at once. It is really rather a dangerous place. Gad, I am cold!'

The man was shivering. Little wonder, for the evening air was growing chill.

'I wonder where I can best get a change of clothes,' he went on; 'for I can't go back to Willchester like this.'

I hesitated. I knew that there was no public-house in the village; the whole place was the property of a rich banker, who, endowed with rigorous temperance views, had closed the only licensed house on purchasing the property some years before. There was The Court, inhabited by two old maiden ladies; I could hardly send this dripping figure there. There were, of course, some cottages; but it was Sunday, and the male villagers would probably be wearing their best clothes themselves.

And yet I hesitated at the thought of taking him to Dare. Dare would be courteous, but he did not care for strangers at the best of times; still less just now, when his whole mind was concentrated on his work, and when that work was of the kind it was. Still, there seemed nothing else to do; I could not leave the fellow unbefriended in his present case.

'This is the nearest house,' I said, and pointed to the farm. 'The tenant is a friend of mine, whose guest I am for a few days. He is a busy man, and greatly occupied just now; but I can let you have a change of clothes. You would be all the better for a warm bath, too.'

'Thanks, yes, I should; but I should be extremely sorry to intrude.'

Without more words, I led the way across the orchard, through the garden, and so to the house. The water was still dripping from the stranger's clothes, and so I made for the back-door. It stood within the angle formed by the house-front and the side. As we approached it, I observed Dare's workroom window lighted. Dare himself appeared a moment later and drew down the blind.

To ask the slightest service of Dare's silent-footed man I had to use a slate; but little need existed to enlarge upon my new companion's case. I saw him to the bathroom, and then went in search of a rig-out of my own; he was too tall for anything of Dare's.

When I had got him all he needed, I went off to break the news to Dare. I found him in his workroom, and laid bare the case. I could see he did not like it, but he was quite courteous, if not exactly enthusiastic.

'Of course you had to bring him in,' he said; 'and he must dine with us—must sleep here,

too, so far as I can see. We cannot turn him out; the man will catch his death of cold.'

This proffered hospitality was more than I had hoped for, and I brightened up. 'He's quite a decent sort of chap,' I said.

'No doubt, no doubt,' replied my friend in his cool tone. 'Well, I have got a few small notes to make of my day's work; then I will join you, and we'll dine.'

I hovered in the hall until I heard the bath-room door unlocked, and then I fetched the stranger down. My suit fitted him reasonably well, and he seemed all the better for his bath and for a jorum of hot brandy that I had already given him. His name, he said, was Alsop. Having had business in the neighbourhood, he had been spending the week-end at Willchester. He chatted pleasantly about the district until Dare came in.

The man's apologies for his enforced intrusion were perhaps slightly too elaborate for good taste, but were quite easily excusable in the peculiar circumstances of the case. Dare accepted them and made their giver welcome with grave courtesy. I noticed that he shot one searching look upon the stranger from beneath his lids as he came through the door; then, during the meal, he seemed to take the new-comer's presence with us as a matter of no moment, talking with all his usual freedom—although not, of course, upon the subject of his work. I, naturally, was careful not to hint at any special topic of the sort.

Dinner was finished, and our guest began to speak of going.

'Your clothes are certainly not dry, nor will they be for several hours yet,' said Dare. 'I can quite easily accommodate you for the night.'

Alsop protested, but at last yielded to the invitation. Certainly, perhaps, he said, it would be rather better not to venture into the night air. It was extremely kind of Mr Dare, and he greatly regretted the intrusion of which his carelessness had made him guilty.

Dare listened to all this and something more with a grave, quiet smile, and led the way into the sitting-room upon the farther side of the hall. Cigars and pipes were lighted, and Dare turned to me.

'I don't think we'll have pussy in to-night,' he said.

The stranger hastened to protest. 'I hope you are not banishing a pet on my account. Is it a cat? I am very fond of cats.'

'Still, she is better where she is to-night, I think,' said Dare; and as he spoke he flashed a look at me which I interpreted as a command that his great cat's identity was not to be revealed.

By half-past ten the conversation languished, and we went to bed.

BAKHTCHI SARAI.

THE OLD CAPITAL OF THE TARTAR KHANS OF THE CRIMEA

By R. Courtier Forster.

BURIED in the heart of the Crimea, at the foot of the mysterious mountains which contain the dead cities of the People of the Caves, lies the old Tartar capital of Bakhtchi Sarai, the city of the Howling Dervishes, where frenzied rites are still performed each week. It slumbers among olives and vineyards, shaded by heavily scented acacia-trees, dreaming of lost magnificence and mighty khans who in the fifteenth century swept the great population of a vanished and puzzling civilisation off the face of the Crimea. Now it lies forgotten and almost unknown. Russian tourists do not discover it. The crowds of travelled people who come down from Petrograd and Moscow year by year to Yalta and the Crimean coast are never seen within the Tartar town. High above the drowsy, crumbling dwellings tower the huge basaltic rocks, smooth as glass, and weird balanced boulders, which look as though they would slip down and crush the old streets to powder.

A mile or two to the north rise the precipitous cliffs of the rock mountains, where, on plateaux some two thousand feet up, stand the dead cities of Tchufut Kalé and Magup Kalé. Bakhtchi Sarai remains almost exactly as it was three hundred years ago, clinging to the fringe of the inland mountains, with its quaint, old, jumbled, bright-hued Tartar houses, now red, now blue, now brown; some raised two or three steps above the roadway, others only entered by descending a foot or two below the road. Veiled women peep from behind little latticed windows under deep eaves of pointed gables carved and fretted with strange beasts and birds among curling circles of barbaric colours. The chief street, not more than twenty feet wide, twists and turns in a snake-like progress up the town. The queer little houses, as though frightened of it, have forgotten to stand in line. One has backed away from the narrow, high pavement; another has jumped forward almost into the road. Here and there thick-foliaged acacias grow from the curb, and shed showers of white blossoms into the hummocky highway of dishevelled cobble-stones; while little Tartar boys in glorious clothes saunter by, singing, '*Oo arh lee! Oo arh lee!*' The street is flanked on either side by narrow pavements, which generally the houses have overstepped till less than a yard remains. They

are raised a foot and a half from the roadway, with worn stone steps at intervals to bridge the rushing torrents of the winter rains.

Here the fronts of the strange, bright shops are let down on hinges by day, and rest on trestle feet, and on these stands are piled the wares for sale: bright leather goods stained blue and wine-red, broidered in silver; satchel-bags fastened with glass beads threaded on leather thongs; boots of vermilion and yellow; and charms sewn into triangular amulets stringed with two blue beads which, when worn upon a horse's head, protect the good beast from spavin and other harm. Some shops are piled with fresh fruit—cherries of saffron and black and purple, and pyramids of scarlet tomatoes on banks of green parsley—interspersed with old glazed wine-jars filled with great bunches of tall white lilies. The metal-workers, sitting within the shade, make a cheerful *tink-tink* with their delicate tools as they grave their pots, bending cross-legged on their benches in robes woven in Tashkent.

The modern railway passes Bakhtchi Sarai some two miles to the west. A peasant's cart and an antiquated high-seated barouche well raised out of the mud of the unmade road wait at the station to drive any chance passengers to the city of the once dreaded Tartar kings. The khans and their sovereignty have gone; but the Tartars remain, olive-skinned and almond-eyed, clad in robes of emerald green and rose, and coats of purple and lemon and crimson stripes, and cloths of puce and white, with threads of gold wound round their waists, and skull-caps of coloured silk or velvet instead of the fez, embroidered with flowers in blue and silver, and strange and beautiful devices of the Tartar mind. We passed them singly and in groups as we drove into the city to the great walled enclosure of the once closely guarded palace of the gorgeous khans, built by the proud Abdul Sahel Girai in 1518. The massive iron-studded gates stood open under the shadow of the heavy arch through which the last of the khans passed, never to return, in 1783; for, though the Tartar Empire fell into ruin before the victorious armies of Prince Dolgoruki in 1771, and they were utterly defeated and broken by Suvarov in 1777, during six more years of despair and bitterness the khan held his court within these walls. Now a single Russian soldier sleepily directed us across a corner of the palace gardens to an entrance within the inner walls, where a clanging bell at length disturbed an astonished keeper of the gate, who opened for us a palace of the *Arabian Nights*. We passed through courtyards of mellowed marble, where fountains centuries old still played among trailing roses, and under great arches glowing with faded vermilion and gold and blue. We were led along queer corridors and up old marble steps, and round and on through rooms where fair women had loved and laughed, and found their beauty fade and others steal their places, and planned swift death and dark intrigue, as they moved, desolate and hungry-eyed, under the stars in the dark shadow of the Girai's palace walls. We stood in the Royal Garden Room where a queen had fought with all a woman's wiles, passionate and pitiful, to revive a prince's dying love, and other women watched and understood, the while, beneath her gracious smile, she was fiercely aware of their every thought. We mere passers-by wandered through rooms whose walls were eloquent of centuries of love and hate. So we passed up to chambers panelled and ceiled with carved cedar-wood, where trellised windows looked down into a deserted garden of tangled lilies and sweet-smelling flowers. Below lay, half-buried in untended blossoms, the marble bathing-pool of the Royal Harem. We stood where a little earlier in the day of time no man save the great khan, the sovereign lord himself, might stand and live. Around us were the soft-toned panelled walls whose very luxury of design was chosen carefully to please the eyes of the idle beauties of the last khan's Court. A pile of faded, moth-eaten velvet cushions, broidered in tarnished silver, still lay where they had been thrown in a corner of the low marble divan that ran round the room, against the windows. The last of the Tartar princes had stood here little more than a hundred and thirty years ago. Tattered hangings of faded silk brocade, once rustled with the whispered laughter of a dead khan's loves, hang forlornly in archways where no lover comes to break the spider's web.

In the once magnificent Hall of Audience a stream of water had poured through the exquisite painted woodwork of the ceiling from the heavy rain of the night before, and lay in a pool, rotting the floor. On a little table were still standing in the dust three wonderful vases of Venetian glass, once the possession of some fair bather in the Forbidden Garden. Amid the crumbling splendours of the Throne Room stood some glass cases, dim with the dust of years, containing treasures and relics of the royal Tartar dead—rings and little intimate things in daily use by the once dreaded owners of the palace.

High up in the thickness of the wall above the Hall of Gold we entered a little chamber where the khan often stood, unseen and unknown, and heard every whisper of his courtiers in the great hall below in the days of deadly intrigue when palace plot was met with counter-plot.

In a covered court all open on one side through pillared arches to a garden of figs and flowers, where the gray doves come and go at will—doves which the peasants say are the souls of fair women who once flitted through the corridors—there is the Fountain of Tears, a marble fountain in a marble wall, soft-hued and stained gold with age. Here the water slowly falls from the wall drop by drop, as tears fall, into tiny marble

basins no larger than the palm of a woman's hand. The story has it that the Khan Mengli Girai captured and held prisoner a Russian countess of surpassing beauty and grace, whom he loved passionately, but with honour refused to take advantage of his power until she willed to come to him. The Russian beauty remained deaf to all his passionate entreaties and his love, and wept her life away in captivity within the palace walls, when her soul passed into the fountain whence her tears still well and flow.

We waded knee-deep in flowers and grasses through a little walled garden to the domed octagonal Mausoleums, shining white among the cypress-trees where the great khans and their queens lie buried beneath worn marble sarcophagi, those of the khans shown by a turban, the tombs of the queens distinguished by a hood. Within the Mausoleums the doves, unfrightened and secure, fly in through the open lattice-work beneath the roof, and rest about the pillars and the tombs, watching us with curious eyes. The old keeper of the gate turned and bowed to them with calm respect and the ceremonial inherited from centuries of palace servitors as we passed out into the sunlit garden again. Here among the roses lies the khan who so loved the flowers and wind and sky that he refused to be buried within the Royal Mausoleum, and asked that his tomb might never be covered; therefore it stands beside his now deserted palace walls, a shrine of marble lattice-work and slender pillars, storm-swept and stained by sun and rain, unroofed and open to the earth and the stars.

When we passed out through the great gates again, and over the brawling torrent of the Tchuryuk, we crossed the open space before the palace, ascended the old stone steps to the low veranda of the Tartars' coffee-house opposite, where quiet men in multicoloured robes sat cross-legged, drinking Turkish coffee and playing dominoes. From beneath us, through the drowsy stillness of the afternoon heat, floated up the *tink-tink* of the brass-worker making little metal pots. Delicate henna-tinted fingers fluttered the curtains of an inner doorway slightly aside for a moment, and the odour of the burning spices cast into a brazier floated out like incense to the open veranda and the domino-players. The myriad acacia-blossoms hung unmoving from their trees beneath the tapering white minaret of the great mosque. Only a faint murmur rose from the old town as it stirred in its sleep and perhaps dreamed of the home-coming of dead kings and victorious armies, and an empire now vanished and almost forgotten.

WITH THE GUNS.

AN IMPRESSION BY THE WAY.

By Lieutenant J. R. CLELAND, R.F.A.

OH God! what a day! It makes one feel that it is above all things good to be alive. All nature is at work. Everywhere the living green of her summer mantle shines resplendent; the birds are singing and calling to each other, and the hum of myriads of insects fills the air.

Otherwise no sound breaks the stillness except the occasional interruption of the telephone, 'Buzz-z-buzz-z — buzzz —— buzzz-buz-buz-buz, O—B—O—B—O—B,' and the signaller's voice as he tests the line: 'Hallo! Yes! Is that all right? Right-o!'

The observation-officer sits back in his chair, and sighs, 'How long, oh Lord, how long?'

For many weary days and weeks he has sat there, looking through the shell-hole in the gable of a deserted house in a deserted and ruined village. He is tired—oh, so tired—of this constant strain of watching and waiting, the monotony of which is varied only by occasional firing or being fired at!

To-day he feels at peace with the world; he is so tired of all this bloodshed and slaughter. Oh, will there never be a move? He scarcely seems to want it now. Late spring is here, and all nature is entering upon the joys of summer; but unmoved is the portion of the line he watches.

The observation-officer draws from his pocket a little leather case and opens it. It contains the portrait of a girl. The pictured face speaks of calm resolution and strong-minded contentment. 'Gladys!' he whispers.

Snap! The case is shut and returned hurriedly to the pocket whence it came. 'Buzzz —z—z!' goes the telephone.

'Hallo! Yes . . . message . . . half-a-mo'!' The operator grabs a message-form and pencil. 'Hallo—yes—go on. . . . O.C. —th Battery . . . yes . . . break . . . yes . . . date A.A.A. Yes . . . enemy reported . . . yes . . . to be massing . . . yes . . . on your front . . . yes . . . keep sharp lookout . . . yes . . . towards points . . . yes . . . A6 . . . yes . . . and B5 . . . yes . . . break . . . yes . . . —th Brigade . . . yes . . . Here you are, sir; message from brigade, sir.'

'At last,' mutters the observer; 'or it may be just another of their scares. Well, we'll keep a sharp enough lookout, and give it to them hot and strong if only they will come on.'

He returns to the contemplation of the country through the shell-hole. In front of him is spread a wide open plain, stretching on either side, until it becomes tree-clad and merges into dis-

tance. The view straight ahead is blocked at a distance of about fifteen hundred yards by a straggling village with high trees at intervals throughout its length. Behind the houses are more trees—trees everywhere; trees of different kinds and fantastic shapes at varying distances.

Between the two villages the plain is intersected by roads and lines of willows marking ditches, and the little stream which runs oblivious of the fact that fifty yards from either bank stretch the lines of barbed wire which safeguard the high walls of sand-bags and earth erected by the opposing armies for protection against bullet and shell.

Omou—u—u—u! Louder and louder grows the sound as of an express train approaching. In front of the village rises an inverted cone of earth and greasy-looking black smoke, and immediately comes the noise of the bursting shell —kr-r-rupp!

It is as if this shell had been a signal. Immediately the air is filled, shrieking, rolling, bubbling, and moaning, each shriek, roll, bubbling, or moan being followed instantly by the ping, bang, crash, or krupp of the various kinds of shell bursting. The landscape is blotted from sight. 'Fizz-bangs,' 'Greasers,' 'Woolly bears,' 'Black Marias,' and 'Jack Johnsons'—every sort and description of shell is there, crashing and banging around the breastworks in which our devoted infantry lie awaiting the assault which will inevitably follow this bombardment.

The observation-officer is sitting tense in his chair, watching—watching. He is awaiting an opportunity to observe the first rounds he fires. At present the smoke is too dense.

'Battery—action!' he calls over his shoulder.

Buzz-z-z! 'Hallo! . . . battery . . . action.' The operator takes up the tale, and passes it on to the guns. 'All guns on communication-trench A5.'

Through a rift in the smoke the observer has caught a glimpse of movement in the enemy's communication-trenches at a point which he has previously registered.

'High explosive—one-round, battery fire ten seconds.' The order rings sharp and clear, and the imperturbable telephonist passes it on.

'No. 1 fired,' announces the telephonist.

Above the din of the enemy's fire comes another sound—boom—um—whizz—z—bang!

The observer's face is drawn, and he stares intently through his glasses. The sound is repeated six times in all, the telephonist reporting the guns as they fire. The smoke is too thick to see all the bursts, but the observer spots one of them. It has burst correctly.

'Repeat!' Again the sharp, clear word of command.

Another telephonist comes up the ladder. His face is white, and a scared look is in his eyes. 'They've put two just over us, sir, on the cross-roads.'

'All right; let me know if they come nearer. Battery fire five seconds.'

Omou-u-u-u! Kr-r-rupp—rupp—rupp! Three heavy high-explosive shells have burst just short of the house; but the bombardment of the breastworks seems to be slackening.

Omou-u-u-wump!

'Thank God, that's a dud!' A blind shell has landed just at the foot of the wall where he watches.

Suddenly the bombardment stops, except for the heavy shells, which continue to come thick and fast into the village and on to all roads leading up to the breastworks from the rear. Kr-rupp! thump! bump! bang!

'Target B—shrapnel—one-round battery fire three seconds.'

The observer is going to get his guns on to the area between the lines of trenches before he looks to his own safety, although the shells are coming nearer now, and the houses on either side of his observing-station have been hit.

. . . . . .

The sun is beginning to sink in the west. The shells still shriek overhead and burst, knocking houses and trees and earth about, and making a thunderous din. A long gray line is emerging rapidly from the enemy's trenches. Immediately a rattle of musketry sounds, but the line advances in quick rushes toward our breastworks.

'Gun-fire!' shouts the observer.

The line comes on, and the buzz and bang of shell continues. Suddenly, directly in front and above the advancing infantry, appears a white puff of smoke, and three men fall forward to the ground. Another puff, and another, then three together, until the line of bursts merges into a continuous pall of white smoke raining death on the human beings advancing beneath it.

Other batteries on right and left have commenced firing now, and the observer thinks it is time to leave the front line for the infantry to deal with while he tries to stop supports coming up.

'Stop . . . add two hundred . . . high explosive . . . go on.'

Black puffs appear over the enemy's support and communication trenches, and the noise of the bursts alters to a sharper note than before. Meantime the rattle of rifles and machine-guns is continuous, and the observer has to keep well down behind his sand-bags to avoid stray bullets.

Omou-u-u-u-crash! kr-rupp! Clatter, clatter, clatter come the tiles and woodwork and a few bricks.

He sees the telephonist disappearing straight down, and makes a grab. He is falling. Ugh! all feeling is gone from his left arm. He is falling, fall-ing, f-a-l-l-i-n-g!

. . . . . .

It is night. The dark blue of the starlit sky is broken by the darker masses of cloud, and lit up fitfully by the white glare of trench-lights and the occasional flash of gun or shell-burst.

The attack has been successfully repulsed, and a sharp counter-attack has gained us some ground. A squad of men with stretchers makes its way slowly through the street of the village.

'Help! help!' The faint cry echoes through the darkness.

''Ere, Bill, stop a mo'!' says a voice; 'that there call came from the artillery observing-house.'

Two men detach themselves from the group and cross the street; one of them produces an electric torch and presses the switch. A man's head and shoulders are visible outside a dug-out of sand-bags built against the rear wall of the house. The wall has collapsed and broken in the roof of the splinter-proof, pinning the man's legs so that he cannot move.

'Give a hand, mate, and help us out o' this,' he says, 'and get some o' your fellers to look in the house for the officer and my mate.'

He fainted. With difficulty the two men moved a heavy beam, and lifted the unconscious man on to a stretcher.

At this moment a platoon of infantry, headed by an officer, come along the road. They are returning to rest, having been in the support-trenches for two days.

'Hallo, you fellows!' cried the officer, 'whom have you got there?'

'Gunners,' remarked the stretcher-bearer. 'The 'ouse looks pretty well wiped out, and this bloke, afore 'e fainted, said there were an orficer and a telephone cove inside somewhere. We ain't bin in ter look yet.'

The officer rushed into the building, calling out, 'Come on, sergeant-major; come with me,' as he went.

A big man came forward from the group in the road, and followed the officer into the house.

'I know the way,' said the officer; 'I was up here this morning having a look round.'

He led the way up a narrow staircase till he reached a landing. Here he stopped. The stairs to the top floor had disappeared, shot away by the great shell which had hit the house. Above the two men was a gaping hole where once had been the roof. They recoiled in horror. There, suspended in the faint light, was a dark mass, which, as their eyes grew accustomed to the light, resolved itself into the figure of a man hanging by his left arm, his right holding the body of another, from whose head hung a telephone instrument held by the receiver-leads.

A party of men were brought in to assist, and with difficulty they got the two men away. The observation-officer had grasped the telephonist as the floor disappeared from under him. In doing so he had overbalanced himself, and only caught a rafter with the crook of his left arm, which was immediately pinned by a falling beam. The telephonist was unconscious, with a terrible gash in the head from a splinter. The observer was wounded in the leg, his left arm was crushed, and he was completely exhausted and delirious; and as soon as he was brought down he subsided into unconsciousness, muttering a word which sounded to the infantry officer like 'Gladys.'

. . . . . .

It was evening. In a beautifully furnished room, once a fashionable London drawing-room, now a ward in a private hospital for officers, a man lay tossing and turning and muttering in delirium. His left arm was bandaged tightly to him, so that he could not hurt it. Beside him stood a sweet-faced girl. Tall, dark, and beautifully formed, she made a lovely picture, standing there in her close-fitting, gray-and-white nursing-dress, trying tenderly to quiet the sufferer. As we watch she straightens up, and the Red Cross upon her breast intensifies the paleness of her face. She has been crying, and her eyes are still moist.

She raises her eyes to the ceiling with a gesture of pleading, and her lips move. 'How long, oh Lord, how long?'

. . . . . .

It is morning. The curtains are drawn, and the bright sun shines in through the windows, throwing deep shadows into the corners of the room, and lighting up the clean white of the patients' beds and the radiant colours of the flowers disposed about the room. The girl looks worn and tired, but a faint hope lights her eyes. The sufferer near the window is sleeping more peacefully than he has done for a week past. The crisis must be over.

She seats herself by his bedside, and takes up a newspaper which had been brought in shortly before, and had lain unnoticed. She turns the pages listlessly. Suddenly a change comes over her, and she sits upright. She has noticed a name in one of the lists. It is under the heading of those upon whom is conferred the honour of the Victoria Cross.

At that moment the sleeper moves and opens his eyes. The tired brain has cleared. He is sane. 'Gladys,' he whispers.

'Jack! Oh Jack! Thank God!'

The patient is asleep again, quietly and with a smile upon his lips, and the sun smiles upon the diamond tears of the girl, which this time are tears of joy.

THE BORDERLAND.

Just ere the recollection of the strain,
And stress of daily life is banish'd quite;
When facts are blent, and interfused, the light
Touch of a hand comes near; and once again
We hear the soft, rich voices we would fain
Forever hear; and then we take our flight,
Oarless, across the foam; pull far from sight;
Earth and its beckonings blown off, as rain
Ends in the yellow light of earliest morn.
Once more we traverse fields our youthhood knew;
Once more the trysting-place we near, and sue
With gentle words a maiden, whose light scorn
Breaks in a ripple of soft laughter. Tears
Are on our faces when morning reappears.

THE ISLES OF THE GOLDEN WEST.

By W. J. Hooper.

LONG, long ago, so the legend relates, the fair land of Cornwall, bearing upon its shores and heights a wealth of that semi-tropical vegetation, vestiges of which even now greet the eye of the traveller in the gardens of Scilly and the environs of Penzance, jutted fully thirty miles farther out into the Atlantic than is the case at the present day. This promontory, over which the sullen Atlantic now rolls its mighty waves, formed the mythical kingdom of Lyonesse. Here we now find nought save the sadness of the mighty deep, the cry of the seagull, and the everlasting roar and swirl of the hungry ocean.

One portion, however, of this fair land has successfully evaded the savage onslaughts of its perpetual and untiring antagonist. Twenty-five miles west by south-west of the Land's End, huddling close together as it were for protection from the raging surf which ever dashes in thundering cataracts of dissolving spray and foam against the outlying reefs, stands a miniature assembly of rocks and islands—the solitary and romantic isles of the west, the Scilly Isles. They are best known, perhaps, for their flowers and the awful shipwrecks to which they have been subjected from time to time. Beyond these items, the general public evinces little or no enthusiasm; indeed, so many people seem to be under the false impression that the islands belong to France, and are inhabited by a French-speaking population, that it may be as well to state at once that they are the exclusive property of Great Britain, and support an English-speaking race mostly of Cornish and mixed extraction.

For the benefit of those who have not visited these islands, we may state that a royal mail steamer visits them three times a week from Penzance, the passage occupying about three and a half hours, the distance being roughly forty-two miles.

Here, within easy reach of the tourist, we have a collection of islands, the climate, beauty, and romance of which are unequalled by those of any other locality in the British Isles. Fishing is to be had in a variety and an abundance to which that of some of our best-known fishing-grounds bears no comparison. The fairy-like bays and coves, full of deep-blue water as clear as crystal, and fringed by a curving line of sand and shells, remind one of those coral lagoons which dot the tropical waters of the deep Pacific. Here the delights of boating, bathing, and swimming may be indulged in with a freedom and an impunity never dreamt of by the sophisticated crowds which throng the heated sands of Eastbourne and Margate. And the climate? Ah! we who have tasted the scents of Scilly, let us summon the gracious muses to our mortal aid in celebration of that supernal atmosphere!

First, in the strict sense of the word, Scilly knows no winter. Let that be clearly understood. There are three seasons: summer, autumn, and spring. At a time when we in England are already in the throes of winter's biting frost and cold, the bulbs of Scilly are gladly throwing their tender heads above the ground in readiness for the great Easter exodus, when ton-loads of the fragrant blooms quit St Mary's pier for the motley precincts of Covent Garden.

The flowers are grown in fields, just as we in England grow fields of corn. Here it is possible to witness the magnificent sight of an acre or so of narcissi in full bloom, another of arums, another of the great single daffodils in all their golden glory. These fields must be palisaded round with wattle to protect the flowers from the winds which sweep across the islands with such fury. Sometimes whole fields of the most delicate blooms are destroyed by a strong gale. In the stormy season the winds at Scilly reach an intensity and fury of which mainlanders can form no adequate conception. All young trees must be protected by shelters, and it is often difficult for a man to walk upright. During these storms the islanders anxiously scan the distant horizon, or remain closely locked within their homes.

The flower season often begins in December, and generally continues till the end of May. While it lasts the blooms must be cut, tied in bunches, and packed in boxes as quickly as possible. At this time the services of every one are required, and men, women, and children work from morning till night until all are safely gathered in and despatched to the markets of London.

With reference to the dreadful shipwrecks which have occurred from time to time amongst these dangerous rocks, it is essential that the

 [*All Rights Reserved.*]

reader should bear in mind the important fact that perhaps nowhere else in the world is there so numerous and varied a sea-traffic as that which daily and nightly passes the forbidding coasts of these solitary isles.

The configuration of the group is easily described. The islands are extremely small, and lie so closely huddled together that from the highest point of each it is possible to take in at one glance the whole conformity of the component mass. St Mary's, the largest, may be roughly said to have a length and a breadth of two and a half miles and one and a half miles respectively. On it is situated the most populous and important town of the archipelago—Hugh Town. Next in importance ranks Tresco, where the governor of the islands resides. This island, one of the loveliest, is placed in the centre of the group, due north of St Mary's. It is roughly two miles long and a quarter of a mile broad. Here we find the celebrated Abbey gardens, the lake into which King Arthur is supposed to have flung his magic sword, and a subterranean cave containing another lake, known as Piper's Hole. Only three other islands, St Martin's, Bryher, and St Agnes, are inhabited.

The nature of the rocks, channels, tides, and currents surrounding these treacherous coasts is so complicated and insidious that it takes years of patient seamanship to understand them thoroughly. Many a party, even of skilled boatmen, has set forth never to return.

The occasion of a wreck marks a red-letter day in the annals of Scilly. Once its existence becomes known everything else is forgotten. Occupations and engagements, however urgent, are hastily forsaken in the excitement and curiosity of the moment. In a word, industry and the monotonous routine of daily existence give place to a feverish anxiety for saving human life, and a not altogether excusable lust for plunder.

In connection with both these instincts an amusing story is often told. During the course of a Sunday evening service in the church at Tresco the preacher was surprised to notice that his congregation was gradually growing smaller and smaller, until at last only two remained. Wondering what could be the cause of this remarkable diminution in the number of his flock, curiosity at last compelled the austere divine to interrupt his sermon and inquire the reason for so sudden and stealthy an exit. He was informed that there had just been a wreck. That was enough. The last thing seen by that faithful couple was a cassock and a surplice disappearing at lightning speed round the corner of the church porch.

Perhaps the most terrible wreck which has ever cast its shadow of gloom over these islands was that of the *Schiller*, a German mail steamer carrying a crew and passengers numbering three hundred and fifty-four, which struck the Retarrier ledges during a fog, and went down, with a death-roll of three hundred and eleven. It is said that a fashionable ball was in progress at the time when the vessel struck, and the scene must have been one of indescribable horror. The vessel did not sink immediately. The wretched passengers, clinging with wild and hopeless despair to the rigging, were washed away one by one.

The largest vessel ever wrecked at Scilly was the *Minnehaha*, an Atlantic liner of thirteen thousand seven hundred and fourteen tons, on her way from New York to London, which struck the Scilly rock during a fog. Every one was saved. From the very first, judging by the way in which the vessel had gone aground, it was thought that by careful blasting of the rocks and removing all the heavy cargo it would be possible to dislodge and drag her into deeper water; a hope which was afterwards fully realised. The *Minnehaha* was a short time ago making her usual passage between New York and London just as though there were no such place as Scilly, or wrecks, or, it may be added, German submarines, to disturb her untiring perseverance.

During this memorable wreck the islands were in a state of continual bustle and excitement. Everything which could be removed from the wreck went overboard—motor-cars, bags of silver, grand pianos, furniture, coffee, tobacco, pencils and paper, typewriters, clocks, sewing-machines, and three hundred cattle. To prevent the islanders boarding and plundering the vessel, it was necessary for the captain to stand constantly on the bridge with a loaded revolver, ready to shoot any one caught in the act. But this precaution could not prevent a great deal of plunder being secretly carried away, because anything which, on being thrown overboard, was not immediately secured by the authorities would be quickly surrounded by a swarm of boats, and carried off. Many of the islanders are still drinking the coffee, smoking the tobacco, and sitting in the luxurious chairs which once filled the spacious interior of the *Minnehaha*.

All sorts of vessels have been wrecked at Scilly. This heterogeneous collection has brought to the islands a corresponding variety of salvage. At one time a cotton-ship threw up her cargo of fleecy bales on the silver strand of Hell Bay; at another, the sea was floating with oranges from the Far West. Another occasion saw the black waters seething with grease and oil from the tanks of a vessel which had gone down some days before. Many a fair ship and many a sailor have found their everlasting tombs amongst the watery chasms which stud the subterranean depths of these frightful ledges and rocks.

There is something awe-inspiring and terrifying about the way in which these black, forbidding, hungry masses of solid granite, surrounded by the perpetual gurgle and swirl of the heaving waters, stand like solitary sentinels waiting for their innocent prey. Often, at varying intervals,

sad relics of wrecks long forgotten are discovered on the lonely beaches of an outlying island seldom visited—skulls in varying stages of decomposition, sodden leather purses, broken spars bearing the name of some long-lost ship.

The romance of Scilly teems with stories of the days when pilots and smugglers held their sway. The old house in which the author spent so many happy days must at one time have been the silent witness of many a goodly haul of goods, many a heated fight. From its capacious cellars an underground passage, since closed in, communicated with the adjacent beach. Some few years ago visitors staying in the house resolved to explore the entrance to this tunnel. Armed with picks and spades, they succeeded in removing near its commencement a considerable portion of the cellar floor. To the amazement and horror of the diggers, two human skeletons, calcified with age and riddled with shot, were unearthed. An old inn, situated in the centre of the same island, was in bygone days a rendezvous for foreign sailors, who were frequently drugged, robbed, and murdered.

In the days of the sailing-ship, when pilots were indispensable for the purposes of Channel navigation, a number of these men lived at Scilly. A pilot frequently left the islands never to return. His wife and children were then left destitute. The lure of some lucrative occupation on the mainland or on the Continent was generally the cause of these desertions. There is a woman whose husband left her in this cruel way still living on one of the islands.

That these pilots were brave men, who knew every rock and tide of Scilly, the following story bears ample testimony. In bygone days it happened that the French had a dispute with the islanders about an encroachment on their fishing rights. To settle the matter they despatched two men-of-war to the distant isles, hoping thereby to awe the inhabitants into a state of submission. On arrival it was necessary to procure a pilot to steer them safely in. After having carefully interrogated the man as to his technical knowledge, the captain put the helm into his hands and bade him take the vessel in charge. All went well for a short time; then—CRASH! Wondering what could have happened, the captain rushed to the bridge, and angrily asked the pilot what, in the name of all that was holy, he meant by such behaviour. 'You told us you knew the rocks.' 'Yes, so I do,' replied the pilot very calmly; 'this is one of them.'

The number and variety of strange events which have taken place in these islands from time to time combine to produce reading at once melancholy, weird, and dramatic. Novels, too numerous to enumerate here, have been written under the influence of these romantic isles.

On one occasion a death-ship put into the waters of Scilly. Her decks were silent and deserted, the crew smitten with deadly plague. The islanders, oppressed with silent dread of the unknown, discussed her fate and theirs with a helplessness born of despair. They were saved in a manner as remarkable as it was strange. One night, when all was still, and the moon cast its melancholy light on the pale, cold waters, the death-ship glided stealthily out to the west. At the tiller stood the helpless figure of a youth, a crazy boy from one of the off-islands, who had boarded the vessel when all were asleep, cut her cables, and drifted out. The ship and her strange pilot were never heard of again.

For scenery the Isles of Scilly provide a fund of variety and colour equalled by that of no other locality in the British Isles. Here the artist finds the delicate blending with the savage, the savage with the refined, until that indefinable sense of beauty which every Scillonian knows so well captivates and leads the mind from a mean and sordid æstheticism to an uplifting conception of the majestic and sublime. Moreover, it is not so much what one actually sees as what one hears and feels which helps to instil into the mind of the visitor that haunting sensation of melancholy romance which permeates the atmosphere of these strange and lonely isles.

Those who have once sampled the delights of Scilly seldom fail to return. The place exercises a sort of haunting influence over those who have lived there long enough to learn its varied moods and passions. The overwhelming preponderance of nature over man, the illimitable waste of hungry ocean, the cry of the seabirds, the evening sunset lighting up the western rocks in a blaze of magic splendour, and, finally, the lighthouses emblazoning the night sky in fantastic arcs of whirling magnificence, combine to produce an effect exalting the soul from the regions of casual indifference to those of eternal and impassioned reverie.

THE DEFINITE OBJECT.

CHAPTER XXV.—HOW SPIKE MADE A CHOICE AND A PROMISE.

MONDAY morning found Ravenslee knocking at the opposite door, which, opening, disclosed Spike, but a very chastened and humble Spike, who blushed and drooped his head and shuffled with his feet, and finally stammered, 'Hello, Geoff!—I—I 'm all alone; but you—you can come in if—if you care to.'

'I dropped in on my way down just to have a word with you, Spike.'

With dragging feet Spike led the way into the

sitting-room, where lay his breakfast, scarcely tasted.

'Sit down, Geoff; I—I want to apologise,' said the lad, toying nervously with his teaspoon. 'I guess you think I'm a mean, low-down sort o' guy; an' you're right; only I—I feel worse 'n you think. An' say, Geoff, if I—if I said anything th' other night, I want you to—forget it, will you?'

'Why, of course, Spike.'

'Hermy's forgiven me. I—I've promised to work hard an' do what she wants.'

'I'm glad of that, Spike.'

'She came creepin' into my room this mornin' before she went; but—me thinkin' she meant to give me a last call down—I pretended t' be asleep, so she just sighed an' went creepin' out again, an' wrote me this;' and Spike drew a sheet of crumpled notepaper from his pocket and handed it to Ravenslee, who read these words:

'Boy dear, I love you so much that if you destroyed my love I think you would destroy me too. Now I must leave you to go to my work; but you will go to yours, won't you—for my sake, and for your sake, and because I love you so? Be good and strong and clean; and if you want some one to help you, go to your friend Mr Geoffrey. Good-bye, dear; and remember your promise.'

Ravenslee passed back the pencilled scrawl; and Spike, stooping his head low, read it through again.

'I guess I've just got to be good,' he murmured, 'for her sake. Oh Geoff,' he cried suddenly, 'I'd die for her!'

'Better live for her, Spike, and be the honourable, clean man she wishes.'

'She sure thinks you're some man, Geoff! I guess she's—kind o'—fond o' you.'

'That's what I've come to talk about, Spike.'

'Are you—fond o' her, Geoff?'

'Fond!' exclaimed Ravenslee, forgetting to drawl. 'I'm so fond—I love her so much, I honour her so deeply—that I want her for my wife.'

'Wife!' exclaimed Spike, starting to his feet, his eyes suddenly radiant. 'D'ye mean you'll marry her?'

'If she will honour me so far, Spike.'

'Marry her! You'll marry her!' Spike repeated.

'As soon as she'll let me!'

'Geoff—oh Geoff!' exclaimed the boy, and, choking, turned away.

'Won't you congratulate me?'

'I can't yet,' gasped Spike. 'I can't till I've told ye what a mean guy I've been.'

'What about?'

'About you—and Hermy. Bud said you meant t' make her go the way—little Maggie Finlay went, an'—oh Geoff, I—I kind o' believed him.'

'Did you, Spike—that foul beast? But you don't believe it any longer, and M'Ginnis is—only M'Ginnis after all.'

'But I—I've got to tell you more,' said the lad miserably, as, meeting Ravenslee's eye with an effort, he went on feverishly: 'The other night, after—after Bud slipped me the—the stuff, an' I'd had a—a drink or two, he began askin' all about you. At first I blocked an' side-stepped all his questions, but he kep' on at me, an' at last I—I give you away, Geoff.' Here Spike paused breathlessly and cast an apprehensive glance toward his hearer; but, finding him silent and serene as ever, he repeated, 'I—give you away, Geoff!'

'Did you, Spike?'

'Yes; I—I told him who you really are!'

'Did you, Spike?'

'Yes! Yes! Oh Geoff, don't you understand?'

'I understand.'

'Well, why don't ye say something? Why don't ye tell me what I am? Say I'm a dirty sneak—call me a yeller cur—anything!'

'No, you were drunk, that's all; and when the drink is in, honour, and all that makes a man, is out—you were only drunk.'

'Oh, but I wasn't s' drunk as all that,' gasped Spike, cowering in his chair; 'but he kep' on comin' at me with his questions, an' at last, when I told him how I met up with you, he kind o' give a jump, an' his face'—— Spike clenched his fists, and, slowly raising them, pressed them upon his eyes. 'I'll never forget th' look on his face! So now you know as I've blown th' game on ye—given ye away—you as was my friend!' With the word Spike sobbed and fell grovelling on his knees. 'Curse me, Geoff!' he cried. 'Oh, curse me an' tell me what I am!'

'You are Hermione's brother!'

'My God!' wailed the boy, 'if she knew she'd hate me.'

'I almost think she would, Spike.'

'You won't tell her, Geoff; you won't never let her know?'

'I don't get drunk, Spike.'

'But you won't tell her?' he pleaded, reaching out desperate hands. 'You won't?'

'Not a word, Spike!'

'Oh, I know I'm rotten!' sobbed the lad. 'I know you ain't got no use for me any more; but I'm sorry, Geoff—I'm real sorry. I know a guy can't forgive a guy as gives a guy away if that guy's a guy's friend. I know as you can't forgive me. I know as you'll cut me out for good after this. But I want ye t' know as I'm sorry, Geoff—awful sorry—I—I ain't fit t' be anybody's friend, I guess.'

'I think you need a friend more than ever, Spike!'

'Geoff!' cried the boy breathlessly, 'say—what d'you mean?'

'I mean the time has come for you to choose between M'Ginnis and me; if I am to be your friend, M'Ginnis must be your enemy from now on. Wait! If you want my friendship, no more secrets; tell me just how M'Ginnis got you into his power—how he got you to break into my house.'

Spike glanced up through his tears, glanced down, choked upon a sob, and burst into breathless narrative: 'There was me an' Bud an' a guy they call Soapy—we 'd been to a rube boxin' match up th' river. An' as we come along Soapy says, "If I was in th' second-story-lay, there 's millionaire Ravenslee's wigwam waitin' t' be cracked;" and he pointed out your swell place among th' trees in th' moonlight. Then Bud says, "You ain't got th' nerve, Soapy. Why, th' kid 's got more nerve than you," he says, pattin' my shoulder. An' Soapy laughs an' says I 'm only a kid. An', Geoff, I 'd got two or three drinks into me, an' th' end was I agreed t' just show 'em as I had nerve enough t' get in through a winder an' cop something—anything I could get. So Bud hands me his 'lectric torch, an' we shin over the fence an' up to the house—an' Soapy has th' winder open in a jiffy, an' me—bein' half-soused an' foolish—hikes inter th' room, an' you cops me on th' jump, an'—an' that 's all!'

'And M'Ginnis has threatened to send you up for it now and then, eh?'

'Only for a joke. Bud ain't like me; he 'd never split on a pal. Bud wouldn't gimme away.'

'Anyway, Spike, it 's him or me—which will you have for a friend?'

'Oh Geoff, I—I guess I 'd follow you t' Kingdom Come if you 'd let me. I do want t' live straight an' clean—honest t' God I do, Geoff; an' if you 'll only forgive'——

Spike's outstretched, pleading hands were caught and held, and he was lifted to his feet.

'My Arthur-Spike, art going to the office this morning?'

'Sure I am; my eye ain't—ain't s' bad after all, is it? Anyway, I feel more like what a man should feel like now; an'—gee! look at me doin' the sissy tear-spoutin' act! Oh hell—lemme go an' wash me face. 'N' say, if—if any o' them—I mean those dolly office-boys—has anything t' say, I 'll punch th' sawdust out o' them!'

(*Continued on page 404.*)

HEDGEHOGS, AND A NEW USE FOR THEIR SPINES.

By PERCY VERE, Author of *The Confessions of a Literary Free-Lance.*

SOME years ago the mole suddenly sprang into importance on account of its skin becoming fashionable for ladies' coats. Now it is the turn of another lowly animal—the common hedgehog—to come into prominence, for an officer in the Argyll and Sutherland Highlanders has made the interesting discovery that hedgehogs' quills make excellent needles for gramophones—that they are, indeed, greatly superior to the metal ones at present employed. 'There are some gramophones,' he writes, 'which I, a wounded soldier, can testify utter strident chords to the accompaniment of the persistent scraping of the metal needle—a needle that too quickly wears away a costly record. I have substituted a hedgehog's quill, with the result that you can hear even the words of the singer, and every note of the song in the softest renderings.' He proceeds to say that he has captured hedgehogs in country lanes, and robbed them painlessly of a few spines, the best being those which spring from the back of the creature. He finds it a good plan to stiffen the quill by inserting in it a No. 7 diamond sewing-needle. Those owners of gramophones who may be inclined to experiment with a hedgehog's spine should follow very carefully the officer's instructions: 'Snap the needle off just above the top of the quill, and very little else is required. Do not push the needle down too far, or it will work through the quill and endanger the life of the record. Also, if the point of the quill is too fine, it may be cut with a very sharp knife or razor to enable it to keep an erect position on the record.'

There are many whose pleasure in the performances of gramophones is considerably modified by the scratching of the needles, a fact which is well known to the manufacturers, who, doubtless, will be only too glad to substitute spines for steel needles if the former are found to be more satisfactory. Perhaps the day is not far distant when the breeding of hedgehogs will rank with poultry-farming and bee-keeping as a minor industry, and, by a process of selection, specially fine spines for gramophones will be produced.

Frank Buckland tells us that the quill of a hedgehog, if cut across, will be found to be quite hollow. The walls are formed of a hard, horny substance, and the interior is filled with a sort of pith, as pith lies in the stem of elder. It resembles, in fact, a magnified human hair, which under the microscope looks very much like a hedgehog's bristle when viewed with the naked eye. He also states that German professors of anatomy employ hedgehogs' spines to pin out dissections of nerves and muscles. These preparations are usually placed in bottles containing a corrosive fluid, and if metal pins were used they would soon corrode and spoil

the preparations. Coachmen, he remarks, will sometimes tie a hedgehog's skin on the pole of the carriage, to prevent a shirking horse from leaning against it; and the ancients made use of the skin as a clothes-brush.

The hedgehog goes on the prowl at night, running about with more agility than one would imagine its short legs and dumpy body were capable of. It has a stomach of strong digestive power, to which little comes amiss—cockroaches, earthworms, slugs, snails, frogs, toads, chickens, dead birds, and other animals, and eggs (including the shell), are all grist to his mill. Gamekeepers are their sworn enemies, for well they know that many a pheasant's and partridge's egg or chick finds its way into the alimentary canal of a hedgehog. Some years ago a contributor to *The Field* stated that a friend of his was walking in the fields one evening, when he heard a flapping noise in some long grass, and stepping cautiously up, he found a hedgehog trying to poke off a partridge from her nest (no doubt to get at the eggs), whilst the latter was endeavouring to beat him off with her wings.

If driven to it by hunger, the hedgehog thinks nothing of turning cannibal, and, like rats and rabbits, a mother, if disturbed, will sometimes devour her newly born family.

The older naturalists believed that hedgehogs entered orchards, and, climbing the trees, impaled pears, apples, or plums on their bristles, and bore them off in triumph. Others alleged that they knocked off the fruit, and then, throwing themselves upon it, trotted off quietly with their booty sticking to their spines. This is giving the creature credit for an intelligence he does not possess, for his brain is remarkable for the poorness of its development. Besides, his liking for fruit is not strong enough to induce him to undertake gymnastic feats of this kind.

The female hedgehog makes a snug rainproof nest of moss and leaves, and brings forth from three to seven or eight young ones at a birth, which, like puppies and kittens, start life blind. They are quaint little creatures, with their white bodies and soft spines, and their funny attempts to curl up if touched. The spines, however, soon grow and harden, and as their muscles develop they quickly gain the ability to turn themselves into prickly balls and to erect their spines for self-protection.

The writer one winter day, accompanied by his dog—an Airedale terrier—was strolling in a wood, when he noticed his companion acting in a strange manner at the foot of a tree. The dog repeatedly thrust his head into the undergrowth, and then quickly drew it back, at the same time making an impatient whine. On walking up he noticed blood on the nose of the dog. Parting the bushes and peering in, he saw, almost covered with leaves, many of which were attached to its spines, a fine, fat hedgehog fast asleep in its winter quarters. The prize could not be left, so it was borne home in a handkerchief and placed on the kitchen table. Then a discovery was made that quickly aroused eloquent objections on the part of the lady of the house. The animal was infested with fleas, which hopped about in all directions. An hour later the hedgehog was back in its hibernaculum, the parasites in undisturbed possession of their host.

Young dogs do not, as a rule, maintain for long an attack upon a 'thorny hedgehog;' but older dogs, Richard Jefferies assures us, learn how to go about the business scientifically. They roll the animal over with a paw, touching it gently, so as not to run the spines into the paw, till the depression comes uppermost where the hedgehog has tucked his head inwards. This is the only vulnerable place, and with one desperate bite the dog thrusts his teeth in there, seizes the nose, and then has the hedgehog in his power. The writer once discovered a hedgehog which was bleeding at the nose and in a half-dead condition. It had evidently suffered from a recent scientific canine attack. A small dose of whisky, forcibly administered, revived it for a while; but the stimulant only hastened the end, for a few hours later it gave up the unequal struggle. The hedgehog's omnivorous tastes include, it is said, if not a fondness, at least no dislike, for intoxicating liquors, which have the effect of making him immediately tame, after passing through a period of inebriety, during which his gestures and proceedings have a most ludicrous resemblance to those of a drunken man.

Eagles do not seem to object to hedgehogs for diet purposes, despite their prickly protection, for Frank Buckland puts on record an experience of his in this connection. At one time he possessed, among other singular pets, an eagle and a hedgehog, the former being chained to a perch in the garden. The hedgehog disappeared, a careful search failing to discover the animal. The next morning, when going to feed the bird, Buckland noticed a large ball lying on the ground immediately under the perch, and on examining it he found that it was composed of the bones, skin, and bristles of the missing quadruped, which indigestible substances the eagle had, in the manner of his tribe, disgorged. In making a nocturnal search for slugs and beetles, the hedgehog had strayed within range of the eagle, and had paid the death penalty in consequence.

One certain way of making a hedgehog unroll itself is to place it in water, when self-preservation forces it to swim. It shuts up, however, all the tighter for the fright when it touches land, and, in the words of the showman, 'the more you stir him up, the more he won't uncoil.' Consistent kindness will, with hedgehogs, as with most animals, cause them to lose their timidity, and though they are not capable of manifesting much affection, they show for those

who feed them a certain amount of cupboard love. It is recorded that in the year 1799 an innkeeper at Fulton, in Northumberland, possessed a hedgehog that performed the duty of a turnspit. It ran about the house (answering to the name of Tom) as familiarly as a cat or a dog, and displayed in other ways most unusual intelligence.

The fondness of hedgehogs for 'black-beetles' has led to their being kept in houses for the purpose of destroying these creatures, in the pursuit of which they show much activity, crunching them up with evident relish. It sometimes happens that a hedgehog, newly introduced to such a happy hunting-ground, falls a victim to its own voracity, and dies of overfeeding.

Finally, it should be placed to the credit of the hedgehog that it makes a toothsome meal for Gipsies and tramps, the Gipsies being adepts in the art of cooking it. This is the recipe of an old Gipsy woman: 'You cuts the bristles off 'em with a sharp knife after you kills 'em fust, sir; then you sweals 'em' [Oxfordshire, burn them with straw like a bacon pig], 'and makes the rind brown; then you cuts 'em down the back, and spits 'em on a bit of stick, pointed at both ends, and then you roasts 'em with a strong flare. They are nicest at Michaelmas-time. Some have yellow fat and some white fat, and we calls 'em mutton and beef hedgehogs; and very nice eating they be, sir, when the fat is on 'em.'

A QUIET WEEK-END.

CHAPTER III.

I AWOKE with a start, to find Dare standing by me with his hand upon my shoulder.

'What is the matter?' I inquired.

'Do you think it possible,' he said with a faint smile, 'that your friend Mr Alsop walks in his sleep?'

'How should I know?' I answered rather pettishly, still only half-awake. 'The fellow is no more my friend than yours; I never saw him till to-night.'

'Then I have the advantage of you there,' Dare went on; 'but I asked because he is not in his room.'

'Not in his room!' I exclaimed, now thoroughly roused. 'Where is he, then?'

'That I propose that we should see. Will you get up?'

I sprang out of bed, slipped on my trousers and coat, and then followed Dare. He crossed the passage to the stranger's room, which was exactly opposite my own. It was empty; and a moment's glance showed me that its occupant had evidently left it fully dressed. I looked at Dare.

'Whatever can this mean?' I said.

'That I can tell you later. Meanwhile, let us see if we can find the vanished bird.'

We went downstairs and along to the door which opened on the passage leading to the many buildings in the side-wing of the house. The door was shut, but opened freely on the handle being turned.

'I locked this door last night and took away the key,' said Dare. He held the candle to the keyhole for an instant, and then added, 'Yes, the lock has been picked.'

Just at that moment, from the depths of the long passage, came a cry—a cry which broke off suddenly, as though it had been cut in half. I started forward, but Dare held me back.

'Let me go first,' he said.

And it was he who led the way, with steady and unhurried steps, down the long passage, past the many doors. Only one door stood open, and a sound of muffled growling came from the dark depths beyond. I looked at Dare in horror; it was the door of the large loose-box where the leopard slept.

'Good God, Dare! what has happened?'

'Some disaster to Mr Alsop, I fear,' said Dare composedly. 'Let me go in.'

He entered, while I held the candle at the door. Stretched on the floor lay Alsop's body, with the leopard standing over it. Dare walked up to the creature firmly, and struck her sharply on the neck.

'Get back, Bagheera. Let it go, my girl.'

For some few moments I quite thought the creature would have sprung in fury on her master; but Dare's power over her maintained its sway. Scolding and pushing, striking frequently, slowly Dare forced the leopard backwards to a corner of her box.

'Drag out the body,' he called to me.

I did so, noticing with horror the exceeding limpness of the neck. When I had got it to the passage, Dare came out himself and closed the door, leaving Bagheera raging angrily within. He set the candle on the floor and stooped beside the man.

'The neck is broken,' he said quietly; 'no doubt she did it with a single blow.'

'Good heavens, what a fearful business! But what brought him here?'

'That's a long tale,' replied my friend; 'and meanwhile we must think of what is to be done. Just help me, will you? Take the feet.'

Between us we took up the body, bore it down the passage to a carriage-house, and laid it on the ground. Then we went back to the

hall. Dare led the way into the dining-room, and lit the fire; it was laid ready every evening after we had dined.

'What did you mean just now, Dare, by saying that you had the advantage of me in knowing this man?' I asked. 'Did you know him?'

'As an acquaintance, not at all; but perfectly by sight.'

'But you made no sign of recognising him when you two met last night. Did he know you?'

'Undoubtedly. What he did *not* know was that I knew him.'

'There is some mystery in all this, Dare.'

'Well, yes. Sit down, and I will tell you all about it. But you want a drink. There's some liqueur brandy in the sideboard; it won't hurt you after what you've just gone through. And we shall have to settle what is to be done.

'Your dripping acquaintance of last night,' continued Dare, 'saw fit to introduce himself as Alsop and an Englishman. Now, I prefer to recognise him as a German of the name of Woell.'

'A German! Do you think he was a spy?' I exclaimed, my mind naturally following the thoroughfare popular at the moment.

'A spy in general? Very likely—yes, most probably indeed. And certainly, in regard to this particular visit here. He is—or, rather, was—the nephew of the old professor whom I told you of. His uncle and he were not on very cordial terms, but Woell would call upon the old man now and then. He did so once when I was there; but it chanced quite simply that, though he saw me and I him, *he* was unaware that I had seen him. He did not live in Heidelberg, but in Berlin, where he was occupied as a business "agent" of some kind—ostensibly. But, to my notion, he was in the pay of the police.'

'Then you believe that he was after you down here?'

'My dear fellow, just review the facts you know. His uncle invents a valuable agent of war, and disposes of the secret to the German War Office. Then he is further known to be engaged on something else of the same kind. He meets sudden death by an accident. No traces of his work on this unknown discovery are to be found in his rooms. I, who have been on terms of acquaintance with him, and have shared the use of his laboratory, soon move from Heidelberg. That is sufficiently suggestive, is it not?'

I nodded. 'Then he came down here to spy on you?'

'To spy? Well, yes; but what he wanted was the record of his uncle's work, and also of what I have lately done to further it. Germany has maintained spies everywhere for years. In spite of every care, I dare say that my doings, my visits to the War Office, are known.

'Of course, I recognised him when I came into the room last night; in fact, I thought his figure seemed familiar when I watched him cross the garden at your side. I guessed at once what brought him here. A clever trick, his choosing Sunday, and his falling into the pond. He had, no doubt, been reconnoitring round the place before. It was impossible, as he foresaw, for us to do otherwise than ask him in.

'As I came from the passage, crossed the hall, and went into the study, he was standing where he could observe the hall; the study door was open, and he saw the door through which I came. And he had previously observed me from the garden drawing down the blind. You follow him? He sees me safe to bed; he hears me snoring—I took care to snore'—Dare smiled. 'He goes downstairs, soon picks the lock—a simple one—and sets off down the passage to explore. One thing he did not know, and therefore did not bargain for—the presence of Bagheera in the house.'

A sudden, horrible idea occurred to me. I tried to put it from me, stifle it; but Dare, no doubt, had seen the terrible suspicion on my face.

'Well, my dear man, speak out,' he said.

'Dare—for God's sake!—you didn't surely'——

'Didn't leave Bagheera with the range of the whole passage that our German might encounter her?' my friend replied, his steady eyes on mine. 'Well, had I done so I am by no means certain that I should not have done right. This man, a spy, was compassing what would have meant the death in agony of many thousands of men. Why should I not arrange that he should meet his own?

'However, I did not do that. No; it was unfortunate for Herr Woell that Bagheera seems to have achieved last night a small success which she has been attempting to accomplish for some little time—the trick of opening her box-door by clawing the handle. I see the handle is much marked with scratches, so that she has been at it for a few days. To-night she has succeeded. Perhaps she heard him coming, clawed the door open, and sprang out on him as he came; perhaps she was out already, and he met her there. We can't know now, but I think probably the latter was the case. And now we have to settle what to do.'

'Shall I fetch a doctor? The police, too, must be told.'

'My dear chap, no. There is no hurry for a doctor. Woell is dead. And local doctors and police are the last people we want here.'

'But, Dare, the law. Of course, there 'll have to be an inquest. I know it is unpleasant, but'——

'My dear, good fellow, you are all for trifling legal detail, while I have much more important things in mind. In general, I know, it is obviously desirable that a public inquiry should be held into a sudden death. In this particular case, and at this particular time, it is of the most vital importance that the affair should be smothered.'

'Good heavens, Dare, how can you smother such a thing as this?'

'In more than one way, perhaps; in any case, we *must*. The War Office would be indignant with me if I let the two main facts get out—that work for them is being done here, and that a German spy has been prying into it and lost his life. Therefore, it must be smothered; but next comes the question, how?'

Dare stroked his chin for a few seconds, looking thoughtfully at me.

'The really simplest way, and the one entailing little loss of time—a most important thing just now for what I have in hand—is one to which I fear you would object, you are such a stickler for law and order. Were I alone in this affair I think that I should put Woell's body in the pond, with stones tied fast to head and feet, and try to think no more of it. Indeed, I should forget it without trouble, occupied as I now am. But that would not suit you?'

'You would not dream of such a piece of folly, Dare! We should lay ourselves open for life to suspicion of a murder. Don't speak of such a thing.'

'Yes,' said Dare, smiling in a way that made me question whether he was jesting or in earnest in the hint that he had dropped—'yes, I feared that that would be the view you'd take. As you object, there's nothing for it but that I should get the car out and go up to town. I have friends there who will soon deal with the affair. You don't mind staying here a few hours by yourself? I think, if you don't object, you'd better keep inside the house.'

I cannot say that I was much delighted with the prospect, but, of course, I readily agreed. It was just half-past two when Dare waked me, and by four he was upon his way to London, leaving me alone.

I went back to my room, though not to sleep. At breakfast-time I told the servant that his master had been called to London—news which seemed to cause him no particular surprise. With the aid of books I passed the hours of the morning and the early afternoon as best I might; but they were hours I have no desire to re-live. Before the printed pages ever rose the picture of my company in that old house: two deaf-mutes, a full-grown and half-tamed leopard, and the lifeless body of a man.

At three o'clock I heard the welcome sound of a car stopping at the garden gate. A moment later Dare came in, accompanied by two keen-looking, well-dressed men.

'I'm afraid that you have had a long, slow morning of it,' said Dare cheerfully to me; 'but we are all right now. First, let me introduce these gentlemen—but not by name. This'—and he pointed to the taller man, who bowed to me—'is an official from the Home Office. He is vested with absolute authority to act in this matter, and we may look upon him as representing to us the Home Secretary. This other gentleman is a special officer from Scotland Yard. They will, to satisfy you, show their warrants of authority to act as they think best.'

I did not stand upon the letter of the offer, for in vital things I absolutely trusted Dare.

'Perhaps, Mr Dare,' said the official from the Home Office, 'your friend will give us his account of the affair, so far as it is known to him.'

I did so, both officials taking copious notes. When I had finished, we adjourned to where the body lay. After a casual glance, and while the Home Office official was satisfying himself about the broken neck, the detective took from his pocket a letter-case, chose a small photograph from other papers, and compared it with the dead man's face. He passed the photograph to his companion, then to Dare and me. It was an obvious likeness of the man who lay upon the floor.

'A very clever spy, who has been working in this country for some weeks,' the detective said. 'We've nearly had our hands upon him more than once, but each time he has just slipped through.'

Dare now proposed an interview with Bagheera, and the two men glanced at her through a small 'judas' in the upper portion of her loose-box door. When we were once more in the study, the official from the Home Office decreed what must be done. Although he spoke ostensibly to Dare, he looked most frequently at me, as though divining—or most likely Dare had told him—that it was my scruples that he had to overcome.

'This matter must be kept quite quiet locally,' he said; 'the special needs of the country, the requirements of the army authorities, are matters before which all usual forms give way. We shall arrange for the body to be taken to London; there a doctor will certify the cause of death, and it will then be dealt with—in the proper way. The man, if he had been captured, would, I feel quite certain, have been shot. As both your servants are deaf, and the affair took place at dead of night, it is most likely that there is no rumour of the matter in the neighbourhood; but to avoid any trouble in that way, I will cause the coroner and the chief constable of the county to be informed that a death has taken place in this house, and that the body has been removed by the Home Secretary's orders; further, that they are to take no proceedings, and must keep the information absolutely to themselves.'

'Suppose inquiries are made from his hotel at Willchester?' I said.

'I doubt his having been at an hotel at all,' said the detective. 'He was believed to have a motor-bicycle, and he most likely rode straight here from town.'

The matter of the wheel-mark in the gateway of the wood occurred to me. I mentioned it. Five minutes later the detective and myself were at the spot. Examining the path, we traced the wheel-mark through the gateway and along the path until it turned off suddenly among the trees. I wondered that its course had failed to catch my eye the previous afternoon; branches were broken from the bushes; fern and grass were crushed.

Thus guided, we went on until a clump of nut-bushes was reached. Behind it, screened on all sides by other clumps, there stood a motor-bicycle, with a neat, bulky parcel strapped over the saddle. It presently displayed a heavy overcoat, a pair of goggles, and a cap.

'You see he obviously came down from town that day, hid his kit here, and then posed as being a casual visitor from Willchester. Thus he would count upon being recognised by no one in the neighbourhood except yourself and Mr Dare.'

We returned to the house and reported our find.

'The motor-bicycle had better go to town as well,' declared the chief arranger of affairs. 'Your car won't take it, Mr Dare, and I should prefer not to trouble the railway company in the matter.'

'A light, quick-running motor-lorry would be best for it and for the—other thing,' suggested the detective deferentially.

'The police at Willchester have one,' said Dare.

So it was arranged by the great man. By half-past ten that night the motor-lorry had arrived, had taken up its double burden, and had gone, the Scotland Yard detective sitting by the constable who drove. The German's body had been wrapped in sacking until quite unrecognisable for what it was. We three who stayed behind had supper, and a little later Dare drove the Home Office official to the mail.

'I really am extremely sorry that your visit should have turned out as it has,' Dare said when, late that night, we once more sat alone. 'But what would you? Fate is master of us all. And, after all, you have no cause to worry, either for yourself or for me. My mind and conscience are entirely at rest.

'Entirely,' my friend continued, throwing down a match. 'I know what is in your mind: that I kept a dangerous beast in my house, taking no proper care to prevent its doing mischief; that I should have kept its box-door locked. That I deny. The servants, both the man and his sister, knew that they had no business in that portion of the house unless I sent them there—as I did send the man sometimes. They slept in rooms upon the second floor; the leopard never came beyond the passage door unless I was at hand.

'Why should I, then, take any steps to make a spy or a burglar safe? If such men come, they do so at their proper risk. Woell well deserved to die; he would assuredly have died if caught. As to the manner of his death, as well the swift blow of a velvet paw, a broken neck, as to stand blindfolded against a wall in that old Tower and front a dozen rifles levelled at his breast. No, frankly, I am unconcerned; and you should be the same.'

Perhaps so; but it was long ere I could chase the dreadful business, even for a moment, from my mind. As for Dare's sentiments, as I have said before, you had to take Dare as you found him, if at all.

On reassembling after such occasions as a mid-term holiday, it was my custom to pass a few preliminary minutes in exchanging news of the vacation with my class. I had intended to describe Bagheera, judging that a jet-black leopard would be new to every boy. As things had turned out, I decided it was best to leave the leopard undescribed.

THE END.

A RUINED WORLD.

SOMEWHERE IN FRANCE—WHAT THE LAND IS LIKE.

By LAUCHLAN MACLEAN WATT, C.F.

IT is impossible for the people at home to imagine the effect of war upon a country. What were beautiful rural retreats are now smashed and scarred out of recognition. A heap of dusty bricks marks where a village stood only recently; a broken wall is all that is left of a fine old church, which was encrusted by most sacred memories; a few stunted spars, splintered and blackened, show where once was a forest of shimmering greenery fit for the haunt of fairies. Where was a country road, down which were wont to come the laden carts in harvest-time, is a miry track, torn by shell-holes, powdered and crunched into clinging mud-paste by the ambulances, the motor-lorries, the transport limbers, and the long lines of jaded, soaked, earth-stained men continually on the move along it.

All over the hillside, once beautiful in the

sunshine, with waving corn, and woodlands where the birds were singing, run the intricate mazes of forsaken trenches, broken and ploughed by the terrible artillery, gaping with the huge craters of exploded mines, wrinkled and scarred, seared and blighted as if with some horrid leprosy. It is strewn with graves. It is a land that bears the story of its torture in every feature. And the fruitful soil has been buried deep under stones and chalk refuse. It is an emaciated thing, like a blind beggar, the very bones projecting through its rotting skin. It is not like a bit of God's fair earth at all, but rather some kind of underworld, away from hope and laughter. And it was only so recently beautiful among the nations, and the pride of the people whom it bore.

All over those ruined fields battle upon battle has swung in passionate struggle to and fro. For the enemy had laid down, with consummate thought and masterly design, what he intended to be an absolutely impregnable frontier line of earth-fort, strong dug-out, and powerful trench. And you would understand, as he has been made to understand, as never before, the stuff of which our race is made, if you saw the kind of place from which your boys drove out the stiffest and most stubborn foe we ever had to face.

The dug-outs which have been left undamaged ought to be preserved for all the world to see, as monuments alike of determined and purposeful industry, and of invincible courage and sacrifice. Some of them are two and three storeys in depth. You go down stairs that are wood-lined all the way with great strong beams; you can go along from passage to passage, looking into rooms comfortable, dry, and ventilated, furnished with many a titbit shifted from the homes which the guns have now blown flat—big, fine French beds, cosy arm-chairs, gilt-framed mirrors that once were in drawing-rooms, sumptuous rugs, warm curtains, stoves, and electric light. The men who occupied these never expected to be shifted. Deep down there they could sit secure from bomb and shell, the explosions of which sounded far away. There, in safety from our unspeakably terrible bombardments, the Germans crowded together and lay low, and then, rushing up, brought their machine-guns to bear on our advancing lines. But yet, despite it all, the lads from our firesides at home and oversea stormed the stern citadels, snatched the strong shelters from the grip of the enemy, and with bayonet and fist forced the dismayed and astonished Huns into death or surrender. They are the true monuments and mementoes of our army's devotion. The heart swells with a pride that has tears behind it, beholding the strength which was overcome, and remembering the sacrifice willingly given, in the strenuous hour of honour's call, by those of our flesh and blood. God grant we may be worthy of them in the days that are to be!

The very human instinct which makes people write their names upon the Pyramids, and in holier places, leaves its trace in the dug-outs also. On the lintels and jambs, in indelible pencil, is written name upon name; sometimes the legend, '*Gott mit uns;*' a stanza of Luther's hymn, '*Ein' feste Burg ist unser Gott;*' or a verse or two of some old folk-ballad. At the door of one of these strongholds, on the ridge of a slope overlooking a once beautiful valley, I found a verse of warmest sentiment, inspired by the thought of a girl far away, and by the vision of the red, round moon in the hazy sky. Some Saxon lover's heart was for a while uplifted from the grim environment of war by the magic of remembrance, while the vast solemnity of moonlight flooded that place of death and doom and dire destruction. On at least one of the dug-outs a desire for strict privacy had prompted the occupants to inscribe upon the lintel the notice, '*Durchgang verboten*' ('No admission'). They forgot to put 'except on business,' so our brave Tommies went right in without knocking and took possession.

Some of the mine-craters are awe-inspiring, huge and monstrous evidences of the reality of war, scarified traces of terrible sacrifice. I saw one which must be about fifty yards in diameter and nearly fifty feet deep. The chalk soil and gravel glistened in the sun. And it reminded me of nothing so much as the photographs of mountains in the moon which were in our manuals of astronomy at college. Right down at the centre of it was a little cross; and here and there along the sloping sides the marks of brave dust's sleeping-places, with remains of German uniforms scattered about. Not far from the edge of it stands a big, simple white cross inscribed, 'Here lie buried the gallant men of the ——th Division, killed July 1st, 1916.' Then follow the names of some well-known regiments, including one of our own. Everywhere in No Man's Land, the scene of conflict on that memorable day, where, among the rough grasses and thorns, the broken and rusting barbed wire caught your foot, are to be found memorials of the fallen. There is a touch of extreme pathos in some of the distinctive marks, as, for example, the weather-worn broad bonnet of a Scottish regiment, the ordinary regulation cap, a trench helmet or two with the hole made by the bullet which was the sudden messenger of death. These, placed on the top of the little, rude wooden crosses, showed where had been found unknown and unidentified dead. The piteousness of the lost, who fell without a message, strikes you there.

I remember another mine-crater, in another place, where the graves were for the most part those of French soldiers who had been laid to rest by the hands of those who knew them not. There was a slab about the centre to the memory of '*Plusieurs soldats français inconnus morts au*

champ d'honneur.' To one cross was affixed a letter from the little daughter of the man whose stricken body slept below. It had been found in his pocket, stained and creased, but kept as a tender souvenir of home. It was addressed, '*A mon père à la guerre.*' It spoke to us, beholding it, of a young heart, somewhere, with the first touch of the mystery of death and the enigma of the empty chair cold upon it.

The stillness of those places, so lately swept by the overwhelming thunders of doom, was beyond description. And Nature's exquisite poesy had intervened; for, along the forsaken trenches, and near the graves, the drowsy scarlet poppy was waving in the silent garden of sleep. And sometimes it was as though war's destructive hand, rending the clay, had loosened the slumbering seeds of countless wild flowers, and given them their chance to hide the scars which the wrath of man had made on the face of the world.

We sat on a ridge there for a little while, and looked down on the battered village below, and the wood beyond, where such a dire struggle had so recently marked the dawn of a summer day; and the tragedy of it all came close in beside us, keeping us silent as those whose grave-mounds were scattered in the green plots near. Just in front of us was the grave of a German officer; the silver-gray moth which was creeping up his broken cross seemed to take a sudden meaning in that quiet place. And across the valley we could see the long line of men in khaki winding over the hill, horizonwards, through a ruined land.

As one moves from place to place one cannot but ask what is to be the fate of those shattered places, where happy folks once dwelt together, and of which, save for some heaps of brick-dust and a few spars, scarce a vestige now remains. Will they be rebuilt? I fancy, however poor the ruins are to-day, sentiment will bring back the scattered people to the old sites, that still in their desolateness are dear to the memory of those whose homes were there. For a long time after the war there will be villages of huts, for I have heard a whisper that the wooden buildings in our encampments may be purchased by the French Government for this very purpose. But it is at present difficult to conceive a set of settled communities in these valleys and fields of death. And yet every day one has seen how the people cling to the land. Shells may fall with nerve-shaking insistency, but the peasant will go on with his ploughing or his harrowing, turning a deaf ear to the threat of war. And the industry of the French nation has in the past wrought wonders when the cloud of war has removed its threat from their country.

Perhaps as terrible as crumbled ruins is the deserted village, where the houses still are standing, though at intervals along the street some have had their roofs blown in or the front walls shattered, and the church has been pierced by shells. I remember the first of these through which I rode in the dark. The empty, windowless rooms sent back the beat of our horses' feet most eerily, and we hushed our voices to a whisper as we rode. A large convent loomed by the roadside, empty and dark. And one felt something like the shadow of some great despair behind those forsaken walls. By daylight it was just as eerie. And you saw what wreckage war had made. At one door, in the passage, a cradle had been left behind. The people had apparently been in flight when a shell had dropped in the street, and they had fled precipitately then for dear life. The church precincts and the convent garden had been thoroughly searched by artillery, shell-hole lying in almost immediate contact with shell-hole. There was not a sign of life anywhere, except a stray cat or two which still lingered about the familiar places, and the chirp of the sparrows which thronged the bushes about the silent convent. In a corner of the garden there, a little gathering of plain white wooden crosses told where the tired ones were sleeping till the great awakening. In that place I have spoken of the resurrection and the life above the sleepers, in the sunshine and the rain.

Perhaps as pathetic as the deserted village is the half-forsaken town, where, because the German guns drop their 'crumps' there daily, most of the population have shut their doors and fled. I was often in one such, where before the war probably almost twenty thousand people led a busily industrious life. In the thoroughfare which bears the French equivalent of 'Commercial Street' the grass was growing thick. Everywhere windows had been blown in, and high roofs broken like matchwood. The beautiful old square was silent, the green grass flourishing between the paving-stones, and scarcely a footfall disturbed its slumber. But one day my servant said, 'Ride round this way, sir. There 's something here that touched my heart yesterday.' And we turned into a side-street of working folks' houses. And there were bairns laughing in their games, forgetful of the ruin and desolation. John stopped his horse, and his voice was husky as he said, 'There 's something in the Scriptures about a thing like this; a promise that in ruined Jerusalem there shall be children playing in the streets again. I found this here yesterday, and it minded me o' that.'

As sad as anything is the old château in the pleasant, wood-environed meadow, like a lamed and wounded thing, with ancient names on the marble slabs in the vaults, and the gilding still on the drawing-room, though sorely tarnished by the rain and the fog that have had too free entry through the dilapidated ceiling. I was sitting in one like that, chatting with some doctors who had made it their headquarters, when suddenly three shells fell in the wood

close by, and rocked the old place like a cradle. Somebody just said, 'Hullo!' and then we went on with the conversation. On the floor of the drawing-room, quite near us, lay an ugly lump of iron which had come in the day previous, through a panel of the drawing-room door, from a similar experience.

You do not need to go up to the front-line trench for risky moments. The messages of Brother Fritz are delivered unpleasantly far back, and when least expected. I have heard them falling quite near us when we thought ourselves in quite a secure billet. And one day, just across a field from where I stood, I saw one burst in a threadbare bit of wood, amongst some men who little looked for such a missive. It was strange to see the sudden alarm, and how the poor fellows ran hither and thither seeking cover, some of them vainly, from their horrid visitor.

All these places had names of their own before the war. They will, of course, have them still when war is over. They will keep the broken remembrance of them somehow, as a maimed brain keeps the memory of its past. But the British soldier has baptised them all by odd terms, making wild, grabbing attempts after the real thing, with the oddest and yet frequently most eloquent meanings as result. When one reflects on his experience in certain neighbourhoods, could anything be more appropriate than Armytears, or Devil's Wood, or Business, for certain well-known spheres of strenuous and painful activity? The trenches get their own names too. You find your way by Paternoster Row out to Ailsa Craig, so called from its remoteness and isolation; and you must be careful going through Na Poo Avenue, for it can be enfiladed by the enemy snipers, and many a brave fellow has been 'na poo' there. It is the soldier's familiar equivalent for the French phrase which expresses the fact that anything has come to an end, that there is no more of it; but it is in reality the patois synonym for the French classical sentence. And sometimes you stumble upon more familiar ground. One day I had to stoop in going underneath an overhead obstacle in a trench; and as I rose too suddenly I received a very sharp blow, which might have stunned me but for my good steel helmet's protection. As I looked up I found that I had just passed through Gibb's Entry. Surely it was an Edinburgh lad from Nicolson Street that wrote the name there.

In this ruined land the presence of winter gives us all serious thought. It is a horrible thing to contemplate. A few days' rain, and you will in some places have three feet of muddy, chill water to waddle through. And farther on, where the great guns have battered the world into smashed pulp of mire, you may go up to the waist, and indeed plunge into death itself, in loathsome mud. Nothing can be drearier, more dismal, or more grim than the landscape there—black slime of clammy clay, with water-filled shell-holes, stretching to a dull gray horizon-line. The camp where the transport lies is a quag, where mud-covered horses and men shiver by day and night. And the line is a series of deadly holes, where the faithful hold their posts in hideous discomfort, under an intermittent fire of shells which splash into the mire, flinging up first of all dirt and stones around them, and then, with a roaring burst, showers of missiles and fragments of iron, with the red fiery thing of hate in the heart of them. And that is the discipline through which our boys pass, without despondency, till the time for advance comes again, and we go forward once more along the inevitable path of sacrifice to victory.

A CELESTIAL SIGN.

By Andrew Quentin.

AS the matron, tray in hand, turned to leave the sickroom she paused, and glancing at the convalescent in the bed, said firmly, 'Now, remember, Mr Cunningham, no more tricks, such as getting out of bed and walking round the room, to "admire the scenery," as you say. On no account must you get up for at least three days. Your last escapade might have been fatal, and the next will almost certainly be so.' She glanced severely at the pale face on the pillow, not unhandsome even with its three weeks' growth of brown beard.

The patient smiled cheerfully back at her. 'All right, Miss Blaydon; I'll attend to that,' he murmured, with an almost ludicrous attempt at penitence.

'Your word, please, Mr Cunningham,' went on the matron, entirely unmoved by the apparent contrition. From long experience Miss Jane Blaydon placed little faith in the repentance of a convalescent.

'Oh, I say, Miss Blaydon, that's a bit stiff. Surely you can trust me.'

'Your word, please. Your life has some value, Mr Cunningham, although you apparently do not think so.'

'Very well, I give you my word,' replied the occupant of the bed, half-sulkily, as he swung round into a more comfortable position.

The matron, with a grim smile, and a satisfied nod of the head at the result of her firmness, noiselessly departed, closing the door carefully behind her.

When she was gone Roddy Cunningham sat

up in bed and shook his fist at the closed door.

'Confound that angular damsel!' he ejaculated angrily. 'Here am I chained to this blessed bed for another three days. Ugh!' And he scowled at the various interesting and agreeable objects in the room, winding up with a gaze of particular and intense hatred at the tumbler of Vichy water on the table at his bedside.

It was May 1900. He was lying in the English hospital, planted on the hillside above the great South American port of San Pedro, just recovering from a severe bout of yellow fever—far more severe, in fact, than he had had any notion of. But he had pulled through, thanks to a powerful constitution, inherited from his Scottish ancestors; thanks also to that spice of luck which is necessary to every man at the critical moments of his life's history. Now he had only two desires—to be allowed to get up, and to be furnished with what he considered a sufficient amount of sustaining food. Yesterday he had horrified his pretty, but prim, nurse, Miss Watson, by demanding a large beefsteak with a fried egg on top, plus a bottle of pale ale. To-day she had been even more horrified, on entering his room unexpectedly, to find him standing at the open window, gazing entrancedly at the great view beneath him—the hillside with its luxuriant vegetation waving in the fresh breeze; beyond, the superb bay crowded with merchant and naval shipping. As a matter of fact, at that moment he was meditating a stroll along the veranda outside the window, and a talk, through *their* open windows, with the few other fever-stricken 'Inglezes' occupying similar rooms along the corridor.

This most irregular proceeding had promptly been reported by Miss Watson to the matron; result, the interview above recorded, ending in the complete rout of Roderick Cunningham, accountant at San Pedro of the great English Bank of South America.

Ugh! He lay down again, drew the bedclothes round him, and fell fast asleep.

A few hours later he was roused by the sound of footsteps moving softly about the room. Opening his eyes slightly, he perceived the slim figure of Miss Watson—Nurse Mary. She was closing the window, as dusk was about to fall. This done, she approached the side-table, and, to his extreme astonishment, Roddy saw that she had recently been weeping bitterly. For a few moments he watched her arranging the medicine-bottles; then, stretching himself with a yawn, 'Hullo, nurse! What has gone wrong now?' he inquired.

The nurse started violently, almost upsetting the detested tumbler.

'Nothing, Mr Cunningham,' she replied; 'nothing at all.'

Roddy eyed her narrowly. He had not had a diverse experience of men—and of women—in several portions of the globe for nothing.

'Come now, nurse, that won't do.' Then, as a sudden thought struck him, he added, 'By-the-by, how is Merton getting on?'

Merton was one of the aforesaid inmates of the corridor rooms, and was reported to be a rather bad case of Yellow Jack.

The nurse burst into tears, and, without attempting any reply, hastened from the room, holding her handkerchief to her streaming eyes. He could hear the sound of sobbing as she hurried along the passage, and even in the midst of his surprise Roddy caught himself hoping that Miss Blaydon would not appear at that particular moment. If she did, Nurse Mary would wish herself back in dear old London by the time that strict disciplinarian had finished with her. Roddy rather liked Nurse Mary, although he had a shrewd idea that his manner of life and conduct met with her severe disapproval.

He stared now in deep thought at the white plastered ceiling, glimmering faintly in the dusk. Merton, poor chap! must be in a bad way. That was a dashed pity. Not that he, Roddy, was a friend of Merton, or even liked him as an acquaintance—rather the contrary. For Merton was one of those 'churchy' fellows one meets with occasionally abroad; never went to the Casino, the bull-fights, or the races; hardly touched wine; attended the English church every Sunday in his life, including the most grilling days of a tropic summer; while Roddy . . . No, he was no friend of Merton. Still, it was infernal hard luck to peg out like that, a man under thirty, with all his future career to look forward to.

And the nurse? When he had asked her that sudden question, he had recollected meeting Merton and Miss Watson, one Sunday forenoon a few months ago, on the shore front, not far from the English church. He was on his way to the boat-races in the next bay, and they were evidently just returning from the morning service. He had thought at the time that they appeared to be on very friendly terms. Infernal hard luck! Still, there was always a chance while life held. He would inquire of Miss Blaydon to-morrow.

But on the following day he did not see the matron until late in the afternoon, when she entered the room, grave and sedate as usual, but carrying what appeared to his incredulous eyes to be a bottle of champagne! Nurse Mary had not appeared that day, another nurse having evidently taken up her duties in that part of the building.

As Miss Blaydon perceived the unbounded surprise with which her refractory patient was staring at the bottle a faint smile crossed her lips, but she merely remarked, in her customary calm voice, 'To-day is the Queen's birthday, Mr

Cunningham, and our custom is that every person in the hospital receives a glass of champagne on that day, to drink her Majesty's health.'

'By Jove, Miss Blaydon!' answered the unregenerate invalid in the bed before her, 'that is absolutely the most magnificent custom I ever heard of. Just put it down on the table here, please. But, I say, couldn't you make it two glasses?'

The matron shook her head solemnly, though still smiling. 'Only one glass, Mr Cunningham. Then, generously, and as one making a great concession, she added, handing him the bottle, 'You may pour it out yourself.' As she spoke she placed a glass on the table.

Roddy sat up in bed and held the bottle up to the light. 'Look here, Miss Blaydon, it's almost empty,' he said in tones of the utmost alarm.

The matron's smile broadened. Perhaps in her inmost heart there burned more than a flicker of admiration for the fair-haired, six-foot Scot.

'Now, Mr Cunningham, there are at least two glassfuls left. But as a special favour, and as you have kept your promise about remaining in bed, I will leave the bottle with you. Take care not to spill any,' she added, shooting this Parthian arrow as she retreated towards the door.

With a seraphic smile the convalescent took up the glass, but even as he did so he recollected his brief conversation with Nurse Mary on the previous day.

'I say, Miss Blaydon,' he called, 'a moment, please.'

The spare figure of the matron reappeared in the doorway. Roddy bent forward, and lowered his voice: 'How is Merton?'

Miss Blaydon advanced slowly to the bedside, and, pausing there, gazed down at her questioner. Across her face there passed an expression of supreme pity, but her tone was level, steady, controlled. 'Mr Merton's condition, I am sorry to say, is quite hopeless. He cannot live beyond midnight.'

Roddy stared at the sallow face above him. 'Dashed hard lines,' he murmured; 'although we must all take our chance. But yet, "while there's life there's hope," you know, Miss Blaydon,' he added, quoting that venerable adage which has given consolation to so many thousands of anxious hearts.

The matron shook her head. 'No, Mr Cunningham,' she answered sadly; 'that does not apply to yellow fever. There may be life, and no hope. The doctor has just seen poor Mr Merton, and his verdict is final.' With a sigh she turned away, and Roddy lay down again, leaving the champagne unpoured, untasted.

So Merton was doomed. Hard lines indeed! But Miss Blaydon had seen too many cases of yellow fever, fatal and otherwise, during her long stay in San Pedro to be deceived. She was reputed to know almost as much as any doctor in the great city about that terrible scourge. When she spoke in that definite tone it must truly be only a matter of hours.

Not beyond midnight! and already night was approaching. Roddy glanced at the window space framing the fast darkening sky, and as he did so his eyes lighted on the champagne-bottle. Merton would drink no health to her Majesty that evening. Unconsciously his thoughts turned to the friends of past years whom he had lost by fever; then to the few, the very few, almost miraculous recoveries, even in the article of death. One especially he recollected —Constable, now in London alive and well, who had suddenly awakened from the final state of coma, and demanded—a bottle of Dublin stout! to which request the doctor in attendance, on being interrogated, had replied almost sardonically, 'Give him anything he asks; nothing matters now.' Yet from that hour Constable had turned his face towards life, rejecting death. A miracle!

Perhaps if Merton received a mouthful of that champagne he also would get round the corner. It was, at any rate, worth trying. As the thought struck Roddy he stretched his hand towards the little bell on the table to summon the nurse. But his arm stopped in mid-air. The nurse would think that he was mad. So would Miss Blaydon, of a surety. He well knew the matron's strict views as to fever patients and alcohol. With a shrug of the shoulders he drew back his hand, then suddenly sat up in bed.

Why should he not give Merton the champagne himself? He glanced swiftly at the closed door, then at the open window. The nurse would come in very soon to close the window for the night; but five minutes, less, would be enough. He threw off the bedclothes, pushed his feet into the slippers he had worn on the previous day, and hastily donned his dressing-gown. Suddenly there flashed across his mind his promise to the matron, and her grave warning. He stood irresolute. 'His word of honour;' 'his life.' Life is as sweet at thirty-five as at eighteen, especially when one has just emerged from the clutches of such a malady as Yellow Jack. After all, Merton would not have one chance in ten thousand.

Suddenly he grasped the bottle, and turned quickly to the window. His resolution was taken. Merton should have that last chance, were it one in ten million.

Silently he stepped out on to the veranda. As he did so, railing, house, trees, all swayed around him, but a timely grasp of the framework prevented him from falling.

'Dash it all! I am weaker than I thought,' he murmured.

Pausing a few moments until the mist had cleared, he passed along the veranda. Merton's room, he knew, was next but one to his own, so at the second window he bent his tall figure and peered in.

Yes, that was Merton; a small, slender form, almost puny, lying motionless in bed, with wasted, haggard face, unseeing eyes, turned towards the light, his spirit undoubtedly travelling fast towards its journey's end. Roddy slipped quietly into the room, and stooped over the bed.

'Merton, old chap—Merton!'

From the prone figure there came no movement, only a faint sound as of interrogation.

'It's Roddy Cunningham—Cunningham of the Bank, you know, Merton. I say, old chap, would you like some champagne to drink the Queen's health?'

Merton moved feebly, and apparently tried to raise his head from the pillow, but in vain. Roddy glanced anxiously round. Time pressed. At any moment the nurse might come in, or might enter his own room, to find it empty. Bending again over the bed, he whispered, almost hissed, 'Merton, some champagne!'

There was no reply; but Merton, moving his head partly round, slightly opened his mouth as if to imbibe the precious liquor. As Roddy hastily stooped lower, it occurred to him that he had forgotten to bring the glass.

'Confound it!—no matter,' he muttered, and tipping up the bottle, he poured the contents down the dying man's throat, to the last drop. Then, gathering up the skirts of his dressing-gown, he swiftly passed through the open window, and regained his room, and bed, with all speed.

As he laid his head on the pillow and drew a long breath of satisfaction the door opened, and the night nurse came in.

'Well, Mr Cunningham, how did you enjoy the champagne? Why,' she continued, with a touch of acerbity, 'you have taken the bottle to bed with you.'

'So I have, nurse,' he answered apologetically, lifting the empty bottle from the side of the pillow, where he had laid it on his hasty return. 'That shows how fond I am of it.'

. . . . . .

Four weeks later Roddy Cunningham, fresh from his recuperative sojourn in the hills, was turning into the broad Avenida Grande, when he perceived advancing towards him Miss Blaydon and Nurse Watson, evidently busy on a shopping excursion. The matron, stiff and austere in her white costume, with her hair drawn flatly back from her sallow forehead, was as indifferent to the amused smiles of the South American gilded youth as to the admiring glances directed towards her pretty companion. Both ladies greeted Roddy almost with effusion. As his eye caught the gleam of the diamond on the younger nurse's left hand he bowed and murmured, 'My best congratulations.'

'Certainly it was a most marvellous recovery that Mr Merton made, wasn't it, Mr Cunningham?' queried Miss Blaydon, her glance resting with a hint of approval on the manly figure before her. Without waiting for a reply, she went on, in her even tones, 'The Reverend Mr Danby made special reference to it in his sermon on the Sunday following; he said it could only be considered as a direct celestial sign of favour, a merciful interposition of Providence at the last moment.'

Roddy drew in his lips tightly, and stared at the pavement. Before his mind's eye there flashed the scene in Merton's room—his own fever-stricken, trembling arm pouring down the moribund's throat that life-giving, resurrecting fluid; he, Roddy Cunningham, in the guise of a merciful Providence!

But some remark had to be made; the ladies were expectant. 'No doubt Mr Danby was quite correct,' he observed gravely. 'After all, Providence is an old hand, and should know its business by this time.'

Miss Blaydon shook her head half-smilingly; but Nurse Mary was evidently somewhat shocked at this too light-hearted allusion to her fiancé's extraordinary escape from death. As the ladies proceeded on their way she suddenly remarked, 'I really don't care much for that Mr Cunningham. I don't think he is quite a good man. When at the hospital he told me that he had not been inside a church for seven years.'

The matron's face clouded over at this open condemnation, then cleared again as a redeeming thought evidently occurred to her. 'Of course, he is Scotch, my dear—no doubt Presbyterian,' she answered placidly; 'and everybody knows that they are rather peculiar.'

A SUMMER SIGH.

Soft breath of summer, sighing through the pines
And o'er the sloping moorland near the sea,
Swaying the trembling grass and drooping vines
Where fitful shadows flit across the lea—
Bring back again the voices that of yore
Made music which re-echoes evermore.

And, gentle rose, whose perfume never dies,
But lingers still, though time may pass away;
Pale lavender, whose scent stern age defies;
Sweet-brier, sweet next year as yesterday—
Restore to me the fragrance of the past,
The hope that died, the joy that fled so fast.

Gay, slender swallow, flashing swiftly by;
Sad nightingale, whose silence comes so soon;
Light, fleecy clouds, that race across the sky;
And tender mists, chased by the rising moon—
Can you not bring to me, when you return,
The heart I lost, the love for which I yearn?

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

IN recent weeks a bright light has been shining in the west of a world of sorrow and of glory. Its brilliance increases. It has seemed like a heavenly fire, and its effulgence has spread over the earth, lightening obscure paths upon which harassed men in search of a great ideal have been arduously pressing their way. It has needed but a little imagination on the part of those who have perceived this shining light, its significance and its splendour, to see also a scintillating halo flashing round the head of that noble statue of 'Liberty Enlightening the World' that towers up at the entrance to New York harbour, to see the fire of justice and truth burning from the torch that the figure of Liberty holds aloft. I think that, perhaps more than the Americans themselves, all who have visited the United States must be led at this present moment to profound reflection on the significance of that great statue, the old significance and the new. It is tremendous. In the days of peace the visitor to those hospitable American shores could hardly look upon that work for the first time without experiencing a deep emotion. There is something that thrills about that view of Liberty at the gates of the freest people. And to-day we cannot fail to recall that the statue was France's gift to the United States. That is something to remember now, one of the little crumbs of history about which three years ago perhaps not one person in four or five on the deck of an ingoing liner knew or seemed to care. Those were careless days, if happy in their way. Now we see that at the first moments of her entry into the war the United States thinks first of all of the civilisation of the world and her own situation and responsibility in regard to it; next she thinks of France, then of the other Allies and Britain with them. She is right in this order of thinking, although there may be a few of the more superficial egotists in our islands who may wonder as usual why Britain does not come first, since it is on her that the burden of the war is now chiefly falling. But certainly America is right. If you spend a little while in any part of that great country that stands between the Atlantic and the Pacific you will come to a new understanding of the affection that it has for France and all that is French; and then if you will read only a little of the elementary history that has been forgotten, and consider anew the nature of these people now, you will see why it is so. The significance of this marvellous statue increases with every thought. It is America as nothing else has ever indicated her; and now it is the new America that leaps from isolation in her own western continent and flings herself afar upon the enemies of the old world from which she rose. I remember well the subtle emotion that crept within me the first time that I saw this work. It was not in the sunlight of morning or in the blue dusk of an American evening, as I had hoped, for I was looking forward to the view. I saw it through the torrents of a storm, with the wind screeching through the fittings of my ship, and furious rain ricochetting on the deck planks, and water-mists blurring everything around. From this fury and chaos the figure of Liberty came slowly out, better defined at each murmur of our engines. Just in time the gale seemed to abate for a moment, as if by, or in obedience to, that force of Liberty, and as we sailed by we had a fair view of the noble form and face, of the strong right arm (which I may tell you is forty-two feet in length!) holding on high the flaming torch. My clothing was soaking wet as I turned away, Liberty fading into the storm again; but I had gained a great impression, and, wonderful as they are, the sight of the tall buildings that seem to kiss the sky failed in its effect as we steamed through placid waters to our harbour berth.

* * *

How splendid is the statue's situation! Auguste Bartholdi, the French sculptor, had a fine inspiration when he chose this little Bedloe's Island for the site. The French people had decided half a century ago to make a gift to their true friends of the great republic across the seas, to commemorate the centenary of their independence and the long-established warmth of feeling between the two nations. They sent Bartholdi to New York to study the project and prepare for it. As his ship sailed through the Narrows and on towards Manhattan, he went on deck like the others to strain his gaze, with a curious wonder, towards the shores of this new world, now seen for the first time. Bartholdi

 [*All Rights Reserved.*]

was impressed with this general eagerness to look upon the country, and when, gazing and wondering like the rest, his eyes fell upon Bedloe's Island in the middle of the upper bay, he knew he had found his true site ere he landed. It was perfect. He would, with the help of God and his own true genius, make a statue that should be fit for it, an indication of America and her meaning that should be presented to the view of expectant visitors and emigrants as they approached the country. On the threshold of America this Liberty should be seen holding high her lighted torch as an emblem of freedom and opportunity in this new world. Bartholdi did his work in a splendid way. Completed in 1884, it was erected on the chosen site two years later, there to commemorate for ever the first centenary of American independence and the French Government's affectionate interest therein, their joy that in this new land there should be *Liberté éclairant le Monde*. The tablet has on it the date, 'July 4, 1776.' It may well be impressive, apart from its meaning and the effect of that meaning upon all history, for this is the greatest colossus in the world. Its pedestal rests firmly upon a foundation which is a monolith of concrete declared to be the largest artificial single stone that has ever been made. The figure is of copper hammered to its shape, fastened to form by rivets and supported within by an iron framework which was designed by the engineer Eiffel, the same who made the tower in Paris. It is a scientific affair, as it needed to be, since here it is alone with the water and the wind, and there is more than three hundred feet of it from the foundation to the torch, the Liberty herself being well over a hundred feet, her hand sixteen and her finger eight, a finger-nail veritably a matter of thirteen inches by ten. There are allowances and contrivances made for expansion and contraction by heat and cold, and there is asbestos packing to insulate the copper from the iron and prevent the corrosion which would otherwise be caused by the effect of electricity induced by the salt air. If, as we are thinking of Liberty, the joy of free peoples, and the nobility of ideals, there may seem for a moment to be something a little unsuitably materialistic in the mention of these details, it is not so; for here are foresight and mechanical perfection, strength and permanence, and these things are of America even as Liberty is. If I heard that this statue shook, that Liberty's torch fell down, that this majestic pile collapsed and sank into the waters of the bay, then I might fear indeed that the cause of freedom in the world was about to be lost, and that criminal Germany might be victorious and so spoil the whole scheme of creation and the world. It would be such a mighty and overwhelming portent. But we know that this Liberty, so strong, so sure, will not fall down. On the night of Victory might not the Government of the United States, partner in it, order that real fire and flames shall sparkle from that torch and signal to heaven that the work is done? Meanwhile it is symbolical of determination and serenity of confidence. There is a beautiful, a benevolent calm on the countenance of this figure. Bartholdi, I was told, modelled the features from those of his dear mother. Now he is dead. It is thirteen years since he passed away, just about the time when Germany was beginning the first preparations for her grand attack upon the liberty of the world. There was some Italian blood in this Bartholdi, yet he was utterly and passionately French. He was an Alsatian; Colmar was his birthplace.

* * *

Even though the news was expected, how wonderful was the thrill that spread through the fighting Allies when they heard they were joined at last by the United States of America, the strongest and freest people, the people who had nothing to gain! Some mysterious significance of this momentous event seemed to strike with a quick shock of exhilaration upon the very soul of mankind. Much of the meaning and the possibility were understood, and yet there was something beyond, uplifting, strengthening, which belonged to the instinct and the spirit, and could not be explained. America, the new land, the new world, the country and the nation that had begun life over again, separate and distinct and far away from the old scenes of the world—much of the system of which she disliked and even abhorred—had been moved to the most active sympathy with the fighters for right, to the most active anger against their devilish enemies, and she would fight with France and Britain and Italy, and with that new-born Russia come through trials to its freedom. America would abandon her isolation and take her turn in the crisis of old-world affairs with which every continent was at last closely concerned; she was definitely and intimately to associate herself with the cause and effort of the Grand Allies. With all its generosity and its boundless capacity, this richest and ablest of nations was to come to the support of the brave peoples struggling so desperately with the foe. It was a splendid act. It will bind the free peoples together in such love and harmony as could never have been without this grand decision. It gives a more magnificent hope for the world than the uttermost optimist could have cherished before. The war is a vast and appalling thing; we who live through it know that we are witnessing the most stirring, tremendous, and effective epoch in the history of the world, something so enormous in its character and its consequence that one almost feels that the heavens themselves, the other planets, must have regard to what is happening here and be affected by it. But, great as is the

war as we have known it, it is not greater than the American entry into this struggle.

* * *

It has been interesting to observe the development of a certain change of attitude and opinion towards the citizens of the United States and their President by the people of this country. There have been suggestions of admission that old judgments have been incorrect and need revision, that facts and circumstances which exist and are of ponderous importance had been but imperfectly understood and appreciated. Now, it is said, the real difficulties of the United States, as they have been, are perceived, and the character of the people is known. Certain withdrawals in regard to the President have been ungrudgingly made; his wisdom and his heart, his statesmanship and his conscience, have the most handsome and spontaneous tributes paid to them. It is well that this should be so. The complete belligerent in these days is not in the best position for a calm judgment upon the motives and the quality of neutrals. He would need to be superhuman if his judgment were to be unaffected and unbiassed. No doubt it has been hard for some of our people to realise the terrible truth of our own sacrifices, and to behold another nation, with much of our own blood in its veins, speaking our own tongue, at peace, becoming enormously rich through its neutrality, and being, as it seemed, willing to bear punishment itself from the Germans without retaliating. We were too proud, it was thought, to ask the help of any one; but there were things that were thought. Certainly, also, it was believed that the President was weak (a suggestion against which the writer vehemently protested in these pages months ago), that he was careless of the national honour, and that he was too willing to agree with any of his countrymen who might suggest that the true course for the United States was one of peace at any price. Now it is agreed that many of these judgments were wrong. There may be some opportunism in this revision, and yet there is a deep and joyful sincerity also. Our people are being taught a war lesson once again, and they realise better than before that they are given to a considerable superficialness of thinking and of speaking. Even now they must understand that if America has 'come in,' she has not done so entirely from respect and love for Britain, though she likes us. Herself and her principles have been the first consideration; her affection for France has clearly been the second. In our new enthusiasm let us not lose sight of the true values, in a national egotism that has often led us sadly astray. We shall henceforth be far better friends with the Americans than in the past, and at the outset, in wondering upon the marvellous preparations of our cousins, their splendid generosity in financial affairs, and their amazing display of order, method, and efficiency, superior by far to the best efforts of our enemies in this respect, let us come to a real appreciation of all the circumstances.

* * *

Too many British people seem to labour under the fancy that America is jealous of us, and that, with our blood in her, she is like an ungrateful child. They do not seem to understand how and why America has come to be, and what it is. They seem to have forgotten the *Mayflower*, and the great Puritan emigration of so much that was best in the bodies and brains of our countrymen that speedily followed; how and why that strong and splendid colony was built up in Massachusetts. In those years when the shores of North America were only just being discovered, they did not leave their native land for the mere love of adventure and change. They had been taught already that gold-hunting in this new country was useless; the principle was propounded by the great John Smith, and accepted afterwards universally, that only labour was good. 'Nothing is to be expected thence but by labour,' he wrote; and it was in labour and tears for the homes that had been left, and with a smile of hope to the future, that the first British settled in America. They had left Britain because of their loss of liberty, because of the unbearable tyrannies that had been forced upon them, because they yearned for freedom, for religious freedom. People of all nations went to this new land also. They had had their own sufferings and disappointments at home; they longed for a new life, new liberty, new opportunities. They wished to be rid of all the shackles of the European systems, the tyrannical survivals of ancient times. They were for freedom and equality. But allegiance was paid to Britain until Britain, as we all know now and freely admit, made appalling blunders in her handling of the new colony. Loyalty was tested too far, tyranny ventured across the sea, and then the States declared for liberty complete and an end to the European system and all its hateful works. They would live their own lives in their own way, free and independent. They asked nothing of Europe, and would tolerate no interference. Europe could go on its own way, with its autocracies, its machinations, its alliances, its diplomatic exercises, its gigantic armies, and its continual threats and fears of wars. America was not for these things, but for peace and labour. That is the spirit of the States, and the country's great foundation. It has been to escape from the European thraldom, and obviously with a sense of disappointment with their homeland, that most emigrants have gone to this new country. They have been tired of Europe. Perhaps at times America, in her strength and her independence, has been a little arrogant, but never was a country more entitled to a splendid pride. She is the wonder of the earth. Three hundred years have seen her grow from nothing but

the wild land of the Red Indian tribes to be the pivot of the world, as we see her, and the undoubted centre of future civilisation, which moves from the old to the new. And yet if she has been, as we say, arrogant at times, too prideful perhaps, again let us call to mind that in her own great domestic war, when she fought to purge herself of slavery, some of us in Britain were not her best friends then. Still, by some of those to whom we have referred, it has been thought that, despite all this, at the first rattle of the guns in Europe, this blend of blood in America, a full mixture of all the white races, should immediately abandon its principle of separation from the European system and fly to the battlefields. All that its first separation from Europe had meant, and all that its three hundred years of American history had taught, were to be given up. But, it is said, there was the cause of Humanity, there was the case of Belgium, the *Lusitania*, and a thousand other things. These were tremendous matters; America weighed them well. She was not indifferent; gradually, surely, she brought herself to the sacrifice of the great principle on which she had established herself, that of her absolute independence and separation from the European system. Naturally, some provocations to which she was subjected forced the decision, but there was never any doubt as to the direction in which her sympathies and tendencies lay.

* * *

And, again, as to what seemed her hesitation, it is not appreciated how far America is from Britain. I do not mean in a mere matter of mileage—though even then it is far—but in thought. New York, the eastern shore, is near enough; but only those who have travelled through the country, have boarded one of the great west-going trains from the Central or Pennsylvania stations in the city, and, with the big engine bells clanging mournfully through the night, have followed the path of the sun and gone over thousands of miles of barely developed country, sped over the prairies, gone on and on towards the far Pacific, can understand how distant Britain seems to be, how utterly remote is our dear land. In the central States it has seemed to the wanderer to be nearly as far away as the stars themselves; and I remember how once, after such a wandering, returning to the east coast, I saw the Atlantic sea again for the first time one autumn afternoon at Newport, Rhode Island, and, for very joy of the fact that this same ocean touched my native shore, ran down to the beach to splash hands upon the wavelets as some demonstration of affection. But the people of other races, a blend of races, so far remote from Britain, going on peacefully with their business, were expected to hurry to the slaughter at its first beginning. Herein one tries to present the case not from a partisan view, but as it might appear from the neutral view and fairly. On our side we know what there is to be said, and it need not be repeated. The heart of the American people is good and true. We who have been with them in their homes know them better than do those who merely see them passing through our country on their holiday trips. They need no lessons in right, in conscience, or in strength. The life of Abraham Lincoln was not thrown away.

THE DEFINITE OBJECT.

CHAPTER XXVI.—WHICH MAKES FURTHER MENTION OF A RING.

RAVENSLEE, strolling in leisurely fashion along Tenth Avenue, became aware of a slender, pallid youth whose old-young face was familiar; a cigarette dangled from his pale, thin lips, and his slender hands were hidden in the pockets of his smartly tailored coat. On went Ravenslee, pausing now and then to glance idly into some shop window, until, chancing to slip his fingers into a waistcoat pocket, he paused all at once, and, drawing thence a ring wrought into the semblance of two clasped hands, drew it upon his finger. Now as he glanced at the ring his eye gleamed, and, smiling as one who has a sudden bright idea, he set off faster than before, striding on light and purposeful feet. But as he turned a corner he noticed that the pallid youth was still close behind; wherefore he halted before a shop window where, among other articles of diet, were cans of tomatoes neatly piled into a pyramid. At these he stared, waiting, and thus presently found the pallid youth at his elbow, who also stared upon the tomato pyramid with half-closed eyes and with smouldering cigarette pendent from thin-lipped mouth. And after they had stared awhile in silence, cheek by jowl, Ravenslee spoke in his pleasant, lazy voice. 'Judging by the labels, these tomatoes are everything tomatoes possibly could be.'

''S right!' murmured the pale one imperturbably.

'Fond of tomatoes?' inquired Ravenslee.

'Aw!' answered his neighbour, 'quit foolin' —talk sense!'

'Certainly! Why do you follow me, Soapy?' asked Ravenslee.

Soapy's eyes grew narrower and the pendent cigarette stirred slightly. 'Know me, hey?' he inquired.

'Heaven forbid! 'Twas a bolt at a venture —a shot in the dark.'

'Talkin'—o'—shootin',' said Soapy, grimly

deliberate, 'pea-nuts ain't a healthy profesh around here—not for your kind it ain't!'

'Oh, I don't know,' answered Ravenslee, shaking his head gently at the tomatoes. 'I've heard of professions even more unhealthy.'

'Aw—well—say what?'

'Well, talking of shooting—yours!'

Soapy's narrow eyes gleamed with an added viciousness, his pale nostrils expanded, but the retort died upon his curling mouth, his puffy eyelids widened and widened as he stared at the ring on Ravenslee's finger, and when he spoke his voice was strangely hoarse and eager. 'Say, sport, where'd you—get that—ring?'

'Why do you ask?'

''Cause I want to know, I guess.'

'Think you've seen it before?'

'Sport, I don't think—I know. I seen it many a time. I'd know it in a million, sure.'

'Where did you see it before?'

'On M'Ginnis's mitt. It useter belong t' Bud.'

'Ah!' exclaimed Ravenslee, scowling down at the ring, 'you make me wish more than ever that I had throttled him a little harder.'

'Where'd you get that ring, sport?' Soapy repeated.

'From Maggie Finlay's father.'

Soapy turned away to stare at the tomato-cans again. 'Meanin'?' he inquired at last, hoarser than before.

'That once upon a time it belonged to—her.'

'Sport,' said Soapy after an interval, still staring at the pyramid of cans, 'I useter know her once, an' I've jest nacherally took a fancy t' that ring. If fifty dollars'll buy it, they're yours—right now.'

'It isn't mine,' answered Ravenslee, still scowling at the ring, which he had drawn from his finger. 'I'm on my way to take it to—its owner. But if that person doesn't want it, and I'm pretty sure—that person—won't, you shall have it, I promise you. And now,' said he, pocketing the ring and turning, still scowling on Soapy, 'you are one of M'Ginnis's gang, I fancy; anyway, if you see him you can tell him from me that if he gives me another chance I'll surely kill him for the foul beast he is.'

'Sport,' said Soapy, 'I guess the Spider's right about you—anyway, you ain't my meat. An' as for killin' Bud, you sure ain't goin' t' get th' chance—not while I have the say-so. S'long, sport!' and, turning upon his heel, Soapy lounged away.

Reaching Times Square, Ravenslee entered the subway, and, buying his ticket, was jostled by a boy, a freckled boy, round-headed and round of nose, who stared at him with a pair of round, impertinent eyes.

Lost in happy speculation, he was duly borne to One Hundred and Thirtieth Street, where he boarded the ferry. Upon the boat he was again conscious of a round head that bobbed here and there amid the throng of passengers, but paid small heed as he leaned watching the broad and noble river and the green New Jersey shore. At Fort Lee, exchanging boat for trolley-car, he was once more vaguely conscious of two round eyes that watched him from a rear seat; but as the powerful car whirled them uphill, plunged them down steep inclines, swung them round sharp curves, through shady woods, past far-flung boughs whose leaves stirred and whispered as the great car fleeted by, he fell again to dreaming of Hermione and the future; and so betimes reached Englewood, a small township dreaming in the fierce midday sunshine. Here he inquired of a perspiring butcher in shirt-sleeves the whereabouts of the house he wanted, and, being fully directed and carefully admonished how to get there, set off along the road. And, remembering that her feet must often have traversed this very path, he straightway fell to his dreaming again; and thus how should he know anything of the round head that bobbed out from behind bush or tree ere it followed whither he went? So Ravenslee came where the road led between tall trees to smooth green lawns, beyond which was the gleam of water, and so at last to the house he sought.

Now beside this house, separated by a wide stretch of lawn, was a small wood; and, lured by its grateful shade, he turned aside into this wood and began pushing his way through the dense undergrowth, which, presently thinning, formed a small clearing roofed and shut in by leaves and full of a tender green light. Here he paused, and, espying a fallen tree hard by, sat himself down and began to fill his pipe. And now, remembering his shabby person, he felt disinclined to go up to the house and demand to see Miss Chesterton; yet see her he would; but how? He was frowning over this problem, when it was resolved for him quite unexpectedly; roused by the sound of a snapping twig, he glanced up, and Hermione was before him. She was coming down a narrow path that wound amid the leaves, and, because she wore no hat, the sunlight filtering through the branches made a glory of her hair as she passed; her head was bowed, and she walked very slowly as one in thought; she had brought sewing with her, but for once her busy hands were idle, and as he looked upon her beauty, scarce breathing, he saw again that look of wistful sadness.

As he rose she glanced up, and, seeing him, stood utterly still. Thus for a long moment they gazed upon each other; then, even as he hasted to her, she came to him on swift, light feet, and, flushing, tremulous, quick-breathing, gave herself into his arms.

'Oh Hermione, my beloved!' he murmured, his voice tense and eager, 'didn't I say enough last time—didn't I? Don't you know I love you—worship you—hunger and yearn for you? I want you with every breath I draw. When

will you be my wife—eh? When will you marry me, Hermione?'

For answer she reached up her arms, sudden, passionate arms that clung about him close and strong. They stood thus, heart beating to heart, thrilling at each other's nearness, yet drawing ever closer until, lifting her head, she gave her lips to his.

'Oh my dear, my dear,' she whispered, 'is it right to love you so, I wonder? I never thought it could be—like this. It frightens me sometimes, because my love is so great and strong, and I so powerless. Is it right I—— Oh!' she broke off breathlessly, 'how can I speak if—if you'——

'Kiss you so much?' he ended. 'You can't speak, so don't speak, my Hermione!' But now, all at once, he started and glanced up among the leaves above them.

'Dear,' she whispered, 'what is it?'

'That tapping sound,' he answered, still gazing upward.

'It's only the woodpecker.'

'Why, of course!' he laughed. 'It's strange, but I dreamed a scene like this—yes, the great tree yonder, and you in my arms—though it seemed so impossible then, and'——

But uttering a sudden, low cry of alarm, Hermione broke from his clasp and fled from him along the leafy path, while he stared after her, lost in amazement; then he ran also, and caught her upon the edge of the little wood.

'What frightened you, Hermione? Who was it?'

'I—I thought I saw some one crouching behind a bush, watching us!'

'Not M'Ginnis?' he demanded, fierce-eyed.

'No, no, I'm sure it wasn't!'

'I'll go and look,' said Ravenslee, clenching his fists. But now, as he turned away, two round arms were about him again, soft and compelling, and she was looking up at him all shy-eyed, passionate tenderness; and before the revelation in that look he forgot all else in the world.

'Hermione, when will you marry me?'

Now, softened by distance, there floated to them the mellow booming of a gong.

'That means I must go,' she sighed.

'Hermione, when will you marry me?'

'Good-bye! good-bye! I must run!'

But his long arms only clasped her the closer. 'Hermione, when will you be my wife?'

'Oh, please, please, let me go—if I'm late'——

'When, Hermione?'

'When I come home, if—you really—want me. Oh, now my hair's all coming down, I know. Good-bye!'

Reluctantly he loosed her and stood to watch, until, reaching the veranda of the house, she paused to glance back to where he stood among the leaves ere she vanished between the screen-doors. Then Ravenslee turned, and, remembering her sudden fright, looked sharply about him, even pausing now and then to peer behind bush and thicket; but this time he did not think to glance upward, and thus failed to see the round eyes that watched him from amid the leaves of the great tree. So he came again to the dusty highway and strode along throbbing with life and the lust of life, revelling in the glory of earth and sky, and quite unconscious of the small furtive figure that flitted after him far behind. And it was not until he sat in the ferry-boat that he remembered he had forgotten to give her the ring after all.

BURNS'S COTTAGE.

By JOHN HORNE, Author of *A Canny Countryside*, &c.

ON an average, there are some sixty thousand visitors annually to the birthplace of the poet. How many thousands have entered the shrine since it became a popular rendezvous would be no easy task to compute; but what concerns us, at this point, is to try to identify the pioneer of this almost countless multitude. Who was the first pilgrim? I venture to claim that distinction for Tannahill. The publication of 'Tam o' Shanter' so ignited the Paisley poet that he determined to see Kirk Alloway and its environs for himself. In the summer of 1794—while Burns was yet alive—he actually tramped from Paisley to Alloway and back in fulfilment of his resolution. The fact is to the abounding credit and prescience of Tannahill, a rival courtier in the palace of the muse. I feel pretty certain that this record cannot be beaten in point of time, and that we are safe in affirming that Tannahill has the honour of being the first admirer to set his steps to the track that has since been broadened and hardened by the feet of an ever-growing throng.

Another early visitor worthy of note is no less than John Keats, the English poet. In the month of July 1818 the now famous singer of England came to pay his tribute to our glorious Scot. We should not have known of it but for a letter written by him to his brother Tom. He seems to have walked from the direction of Maybole, and over Carrick Hill, for he begins by saying: 'We were talking on all things different and indifferent when, on a sudden, we turned upon the immediate country of Ayr.' Then he proceeds: 'The sight was as rich as possible. I had no conception that the native place of

Burns was so beautiful. The idea I had was more desolate; his "Rigs o' Barley" seemed always to me but a few strips of green on a cold hill. O prejudice! It was as rich as Devon. I endeavoured to drink in the prospect, that I might spin it out to you, as the silkworm makes silk from mulberry-trees. I cannot recollect it. Besides all the beauty, there were the mountains of Arran Isle, black and huge, over the sea. We came down upon everything suddenly; there were in our way the "Bonnie Doon," with the brig that Tam o' Shanter crossed; Kirk Alloway, Burns's Cottage, and the Brigs o' Ayr. First we stood upon the bridge across the Doon, surrounded by every phantasy of green in tree, meadow, and hill; the stream of the Doon, as a farmer told us, is covered with trees from "head to foot."' It may be noted in passing that the scenery around Alloway is quite worthy the eulogium of Keats. While in the cottage he wrote a 'Sonnet,' a performance, however, which did not please him, and he recast it later.

The only other visitor of outstanding renown to whom I wish to refer—although there is an abundance of such visitors—is Tennyson, our great Victorian. In the recent Life of him by his son there are several flattering references to Burns. One of these (a letter to Aubrey de Vere, himself a considerable poet) describes his visit. The epistle is dated October 1848. 'Dunkeld is lovely, and I delighted in Inveraray,' &c., writes Tennyson, 'but on the whole, perhaps, I enjoyed no day more than the one I spent at Kirk Alloway by the monument of poor Burns, and the orchards, and the "banks and braes of bonnie Doon." I made a pilgrimage thither out of love for the great peasant. They were gathering in the wheat, and the spirit of the man seemed to mingle with all I saw. I know you do not care much for him, but I do; and hold that there never were immortal poet if he be not one.' By the time of Tennyson's visit there was a visitors' book at the Cottage, and he entered his name—which proves that he also stood in the 'auld clay biggin'.'

These three samples of distinguished visitors will suffice. Following them, I wish to place three other types. While at the Cottage one day I came on a gentleman touching the ceiling with his finger, and saying quite audibly, 'Why, I can touch the roof—I can touch the roof!' As I entered he turned to me and exclaimed, 'Stranger, I never saw such a low roof in all my life!' He then told me that he was a doctor from America, that when he began business there twenty-five years ago he made a resolution to set aside a small sum yearly for the purpose of visiting the birthplace of Robert Burns, and that he had now fulfilled his resolve. 'And to think,' he cried, 'that the great soul who has filled the world with his fame was born in a room so low that I can touch the roof—it quite overcomes me!' He spoke with an emotion whose sincerity could not be questioned.

Another day I encountered an old man—a working-man—regarding the exterior of the building with uncommon interest. In the course of conversation he informed me that his grandfather was at the funeral of Burns's father; and he narrated to me his grandfather's story—how the body was carried from Lochlie between two ponies (one following the other), strapped crosswise on two poles, whose ends were fastened to the ponies' sides. At Alloway he particularly remarked the attitude of Burns standing reverently at the head of the grave, unbonneted. His face was very sallow, and marked with smallpox; and it showed no sign of distinction except in the eyes. His voice was deep, and carried like that of a good bass singer. These few details convey a picture which strikes one as being very real.

One other. While the light railway to Turnberry was being laid, and when work was proceeding at Alloway, a navvy entered the Cottage, and remained within for some time. Curious to know what had detained him, I entered after he had left, and found an entire page of the visitors' book covered with his writing. It was in the form of a letter to Burns in heaven, and its evident purpose was to bring the poet's information up to date. The writer began with the quotation:

> 'The Muse, nae poet ever fand her
> Till by himsel' he learned to wander,'

and then proceeded: 'The rural aspect of your environment is broken up, Robbie. The electric cars are running to your door; a new scheme is known for sending messages on wireless poles by an Italian; you can buy a suit of clothes for 15s.; you can travel on the railway for ½d. a mile; you can get your provisions from America as cheaply as from home; you get Dr Hornbook to fight with Death in reality; if you go into the surgical wards of some medical institutions, and watch the skill and care and judgment used for the benefit of suffering humanity, you will say that medical science has progressed also. Yes, Robbie; but I do not believe in vivisection; I hate to take life, even of the smallest atom, and yet in self-defence I would kill a thousand. Yes, Robbie, I would fight to death; and if any man made an attempt on my life, I would not rest until I had taken his life. How often have I thought on your verse,

> "A' lanely by the ingle cheek
> I sat an' spied the spewin' reek,
> That hoasted wi' provokin' smeak
> Aboot the ingle." J. M. F.'

This assortment of visitors is offered as illustrating the wide range of Burns's appeal. Polished literati and wanderers alike find their solace in him. No other writer in the world's history interests so many diverse readers. Even Shakespeare's constituency is circumscribed: the

average man gives little response to him. Yet those who read Shakespeare, and those who don't, find a common pasture-land in Burns. This is his great and exceptional achievement. He sweeps into his net every kind of fish. He is quoted by orators and mechanics; in him the classes and the masses are in agreement. This is the miracle of the peasant poet; it may also be said to be the miracle of literature, for its records do not reveal a parallel.

THE VOICE OF GOLD.

By Bart Kennedy.

THINGS were very tight with us when we got one afternoon to Los Angeles. Business had been bad, and for the last three or four weeks salaries had not been paid. The ghost had not even attempted to walk. But we were all filled with hope—all, from the prima donna to the feeblest chorus singer, who was perhaps myself. We were booked to play for a month in the Pavilion, and we felt that the inhabitants would come forth in their thousands—ready-money in hand—to hear us warbling the operas.

There was, however, a certain slight difficulty to be got over. We had got to the town a month before our actual opening night, and during that month it would be necessary for us to partake of food. A confiding hotel proprietor had to be found. But this did not bother us very much, for we had for our manager one Jimmy Pike. He had often got us out of such difficulties before. Often he had got us food through the magic of his personal magnetism. He was an artist at the weaving of the enthralling tale to the sceptical hotel proprietor.

He was a man of genius, who had been ordained by fate to be the manager of a tenth-rate opera company. He was possessed of a graceful and confiding manner, and a large and healthy imagination. He could transform a small chick into a full-sized swan with great ease. His voice, when he was telling the tale, would have attracted the bird from the bough. It was a beautiful, soft, put-your-trust-in-me voice. Nothing could withstand it. The coldest and hardest hotel proprietor heart melted before the sound of it as snow melts before a fire. A great ambassador was going to waste in Jimmy.

In person he was big and handsome and dashing. And the ladies of the company looked up to him with much fondness. He had an eye at once affectionate and daring. And there was another thing about him, too. He was as polite and as friendly to a chorus singer as he was to a principal. He was a great man in every way, was Jimmy.

And we were all very proud of him as we stood with him here in the station at Los Angeles. We knew that everything would be all right. At the moment he was talking to the prima donna, his hand placed affectionately upon her shoulder. He was soothing her, and telling her to wait for a little while with the rest of the company at the station, whilst he went into the town to fix things up.

Gallantly he went forth, I quietly following him. My desire was to see a great artist at work. He walked with the easy, assured gait of the person who possesses much substance, and who is at the same time modest about it. And he came to an hotel. But he evidently did not consider it good enough, for he passed on. And then he came to the big hotel of the town. In he went, and, after he was well in, I followed.

There he was, standing near the counter in the hall of the hotel, telling the tale to a flint-faced, angular man, who looked as if everything, including even the glorious Californian sunshine, disagreed with him. I could hear the murmur of the voice of Jimmy as I stood in the offing pretending to gaze at nothing in particular. That voice! That beautiful voice! The sound of it meant more to me than the sound of the voice of the greatest tenor in grand opera. It meant food and shelter!

Would he pull it off? Would he be able to get food for his brood of songsters? I took a cautious glance at the flint-faced man. It—well, it appeared to be softening. Yes, it was softening! A look of humanity was slowly suffusing it. The overpowering magnetism of Jimmy was gently steering the owner of it into the path of virtue. That melodious, put-your-trust-in-me voice was getting in its work.

I quietly left the hotel and waited outside. After a little Jimmy appeared. In his eye was a look of calm triumph.

'Ah,' he said as he saw me, 'it is all right. Everything is as it should be. I've stood the hotel off for the whole company. We're to board and lodge there during our stay in Los Angeles. Go and tell them. Be quick!'

I dashed swiftly ahead to the station with the glad news.

Such was the way that Jimmy handled whatever difficult and delicate situation turned up. He always managed to pull us through. He never failed us. If he were unable to fulfil his promise of paying for our sustenance at an hotel, he related to the proprietor still another tale concerning the big things that would happen when we played a return date. And we were always let forth with our trunks, and belongings generally, to try our luck in

pastures new. His beautiful, soft, put-your-trust-in-me voice was as a voice of gold.

I, personally, played but a humble part in this tenth-rate opera company. I was but a chorus singer with an ordinary kind of voice. My salary was alleged to be fifteen dollars a week. As a matter of fact, however, I hardly ever saw the colour of a dollar. But I was fascinated with the life. We, the members of this opera company, were a bright, merry, and gay crowd, and the hard-upness that we endured but brought us into a closer intimacy. The fact that salaries were rarely paid made for a democratic feeling amongst us. The principals did not give themselves airs with the members of the chorus. We were a happy family. And we were travelling through California, that most beautiful of all the countries of the world. We did not, to be sure, always pay our way. But there are lots of good people who owe a bit now and then.

After we were settled safely in the hotel, we began to rehearse. The Pavilion was a fine big place with plenty of light in it. It was not at all like the ordinary theatre that in the day-time is gloomy and dark. Rehearsing in it was a pleasure.

Need I say it? The ladies of the company, especially the chorus ladies, were all beautiful —or very nearly all. My heart was lost irretrievably.

If I remember aright, the first opera we rehearsed was *La Mascotte*. Jimmy played Beppo. I forgot to mention that he was a singer as well as a manager. But his voice in singing had not the golden quality that was in it when he was telling the tale to an hotel proprietor. Still, it was quite a good singing voice—a high baritone.

I liked the music of *La Mascotte*. It was bright and merry and sunny and gay. It seemed in a way to be like ourselves and the life we led. I haven't the score at hand now, but I am almost sure that it opened with a chorus. At any rate I remember distinctly singing in a chorus in the beginning of the opera. It was descriptive of the opening of spring after the close of winter. The words come to me: 'Now the winter-time is over, lads and lasses gaily meet.' We danced as we sang. It was a wonderful chorus, full of the joy and the tenderness and the beauty of life. It thrills me now as I think of it, though so many years have passed since I sang in it at the Pavilion in far-away Los Angeles.

We also rehearsed *Boccaccio*, *The Beggar Student*, *Fledermaus*, *A Night in Venice*, and some of the operas of Gilbert and Sullivan. I fear, however, that the royalties paid to Gilbert and Sullivan were of the invisible order. It was the fashion at that time in the States to forget the existence of authors. How it is now I don't know.

Los Angeles was an adorable town. In it were all kinds of interesting people—scallywags hailing from any place you like. The respectable person was conspicuous by his absence. I had the pleasure of meeting a three-card artist who belonged to the north of England. I happened into a saloon with a brother chorus artist, and the card-manipulator honoured us by introducing himself. He had the lined face of one who knew a thing or two, and he very kindly stood us a drink. After that he tried to get us to 'spot' the jack, for even a three-card artist has to live. But he was really a good sort, for when I explained that we were only chorus singers, and that we possessed but a dime between us, he charitably stood us another drink. And then he and I began to talk of the north of England. Both of us belonged to the same county! He was a good chap, that artist with the dexterous fingers. And I sincerely trust that he is not now doing time.

A land boom was going on in the town, and things were brisking up. It is not my intention here to define a land boom. I will content myself by remarking that compared with a land boom the three-card trick is a most innocent and honest transaction. One of the humorous things in this world of ours is that the real thieves never do time.

Under the spell of Jimmy's golden, put-your-trust-in-me voice the flint-faced, angular hotel proprietor blossomed forth into a noble character. He advanced Jimmy enough money to pay the company half what was owing them in salaries. I remember getting twenty dollars. It was given to me in the shape of a great gold-piece the size of an English penny—a twenty-dollar gold-piece! It was so soothing and noble and magnificent a coin that it seemed a shame to change it. A splendid and glorious golden penny! I could understand why misers hoarded up and gloated over golden coins. But my admiration for the beautiful coin did not allow me to hoard it for long. Within five minutes after getting it I had changed it. It had left me. It had gone forth on its journey of service, even as all coins should go.

When the opening night of our season came we had a big, thumping house. I believe that the opera we put on was *La Mascotte*. We were all feeling fit, all in good form. Before the curtain went up Jimmy went around to the members of the company, giving forth words of encouragement and cheer.

The curtain was up now, and we were on the stage, singing. And there, in the third row, was sitting the flint-faced hotel proprietor. He looked pleased; that is, he looked as pleased as it was possible for him to look. And well he might. For the size of the house was the surest kind of augury that he would get his money. It looked as though we should do good business through the whole of our month at the Pavilion. And we did. The people of Los Angeles flocked

to see us and to hear us warble. And also they came from the places round. And, most soothing of all, our salaries were paid on the nail. The ghost arose and walked. And there occurred a still more soothing thing. It became possible, before the month was up, to get an advance against one's salary to come. Any one who possessed confidence enough could go and touch Jimmy for a bit ahead. He always parted. He was a dear boy.

It was a glorious month in a glorious town in a glorious country. I had the time of my life. It was one long, perfect dream. And the face of the angular hotel proprietor became softer and softer. He began to look like a human being. In the end the flintiness disappeared from his features altogether. Well was it for his character that he had listened in the first place to Jimmy's gentle, put-your-trust-in-me voice. That voice! That voice of gold!

Well, at last there came the end. I was very, very sorry. I would have liked to go on singing in Los Angeles for ever.

We closed our season with *La Mascotte*. And after we left the theatre that night we had a grand supper in the hotel. The landlord took the chair, and Jimmy, our Jimmy, was the guest of honour. By his side was the prima donna, looking very happy.

What a supper it was! We had the best of everything. And champagne—well, champagne flowed like water. Speeches? Yes, we had speeches. And needless is it to say that Jimmy's was the best by far. He said kind things about everybody in his beautiful, put-your-trust-in-me voice. He mentioned us all by name—all, from the prima donna to my humble self.

That voice of gold! Years and years have passed since I heard it on that night. Years and years have passed since I last saw Jimmy, who was so resourceful, and who, at the same time, was so good and kind to everybody.

SUPERSTITIONS AND THEIR ORIGINS.

By J. Arthur Hill, Author of *Psychical Investigations*, &c.

MAN'S curiosity is in excess of his power to interpret and understand. Consequently he guesses, and when he guesses wildly and—as it seems to others, probably of later date—inaccurately, his guess is called a superstition. Owing to the innate conservatism of human nature, a superstition will linger long after its origin is completely forgotten, and after people have clearly seen that there is no rational evidence for the thing believed. This applies to customs of all sorts. It is on record that in a certain church the peasants were in the habit of bowing or genuflecting when they passed a certain part of the wall. None of them could give any reason, except that they had been taught to do it. Even the oldest inhabitant had never heard of any reason, and did not think that any was known to the previous generation. It was just a custom that had been handed down. But when some repairs came to be made, and the wall was stripped of lime, it was found that a painting of the Virgin Mary had existed, and still fragmentarily existed, at that place. It had evidently been covered up at the Reformation; but the customary obeisance had been kept up even after every one had forgotten the reason for it.

So with superstitions. There is some sort of reason to begin with, usually a mistaken guess; but this is forgotten, while the belief remains. For instance, take the 'thirteen at table' superstition, which has spread to thirteen of anything—even to No. 13 in a street or terrace, which often remains unlet, the landlord sometimes resorting to the subterfuge of 12A and 12B. The origin of this prejudice against the number is usually supposed to be the fact that thirteen persons sat down at the Last Supper, after which occurred the most tragical event of the Christian era. But it can be shown that of any thirteen people taken at random—or any twelve or fourteen either—it is an even chance that one will die in about a year. Quételet pointed this out in his *Theory of Probabilities* applied to political and moral science; but superstition dies hard when it has a sort of quasi-support from facts. Matthew Arnold was one of a party of thirteen, and he died within the year. To many people this would be convincing evidence of the maleficence of the number; but he would have died all the same if there had been fourteen. Moreover, the thirteen superstition is older than Christianity, for Hesiod says it is unlucky to sow corn on the 13th of the first month. And there is an old Norse legend according to which the twelve great divinities were dining in Valhalla, when Loki, the god of discord, appeared, and a quarrel with Baldur ensued, in which the latter—the god of peace—was killed. There is a similar belief in India. The superstition languished in the late Middle Ages, but had a curious rejuvenation in the last century. In many capitals, notably London, there were men who made a living by hiring themselves out at a moment's notice as guests at dinners where, owing to some disappointment, the number at table would otherwise be thirteen. Prince Bismarck shared the 'thirteen' weakness, and indeed was rather specially superstitious about numbers. Three was his lucky one. He was Chancellor under three emperors, received three titles of nobility, was responsible for three wars, and had three

children; and, according to the caricaturists, had three hairs on an otherwise bald head.

There are various forms of this 'three' superstition, one of the most objectionable—from a housewife's point of view—being the common belief of servants that if they break an article two more are sure to meet the same fate before the day is out. A certain lady, unacquainted with this superstition, was astonished to see her Abigail open the back-door and deliberately smash a jam-pot on the steps, afterwards picking up the pieces and throwing them into the dust-bin. By cautious inquiry she discovered that the girl had accidentally broken a plate and a cup that morning, and as she firmly believed that the gods demanded three such sacrifices before they would be appeased, she selected the jam-pot lest the doom should fall on something more valuable.

One of the silliest superstitions extant is the one about seeing the new moon through glass. I have never been able to trace this with certainty to anything connected with sense or reason. And the supposed connection of the moon with insanity (*luna*, lunatic) is not much better. The belief that the sun puts the fire out is comparatively reasonable, though mistaken; for, of course, it *seems* to dull the fire's brightness. But interpose a screen, and the fire is obviously as vigorous as ever.

In some parts of England, notably the eastern counties, there is a flourishing belief in 'charms,' which some local 'cunning man' sells for a few shillings, to be worn round the neck in a canvas bag. This belief in amulets is, of course, world-wide. Fielding Hall mentions a case in Burma, the charm (worn by a Buddhist) turning out to be a printed prayer of the Roman Catholic Church! There are some rather curious instances, which cannot be altogether laughed away, of amulets seeming to do real good in cases of illness. Some of these have passed the scrutiny of the Society for Psychical Research. The psychological explanation is that a 'suggestion' is implanted in the patient's subliminal mind, and the cure is a sort of faith-healing.

The 'Friday' superstition has a religious origin, having arisen because the Crucifixion is supposed to have taken place on that day. It has been recognised as particularly unlucky by sailors. As with all such superstitions, men noticed when it 'came off,' and overlooked the miss when it did not. But with greater control of the elements, and greater safety of travel—barring torpedoes—the superstition has faded. Probably few people now, even sailors, have much fear of embarking on a Cunarder which sails on a Friday; and railway journeys are undertaken on that day without hesitation. To many millions of people Friday is the luckiest day of the week, for it is their wage-day!

The unluckiness of spilling the salt has not been unanimously explained. Some think that it is because Judas Iscariot seems to be spilling it in Da Vinci's picture of the Last Supper. Others think that it is because salt is a symbol of incorruptibility, and its spilling is therefore a sign of broken friendships and general upsets. Very superstitious people will take a pinch of the spilt salt and throw it over the left shoulder, which is supposed to avert the evil consequences of the mishap. The left shoulder is associated with the Devil, or one's evil genius, and the thrown pinch is supposed to appease him.

There are some curious and very widespread customs, of superstitious nature, about sneezing. Old country-people will often say 'God bless you!' to the sneezer. The Romans had a similar custom—'Jupiter preserve you!' &c.—as Martial and other writers show. The Greeks did the same, and the custom was ancient even in the time of Aristotle, for he endeavours to account for it in his *Problems;* but he evidently knew nothing of its origin. His guess was that the first men, prepossessed with the idea of the superiority of the head to the other parts of the body, extended their reverence to all forms of its activity. A very poor sort of explanation for the Stagirite whom Dante calls 'the master of those that know!' The idea runs through classical literature—for example, Telemachus's lucky sneeze in the *Odyssey*, the soldier's good-omened sneeze in Xenophon, and a remark of Pliny, '*Cur sternutamentis salutamus?*' When a Hindoo sneezes bystanders say, 'Live!' and the sneezer replies, 'With you!' The Zulu thinks it is a sign that good spirits are with him, others that evil spirits are being expelled. Probably some notion of this kind is at the root of the belief and the customs associated with it; but nothing definite is now discoverable.

The various knife superstitions are easily explicable. It is unlucky to give a knife to a friend, because knives sever things, and might sever friendship; but if he gives you a halfpenny in return the danger is avoided, for his gift is a token of continued affection. It is unlucky to place one's knife and fork crosswise on the empty plate, because it invites crosses and misfortune, also recalling the Christian symbol of suffering.

Black cats are lucky, but nobody knows why. Cats of all sorts were regarded with reverence in ancient Egypt; but it is curious that black—the sign of mourning in Western countries—should be associated with luck. The Jam of Nawanagar ('Ranji' of cricket fame) had a partiality for this superstition, claiming that twice in succession the timely appearance of a black cat had been instrumental in winning a county match for Sussex, as well as on other occasions.

We often hear the half-jocular remark, 'My ears tingle; some one is thinking about me;' or sometimes the sign is a burning of the cheeks.

No doubt this arises from the fact that these conditions arise when a person is scolded or has his ears boxed, or when 'she' is made love to. Consequently, when they arise without the external cause, it is thought that some one's mind, if not his hand or tongue, is somehow exerting influence at a distance upon us. This belief also is very widespread. Warburton refers to it in explaining Beatrice's 'What fire is in mine ears?' in *Much Ado About Nothing*. Pliny says: 'Moreover, is not this an opinion generally received, that when our ears do glow and tingle some there be that in our absence do talk of us?' Sir Thomas Browne and Herrick, among others, allude to it.

The origins of the various marriage superstitions are mostly unknown. We have no idea why it is unlucky to marry in May, or why an old shoe must be thrown after the going-away couple. We know that the old notion of a special artery from heart to wedding-finger is mistaken, and that probably this particular finger is chosen because it is the most protected.

Some few old 'superstitions,' however, are turning out to be true. The most notable instance is that of the divining-rod, by the twitching of which, when held in the hands, underground water is detected by persons gifted with the faculty. Sir William Barrett has made lengthy and laborious experiments with various diviners or 'dowsers,' as they are called, and he was driven by sheer weight of evidence from a position of scepticism to one of belief. His opinion is that these people have clairvoyant powers in the subliminal strata of their minds, and that the rod is a handy externaliser of the perception, though without special virtue of its own. It need not be hazel or any particular wood; and 'electricity'—that favourite explanation of the ignorant—was excluded by Sir William's ingenious insulation devices. It seems quite possible, in view of discoveries made by the Society for Psychical Research, that even witchcraft had a basis of truth; for, if telepathy is a fact, an ill-wisher may exert real influence. But it is too early to come to conclusions on this point; and excessive scepticism is preferable to excessive credulity in such matters, for the latter leads to persecution. We want no return to the methods of Matthew Hopkins. Scepticism is better than superstition of that kind.

A rather common bit of pseudo-science is the belief that for healthful sleep the bed should be north and south. I know a man who believes that he was cured of long-standing disease by changing his bed from its former east-west position. Charles Dickens, whenever he left home for a night, always took a compass with him, so that he could put his bed north-south. Other famous men have had their weaknesses. Macaulay had superstitions about stepping on this or that part of flagstones or paving-stones; Max Müller always carried in his pocket a small coin with a hole in it; and Lord Roberts was once credited (but in a German newspaper) with a fondness for a horseshoe picked up near the Nelson Monument in Trafalgar Square, as well as with a constitutional dread of cats.

The prejudice about the danger of being the first occupiers of a new house is perhaps a dim recollection of our prehistoric ancestors' attitude towards a newly discovered cave. There might be wild beasts already in occupation.

The superstitions connected with marriage are legion. The most sensible one is, 'Happy the bride the sun shines on,' for fine weather is particularly welcome at times of gorgeous apparelling. But in some countries the bride prays for rain, taking it as an omen that all her tears are shed before marriage, which shows the optimistic faith of the female heart *in excelsis!* Alas that she should sometimes be disillusioned!

THE MONTH: SCIENCE AND ARTS.

MORSE CODE SIGNALS FOR AIRCRAFT.

EVEN before the war wireless telegraphy was used by aeroplanes for communicating with the ground, and we might well suppose this system to be the one chiefly employed by aircraft at the front. According to the *Scientific American*, however, other methods are largely adopted. The Germans, for instance, use a small search-light having a very powerful lamp no larger than the ordinary electric bulb, through which an exceedingly strong current is passed, giving an intense white light. Such treatment naturally shortens the life of the lamps, which seldom last more than fifty hours, but this is deemed of little importance in the circumstances. The projector is designed to give a very narrow beam of light, which can be seen only by the receiving station to which it is directed, and signals are transmitted by the Morse code. Electricity is supplied by a battery so constructed as to allow of its being turned upside-down without the acid being spilled. Another useful form of signalling apparatus for aircraft is a device for discharging black powder from a container provided with a suitable valve. As the machine flies through the air the powder is discharged and forms a series of black lines varying in length according to the time the valve is kept open. In this way long and short lines can be produced to signify the dots and dashes of the Morse code. These signals retain their form for an appreciable

time, and they can be seen from a distance of six miles.

LARGEST LOCOMOTIVE IN THE WORLD.

From time to time in these pages descriptions have been given of large locomotives built in the United States, where their size is not restricted by tunnels and bridges to the limits obtaining in this country. What we believe may fairly claim to be the biggest locomotive in the world has lately been put into service on the Virginian Railway. This leviathan is of the Malet triple-articulated type; that is to say, it is supported upon three ball-and-socket swivelling joints, which allow the three sets of coupled driving-wheels to accommodate themselves to the curves of the track. How necessary such an arrangement is may be gathered from the fact that the engine measures close on one hundred feet in length. Propulsion is effected by six cylinders, arranged in three pairs, each of which drives four pairs of wheels coupled together. The wheels are comparatively small, being only fifty-six inches in diameter, as this size of wheel is the most suitable for the work to be done—namely, the hauling of coal-trains up steep gradients at comparatively slow speeds. When running at thirty miles an hour, this locomotive normally develops some eight thousand horse-power, while its tractive force is one hundred and sixty-six thousand pounds. For short spells, however, the horse-power can be greatly increased. The boiler needed to raise the enormous quantities of steam required measures eight and a half feet in diameter and is over fifty feet long, while the fire-grate is eight feet in width and ten feet long. Of course, even two men would be incapable of stoking such a colossal furnace, and the work of keeping it supplied with coal is performed by a mechanical stoker. Naturally a very large supply of coal has to be carried, while the water-tank has a capacity of thirteen thousand gallons. The weight of the complete locomotive is three hundred and seventy-five tons, and it has been built at the Baldwin Locomotive Works, Philadelphia.

CHARACTERISTICS WHEREBY THE CRIMINAL TYPE MAY BE DISTINGUISHED.

Some very interesting characteristics of criminals were given in a paper written by Mr Albert Marple and recently quoted from in *Popular Science Siftings*. According to the writer, the average characteristics of fifty criminals are given by Mr James Cline as follows: age, thirty-two years; height, five feet six and a half inches; weight, ten stone eight pounds; slope of forehead, forty degrees; collar, fifteen and three-quarter inches; jaw, protruding, heavy, and wide; ears, large, the tops being in line with the eyes. The most distinctive feature is the ear-lobe, which is often rudimentary and meets the cheek in a straight line. Keen and piercing is the average criminal eye, while the brows are slightly lower and farther apart than in other men. Prominent cheek-bones form another important feature, together with a long, wide, pointed nose in line with the sloping forehead. The colour of the hair is from medium brown to light brown, and the complexion medium light, while the lips are inclined to be thick. A brief general description of the criminal type includes inset piercing eyes, almost lobeless ears, high cheek-bones, receding forehead, and protruding chin.

ARTIFICIAL MILK.

A process has recently been patented for the manufacture of artificial milk. The chief constituents besides water are bleached meal made from nuts, sugar, and potassium phosphate. The solution is first boiled, and is afterwards treated in a vacuum-pan. Lactic bacteria are then introduced to give the necessary degree of acidity, and the milk is pasteurised for twenty minutes at a temperature of about one hundred and fifty degrees Fahrenheit. The final operation is the stirring in of a minute percentage of citric acid. The inventor claims that milk made in this way can be condensed, or dried and powdered, as in the case of the natural product; while cream may be formed by the addition of nut fat when the milk is in the vacuum-pan.

THE PROBLEM OF TRANSATLANTIC FLYING.

In a paper read before the Institution of Engineers and Shipbuilders in Scotland Mr L. Desbleds explains some of the advantages and difficulties of transatlantic flying. With regard to the former, the carrying of the mails in a quarter of the time at present needed for the voyage between America and Britain would, in the author's opinion, be of immense benefit, as he considers that the correspondence of a country may be taken as a measure of its commerce with other nations, and the accelerated rate of exchange of correspondence would react upon commerce and shipping. Coming to the problem of carrying mails across the Atlantic, Mr Desbleds considers that existing knowledge of aeroplane construction and propelling machinery only allows of such flights by reducing the strength of the machines employed to far below that of the aeroplanes now in use; consequently those undertaking the passage would run grave risks of coming to grief on the way. Some particulars of an aeroplane for flying the Atlantic are given in the paper, the proposed machine having a weight by itself of about four tons, which is doubled by the addition of fuel and stores, while a crew of ten men account for another fifteen hundredweight.

ARTIFICIAL LIMBS MADE FROM CARDBOARD.

Few people would imagine that artificial limbs could be made from such unlikely material as

cardboard. Yet this is being done on a considerable scale, according to the London correspondent of the *Manchester Guardian*. Legs and arms are cut out from cardboard about three-sixteenths of an inch in thickness, and bound together with bandages soaked in a solution of starch. Two flat pieces of cardboard are cut out, of which the combined widths equal the girth of the limb. These are soaked in water until they can be bent round into the requisite form, when the aforesaid starched bandages are applied. The finished article being hollow, it can be worn before the stump of the leg or arm has completely healed; in fact, this is often done within a fortnight of amputation. In the case of legs this invention obviates the need for crutches, the patient being able to get about with the aid of a stick. Limbs made in this way are not intended for permanent use, but only while an articulated limb is being prepared. They are, however, much more durable than might be supposed, their useful life being from six months to a year. Cardboard limbs made in the way described were invented by a Danish doctor at the Danish hospital at Paris, and it is claimed that a leg can be made from the inventor's instructions at a trifling cost in half-an-hour.

WOOD AS A SOURCE OF FOOD.

In their efforts to utilise every conceivable form of food, the Germans have lately been trying experiments with wood, upon which dogs and sheep have been fed. Birch wood was chosen as being the most promising. It was prepared by being pulped in a paper-mill. The pulp was then mixed with other foods, and given to the animals. As regards both digestibility and nutritive value the results are said to have been satisfactory, and it is thought that pulped birch wood might be mixed with cereals for making bread to the extent of 15 per cent.

ANOTHER SIMPLE CINEMA APPARATUS FOR AMATEURS.

A cinema apparatus comparable with the ordinary film camera for simplicity and cost has recently been placed on the market in America. The camera—for in appearance it is nothing more—measures seven inches in length by five nches in height, with a thickness of only two and a half inches. No adjustments are needed, and the only fitting in addition to those common to all roll-film cameras is the handle for causing the film to travel. A special feature is a daylight-loading film container, which is operated with a facility equal to that of an ordinary camera. Each roll of film contains fifty feet, and lasts for about two and a half minutes; and the small size of the pictures brings the cost within reach of the amateur. The projector is necessarily larger, but this feature is not of much consequence, as it does not have to be carried about. A seven hundred candle-power half-watt electric lamp, connected to the nearest lamp-socket, forms the source of light, and the pictures on the screen can be varied in width from eighteen inches up to nine feet.

CUTTING BARBED-WIRE ENTANGLEMENTS WITH RIFLE-SHOTS.

To some extent the well-known competition between the naval gun and the armour-plate has been simulated on a miniature scale between barbed-wire entanglements and the appliances for cutting them away. Among the more recent of these appliances, according to the *Scientific American*, is a device attachable to a fixed bayonet, by means of which the wire is cut when a shot is fired. This invention, which is the work of Joseph A. Steinmetz of Philadelphia, consists of a steel block attached to the bayonet by a thumbscrew close to the muzzle of the rifle. At the outer end of the block is a V-shaped recess, into which the wires to be cut slip automatically when caught up on the bayonet. A hole through the block in line with the rifle-barrel comes out at the bottom of this recess, and compels the bullet to pass through the wires. Several wires can be cut by one bullet, which, in fact, is capable of severing much thicker wire than could be used in actual warfare. The device has no detrimental effect upon the aiming of the rifle for ordinary use, and similar appliances can be attached to pistols and revolvers. Obviously such an instrument could not be used for night surprise attacks, but many charges across No Man's Land are made in the daylight, when the noise of the 'shooter-cutters' would be of no consequence, if indeed it were heard at all. A distinct advantage of this invention is the readiness of the rifle for offensive purposes in that the soldier holds it as he would for firing or bayonet-work. Moreover, the cutter can be effectively used by a man crawling forward.

VARNISHING THE SOLES OF BOOTS INCREASES THEIR LIFE FOURFOLD.

In view of the shortage of leather and its consequent increase in price, any device or process is welcome which will lengthen the life of our footwear. In this connection it cannot be too widely known that varnishing the soles of boots and shoes makes them wear four or five times as long as they would do without this treatment. An inferior type of copal varnish is quite good enough for the purpose, and half a pint, costing, with a suitable brush, about a shilling, should keep one person's boots treated for a year or more. The leather must be quite dry and bare when the varnish is applied. New boots should therefore be worn for a day before treatment, so as to remove the black varnish from the soles. The operation is carried out by brushing on the varnish, at intervals of, say, half-an-hour, until the leather will not soak up any

more. This condition may be recognised from the surface remaining shiny all over, instead of becoming dull in places. After being hung up to dry for about twelve hours, the boots are ready for wear. The usual plan is to wear out the soles after one varnishing, but an even longer life can be assured by treating them once a month. Those who have never tried varnish on the soles of their boots will be astonished at the length of time they wear when so treated; while last, but not least, the varnish renders them waterproof.

THE DEVELOPMENT OF THE 'SERVICE' WATCH.

The war has led not only to new inventions, but to the development and improvement of things previously known. In the latter category may be included the wristlet watch, little used by the sterner sex before the war, but now to be seen on the wrist of nearly every man in uniform and of many men in civilian attire. The first wristlet watch was naturally a small pocket watch fitted into a leather holder and strapped on the wrist. This was soon improved by soldering to the sides 'knuckles' or loops, through which the strap was passed. But such a watch worn on the wrist was so open to dust, and so much exposed to the effects of the weather, that it quickly became dirty. To obviate this the case was next made in one piece, into which the works were screwed; but this device was found to have certain disadvantages. With the advent of war a great demand arose for a watch that would stand the hard wear incidental to 'service' use, and it is claimed that the demand has now been adequately met. Two submarine commanders approached a certain firm, and asked them to consider the construction of a special watch suitable for their work. It was explained that it must fulfil certain conditions. (1) It must be water-tight; for even when a submarine is on the surface the deck is always more or less awash. (2) It must be non-magnetic; for under water the submarine is driven by electricity, and in such a limited space watches made of magnetic materials are necessarily affected. (3) As, for the same reason, a compensation balance of the ordinary kind is impossible, the balance must be of some material which shows a minimum of expansion and contraction with variations in temperature. This condition is met by the employment of an alloy of iron and nickel, which expands and contracts so little that this factor may be disregarded. (4) The face must be quite legible at any time, and as the usual yellow luminous figures, when placed on a white dial, are not readily discernible in moonlight, twilight, or subdued artificial light, a black dial is used, thus making it easy to read the exact hour in any light. A watch fulfilling every one of these conditions, and fitted in addition with a small luminous seconds-hand, has now been on the market for some months, and appears to have before it a distinctive sphere of usefulness.

MOSQUITOES AND THE PLAGUE.

The destruction of plague-carriers has long been a problem of primary importance, especially in countries like India, China, and the Dutch East Indies, where the disease has come to be endemic. At first the rat in general was suspected, until it was found that the field rat must be eliminated, as only the house rat was connected with the spreading of the plague. Finally, it was discovered that even the house rat is, like ourselves, a guiltless sufferer, and that the real culprit is the flea found on the rat. Once public attention was drawn to stinging insects as the immediate agents in plague-carrying, scientists began to wonder whether, as in the case of malaria and yellow fever, mosquitoes might also be responsible for spreading the disease. In the famous Dutch medical laboratories for tropical research at Weltevreden, near Batavia, the capital of Java and of the Dutch East Indies, several series of experiments have been carried out with a view to solving the problem. They have been conducted by Dr Flu, the celebrated sub-director of the establishment. For each series a certain number of female mosquitoes were used, which had been obtained from the larvæ of *anopheles rossi* or of *stegomyia*. Dr Flu first allowed these *imagines* to starve during twenty-four hours, and then fed them on a guinea-pig infected with plague and suffering from plague septicemia. After the mosquitoes had satisfied themselves at the expense of the diseased animal, they were caught and starved for another twelve to twenty-four hours. They were then set on a healthy guinea-pig, which was not taken from the cage before the mosquitoes had satisfied themselves, and had consequently stung the animal several times. After the insects had once more been starved, the experiment was repeated with another healthy guinea-pig. In some cases this process was gone through even three times. At the end of each series of experiments the remaining mosquitoes (the majority had died during the process) were pounded into an emulsion, which was subcutaneously injected into a fresh guinea-pig. The various series of experiments differed either as to the species of mosquitoes used, or as to their number, or as to the virulence of the plague bacilli, or, finally, as to the time of exposure of the guinea-pigs to the infected insects. The investigation was, therefore, conducted with true Dutch thoroughness, and the results obtained can be said to be absolutely definite. One set of experiments, indeed, yielded a negative result. But the others proved convincingly that although plague bacilli can remain for several days in a virulent condition in the gastro-intestinal system of mosquitoes, these insects are

unable to transmit the plague through stinging. This conclusion corresponds with that based on experience of epidemics in plague districts, for no connection has ever been observed between the prevalence of mosquitoes and the breaking out of the disease or its spreading. But the fact that several investigators had discovered virulent plague bacilli in the stomachs and intestines of mosquitoes had given rise to doubt, and made a series of decisive experiments most desirable.

ONE-MAN RAILWAY.

Railway companies that have to give up side-branches of their lines consequent on the new arrangements, or through finding the working expenses of them too heavy, might with advantage to themselves and the districts concerned consider the case of a certain American railroad. A number of years ago the Idaho Southern Railroad was constructed between Gooding and Jerome, Idaho, for use while the great irrigation schemes of the Twin Falls country were being carried out, and used to haul freight and passengers. On the irrigation projects having been effected, the railway was abandoned by the owners, the State Utilities Commission refusing to grant them an extension of their charter unless they put their line and engines in first-class condition. There was not enough money in the business to justify such undertakings, so the owners of the line decided to cease operations. Now, however, an enterprising South Idaho man has seized the opportunity. He leased the line, ordered to be built for him a sixteen-passenger, high-powered automobile fitted with flange-wheels, put it on the rails with two light trailers for freight and express work, and now has all the business that he can handle. Indeed, so heavy is the traffic that he has ordered two other sets of automobiles and trailers. He operates his auto-train on a regular schedule, and keeps time punctually. It is the only one-man railway in existence so far as is known.

INCOME-TAX RETURNS.

The widespread interest aroused by the article on 'Income-Tax Adjustments,' by John Burns, W.S., published in the March issue of *Chambers's Journal*, induces us to draw the special attention of our readers to a little manual written by the same author, and published under the title of *Chambers's Income-Tax Guide* at 1s. 6d. net. In this clearly written volume, the author, while urging upon all the patriotic duty of paying with cheerfulness the income-tax legally due, expounds with 'great plainness of speech' the various abatements, reductions, and reliefs to which most payers of income-tax are entitled, in many cases without their knowing it. By means of specimen forms he shows clearly how Income Returns and Repayment Claims should be filled up, and makes it the simplest matter in the world to obtain the adjustments and reductions of the assessments (or, failing these, the repayments) to which so many people are entitled, but of which they may perhaps be unaware until they read Mr Burns's pages. To the man or woman of moderate invested means; to the doctor, the dentist, the clergyman, the shopkeeper; and generally to the professional, trading, and industrial classes, not forgetting the workman in receipt of more than two pounds ten shillings per week—indeed, to nearly every section of the community—this little manual will prove extremely helpful.

SUBSTITUTES FOR PETROL AND PARAFFIN FOUND IN NEW ZEALAND.

The high prices of petroleum all over the world have led to the introduction of many substitutes for petrol and paraffin. Among the substances from which suitable spirit and oil can be extracted is the peat to be found in North Island, New Zealand. Hitherto this peat has been worked mainly for the abstraction of kauri gum for making varnish, although the fact that spirit and oils could be distilled from it has been known for some years. The yield of oil averages some twenty-five gallons to the ton of peat, of which a quarter consists of a spirit suitable for driving motor-cars and aeroplanes, while the remainder can be split up into various kinds of oils. Very extensive beds of this peat are found in North Island, and a company has recently been formed for extracting oil therefrom.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

NIGHT SOUNDS.

THE wind whips all the budding trees to-night,
And roars among the conifers; the rain
Still drips from eaves; I hear a hinge complain;
And in the dark a hoot-owl, in his flight
Across the water, calls; his eerie sight,
Keen for the hunting that will ease his pain:
The grouse beats whirring wings—a suitor's strain:
The wind, at length, is still; the waves plash light.
Last night deep silence held the wood around,
And ne'er a murmur struggled from the lake;
The very stars in heav'n a more profound
And cosmic silence could not hope to breathe:
Then to my spirit seem'd heav'n's depth awake,
And there was more than earthly life beneath.

FRANCIS EDWARD BROPHEY.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible. ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

OLD LAVERY'S MONEY.

By C. A. NASH.

CHAPTER I.

OLD John Lavery had been for a great many years in the receipt of a more than comfortable income. He was agent for several large landowners in the south-west of Ireland, and, besides, farmed on his own account on quite an extensive scale. He had the name of being an honest man, and he deserved it. He owed no money to any man, and he certainly took good care that no man should owe any to him, without good security.

Old John lent money. He did not advertise the fact in the newspapers, and he courted no business in that line that was attended with risk. He did not care for lending to small farmers, even though he might get two or even three good 'names' on the back of a bill. This kind of business involved too much trouble and book-keeping; besides, in the event of their failure to meet their engagements, he deprecated the unpleasant publicity consequent on going to extreme measures. But if a few thousands were needed by a landlord who had 'outrun the constable' through a prolonged sojourn in London, or among the seductive attractions of Paris or Nice, John was always ready to give the needful aid under certain well-understood conditions. Nothing less than a first mortgage satisfied him, and his terms were always the same—10 per cent. This was much better for the borrower than getting into monetary relations with some of the gentry who did business in an unassuming back-parlour in Westminster. In the latter case, the calculation of the rate of interest charged would tax the analytical skill of an exceptionally well-qualified chartered accountant.

John had never married. Indeed, he had had no time to think of any such distraction; and at the time when we make his acquaintance he had reached the age of seventy-five. His next of kin consisted of an old sister who lived with him, and a niece, the daughter of a deceased brother. To his niece, who at this time might have been some twenty-two or twenty-three years of age, he had shown his generosity by furnishing twenty pounds, the fee required to bind her to a dressmaker in Cork. Upon the completion of her apprenticeship she had asked him for some assistance to help her in starting a business on her own account; but this he had peremptorily refused. The girl, having a spirit of her own, had given her opinion of his churlishness in pretty plain terms, which completely broke off all relations between them. The idea of setting up for herself had thus, for the present at any rate, to be abandoned, and she took a situation in one of the larger houses in Cork, in which her undoubted ability and close attention were rewarded with the success they deserved, and she had now attained the position of chief in her department. As to 'Uncle John,' she tried to forgive him, and succeeded in forgetting him.

Old John Lavery's old sister—they were twins—was somewhat of a 'character.' Both brother and sister were people of a good deal of refinement. They had been for many years in very easy circumstances, and if they did not associate on terms of equality with the 'county' families, as, of course, they did not, they were quite able to hold their own with any of the members of the said families who might visit them. As for themselves, they never paid visits.

'Miss Nell,' which was the name by which the old lady went, superintended the household affairs at Elmvale, as the place was called. She was a perfect housekeeper, seeing that there was enough for every one, but visiting severely anything in the way of waste. She seldom changed her servants. The latter knew when they were well off. She kept her eyes very wide open, and it was a common saying among her dependants that 'Miss Nell could tell what you were thinking of;' such was their belief in what they called her 'cleverality.' One offence she never pardoned, and that was a lie. No excuse availed to avert her sentence. And that was instant dismissal.

I have said that Miss Nell was a 'character;' but perhaps it was her force of character, indeed, that gained her the reputation, rather than any pronounced peculiarity of manner. She certainly would challenge the attention of a stranger by the costume she assumed when superintending the outdoor operations at Elmvale. She retired to her bedroom every morning after breakfast, and reappeared in a few minutes in her working-

 [*All Rights Reserved.*]

attire. This never varied. It consisted of a man's frieze coat, confined at the waist by a broad leather belt with an immense brass buckle, a man's tall hat—an old one of John's—and a pair of top-boots, a legacy from the days when her brother, on rare occasions, followed the hounds. No portion of the farm escaped her inspection. The hens, the cows, the ploughing or sowing, or reaping, or haymaking, all came under her close scrutiny, with perfect impartiality.

Miss Nell could have posed for what is known as a 'quick-change artiste,' for on being called indoors to receive visitors, she might be seen at three o'clock tramping past the drawing-room windows in field panoply, and at ten minutes past she would be calmly seated in that apartment doing the honours of the tea-table in her black-silk dress and old Limerick lace collar.

I have said that Miss Nell and her niece, Agatha Lavery, were old John's nearest of kin. He had a very distant cousin—indeed, so distant that only in Ireland would the term be applied. And, perhaps, had John been a poor man the relationship might not have been remembered.

This cousin was a certain Mrs Lysaght, who lived with her husband, a fairly substantial farmer, at a place known as Bawnmore, some two miles from Elmvale. There was not much intimacy between the Laverys and the Lysaghts. They met every Sunday at Monaleen Chapel, which was midway between Elmvale and Bawnmore, and where both families attended last Mass. A few remarks were exchanged between old John and Lysaght about the crops and the weather, and Anne Lysaght made a point of asking Miss Nell's advice on some item of domestic interest. This was the extent of the friendship existing between the 'cousins.' The Lysaghts were never invited as guests to Elmvale, and indeed never visited there, except on the rare occasions when some passing indisposition of either its master or mistress rendered a diplomatic assumption of anxiety advisable.

Meanwhile, as time went on, old John, who had always been as hard as iron, began to fail. He had led an active outdoor life, and chafed a good deal when very persistent rheumatism confined him to the house. Still, neither he nor Miss Nell was at all alarmed. Both thought it would mean only less activity, and great was the old lady's distress when one morning John, having failed to answer the usual knock at his bedroom door, was found to have quietly slipped out of the world during the night. He had reached his eighty-first year.

When his will was opened, it was found that he had left everything unconditionally to his sister. Much surprise was expressed that he had not remembered his niece, even to some small extent; and as his will was dated only some two years before his death, it was thought by most people that that young lady's free expression of the opinion she entertained of her uncle had been her undoing.

Mrs Lysaght, in particular, was very indignant with Agatha, and on her first visit of condolence to Miss Nell gave vent to her feelings in very severe terms. 'The ingratitude of some people,' she said, 'passes everything. It was most generous of her uncle to give her what he did. There was nothing before her but domestic service, and he put her in the way of being, I may say, a lady. And then to turn round and abuse him, as if he hadn't a perfect right to do what he liked with his own! And 'tisn't that alone, but the pain she gave you, to hear your brother insulted.'

'Ah, well, Anne dear,' replied the old lady, 'we must make allowance for the impetuosity of young people. You must not expect them to be as wise as their elders, or to love their relatives, like you, I am sure, loved poor John, for his personal qualities solely. And it was only natural that poor Agatha should wish to be independent, and strike out for herself. However, perhaps it was all for the best. She has got on very well, and who knows but she might only have lost any money given to her? She had no experience in the management of a business, and that was why her uncle thought it would not be for her own good to comply with her request; and I'm quite sure she sees that herself now. She wrote me a very affectionate and sympathetic letter when poor John died.'

'Well, Nell, I have no doubt at all that it was all for the best that John wouldn't listen to her; but, as I said before, I can't forgive her for the terrible language she used to her uncle. Why, we heard at Bawnmore that she went next door to striking him, the virago! Anyway, I am quite sure her treatment of him weighed heavily on him. He was one of those men that say little, but think a good deal. Old people feel unkindness more than the young. And if I were you, Nell, I would keep that lady at arm's length. Worry would not suit you, and as sure as you give her the chance, worry you she will, believe me.'

'And you think, Anne, it would not be well that I should do anything for her now? Poor John left a good deal of money, not to speak of the farms; and I am an old woman with few wants. Indeed, since John's death, I have often thought of selling the farms, and ending my days in a religious house. There are many convents where they take ladies as boarders, and there would be nothing to trouble me.'

'For goodness' sake, Nell, don't let any one hear you talking such nonsense! Why, you would not live a week in such a place, you that were always accustomed to such an active life.'

'Ah yes, Anne dear, no doubt I was, as you say, always busy; but you know that cannot

go on for ever, and in my eighty-first year it is time to think of resting.'

'Of course it is,' said Anne, 'and I think you are quite right in what you say about realising the farms, and giving up the trouble they bring. But it is not necessary for you to bury yourself in a convent. Just part with the farms and the land round Elmvale, keeping the house, and amuse yourself looking after the garden and the fowls.'

Anne Lysaght thought it well to leave it at that for the present. She had rather ambitious designs about the old lady's money, but felt that it was necessary to proceed by slow degrees, and with much circumspection. The chief point at present was to prejudice Nell against her niece. And here, too, danger lurked. Nell was terribly suspicious, and had always shown a marvellous power of reading the thoughts of others.

However, Anne had no reason to think that her interview had been other than satisfactory, even if only in a negative way. Nell had not declared her intention of cutting Agatha off; neither had she said that it was her intention to help her. Of course, the most unspeakable danger of all was that a few of her friends had advised her to have her niece to live with her as her acknowledged heiress. But she in no-wise took to this idea. She said she required no company.

'Ah, well,' said Anne to herself, as she drove back to Bawnmore, 'I must just be careful, and work my point by degrees. She is as cute as a fox. What did she mean by that dig about my loving John for his personal good qualities? I wonder was she pulling my leg! Personal good qualities, indeed! The old skinflint! Why, he never did a kind turn in his life!'

Now this was by no means true. Old John Lavery had done very many good turns in his lifetime; and while averse from having his benefactions published, he had helped many a poor, struggling family in ways that were never heard of. But what Mrs Lysaght meant—perhaps she did not analyse her own thoughts—was that neither during old John's lifetime nor after his death had any of his money come *her* way.

Old Miss Lavery did not change her mind as to disposing of the farms and the land about Elmvale. In less than four months after her brother's death this was accomplished, and the proceeds were well invested. She felt the change at first; but rich people are never neglected, and the ladies who formerly visited her once a month were now weekly callers. But no one was so assiduous in looking after her as Anne Lysaght—which was only natural, as they were related.

I have said that this relationship was a very distant one, so distant, indeed, that the so-called 'cousinship' was rather apocryphal. There were two things that Anne feared—first, that old Nell might make a will, and leave her fortune, or the greater part of it, to 'that hussy' Agatha; and next, that she might die intestate, in which case Anne would get, she feared, only a small share of the good things. Talking matters over one morning with her husband, she expressed her anxiety on both these points, and almost fell off her chair in the panic consequent on his view of the subject.

'Why, Anne, woman,' said George Lysaght, 'if Nell dies without a will, you won't get the value of that half-loaf of bread on the table. Do you really forget what the relationship is between you?'

'Well, I know it is not a very near one; but I 'm her cousin, all the same!'

'Cousin, my grandmother!' said George. 'What is the use of making a fool of yourself? Listen to me. Your grandfather and Nell's grandmother were a kind of cousins by marriage—mind, by marriage!—and if *that* makes *you* Nell's cousin, faith! I think I have a claim myself as a cousin by my marriage with you. No; put it out of your head that you will get a penny-piece if there is no will. And I don't know that you are prudent in trying to make her cut Agatha off, either. If you put the old woman's back up against her niece to the extent you desire, the chances are she may leave all her money to charity. But how do you know that she has not made a will already? Old Mr Mathews, her solicitor, has been two or three times with her since John's death.'

'Oh, I know all about that. And I know, too, that except while the maid was waiting at lunch, on those three occasions—for he was there three times—there was no one else in the room with the pair of them. And, you know, a will requires two witnesses.'

'All the same, if I were you, I would be very cautious. She might think more of you if you showed some consideration for Agatha. Remember, she is her own flesh and blood, and, as I said before, even if you succeed in poisoning the aunt's mind against the niece, I don't see how it brings you a bit nearer to the money. Unless, indeed, you have some plan in your mind that I know nothing of.'

'Well, George, I have, and a good plan, too, I think. I go over to see her every day, and a nice journey I've had, some days lately, with the weather what it is. And she is beginning to be a bit lonesome. Of course, I know I have to be cautious. But I have sounded her about coming to live here with us. At first she refused to think of it; but, you know, the constant dropping wears the stone, and yesterday she got so far as to say that she feared if she came here she would miss what is left to her of Elmvale, and the garden and the cocks and hens, and all the rest of it. But, as I told her, there would be no need for all that. She could drive over a couple of times a week, or every day, for that matter, and then

Elmvale would be a real recreation to her. I told her that you had got rubber tires on the "covered car," and that she could have Tom Nolan to drive her, and he could give a hand in the garden while he was there. And do you know what? I really think the thought of the free labour had more effect on her than all I had said before. Wait a while, George; I'm not such a fool as you think! We'll have her here before long. Oh, I'll do nothing in a hurry—you needn't shake your head—but you'll see that before she's here six months her will will be made, and it won't be Agatha, either, that the money will be left to!'

'Surely to goodness, Anne, you're not thinking of forging a will, or giving her some draught, like the people in novels'——

'Oh no! there will be no forgery or draughts. Everything will be open and above-board. But you'll see my words will come true.'

There was little surprise when old Miss Lavery went to live with her cousin, Mrs Lysaght. The few friends the old lady had, indeed, favoured the idea when she announced her intention of doing so. They thought it much better than that she should be dependent on servants.

One of the arguments which George Lysaght had used to his wife was that Miss Nell would miss the visits to which she had been accustomed. 'You know,' he said, 'many of the ladies who visited at Elmvale — old Lady Linley, for instance—may draw the line at visiting at Bawnmore.'

'George,' said Anne, 'I gave you credit for more knowledge of the world. 'Tisn't you or me they'll be visiting, but the rich Miss Lavery, and they'd visit her if she was in jail, if they were allowed to.'

'I suppose you're right, Anne. Money certainly is a wonderful thing. But be careful. I honestly tell you I don't like your plan of hitting Agatha so hard. The poor girl never did us any harm. And nothing will persuade me that you will ever succeed in getting Nell to see things as you wish.'

'Well,' said Anne, 'time will tell. Six months ago, if I had said I should have Nell living in this house, you would have thought me out of my senses; yet, here she is. And now I tell you that before six months more, or even sooner, Nell will have made her will in my favour; and there will be no hugger-mugger or secrecy. Why, every day she seems to be more pleased with herself for having come to live with us. Only this very morning she said she was never so comfortable in her life, or so well looked after. And now I want you to go over on Monday to Ballyforan, to the auction at old Colonel Baxter's. There's a nice, light victoria that will go cheap, and it will be a pleasant change for Nell from the covered car, now that the fine spring weather is coming on.'

The victoria was duly bought, and every fine day the old lady drove over to Elmvale after breakfast, and spent the day there, returning only in time for dinner at six o'clock. She began, too, to pay a few visits on her own account for the first time in her life, and between the calls on her friends and the interest she took in the little distractions of Elmvale, Anne Lysaght had good reason to think that her solicitude had rendered the old lady's declining years very comfortable.

In the beginning of the month of May, while paying a visit to Lady Linley, old Nell sat by an open window, the day being very fine, and on getting up to take her leave she felt somewhat chilled. She did not, however, pay any attention to the matter, never having been an alarmist. Next morning, however, she was quite feverish, and it was thought prudent to send for the doctor. The latter at once pronounced the case to be one of pneumonia. Before leaving he had an interview with Anne Lysaght.

'Pneumonia, I need not tell you,' he said, 'is always dangerous, and in the case of a person of Miss Lavery's advanced age especially so. She should be told—of course, without alarming her—that, in case of any illness, such business matters as she might have to settle should be attended to. I will send you a very good nurse from the County Infirmary, who will thoroughly understand her duties in the sickroom, and I will come over again in the morning.'

BRITAIN'S OPPORTUNITY.

By E. FEARON.

ONE of the many problems with which this country will be faced when at last the war is over will be the question of labour and production, especially in the engineering and allied trades. Up to the outbreak of war our manufacturers, with few exceptions, had been jogging comfortably along in the same old way that their fathers had done, while other nations, especially America and Germany, had been systematically improving and standardising methods of production, with the result that they were ousting us from the world's markets.

If we take the case of America, we find that one of the reasons of the large output per person employed is standardisation, another is scientific control of all processes, and still another is that

in most cases the factories and works are lofty, well lighted, and well ventilated, with clean and tidy messrooms, lavatories, &c. All of these factors make for efficiency, and have an effect on the men themselves in inducing smartness in dress and appearance; they take a pride in their work, and before leaving have a wash and change their clothes, so that you very rarely see a crowd of grimy men in dirty, greasy clothes turning out of the gate as you do here.

Standardisation in manufacture has been carried to great lengths in the States, with astonishing results so far as cheapness of production is concerned; while in Britain we seem to be just waking up to the fact that it is possible to make a thousand articles all alike at less cost than to make them of varying design. Take almost any manufactured article you like, from motor-cars to typewriters, and you find that American firms, by concentrating on standard methods throughout, can supply them at less cost than British firms; they may not be so highly finished, or last so long, as the British article, but for most purposes that is not essential.

One of the best-known examples is the Ford motor-car; here standardisation has been carried to a fine art—every single part is made identical, and all that has to be done is to assemble the parts. If you care to stand for an hour, say, at the side of a busy main road leading out of one of our big towns, and count the number of motor-vehicles of all sorts that pass along, and notice how many of the total are of this make, it will bring home forcibly to you how much we lose by our antiquated methods.

Nearly every one rides a cycle or a motor-cycle nowadays, and here again the want of standardisation is marked; every maker has his own particular design, his own special thread on bolts, and so on, with the result that if anything goes wrong or breaks, that particular part can only be obtained from the maker, or, if you are lucky, from his agent; and, if you happen to be on a tour in some out-of-the-way place, it generally means considerable delay and annoyance.

The man who, of all others, first saw the remarkable possibilities of system and method was the late J. W. Taylor, who has been called 'the father of scientific management,' and who for many years was employed by the Bethlehem Steel Company, one of the largest concerns in the States.

In Taylor's opinion, 'American and English workmen work at sport and play at work,' and for every person who is overworked there are a hundred who intentionally underwork. Acting upon this belief, he made a systematic study of men and machines, and, with a number of highly trained assistants, went very thoroughly into the whole subject. An instance of his thoroughness may be cited. At the Bethlehem Steel Works were some eighty thousand tons of pig-iron stacked in small heaps near a railway line, and a gang of seventy-five men, under a good foreman, was putting the iron into railway-trucks at the rate of twelve and a half tons per man per day. This was about an average speed for the work in the district, and was considered satisfactory by those in charge, but was not good enough for Taylor. He and his staff began carrying the iron themselves, and also studied the way in which the gang worked; and after some time they came to the conclusion that each man ought to load nearly fifty tons a day instead of twelve and a half. Their conclusion was brought about thus. They noticed that one man in particular left at the end of the day as fresh as when he started, and they asked him if he would like to earn more money by loading more iron. On his signifying his willingness, one of the staff took him in hand, and directed his every movement exactly to time, telling him when to work and when to rest, the aim being to get the man to work at top speed, and then rest his muscles for regular periods. At the end of the day he had loaded forty-seven tons without undue fatigue! Other men were picked out, and in a short time all the iron was being handled at this rate, and the men were receiving 60 per cent. more wages than they earned before. Other forms of labour were systematised, and the results were always the same—lessened cost of production for the employer, and better wages for the employee. Throughout the United States this 'speeding up' has gained adherents, and there is already a large number of books and periodicals devoted to the dissemination of knowledge on the subject, which is attracting attention in every part of the country.

In Great Britain one result of the war has been the remarkable way in which, notwithstanding depleted staffs and the employment of unskilled labour and of women who had never before seen, much less worked on, a lathe or other machine, the output has not only been maintained, but greatly increased. The reason for this is not far to seek. The urgent need for all sorts of munitions has caused us to install thousands of up-to-date machines; to erect factories equipped with canteens, well-lighted, airy structures, planned to secure the maximum output from the ground area; and generally to revise our whole methods of manufacture.

One of the few concerns in this country that have adopted scientific management as it is known in the States is a well-known firm of chain-makers not a hundred miles from Manchester; and they have found that by speeding up machines, and doing everything possible to obviate all unnecessary motions on the part of the operator, they were able to double the output of the factory. This was done by standardising all tools and tool-holders, by having a store in which were kept sets of sharpened tools for every job, and having an electric bell on every

machine, so that whenever a tool needed renewing, all the workman had to do was to ring the bell, and a boy at once took the tool away and supplied a fresh one.

Then, too, they made a close study of the output hour by hour, and noticed that it fell off at certain times, especially during the latter part of the morning. A break of fifteen minutes was instituted half-way through the morning, and milk, &c., provided, with successful results.

The report issued by the Ministry of Munitions on 'Industrial Fatigue and its Causes' cites a very interesting example in which the men working on piece rates in the foundry were made to rest fifteen minutes every hour. The men at first resented the innovation, and thought their earnings would suffer; a foreman was therefore appointed to see that the rule was strictly carried out, and it was found that the output actually increased.

But it is to the installation of automatic machines that we must look for help also, and greater encouragement should be given to invention in our own country in this respect. The writer knows of a case in point, in which a manufacturer who was putting up a gear-cutting shop was compelled, much against his will, to get all his machines from America; not one could be supplied in Great Britain. These machines are capable of cutting the most complicated gears with practically no attention; they are set to cut a certain number of teeth to the required shape, and go on till the job is completed, when a fresh wheel can be inserted, and the whole process started *de novo*. A man of ordinary intelligence can easily attend to three or four of these machines; there is no need for a skilled mechanic except in case of a breakdown.

Referring again to the report of the Ministry of Munitions, we find that an old-established firm built a new shop, designed, on the basis of their past experience, for an output of five thousand per week of a certain standard munition. Now, despite the fact that this shop was manned by new and inexperienced hands, the output was actually nearly thirteen thousand per week, a figure which had not been approached by the older but equally well-equipped shop of the firm! The question naturally arises as to the reason of this difference, and there is only one answer—namely, that the new hands were not hampered by tradition and the 'ca' canny' policy of the old employees; consequently they were doing their best, and, by so doing, more than doubled the output, and, incidentally, made very good wages for themselves.

Here, then, we have undoubtedly one of the causes of our backwardness; the British workman is capable of doing as good work as the workman of any other nation, but, for various reasons, he hardly ever *does his best*. He has not, in the past, been encouraged to do it; he has been bullied by foremen, who are too often 'beggars on horseback;' he has been dismissed if he showed himself too independent or if he had ideas of his own; and in nine hundred and ninety-nine cases out of one thousand he has accepted the situation and simply done as little as would pass muster in the fifty odd hours or so he has to put in each week.

Now the day of low wages has gone, and it is extremely unlikely that it will ever return, and, that being so, it is absolutely essential that output must be increased accordingly, by the use of every labour-saving device that ingenuity can give us. But there is another factor that is not sufficiently recognised in Great Britain, which is that it pays to encourage workmen to use their *brains* as well as their hands; to look at the daily work from the men's point of view, and if one of them can suggest any improvement, to give it careful consideration, and, if at all possible, give it a trial. Then, if it is found that better results are obtained, let the man who suggested the improvement have a share in the increased profits that ensue, and it will be found to stimulate working methods all round.

When peace is declared we shall have plenty of handicaps in the way of heavy taxation, war pensions, &c., and if we are to win through, it will only be by every one of us doing the best that in him lies, and that best can be accomplished by encouragement of initiative, by better working conditions, and greater harmony generally between capital and labour.

The chance of bringing about a great reform has come through the grim necessity of war's demands, and it remains for us to take advantage of it. If we fail to do so, it is as certain as anything on earth can be that we shall lose our place among the leading nations; if we seize the opportunity that Fate has given us, we can not only remain in the front rank, but can go ahead and become pioneers and discoverers of newer and better methods in science, industry, and commerce.

The importance of our doing so cannot be over-estimated, for it would be nothing short of a calamity to allow a nation such as Germany to become the paramount Power in Europe; we must, at all costs, prevent that, and we *can* prevent it if we shake off the fetters that have bound us hitherto, and resolve to sink our differences and all pull together for the common good.

THE DEFINITE OBJECT.

By JEFFERY FARNOL.

CHAPTER XXVII.—MRS TRAPES UPON THE MILLENNIUM.

MULLIGAN'S was in a ferment. Bare-armed women talked in every doorway, they talked from open windows, they talked leaning over banisters, they congregated on landings and in passage-ways, but everywhere they talked; while men and youths newly returned from work, lunch-can and basket in hand, listened in wide-eyed wonder, shook incredulous heads, puffed thoughtfully at pipes or at cigarettes, and questioned in guttural wonderment. But Ravenslee, lost in his own happy thoughts, sped up the stairs all unheeding, abstractedly returning such neighbourly salutes as he happened to notice. Reaching his lofty habitation in due course, he let himself in, and, seated in his arm-chair, was in the act of filling his pipe when Mrs Trapes appeared. In one hand she grasped a meat-skewer and in the other an open Testament, and it was to be noted that her bright eyes, usually so keen and steady, roved here and there, from pink rug to green-and-yellow table-cloth, thence to the parrot-owl, and so at last to her lodger; finally she spoke. 'Mr Geoffrey, are ye saved?' she demanded in awe-struck tones.

'Why, really, Mrs Trapes, I'——

'Because, Mr Geoffrey, this day it behooveth us all t' think of our souls an' th' hereafter, I reckon.'

'Souls?' said Ravenslee, staring in his turn.

'Fire,' she continued, shaking portentous head—'fire I'm prepared for; a earthquake I could endoor; battle, murder, and sudden death I could abide; poverty is me lot, Mr Geoffrey, an' hardship is me portion, an' for all sich am I dooly prepared, sich things bein' nacheral; but for this—well, there!'

'What is the matter, Mrs Trapes?'

'Matter, Mr Geoffrey? Well, the millennyum's at hand, that's all—the lion is about t' lay down with th' lamb, tigers has lost their taste for blood, an' snakes an' serpents has shed their vennymous fangs! Mr Geoffrey—the day is at hand—beware!'

'What in the world'—— began Ravenslee; but Mrs Trapes stayed him with uplifted skewer, and, laying it down, drew from the mysterious recesses of her apron a folded circular, which she proceeded to spread open, and from which she read in a hollow voice as follows:

'NOTICE.

'1*st August* 1910.

'On and after the above date all tenants soever residing within the tenement house known as Mulligan's are warned that all rents will be reduced by 50 per cent. BY ORDER.'

'Now what,' said Mrs Trapes, refolding the circular very reverently, and shutting it into the Testament—'jest what d'ye think o' that?'

'Quite a—er—remarkable document, Mrs Trapes!'

'Remarkable?' snorted Mrs Trapes.

'Yes,' said Ravenslee, beginning to fill his pipe, 'extraordinary, most extraordinary—er—very much so.'

'Extraordinary? Mr Geoffrey, is that all you got t' say about it?' And Mrs Trapes sniffed loudly.

'Well, what more should I say?'

'Why, ain't it th' wonder o' th' whole round world? Ain't it th' merrycle of all time?'

'Certainly! Not a doubt of it!' he agreed. 'By the way, what do you happen to have for supper? You see, I've been'——

'Supper?'

'I'm quite hungry—I'm always hungry lately, and'——

'Hungry!' ejaculated Mrs Trapes, rolling her eyes. 'Here I tell him of wonders an' omens beyond pore huming understandin', an'—he's hungry! Lord, ain't that jest like a man! A man's soul, if a man has a soul, lays in his stummick. Hungry! But you shall be fed—prompt, Mr Geoffrey. How 'll b'iled salmon an' peas soot?'

'Splendidly! And I think'——

'"On and after,"' said Mrs Trapes slowly and dreamily—"'on and after the above date all tenants soever residin'"—I've learned it by heart, Mr Geoffrey. Then it goes on to say, "within the tennyment house known as Mulligan's are warned"—h'm! I wonder why "warned"?—"are warned that all rents will be re-dooced 50 per cent."! Fifty per cent.!' she repeated in a dreamy rapture, 'which is jest half, ye see. An', Mr Geoffrey, that's jest what's got me plumb scared—it's all so unnacheral. I've heard o' rents bein' rose—constant, but who ever heard of 'em bein' took down before? Well, well! My land! Well, well!' With which remark Mrs Trapes went about her household duties, leaving Ravenslee to lounge and smoke and dream blissfully of Hermione.

'Ye see,' said Mrs Trapes, wandering in with a plate, 'it 'll make things s' much easier for all of us; we shall begin t' feel almost rich—some of us. "Are warned that all rents will be re-dooced by 50 per cent." Well, well!' and she wandered out again.

But presently she was back once more, this time with the tablecloth, which she proceeded to spread, though still lost in dreamy abstraction. 'At first I couldn't an' I wouldn't believe it,

Mr Geoffrey—no, sir!' she continued in the same rapt voice. 'But every one 's got a notice same as mine, so I guess it must be true, don't ye think?'

'Not a doubt of it!' answered Ravenslee.

'But th' burnin' question as I asks myself is —who? It 's signed "By Order," ye see. Well —whose? One sure thing, it ain't Mulligan.'

'But he owns the place, doesn't he?'

'He did, Mr Geoffrey, an' that 's what worries me—continual. What I demands is—who now?'

'Echo, Mrs Trapes, methinks doth answer, "Who?" By the way, it was—er—salmon and green peas I think you'——

'My land, that bit o' salmon 'll bile itself t' rags!' and incontinently she vanished.

However, in due time Ravenslee sat down to as tasty a supper as might be, and did ample justice to it, while Mrs Trapes once more read aloud for his edification from the wondrous circular, and was again propounding the vexed and burning question of 'who?' when she was interrupted by a knocking without, and going to the door, presently returned with little Mrs Bowker, in whose tired eyes shone an unusual light, and whose faded voice held a strange note of gladness.

'Good-evenin', Mr Geoffrey,' said she, bobbing him a curtsy as he rose to greet her. 'My Hazel sends you her love an' a kiss for them last candies; an' thank ye for all th' medicine. But, oh, Mr Geoffrey, an' you, Ann Trapes, you 'll never guess what 's brought me. I 've come t' wish ye good-bye; we 're—oh, Ann—we 're goin' at last!'

'Goin'!' exclaimed Mrs Trapes, clutching at her elbows. 'Ye never mean as you 're leavin' Mulligan's, now the rent 's been took down—re-dooced 50 per cent.—by order?'

'That 's just what I 'm tellin' ye. Oh Ann, ain't it just—heavenly?'

'Heavenly!' repeated Mrs Trapes, and sank into a chair.

'Yes, heavenly, t' see th' trees an' flowers again—t' live among them, Ann!'

'Samanthy Bowker, what do you mean?'

'Why, Ann, my Tom 's had a gardener's job offered him at a gentleman's mansion in the country. Tom went after it t'-day—an' got it. Fifteen dollars a week an' a cottage—free, Ann! Hazel 's just crazy with joy—an' so 'm I!'

Mrs Trapes fanned herself feebly with her apron. 'All I can say is,' said she faintly, 'if the world don't come to an end soon, I shall. A gardener's job! A cottage in th' country! Why, that 's what you 've been hungerin' for, you an' Bowker, ever since I 've known ye. And to-day it 's come! An' to-day the rent 's re-dooced itself 50 per cent., by order. Oh, dear land o' my fathers! When d' ye go?'

'T'-morrow mornin', Ann. Hazel 'll sure grow a strong, well girl in th' country; doctor said so last week.—You heard him, Mr Geoffrey, didn't you?'

'I did, Mrs Bowker.'

'And my Tom 's that excited he couldn't eat no supper. Oh, an' have ye seen in t'-night's paper, Ann, about Mulligan's?'

'No; what now?' inquired Mrs Trapes feebly.

'Well, read that—right there!' and unfolding an evening paper, Mrs Bowker pointed to a paragraph tucked away into a corner; and, drawing a deep breath, Mrs Trapes read aloud as follows:

'It is understood that Geoffrey Ravenslee, the well-known sportsman and millionaire, winner of last year's International Automobile Race and holder of the world's long-distance speed record, has lately paid a record price in a real estate deal. A certain tenement building off Tenth Avenue has been purchased by him, the cost of which, it is rumoured, was fabulous.'

'Fab'lous!' repeated Mrs Trapes, and sniffed. 'Well, I never had no use for millionaires, anyway—they 're generally fools or rogues—this one 's a fool, sure. Any one is as would give much for a place like Mulligan's; an' yet, come t' think of it again—"are warned as all rents will be re-dooced 50 per cent., by order"—yes, come t' think of it again, what I say is—God bless this millionaire, an' whatever he is, Ann Angelina Trapes is sure goin' t' mention him before th' Throne this night.'

(*Continued on page 435.*)

THE MOST WONDERFUL ESCAPE FROM PRISON ON RECORD.

By George Pignatorre, B.C.L.

LATUDE, who may very appropriately be styled the Champion Prison-Breaker, seems, like Napoleon in war or Edison in electricity, to have been supernaturally gifted in his own special line. Not but that he was a man of great general intelligence, but he was lacking sometimes in that judgment and self-control on ordinary occasions which he possessed in so superlative a degree when planning his escapes. Above all, he was a man of dauntless courage, of unyielding endurance, and of resourcefulness. Physically, too, he must have been endowed with a remarkable vitality, which alone could have enabled him to survive the hardships and privations of thirty-five years of prison life, the horrors of a dungeon of those days.

Latude had left Huverene in the year 1747 to push his fortunes in the city of Paris. He was then a fine young man, full of high hopes, but of a somewhat too impulsive nature, lacking in experience and in cool judgment, eager to realise those bright dreams of the future which spread like a deceptive mirage before his sanguine imagination. Latude, however, knew that to achieve an initial success, to set his foot on the first rung of the ladder of fortune, a powerful protector or protectress was required, without whom, especially in that most corrupt age, the eighteenth century, no one could hope to emerge from obscurity. France was at that period under petticoat government; she was governed by the notorious Marquise de Pompadour, who ruled the country under the name of Louis the Fifteenth, the Well-Beloved (so misnamed). And Latude bethought himself of applying to the all-powerful favourite to obtain some office or post about the Court which would give him his first step; and this gained, he relied on himself to achieve further success. So far, Latude was right; could he succeed in gaining the ear of the uncrowned Queen of France, he could hope to rise high; but being without a letter of introduction, he would have to introduce himself, and here Latude made the capital blunder of his life by hitting on a device so clumsy in its conception that it is difficult to understand how a man of average intelligence could have hoped to reap any benefit through what might have been called a silly practical joke played off at the expense of the most powerful personage in France. The plan in itself, and the mode in which Latude proceeded to carry it out, betray such incredible want of judgment and reflection that his action can only be explained by one of those momentary aberrations of mind from which even the greatest intellects have not always been exempt. The plan conceived by Latude to gain access to the favourite was to enclose some innocuous white powder in an envelope addressed to Madame Pompadour, which he would post, and then, following on the heels of the enclosure, present himself and demand an audience on a matter which brooked no delay. He would then inform the favourite that he had overheard by chance a conversation between two men, which had convinced him that there was a plot on foot to poison her; that the poison, which was of a very subtle nature, would be sent enclosed in an envelope in the form of a white powder; and that he hoped he had come in time.

The plan was carried out, without let or hindrance. Madame Pompadour, who knew how she was hated, gave credence at first to the tale, and was proportionately grateful. She even offered him a purse of louis d'or in the first flush of her gratitude, which Latude refused to accept. She then asked his name and address, proposing to reward him in a manner more conformable to his appearance and seeming station.

Here Latude committed the grave imprudence of writing out his name and address without attempting to disguise his handwriting. This was a great blunder; for when it was discovered that the fatal white powder was nought but common fine table-salt, the handwriting on the enclosure was compared with that of the address written down by Latude, in the presence of Madame Pompadour, and found to be identical! The lady was furious, and not without reason, at being fooled by a country rustic, and being made a laughing-stock; nor did she allow her wrath to cool. Latude, while indulging, perhaps, in his day-dreams, was forthwith arrested and consigned to the Bastille.

The rigours of imprisonment were at first somewhat softened and the prison rules relaxed in his favour through the kindness of Berryer, lieutenant of police, who allowed him the use of writing materials and books, and who had him transferred from the Bastille to Vincennes, where he enjoyed far greater liberty. There he remained several months, till, wearying of captivity, he resolved on escaping. He laid and carried out his plan with that ingenuity and boldness which Latude possessed in such a superlative degree; but we cannot afford to dwell on the particulars of an exploit which, however remarkable in itself, was mere child's-play to what he could do, to his wonderful escape from the Bastille—truly a masterpiece in its way.

But Latude's knack of getting out of prison only equalled his knack of getting in again. His besetting foible seems to have been his inability to understand individual character, and his proneness to trust the wrong person. Thus it came to pass that he revealed himself incautiously to several individuals, and was promptly recaptured and consigned once more to the Bastille. The captive was allowed, as before, the use of paper, ink, and books. For six whole months he possessed himself with patience, reading and writing assiduously; at the end of this time his ardent and impulsive nature asserted itself, and, in a fit of spleen, he scribbled on the margin of the page of a book the following quatrain:

Without being either witty or pleasant,
  Without being either lovely or new,
In France one may aim at a lover
  The foremost of all, as Pompadour knew.

A turnkey read the lines, and carried the book to the governor, who showed them to Madame Pompadour. These four execrable lines spelt irrevocably lifelong imprisonment; even Berryer had to withdraw his protection and to cease active advocacy of Latude. But the lieutenant of police continued to treat him with much consideration and kindness; he was supplied with good food, given a companion at his own request, and his cell was airy and warm. But if Latude had chafed before at the prospect of a long, though terminable, imprisonment, when

he might reasonably have hoped for a not very distant release, he had now become simply desperate at the far more terrible outlook which was before him, and resolved to attempt an escape from the Bastille.

There remained but one way open, and that was up the chimney, down the wall, over the moat, and through or over the outer circuit; but the chimney was obstructed with stout gratings and bars, the inner wall of the Bastille from turret to the surface of the moat was two hundred feet in height, the water in the moat would be five feet in depth or more, and, finally, the circuit was some twenty feet in height. He and his companion would have to fashion their own tools, to conceal the materials and the rubbish in some secure hiding-place, and, lastly, to work by night, mostly in a cramped position, in the dark or in the semi-darkness of a dimly burning rushlight. No wonder that D'Aligre, the companion of Latude, refused at first to have anything to do with what he regarded as a mad scheme, pointing out the seemingly insurmountable barriers which lay between them and liberty. But Latude refuted D'Aligre's objections one by one, explaining his plan, and at last won his consent.

The first thing was to find a place of concealment wherein they could secrete their appliances and implements. Such a hiding-place Latude believed must exist beneath the floor of their cell. He had noticed in all the cells he had successively inhabited that whenever a cell overhead or underneath was occupied he had always been able to hear distinctly the movements of the occupant, and that now for the first time, although the cell below was inhabited, there was no sound to be heard indicating the presence of the inmate. This could only be accounted for by the greater space intervening between the floor of the upper cell and the ceiling of the lower one. Moreover, he conjectured that the space would be partially, perhaps wholly, void, as otherwise the superincumbent solid mass, perchance four or five feet thick, would have been an overweight for the ceiling below. He managed to verify his conjecture one Sunday morning in returning from Mass, when he dropped purposely on the stairs a small cylindrical case, and asked their warder to pick it up. The man had to run some distance down to where it had rolled, and Latude meanwhile had darted up and looked into the lower cell, and measured at a glance the height, which he reckoned to be about ten feet at the outside; then, counting the steps intervening between floor and floor, the aggregate height of which he ascertained by measuring that of one with his handkerchief, he found that his surmise had been correct, and that there was a hollow or only partially filled space intermediate and underlying their cell. This important point ascertained, Latude began operations immediately. Out of two iron pegs or pins on which their table was supported he and D'Aligre made two pointed chisels by sharpening them on the stone flags of the floor, and with these two tools fashioned by themselves they succeeded in raising a flag. The opening revealed a cavity four feet and a half deep, extending under the floor and amply sufficient to contain and hide from view the various articles they would be obliged to conceal from the turnkeys. The flag was replaced so neatly that no trace remained of its having been removed. Their next operation was to undo the seams and draw out the threads of the linen shirts, stockings, and underwear, of which Latude possessed a plentiful supply. According to his own statement, his wardrobe comprised thirteen dozen and a half shirts, besides other underclothing in proportion. They knotted and rolled up the threads in balls, each containing some sixty feet of twine, out of which they made a ladder twenty feet long, by plaiting the strands of thread, which was to support them while they laboured to detach the bars and gratings fixed in the chimney; and it was on this unsteady ladder, half-standing, half-crouching, stifled by soot against which they had no protection, that the two men toiled six whole months to remove the massive bars embedded in the hard masonry, which they had no means of softening save by squirting water from their mouths over the particular spot at which they were working. But their progress was painfully slow, for in addition to the ordinary difficulties which the task presented of itself, they had to take it in hand and carry it through working at odd hours, almost always in the dark and unprovided with proper tools. Lastly, each bar, each grating, had to be carefully put back so as to present a normal appearance, every speck of mortar cleared away, the ladder stowed away, and the flag replaced before the first morning visit of the turnkeys. The chimney cleared, Latude proceeded to make two more ladders—one of cords two hundred feet long to enable them to descend from the roof of the Bastille to the moat, the other of wood to serve for escalading the outer wall beyond the moat bordering on the governor's garden. To fashion this last ladder they had to provide themselves with a saw and a blade, which Latude contrived to manufacture with much ingenuity—the sharp blade out of a steel for striking a light, the rude saw out of a candlestick, which he notched with the cutting edge of the steel. These two new instruments served to cut the logs of firewood which were supplied to them in winter by M. Berryer into billets of a uniform length. These were then dressed and made to fit into each other by grooves and turning joints—'*tiroirs et charnières*' are the rather confusing terms used by Latude; but this he explains farther on by substituting the words '*mortese*' and '*tenen.*' Then each section was pierced with two holes, wherein the rungs were secured with wooden pegs, to which some strong twine was attached, so that the ladder—which, by

the way, had but one arm—could be easily and quietly pieced together. Finally, they plaited a stout auxiliary cord, and fashioned a rude pulley. The cord was to serve to lessen the oscillations of the long ladder. Several smaller additional cords were made to lower or pull up the articles they would have to carry with them. Their preparations were now complete after eighteen months of labour, and it only remained for them to wait for the first dark, windy night to make their attempt. Latude, on reflection, had been obliged to modify his original plan in one respect—that is, to abandon his intention of making their exit over the wall and through the governor's garden, and to choose a more toilsome but less dangerous way by piercing the wall from the side of the moat. True, they would have to work immersed in icy water, but this would be better than exposing themselves to the certainty of recapture, in attempting to cross over the wall, by the sentries posted on the parapet.

On the 25th of February 1756, there being no moon and the weather overcast, Latude and D'Aligre resolved to start on their perilous venture. No sooner had they been locked up for the night by the turnkey who had brought their supper, and who, after the customary inspection, had retired, than they collected their parcels containing their tools, cords, ladders, and two bars which they wrapped round with the flannel lining of two coats, to enable both men to haul them noiselessly up the chimney. These iron bars were to be used in boring the wall. Latude's valise was filled with two changes of raiment and their remaining spare linen, the wooden ladder pieced together, the tackle packed up, and then Latude started up the shaft leading to the roof, working his way up without any help. His progress was retarded by his position; and he does not explain how he managed to reach the top, but merely tells us that he emerged coated with soot and with an excoriated shin. The gratings must have been removed, but one or two of the transverse bars may have remained to help him in his ascent. Latude now let down some strong twine, to which D'Aligre knotted a strong cord, with which the former successively drew up his valise, tools, and other articles, including the wooden ladder, which they were loath to leave behind. This done, Latude lowered down the shaft of the chimney the short ladder which they had used while working, which he secured above by a strong pin of wood placed crosswise against the stack; and this enabled D'Aligre to mount with far greater ease than his companion. The two fugitives, who were now on the platform forming the roof of the Bastille, made their preparations for descending. Lashing the ends of the long ladder to a gun, they let it down the wall and fixed up their pulley, through which they rove the steadying cord. Here again Latude leaves us in the dark regarding the *modus operandi* of planting and securing the tackle, save stating that it was placed against one of the turrets. Anyhow, it was stable enough for the purpose it served; for Latude, winding one end of the cord round his waist, while D'Aligre paid out the cord above, began his descent of two hundred feet. Notwithstanding the help of the cord, the ladder, buffeted by the wind, swung to and fro along the surface of the ashlar wall, and poor Latude, who was always to the fore to smooth the way for his mate, met with some bruises and more excoriations ere he reached the ground. The spot on which he alighted was fortunately a mound emerging from the water of the fosse, and consequently dry. D'Aligre next lowered everything, and then descended in his turn, Latude steadying the ladder below, thus rendering his comrade's descent much easier than his own had been. D'Aligre arrived uncontused and ungrazed.

So far, they had met with no impediment—they had reached the moat safely; but they were still far from being out of the wood. They had both, in spite of Latude's opinion, clung to the hope that perhaps, after all, the way over the wall and through the governor's garden might be practicable; but now, when they heard the sentinels pacing above along the parapet, they perceived clearly enough that egress in that direction was impossible. They saw once the glimmering lights of the links or lanterns carried by the round. To mount the wall would be simply to give themselves up. There was no help for it—they would have to bore through a wall of unknown thickness and strength before daybreak, standing in water up to the waist or the armpits, or abandon the enterprise at the eleventh hour, when on the point of probable success. They had but the choice between two evils; and they chose the lesser of the two. Indeed, it would not have been a choice of evils at all had they been able to calculate the thickness of the wall and their own power of endurance. As it was, they would have to run the double risk of their strength failing and of encountering an impervious obstacle in the thickness and hardness of the material of the wall.

Eleven had struck when Latude and D'Aligre, slipping into the water, commenced boring through the wall, relieving each other at irregular intervals after they dislodged the first block with their improvised crow-bars, for they feared they might injure one another in the dark, or that their limbs would be numbed by the cold. During these long hours of weary toil they were in constant fear of being discovered; the splash of a stone would have led to inevitable detection; the curiosity or vigilance of an extra-watchful sentinel or of the round would have the same result; and, indeed, twice during that bleak February night they were, or feared they were, within an ace of discovery by a sentinel, who

stopped in his beat right over their heads, peering down into the moat. They gave themselves up for lost; but the man had not stopped for any particular reason, and to their immense relief, after gazing around him idly, he resumed his walk. Later on, the patrol, going their rounds, one man holding his lantern, passed by. As he flashed his light over the moat Latude and D'Aligre instinctively ducked, and were saved by the skin of their teeth, their presence of mind alone preventing them from being discovered at work. At length the wall, about four feet and a half thick, was pierced, after six hours of unremitting toil. Their task had been somewhat facilitated by the less resisting nature of the cement, which had been softened by the action of the water; had it been otherwise they would hardly have finished their operation before daybreak. They soon enlarged the opening sufficiently to give passage to themselves, their valise, and their tools; but they had to leave behind, to the great regret of Latude, their ladders and the pulley, the creations of his ingenuity and industry.

They now stood outside the Bastille, weary, chilled to the bone, encrusted with mud, but free men at that. It was still dark, and the street solitary, and it was a fortunate circumstance, for their sorry plight would have led to their recapture by the first city-patrol. They could not attempt to leave the city then and there, for the gates were closed at that early hour, and by the time they would be open their flight would have been detected, and the gates would be watched; so they decided on seeking some safe refuge where they could lie low until the hue and cry was over. A humble friend, a tailor, received them under his roof, where they stayed unmolested for a month. By then the police, assuming that the fugitives had left Paris, had relaxed their efforts to capture them, although spurred on by Madame Pompadour and by the governor of the Bastille, whose *amour propre* had been touched by the fact that the two prisoners had dared to escape from the strongest prison in France. But the police spies kept a watchful eye over the borders. The frontiers of Belgium, where Latude was known to have friends, were especially watched. But of this fact he had no knowledge; and having ascertained that the police were no longer searching for him in Paris, he proposed to D'Aligre that they should both set out for Belgium, but separately, D'Aligre preceding him, as being less likely to be shadowed. D'Aligre started accordingly, and Latude followed a few days later. They had agreed to meet at Brussels; but when Latude arrived, he found that his comrade had been arrested and delivered to the French authorities in virtue of a demand for his extradition. He now evaded the police for some time, and, being thus forewarned, might have made his escape overseas to England. This seems to have been his intention, when he committed a fresh imprudence, the greatest of his life, for his wits appear to have always deserted him when out of prison. He wrote to his family, giving his address, and asking for a remittance of money. The letter was, of course, opened by the police, then deftly reclosed and forwarded to its destination. The father of Latude sent a draft drawn on a Belgian bank, payable to Latude at Brussels. This second letter also passed through the hands of the police, so that when Latude presented himself at the bank he was arrested by the police agents, and kicked with great brutality by the French police spies, who, like the governor of the Bastille, were incensed at having been outwitted and subjected to reprimands for having let Latude slip through their hands.

The unfortunate man was now to taste the full horrors of incarceration as inflicted in those days, at once so near and so remote from us. Consigned to an underground and noisome dungeon, Latude passed forty miserable months, at the end of which he had become a ghost of his former self. No one would have recognised in the spectre before them the handsome, brilliant young man who had entered Paris some thirteen years before—bald, half-blind, bowed, and emaciated, he might have moved to pity even Madame Pompadour had she seen him; but she never did see him, and she remained inexorable, turning a deaf ear to all pleadings. He was, indeed, removed to another cell, where there was more light, though no warmth; but this slight amelioration was due to the fact that the jailers objected to enter a cell sometimes half-flooded, and not to any compunction on the part of the authorities. No real alleviation of his sufferings, no abatement of the rigours of his prison cell, was experienced until the death of the relentless mistress of Louis the Fifteenth in 1764. In that year he was again transferred to Vincennes, and on his escape in the following year was recaptured for the third time. Removed to a madhouse in 1775, he was discharged on condition that he returned to his native village; but, being found in Paris, he was again flung into prison. It was only in 1784 that he obtained his release, which he owed entirely to the persistent exertions of a courageous woman of the middle class, who took up his case, visited him in prison, undeterred by the loathsomeness of his dungeon and the squalor of the prisoner, and supplied him with decent clothing and with money to enable him to purchase those creature comforts which were never refused, as a rule, to prisoners who could afford to pay for them, but without which the prisoner's life was a hell on earth. Madame Legros, as this noble woman was named, by dint of knocking at every door, reached at length the king's antechamber, wringing from Louis the Sixteenth a reluctant order for the liberation of Latude, who

was set free in 1784. He had entered the Bastille a youth of twenty-five; he left a man of sixty, racked with rheumatism, with impaired sight; it is a wonder he left it alive.

But our story ceases with Latude's release from the Bastille. His remaining years were passed in peace, and he lived to see the great Revolution which avenged him on his enemies and brought a tardy but terrible retribution on the perpetrators of the horrors we have mentioned, but which, exceeding the limits of justice, was in its turn productive of violent reaction.

AN OFF DAY.

A TALE OF THE CAMEROONS.

I.

A LARGE camp that has recently been almost emptied is one of the most cheerless sights that can be imagined, especially when such a camp consists of grass huts instead of tents, and is placed in the heart of an African forest. The feeling of loneliness is enhanced by the absolute silence of the surroundings, when only a few hours before it had been humming with the usual noises associated with a large collection of human beings, all packed into a comparatively small area.

Such, then, were the remains of the camp at Noiga after three of the four companies that had halted there had resumed their advance, and the greater part of the fourth had been sent in another direction to find a ford in the Laffia River near Nkwor, and to protect the road for the passage of the transport convoys.

The column had moved out of camp two hours before daybreak, accompanied by its transport, hoping to secure a passage over the same river higher up without opposition, and to cross and get in touch with the enemy's outposts before nightfall. The searchers for the ford had gone off an hour or so later, fully expecting to find the enemy waiting to contest its possession; and as the neighbourhood of the camp was believed to be absolutely free from the Germans, only one weak section and the sick men had been left behind to guard it. When the ford had been found, and the opposite bank secured, one other section would return to Noiga to act as escort to convoys to Nkwor when they began to filter through from the rear.

A subaltern named Beechwood had been left behind in command at Noiga, which was now the foremost of the fortified posts on the line of communications, the next in rear lying a good day and a half away to the south, with two formidable, unbridged rivers in between. The camp was in the bush a mile or more up-stream from the village from which it took its name, and was intended to guard the crossing, though the thick bush completely hid the river from view.

Beechwood's billet was looked upon by his brother-officers as a sinecure, and several had chaffed him upon the rest cure that he was about to enjoy. He, however, was far from being contented with his lot, having already had more than he considered was his fair share of guarding the lines of communication, so that it was in no very charitable frame of mind that he had watched the tail-end of the column filing out of the camp that morning. He had really very little to do, as two small blockhouses had been made before the column had left; so all that was left for him to do was to clear away the now deserted huts that had formed the camp. The river was far too rapid to be bridged, and could only be crossed by wading waist-high and bearing on a stout pole to prevent one's self from being carried away to certain destruction on the rocks below. The villagers from Noiga were already at work clearing the camp and improving the so-called road to Nkwor.

At eleven they knocked off work until one; so, having breakfasted at the grisly hour of 4.30, Beechwood sat down to a solitary lunch, consisting of a very bony fish that his cook had caught in the river, and some baked yam. This done, he stretched himself on his camp-bed, with a cigarette and a months-old magazine, and presently went to sleep.

At one he awoke, and gave the order to resume work; but a few minutes later his sergeant announced that not a single native had returned since the morning, and that none were to be seen on the path to the village. Cursing heartily, he sent his interpreter post-haste to summon them; but that worthy returned, reporting that the village was deserted. Evidently there had been a panic, as the fires were still burning, and cooking-pots and various odds and ends had been left lying in all directions. Two old men and an old woman, who had remained in their huts, accompanied him, and were eagerly questioned as to the cause of this stampede, the most remarkable thing about which was its rapidity and its silence. Terrified African natives are usually the reverse of quiet.

'What for they run away, go?' asked Beechwood of the interpreter, who, after much shouting and palaver, ejaculated, 'Jarmans.'

'Where?'

More palaver. Answer, 'Not so far away, sah.'

'Damn your eyes, where are they?' roared

the officer, who had lost his temper early that morning, beyond all hope of finding it for some time to come. But both villagers and the interpreter were far too panic-stricken to do more than gibber, so that nothing intelligible could be obtained from them.

Meanwhile the native sergeant had mustered the soldiers, who were standing in front of the nearest blockhouse, awaiting orders; while the officer's orderly and his cook were busy packing away his scanty belongings, and pulling down the sides of his hut, in order not to interfere with the field of fire. Released, the old natives scuttled away as fast as their ancient legs would carry them, and were about to be followed by the interpreter, when he was seized firmly by the collar of his bush-shirt and pulled into the blockhouse.

'Not so fast, young feller-me-lad,' grunted Beechwood; 'you come along with me;' and, despite James's frantic efforts to escape, and his appeals to the Almighty to assist him, he was told to stop his infernal noise, and to stand by for orders at once, if not sooner.

The soldiers were all bursting for a fight, as they had experienced many fruitless patrols when the enemy had never been found where he was wanted, much marching, and many arduous fatigues; now it seemed that here was a Heaven-sent opportunity for a scrap on their own, so they looked to their officer expectantly. He, on his part, was every bit as eager; but he realised his responsibilities, his weakness, and his absolute ignorance of the enemy's strength, object, or movements. Beyond the clearing in which the camp had been erected, it was impossible to see anything, as the bush was dense all round.

While James and his cook—the only non-combatants present—were bemoaning their fate, and calling on their Maker to deliver them, Beechwood looked at his following, and thought—hard. His own section consisted of thirty men, of whom three were unable to walk owing to cut feet; but unfortunately a dozen of them were away on escort duty with the carriers between Noiga and the post to the south. He had also sixteen sick men belonging to his own and the other companies, none too sick to defend themselves, but none fit to move any distance. He had, too, four native runners; but, on looking for them, he discovered that they had justified their calling and run away! He was perfectly confident that he could hold out against a very much larger force so long as his ammunition lasted; but that was distinctly limited, and the native soldier has a happy knack of blazing off every cartridge he has got in the shortest possible time. There was also a possibility that the other section might return from Nkwor; but it was equally possible that the enemy might ambush them, and he could not give them any warning, as no one knew the way, now that the runners had disappeared.

Nevertheless, something had to be done, and at once; so he sent three of his best men to patrol the village and report, while two others were sent along the path by which the column had left that morning. The sentries at the edge of the bush were told to move about and to watch for the first sign of any one approaching through the undergrowth; they were to pay particular attention to any paths that they might find. The remainder were allowed to fall out, but were told to keep close to their alarm-posts, to fill their water-bottles, and to cook an emergency supply of food in case it was required. This done, he lit his pipe, and, after a short walk round the edge of the clearing, returned to his dismantled shelter, and pretended to read his magazine, though really his nerves were all agog with excitement and anticipation. A moment or two later his orderly ran up and announced the welcome news that a white man was coming, and a sweating figure appeared, remarking, 'Hallo, old bird! Got such a thing as a drink about you?'

II.

'Where the blazes have you sprung from?' asked the astonished subaltern, after he had shouted to his cook to bring some whisky.

'I?' answered the new-comer. 'Oh, I've come up from the base.'

'Not alone?'

'Lord, no! I'd better introduce myself. My name's Scott, timber concession by trade, soldier by desire, and a blasted drover of condemned carriers by authority. They've stuck me on the transport.'

'Don't you worry; you'll have plenty of fighting soon.'

'I thought so; that's why I've hurried on, in case I was wanted. I've brought four of your men with me, too.'

'Splendid!' said Beechwood. 'But where are the carriers?'

'I left them on the other side of the river; thought they would be safer. There's a doctor man with them; he was full of war when we met half Africa shrieking down the road, but I persuaded him to stay behind and look after the carriers.'

'Did you hear anything about the Germans?'

'Nothing of any use. The apes were yelling "Jarmans! Jarmans!" for all they were worth; so, after we had quieted the carriers, I took these four men and came on to help.'

'Well, I'm jolly glad to see you, anyhow,' said Beechwood. 'I hope they will stay where they are until this palaver is settled one way or the other.'

While Scott was finishing his drink Beechwood roughly outlined the events of the day, explaining his difficulties. It might all prove a false alarm, or there might really be something in it. His conjectures were, however, suddenly brought

to an end by a series of muffled reports from the direction of the village, then silence, then more reports.

'Well, they're there, anyhow,' said Scott; 'those aren't bush guns.'

The noise of the firing seemed to be coming from the village, but as sound is very deceptive, especially so near to a river, the return of the patrol was eagerly awaited. The two blockhouses were manned, each European taking charge of one; though for the nonce they waited together between the two. The firing continued, if anything more energetically than before; but, as there were no signs of the three scouts, it was feared that they had come to grief.

'If they don't turn up in another five minutes,' said the subaltern, 'I shall go and look for them myself.'

This did not prove necessary, as two minutes later one man returned and said that the Germans were firing into the village, but had not discovered them.

'They think man live for town, sah,' added the warrior.

'How much man you see?'

'No reach one section, sah.'

'Any man follow behind?'

'Myself I no see.'

Beechwood and Scott conferred—how good it seemed to the former to have another white man to turn to!—and after a while they decided on a plan.

'Look here, Scott,' said the subaltern; 'I'll take half-a-dozen of my heroes and go and meet them; you stay here with the rest and hold the camp. If it's only a small raiding party we'll soon drive them away, as no doubt they think we are sitting down in the village; that's what they always do, you know.'

The subaltern's party disappeared down the path; and Scott, after rearranging the remainder of his force, went to the edge of the clearing to listen. The firing into the village was still going on merrily, but after ten minutes it stopped, the enemy doubtless having at last discovered that place was empty. After leaving the camp Beechwood made a detour round the village, and soon reached a point from which he could see a little of it, though keeping himself concealed in the bush. The enemy, or such of them as he could see, were searching among the deserted houses for loot, while others were setting fire to the mat roofs as they passed them. At this moment some one must have stumbled upon the hidden patrol, for rifle-shots rang out, which were promptly answered by the enemy, who disappeared from view, and opened a rapid fire in the direction of the camp.

Still keeping hidden among the plantain-trees that surround the majority of villages in those parts, the subaltern and his party worked their way towards the enemy, who were now firing into the bush at the end of the village. So far as he could make out, Beechwood estimated their strength at one European and twenty native soldiers, so that they were obviously a mere patrol or raiding party. As their fire gradually slackened, the patrol must have started retiring towards the camp, so Beechwood judged that the time had come for him to strike. Still keeping among the plantains, he extended his men, and as the enemy collected to follow up the path, they poured a rapid fire on them at murderously short range.

Despite the excitement of his men, the distance was far too short for their bullets to go wide, and several of the enemy were knocked out. The remainder, taken absolutely by surprise, fled at top speed through the village, where a sharp skirmish took place among the burning huts. The heat and the thick smoke made pursuit difficult, but pursued they were for a mile beyond the village; and then the subaltern's party returned to count the casualties.

The three scouts had joined their comrades when the enemy retired into the village, so one of them was sent across the river for the doctor, and was told to bring the carriers and loads into camp at once; while another was sent with a message to Scott telling him what had happened, and that he was to expect the carriers very shortly. The enemy were found to have lost seven of their number either killed or severely wounded, and it was possible that others had been less seriously hurt, but had escaped, as three extra rifles were picked up; the officer had evidently got away. The British casualties were one man killed and one badly hurt. This poor fellow had been pinned under a flaming roof that had fallen on him as he lay helpless on the ground, and so was in a very bad way. Sentries were left at the end of the village; while the rest returned to camp, taking with them the wounded—both friend and foe—and all the captured rifles. The dead were placed in one of the houses that had escaped burning, to be buried later in the evening.

It was after four by the time they returned to camp, but all anticipated a strenuous couple of hours before the carriers would be safely across the river. Scott hurried down to the beach as soon as Beechwood returned, taking with him a few soldiers to help to guide the carriers; but the other satisfied himself that the camp was adequately guarded before following.

III.

By the time he had joined Scott, the doctor had arrived; but the carriers, who had reached the sandy beach on the far side of the river, were hesitating to cross.

It certainly was a formidable obstacle. Picture a hundred and fifty yards of swiftly flowing, brown water, parted in three places by large, slippery-looking rocks, in between which the water boiled at a tremendous pace. From the

beach on the Noiga side a short bridge had been built out to the first rock, thereby spanning the worst of the sluices; but the remainder was totally innocent of bridging. Two soldiers rapidly stripped, seized long poles, and, running along the bridge, dropped into the water, and began to wade out towards the carriers, the water never being less than waist-high. After a few minutes they reached the opposite bank, and, thus encouraged, the carriers armed themselves with poles from the heap lying on the beach, and plunged into the water. Scott, dressed in a helmet and a pair of boots, stood in the middle of the river directing operations, while several soldiers waded in to help.

All went well for some time, and the dripping carriers gradually reached the bridge, and began to climb the steep hill leading to the camp. It was surprising to see how they managed to bear up against the current, though no doubt the sixty-pound load that each carried on his head helped to keep them from being swept off their feet. Some hundred and fifty—rather more than half—crossed in safety, and Scott was slowly becoming less profane. Loads of rice were being brought over, and perhaps these were harder to balance than boxes; but, whatever the reason, one unhappy carrier slipped in the very worst place, and, despite frantic efforts to recover his footing, dropped his load and was washed away. Everything humanly possible was done to save him, but without avail, and he was carried off in the swift flood, doubtless to reappear battered out of all recognition on the rocks below.

Panic seemed to infect the carriers, for the one in front of him turned to see what had happened, and lost his footing. A soldier made a gallant effort to save him, and succeeded, though almost at the cost of his life. Other carriers stopped, and some loads were dropped and lost. Those nearest to the shore turned back and started wading for the bank that they had just left; but Scott's profanity and the soldiers' sticks eventually restored order among them, and the crossing continued, and went on until sundown. Finally, just before dark, the convoy was reassembled in the camp, when it was found that one man and eleven bags of rice had been lost.

By nightfall the camp had settled down almost as if nothing had happened, though an extra watch was naturally kept after the events of the afternoon. Beechwood, Scott, and the doctor were all congratulating themselves that nothing more serious had occurred, when shots were heard on the Nkwor road. Instantly every one sprang to arms, a stampede of the carriers being averted only by a miracle and the activity of Scott and his orderly.

This time, however, it proved to be a false alarm, the sentries at the edge of the bush having fired on some natives who were bringing a message from the company commander. As soon as this was definitely ascertained, the garrison fell out to go on with their normal pursuits, and the messengers were brought to the officer. They carried a note saying that Nkwor had been occupied without resistance, and that not only was there an easy crossing, but there was a far shorter road to the post to the south; consequently the camp and defences at Noiga were to be destroyed, and the garrison were to move to Nkwor the next day. Beechwood was in the meanwhile to send the messengers south at once to warn the transport officer that the new road, which avoided crossing the Laffia River at all, was to be used. The detachment must reach Nkwor before noon on the morrow, as the rest of the company had to go forward to join the advance; all who were too sick to walk were to be carried in litters, but on no account was he to delay.

Mournfully Beechwood, who had been looking forward to a good night's rest, read these orders over to the others, growling in a disgusted voice, 'And that's what those blighters called a rest cure!'

FACES IN THE FIRE.

THE trauchle o' the lang, dreich day is dune,
And snug beside the chimley-lug I doze;
My kingly calabash, wi' 'Luntin' rare,
Exhales the fragrance o' a new-blawn rose.
The storm-wind whustles roun' the gable-end,
And wrecks its wrath wi' wild an' frantic ire;
I draw me closer to the glowin' hearth,
And picture auld-world faces in the fire.

I see them in the jinkin', dancin' lowe—
The leal and true, the cantie an' the kin'—
Wi' love-lit eyes that gleam and speak to me
O' dear and hallowed days o' auld lang syne.
Their hamely sangs keep ruggin' at my hert,
And touch a chord on memory's gowden lyre;
And wi' a pride inspired frae sacred hours,
I kneel before the faces in the fire.

In bygane times, when life was free and gay,
Some buirdly chiels forgathered in my den;
Their crack was halesome, and their rousin' laugh
Wad wake the drowsy echoes o' the glen.
But noo they 're scattered owre the braid world's stage,
And court Dame Fortune's smile among the brave;
While some in Flanders, wi' a prood disdain,
Have found an early but an honoured grave.

I sit alane; but still their sunny smiles
Break through the mist on life's tempestuous way;
I hear them call, while 'yont the eerie miles
They hail me wi' their burnin' hopeful ray.
And wi' their beacon-licht before my een,
God grant that I 'll be steered into the bay,
And anchored safe within a haven o' rest,
Where dawns the peaceful and the perfect day.

The rievin' blast comes roarin' doon the lum,
The priest at vespers wails a holy prayer,
The foamin' Tweed gangs tumlin' owre the cauld,
While I, 'bune a', am blest beyond compare!
My reekin' pipe blaws ilka care awa';
I ne'er wad fash wi' listenin' to a choir—
My shrine 's the great high altar o' the soul,
Where burn the dream-land faces o' the fire!

SEVENTH SERIES

OF KINGSHIP AND DEMOCRACY,

AND BRITISH BRIDES FOR BRITISH PRINCES.

By VALENTINE HEYWOOD.

IT is the unenviable lot of the sovereigns and potential sovereigns of this realm that their marriages are matters of public interest and importance. It is part of the price of royalty, the privileges attaching to which, at any rate in regard to our own constitutional monarchy, are in no way commensurate with the obligations and responsibilities. It is not possible for a King of England or a Prince of Wales to bestow his hand and affections in whatever direction he pleases, having no regard to the wishes of others, and cold-shouldering the many who would fain have a voice in the matter. His marriage is an affair of State, and must be considered in regard to the policy of the State and the good of the realm.

It is not a nice position, and it is one which, particularly during the last two hundred years, has resulted in many marriages which have been purely unions for State reasons, and into which the question of affection has not entered in the slightest. On the whole, it is not even defensible, and that which has most aggravated the evil is the old shibboleth of the effectiveness of dynastic ties.

Recent British rulers have held that their royal state, so far from making them by divine right lords of all they survey, merely installs them as first servants of the State. It is quite conceivable that there may be strong ground in any one case for holding that the public good is better served by the feelings of the individual being subordinated to the obligations of the public servant. Admittedly it is a violation of the 'made-in-heaven' view of marriage, but in a world of human failings it is not always possible to attain the ideal. But admission of such possibilities does not mean adherence to the belief in the political benefits of dynastic ties. Within limits it should be possible for a British king or prince to offer his hand where his heart dictates.

As such, the belief in the effectiveness of dynastic ties is absolutely groundless; more often than not marriages with this end in view have been wholly bad in their results.

In the course of the bitter comment made in the Press recently, on the Kaiser's birthday, on the comparison between the detestation in which he is held in this country to-day and the popular feeling of enthusiasm which the announcement of his birth aroused fifty-eight years ago, some one recalled a couplet which followed every verse of a song heard in the streets of London during the celebrations occasioned by the arrival of the Queen's first grandchild:

> Queen Victoria's lovely daughter
> Has a bouncing little boy.

The lines were recalled to give point to a somewhat obvious satire, but in their origin and meaning they epitomise the utter refutation of that touching belief in the efficacy of dynastic ties in regard to international relationships which was so widely held.

With the birth of the then Prince William of Prussia in 1859 it was felt that the friendly feelings engendered by the marriage of Britain's Princess Royal with the Prussian Crown Prince were made more or less permanently enduring. Never, said optimistic idealists joyfully, would there be danger now of the two countries going to war; with the reigning houses so closely united it was unthinkable. Even before the war it was patent to most people how little reliance was to be placed upon such bonds so far as the Prussians were concerned. The war has rudely dispelled any illusions which survived.

Inter-related as are most of the royal houses of Europe, there has not been one instance during this war of dynastic ties affecting the policy of a country one way or the other. King Albert is married to a Bavarian princess, but that fact influenced not an iota the Belgian outlook when Germany so criminally violated her pledge; nor did it mitigate in the slightest the horrors of the vengeance which Prussian and Bavarian soldiers inflicted upon that heroic little country. The Dukes of Cumberland, Brunswick, and Saxe-Coburg-Gotha are by descent British as well as German princes, holding British titles; all are fighting in the enemy ranks.

King Constantine's pro-German proclivities are popularly assumed to be due to his Hohenzollern marriage, but against that tie can be set

 [*All Rights Reserved.*]

those of his blood relationship with both King George and the Tsar. The Crown Prince Danilo of Montenegro has a German wife. Tsar Ferdinand of Bulgaria is related to the British royal house. Nor can it be supposed that the marriage to a British princess of King Ferdinand of Rumania has influenced that country in joining the Entente, for King Ferdinand is a Hohenzollern, German and not Rumanian born and trained.

The evidence is too strong to resist the conclusion that dynastic ties count for as little as the claims to national gratitude which were generally assumed would prevent Bulgaria or Greece entering the field against the Allies.

Heaven alone knows why such a belief should have been so generally entertained. It finds little or no support in history. The marriage of Charles I. with a French princess did not prevent his making war on his wife's country almost immediately after his accession, nor did Napoleon's union with the Austrian emperor's daughter save him from the active enmity of the Hapsburg monarchy when changing circumstances again made it possible for Austria to take the field against him. There are other instances innumerable, not the least illuminating being the marital alliances between the English and the Scottish royal houses. As Mr James Douglas recently remarked so caustically on the same subject, 'The Scripture says, "Love your enemies." It does not say, "Love your relatives."'

These are matters which are being publicly discussed, and it is because of this public discussion that so much importance attaches to a suggestion regarding the marriage of the Prince of Wales made recently in an article in a morning paper by the Right Hon. G. W. E. Russell, himself an ex-minister of the Crown.

'The Royal Marriage Act,' says Mr Russell, 'limiting the free choice of English princes and princesses by artificial restrictions, was one of the most indefensible statutes which Parliament ever passed. It put difficulties, often insuperable, in the way of such alliances as had linked the Plantagenets, the Tudors, and the Stuarts to the English people; and it helped to impress a foreign stamp on two generations of the House of Hanover. There is to-day a well-beloved young prince, as English in character as in face, who is serving England on the soil of France. Let Providence grant him an English wife, and the last murmur of disaffection will be drowned in the thundering chorus of national rejoicing.'

Mr Russell has stated what most people have been thinking privately. The war has brought to the forefront again, but in a saner, sweeter form, the old cry of 'Britain for the British,' and public sentiment and policy alike demand its extension to British wives for British kings and princes. The marriage of the Prince of Wales is a matter of deep concern to three hundred millions of people, inhabiting a fifth of the earth's surface, people and lands which he will one day probably rule, and which in all likelihood will be ruled by the offspring of his marriage.

For, whatever may happen to the Hohenzollerns, the British monarchy will endure, despite the recrudescence of that unthinking disaffection to which Mr Russell has directed attention. It is not monarchism, as we know it here, which has failed in the events of the last few years. In no sense is this a war of the dynasts. Hohenzollernism alone could not have brought about the war. The fault lies with the psychology of an entire caste certainly, maybe of an entire nation. To a certain extent the Kaiser has been as much a tool as was his grandfather in the hands of Bismarck and Von Moltke.

Hatred of, and fierce opposition to, Hohenzollernism and its conception of kingship is not merely compatible with our British ideas; it is the very essence of British monarchism. Freedom, democracy, and monarchy are in no sense conflicting terms in this country. 'The characteristic of the English monarchy,' wrote Bagehot in his monumental essays on our Constitution, 'is that it retains the feelings by which the heroic kings governed their rude age, and has added the feelings by which the constitutions of later Greece ruled in more refined ages. . . . A republic has insinuated itself beneath the folds of a monarchy.'

This is the strongest prop of our monarchy, that it combines that which is best in both systems. Neither France nor America, with all their greatness, can show anything in its governmental records to improve on or even equal our own sane, intelligent, democratic monarchism. There was a time, admittedly, when even under the limited monarchy royal influence here was distrusted; but the evolution of the Constitution has proceeded apace since those times, and now, to quote Bagehot again, 'the best Liberal politicians say, "*We* shall never know, but when history is written our children may know, what we owe to the Queen and Prince Albert." The mystery of the Constitution, which used to be hated by our calmest, most thoughtful and instructed statesmen, is now loved and reverenced by them.' Succeeding sovereigns have not departed from that high ideal.

There is a wider, an Imperial, aspect, in which, if possible, the Crown looms higher even than in home affairs. Its sentimental value in the evolution of the present status of Dominions, Colonies, and Empire is undoubted. Would the bonds have held equally well with a republic? One wonders. Our Imperial relations were not always so happy as now. There was a time when even foremost British statesmen saw no more satisfactory prospect than separation when the indi-

vidual Dominions felt themselves strong enough. That phase has passed, never to return; but can one doubt that in a large measure it is due to the unifying influence of the Crown, claiming a common loyalty, a common allegiance, from all, in times when conflicting interests and blundering statesmanship were alienating influences? In the new Imperial life which should spring from the new Imperial bonds which have been forged in the furnace of war, the Crown should play a still larger part.

There is India. To vast multitudes there the King-Emperor's name is everything. Would the proud princes and chiefs there bear cheerful allegiance to a republic? One can hardly imagine it. 'Dizzy's' 'peace with honour' part in the Berlin Congress has brought us much tribulation, but his Indian policy, in this aspect of it, should atone for much.

Anything which strengthens the hold of the Crown upon the affection and interests of the people makes for national well-being, because it makes for national unity, holding up before all a common bond which rises superior to all conflicting creeds, interests, and politics. Fortunate circumstances have eliminated all whose claims of descent from the British Stuarts are superior to those of the present royal house, and thus, despite the foreign origin of the Hanoverian dynasty, purely political and partly accidental, we are happily back to conditions in which, divorced from the evil theory of kingship by divine right, it is possible for the occupant of the throne to fill it by hereditary right, subject to the free choice of a free people.

It is because of these things that the question of the marriage of the Prince of Wales becomes vital. For generations now the choice of royal brides for British princes will be confined to the narrowed circle of Allied houses. But since dynastic ties have proved so signal a failure in affecting international relationships, has not the time arrived when we can revert to the old rule of our royal house that its members may choose British wives and husbands? Edward IV., Richard III., Henry VIII., and James II. all married British wives.

There are more modern instances which form happy precedents. Princess Louise married the heir to the Duke of Argyll. Princess Arthur of Connaught, great-granddaughter of Queen Victoria, married to that queen's grandson, and having a son who, in default of other heirs, could succeed to the throne, claims an Aberdeen merchant as ancestor on her father's side. Abroad, King Alphonso's queen, sharing as proud a throne as any, is the granddaughter of a morganatic marriage.

There should be no lack of choice for British princes and princesses. The British aristocracy, titled and untitled, is equal to any in Europe, embracing families with pedigrees as long as that of the royal house itself, and in many cases claiming direct descent from Plantagenet and Stuart kings. The direct line of descent in the male from the royal Stuarts, both Scottish and British, is to be found not in any royal house, but among the British aristocracy.

Events in Russia which have occurred since this article was written have only one moral to point in regard to British monarchism—that of its complete effectiveness. Romanoff autocracy has gone; Hohenzollerns and Hapsburgs must see it as the writing on the wall, Tsar Ferdinand as the beginning of the end of the Teutonic edifice he has imposed upon what is naturally a democratic people. Here, but for its effects upon the Alliance and the course of the war, the revolution would be of academic interest only, tinged by the warm sympathy which one free people must feel for another struggling towards the same goal.

King George's throne remains unshaken, unaffected in its democratic strength by the cataclysm which is sounding the knell of other dynasties. Like the Italian and the three Scandinavian monarchies, the British monarchy can have no fear of revolution, because it is the form of government which a free people has evolved as being the best suited for its own particular needs, and because it rests solely on the broad basis of the people's will.

The Russian throne as we have known it has fallen because of its failure to recognise the march of progress and its own responsibilities. In a utilitarian age, that which refuses to evolve naturally, and so outgrows its usefulness, cannot be allowed to remain to clog the wheels. Of all the lessons which the Russian revolution teaches, none is clearer than that a well-intentioned but weak and vacillating man has needlessly thrown away a great possession and an opportunity for well-doing which comes but once in many centuries.

THE DEFINITE OBJECT.

CHAPTER XXVIII.—WHICH SHOULD HAVE RELATED DETAILS OF A WEDDING.

'IT'S all very, very wonderful, Ann dear! But then—everything is so wonderful—just lately!'

'Meanin' what, Hermy?'

Hermione was darning one of Spike's much-mended socks, while Mrs Trapes sat drinking tea. 'Meanin' jest what is wonderful, my dear, and—since when?' she persisted.

'Oh—everything, Ann!'

'Yes, you said everything before. S'pose you

tell me jest the one thing as you find so wonderful? An'—why an' wherefore that blush?'

'Oh, Ann—Ann dear!' Down went sock and needle, and, falling on her knees, Hermione clasped her arms about Mrs Trapes and hid her glowing face in her lap. 'Ann dear, I'm so happy!' she sighed—her speech a little muffled by reason of the voluminous folds of Mrs Trapes's snowy apron.

'Happy?' said Mrs Trapes, setting down her teacup to fondle and stroke that shapely head. 'Sich happiness ain't all because of the rent bein' re-dooced, by order, I reckon. Is it?'

'Dear Ann,' said Hermione, her face still hidden, 'can't you guess?'

'No, my dear,' answered Mrs Trapes, her harsh tones wonderfully soft, 'I don't have to—I guessed days ago. D'ye love him, Hermy?'

'Love him!' repeated Hermione, and said no more, nor did she lift her bowed head; but, feeling the quick, strong pressure of those soft embracing arms, the quiver of that girlish body, Mrs Trapes smiled, and, stooping, kissed Hermione's shining hair.

'When did he speak, my dear?'

'Last Monday, Ann.'

'Did he say—much?'

'He asked me to—marry him.'

'Spoke of marriage, eh? Did he happen t' mention th' word—wife?'

'Oh, many times, Ann.'

'Good f'r him! An' when s it t' be?'

'Oh, Ann dear, I—I'm afraid it's—to-night!'

'T'-night! My land, he's sure some hasty!'

'And so—so masterful, Ann!'

'Well, ye sure need a master. But t'-night—land-sakes!'

'He wrote and told me he would fix things so he could marry me to-night, Ann!'

'Then he's sure out fixin' 'em right now. Lord, Hermy, why d'ye tremble, girl—ye sure love him, don't ye?'

'So much, Ann, so very much—and yet'——

'You ain't scared of him, are ye?'

'No—and yet, I—I think I am—a little.'

'But you'll marry him, all the same?'

'Yes.'

'An' t'-night?'

'Yes. But, Ann dear, when he comes in I want you to keep him with you as long as you can—will you?'

'Why, sure I'll keep him, jest as long as—he'll let me! Lord, t' think as my little Hermy'll be a married woman this night!'

'And—oh, Ann, I haven't any—trousseau.'

'Shucks! You don't need none. You're best as you are. You won't need no fluffs an' frills, I reckon.'

'But, Ann dear,' said Hermione, lifting her head and shaking it ruefully, 'I have—nothing! And my best dress—I made it in such a hurry, you remember—it needs pressing, and'——

'He ain't marryin' you for your clo'es, Hermy—no, sir! It's you he wants, an'—oh, shucks! what do clo'es matter t' you, anyway? You was meant to be one o' them nymphs an' goddesses as went about clad—well, airy. You'd ha' done fine with them soft arms an' shoulders an'——

'But I'm not a goddess, Ann; I'm only poor Hermy Chesterton—with a hole in one stocking and the lace on her petticoat torn, and her other things—well, look here!'—and up whirled gown and petticoat—'see what a state they're in—look, Ann!'

'My dear, I am,' nodded Mrs Trapes over her tea-cup, 'an' what I say is, it don't matter a row o' pins if a stockin's got a bit of a hole in it if that stockin's on sich a leg as that! An' as for'——

'But,' sighed Hermione, 'don't you understand?'

'My dear, I do. I was a married woman once, mind. An' I tell you "beauty doth lie in the eye o' the beholder," my dear, an' the two eyes as is a-goin' t' behold you this night is goin' t' behold so much beauty as they won't behold nothin' else.'

'But—he loves dainty things, I'm sure.'

'Well, ain't he gettin' a dainty thing? Ain't he gettin' the daintiest, sweetest, loveliest'—— Here Mrs Trapes set down her cup again to clasp Hermione in her arms.

'Do you think he'll—understand, Ann?'

'He'll be a fool if he doesn't!'

'And make allowances? He knows how poor we are, and how busy I have to be.'

'He does so, my dear. But, if it's goin' t' comfort you any, there's that corset-cover you made me last Christmas. I ain't never wore it; I ain't dared to with all them trimmin's an' lace insertion, an' me s' bony here an' there. You can have it an' willin', my dear; an' then there's them'——

'Ann, you dear thing, as if I would!'

'Why not? That corset-cover's a dream! An' then there's them'——

'Dear, I couldn't—I wouldn't! No; I'll go to him just as I am; he shall marry me just like I am.'

'An' that's a goddess!' nodded Mrs Trapes; 'yes, a young goddess—only, with more clo'es on, o' course. I'm glad as he's quit pea-nuts. Pea-nut men don't kind o' jib in with goddesses.'

'Ann,' said Hermione, sitting back on her heels, 'I think of him a great deal, of course, and, just lately, I've begun to wonder'——

'My dear,' said Mrs Trapes, blowing her tea, 'so do I. I been wonderin' ever since he walked into my flat, cool as I don't know what; an', my dear, when I sets me mind t' wonderment con-

clusions arrive—constant! I'll tell ye what I think. First, he ain't s' poor as he seems—he wears silk socks, my dear. Second, he 's been nurtured tender—he cleans them white teeth night an' morn. Third, he ain't done no toil-an'-spinnin' act—take heed t' his hands, my dear. He 's soft-spoke, but he 's masterful. He 's young, but he 's seen a lot. He ain't easy t' rile, but when he is—my land! He don't say a lot, an' he don't seem t' do much, an' yet—he don't seem t' starve none. Result—he may be anything!'

'Anything! Ann dear!'

'Anything!' repeated Mrs Trapes. 'An' havin' studied him good an' heeded him careful, I now conclood he 's jest the thing you need, my dear.'

'Then you like him, Ann—you trust him?'

'I sure do.'

'Oh you dear—dear—dear thing!' And once again Mrs Trapes was clasped in those vigorous young arms and kissed with every 'dear.'

'Though, mind you,' said Mrs Trapes, pushing cup and saucer out of harm's way—'though, mind you, he 's a mystery I ain't found out—yet. D' ye s'pose he made any money out o' them blessed pea-nuts? Not him! Mrs Smalley, as lives down along 'Leventh, she told me as she 's seen him givin' 'em away by the bagful t' all the children down her way—repeated.'

'How sweet of him!' said Hermione, her red mouth all tender curves.

'Yes; but how did he live? How does he? How will he?'

'I don't know, dear; I only know I would trust him always—always!' And, sitting back, chin in hand, Hermione fell again to happy thought.

'When he give up the nuts,' pursued Mrs Trapes, draining the teapot and sighing, 'he tells me some fool tale o' makin' a deal in real estate, an' I—ha, real estate!' Mrs Trapes put down the teapot with a jerk. 'A deal in real estate!' she repeated, and thereafter fell to such unintelligible muttering as 'Record price! Fab'lous! No, it couldn't be! An' yet—silk socks! "On an' after above date all tenants soever residin'—will be re-dooced 50 per cent"!' Suddenly Mrs Trapes sat bolt-upright. 'My land!' she ejaculated; 'oh, dear land o' my fathers, if sich could be!'

'Why, Ann,' exclaimed Hermione, roused from her reverie, 'whatever is the matter?'

'My dear,' said Mrs Trapes, laying gentle hand on Hermione's blooming cheek, 'nothin'—nothin' 't all. I 'm jest goin' over in my mind sich small matters as silk socks an' tooth-brushes, that 's all.'

'But you do mean something—you always do.'

'Well, if I do this time, my dear, I 'm crazy; but the Bowkers have gone, mind that! An' him so fond o' little Hazel!' Here Mrs Trapes nodded almost triumphantly.

'The Bowkers! Why, yes—I 've been wondering'——

'I guess you know he went t' O'Rourke's an' give that M'Ginnis the thrashin' of his dirty life?' said Mrs Trapes rather hastily. 'Nigh killed the loafer, Spider Conolly told me.'

'He 's so strong,' said Hermione softly, her eyes shining. 'But, Ann, what did you mean about—about tooth-brushes and socks?'

'Mean? Why, socks and tooth-brushes o' course! An', my land! here 's me guzzlin' tea, an' over in my kitchen th' finest shin o' beef you ever saw, a-b'ilin' f'r his supper. But now the question as burns is, if a married man this night, will he be here t' eat? An' if him—then you? An' if man an' wife suppin' in my parlour—where will ye sleep?'

'I—oh Ann—I don't know. His letter just said that when I came home it would be our—wedding-night.'

'Why, then, it sure will be. An' f'r a weddin' supper ye couldn't have nothin' better 'n shin o' beef. I 'll go an' watch over that stoo with care unfailin', my dear; believe me, that stoo 's goin' t' be a stoo as is a stoo! What! half after five? Land-sakes, how time flies!'

(*Continued on page 453.*)

THE INDIA HOUSE AND ITS STORY.

By Captain OWEN WHEELER, Author of *The War Office Past and Present.*

OF all the Government buildings in London, the present India Office, in spite of its comparative modernity, is perhaps the most attractive to the casual visitor. Apart from the solemn magnificence of the Council Chamber and the romantic significance of the business transacted in the multitudinous rooms, one is struck by the comparatively clothed look of the India Office, as compared with the bare corridors of other great departmental headquarters. Everywhere there are pictures and statues, and the great Inner Court, with its wonderful floor, is a special and arresting feature. But the historical associations of Sir Gilbert Scott's noble pile, which overlooks St James's Park, and was completed only some forty years ago, cannot of course be reckoned on the same plane as those which cluster round the old home of the East India Company in Leadenhall Street, known for two centuries as the India or East India House. Some interest, too, is attached to 'John Company's' previous connection with

other and still older houses, of one of which, Crosby House, there is still a remnant standing. The following brief account, derived from a variety of sources, may be of interest, more especially as India is just now passing, in various ways, through what may prove an epoch-making stage of transition.

The India House in Leadenhall Street was vacated in 1860, but for the two previous years it had no longer been occupied by the East India Company. The Government of India had been transferred to the Crown, as a result of the Mutiny, in the autumn of 1858. Up to that date the directors and proprietors—the number varied, but in 1848 there were twenty-four of the former and eighteen hundred of the latter—of the Honourable East India Company exercised unlimited authority over the Government of India, except that in matters other than patronage the Board of Control at Cannon Row might, and continually did, intervene with, practically speaking, mandates which the Company more or less cheerfully obeyed. Much of the real power lay with the president of the Board, who was a member of the Cabinet, and who, outside the ordinary relations between the Board and the Company, was able at any time to communicate with the Governor-General direct by means of letters marked 'secret,' of which the Company had no cognisance. For the rest, the ordinary despatches conveying orders for the Government of India were for a great many years previous to the Mutiny prepared by the Board of Control in Westminster, and sent down to the India House for signature by the directors, who used, by a quaint survival, to subscribe themselves as the Governor-General's 'affectionate friends.' This dual government lasted from 1784 to 1858, and was at times productive of much inconvenience, especially to the Governor-General, who, between his affectionate friends and the president of the Board of Control, must often have found his position an extremely trying one.

Still, with all this interference, the East India Company, if only because it appointed the Governor-General and the Commander-in-Chief, and maintained a very considerable army, was an immensely important institution outside its vast commercial undertakings and responsibilities. Very imposing, too, must the India House have been, especially since 1799, when a fine new front was added to an older building dating back to 1726. The India House of the nineteenth century had a stone façade two hundred feet in length, and a portico of six large Ionic fluted columns on a raised basement. The pediment was adorned with an emblematic sculpture representing the Commerce of the East, protected by the King of Great Britain, who stood in the centre of a number of figures, holding a shield stretched over them. On the apex of the pediment was a statue of Britannia, with Asia on a dromedary at the left corner, and Europe on horseback at the right.

The ground floor of this great building was occupied chiefly, we are told, by court and committee rooms, and by the private rooms of the directors, the ornamentation throughout being very rich and striking. The courtroom is said to have been an exact cube of thirty feet, the effect of the excessive altitude being modified by the placing of the windows at a considerable height from the ground. The principal offices of the Company, and the library and museum, were upstairs. The library contained an extremely valuable collection of books and manuscripts, now housed at the India Office. The museum, previous to 1851, was only thrown open to the public once a week; but in that year daily admission was granted, and a catalogue published, of which there is a copy in the British Museum. Most of the collection of curiosities was afterwards transferred to South Kensington, including the famous model with which Tippu Sultan used to amuse himself, representing a tiger eating an English soldier, the former being made by hidden mechanism to growl, while the latter uttered what were supposed to be shrieks of terror.

The India House of the first half of the nineteenth century is no doubt a mine of memories in which patient digging may reveal enough precious metal to satisfy individual cravings. But the proportion of metal to quartz is not large, and the latter is mostly of an uncompromising hardness. To many the most important association with the House is that of Charles Lamb, who entered the accountant's office as a clerk in 1792, and retired in 1825 with a pension of four hundred and fifty pounds a year. The manner in which the pension was granted is described with evident fidelity—with the exception that the East India Company figures as a firm of private merchants—in Elia's essay, 'The Superannuated Man.' The pension was a generous one, being two-thirds of the salary Lamb was then receiving, and it was probably more than he expected, as clerks not infrequently remained forty or fifty years in the Company, and he had served thirty-three only. Canon Ainger surmises that the directors may have wished to pay some compliment to literature in the person of their distinguished clerk, but points out that there is nothing to show that Lamb did not do his work faithfully and well during the very considerable period in question. The story that when reproved for habitual late arrival in the mornings he stuttered out, 'But then, you see, I always go away very early,' is certainly Lamb-like; but there does not seem to be any solid authority for it.

Lamb, who had previously served in the South Sea House, the subject of one of his most delightful essays, was only seventeen when he first entered the India House, with a salary of

seventy pounds a year. There are not many allusions to the latter office in his writings; but he used to declare that the really serious work of his life was done there, and that his literary pursuits were mere recreations. He seems to have chafed against the monotony of his work, which at times, especially in view of his terrible domestic affliction, must have been dispiriting to the last degree. But he realised the importance of a regular salary, and was grateful for the fact that there was 'corn in Egypt while there was cash in Leadenhall.'

One of the extant portraits of Lamb is an etching in copper by a friend in the India House—Brooke Pulham. Canon Ainger, too, draws an interesting pen-picture of him in 1825, sitting at his desk in the office, and looking—he was of notably small stature—the more diminutive for being perched on a very high stool. With his head apparently out of proportion to his slender frame, his Jewish cast of nose, his long hair, and 'almost immaterial legs,' and the queer blackness of his general appearance—his complexion was so dark that in his tight-fitting clerkly suit he is said to have resembled, like Fuller's negro, an image cut in ebony—the figure he presented must, indeed, have been a curious one. But it is pleasant also to remember that this peculiarity of personal appearance was modified by 'a pervading sweetness and gentleness which went straight to the heart of every one who looked on it,' and we may be sure that among his fellow-workers the gentle Elia's charm of manner was duly appreciated.

Of these fellow-workers we have unfortunately only the very scantiest record Indeed, the 'upstairs' of the India House seems to have harboured very few besides Lamb with any sort of claim to distinction. Among the handful may be mentioned James Mill, the historian of India, and Hoole, the translator of Tasso; and the interval which separates these from Elia in the minds of posterity is indeed a long one.

But there are interesting personal associations other than literary with the East India House. Neither the chairmen nor deputy-chairmen of the Court of Directors, though they may have loomed large in the eyes of their contemporaries, were persons of any historical consequence; and from the long lists available it is not possible to select a single name which carries any significance to the great bulk of the present generation. But the case is, of course, different with the great Indian Governor-Generals and Commanders-in-Chief, all of whom must on appointment and return have visited the India House. Portals honoured by the passage of men such as Clive (who, by the way, was never Governor-General, but Governor of Fort-William in Bengal), Warren Hastings, Cornwallis, Minto, Bentinck, Ellenborough, Hardinge, Dalhousie, Lake, Gough, and Charles Napier have a clear claim to the consideration of posterity, apart from that which rests upon the history made in the East India Company's courtroom before the Regulating Act of 1773 subjected the directors to parliamentary control. There were some notable figures, too, among the members of the Governor-General's Council—Macaulay, for example, who held office from 1834 to 1838, and in the interval laid the Company and its successor, the British Government, under an imperishable debt of gratitude by the construction of the Indian Penal Code.

An interesting India House function must have been the appearance before a committee of directors of candidates anxious to obtain a cadetship in the Company's army. In Kaye's *Life of Sir John Malcolm* an account is given of the manner in which the future Governor of Bombay went through this ordeal, which is very pleasant reading. The boy was only twelve years old when, towards the end of the year 1781, he was taken by his uncle to the India House, and he was in a fair way to be rejected; but one of the directors said to him, 'Why, my little man, what would *you* do if you were to meet Hyder Ali?' 'Do, sir?' said little Johnny Malcolm stoutly. 'I would out with my sword and cut off his head.' And the directors were so pleased with the spirited reply that they gave the youngster a commission forthwith.

It was noted above that the nineteenth-century India House was really an older building with the addition of a new front. The eighteenth-century India House appears to have been built in 1726 on the site of Craven House, of which the East India Company had previously been tenants from 1648. The tenancy was a somewhat chequered one, as the estates of the Earl of Craven, an ardent Royalist, were sequestrated by the Parliamentarians in 1651, and for an interval the Company paid rent—one hundred and forty pounds per annum—to other landlords. But the Earl came again to his own at the Restoration, and at the beginning of the eighteenth century we find his successor granting the Company a new lease of the 'large house in Leadenhall Street and a tenement in Lime Street' for twenty-one years at one hundred pounds a year only. The rent of similar premises in that locality at the present day is somewhat higher.

In Strype's revision of Stow's *Survey of London* (1720), the East India House on the south side of Leadenhall Street is described as 'a very large building with spacious rooms very commodious for a public concern. It hath a large hall and courtyard for the reception of people who have business here to attend on the court on their court days. There belongs to it also a garden, with warehouses in the back part towards Lime Street, into which there is a back gate for the entrance of carts to bring their goods into their warehouses.'

During the decade 1638–48 the East India Company resided, at first merely as lodgers, in a building next door to Craven House, which belonged at the earlier date mentioned to the then Governor of the Company, Sir Christopher Clitherow. Sir Christopher, to whom the Company paid one hundred and fifty pounds a year rent, died in 1641, and his widow became the Company's landlady, and a reasonable landlady, too, for she reduced the rent to one hundred pounds only. About this time King Charles I. was one of the Company's customers. Being badly in want of money, he bought up the Company's stock of pepper—then a really valuable commodity—on credit and sold it for cash, an artless method of raising the wind of which he was probably not the first and certainly not the last exponent.

Between 1621 and 1638 the East India Company was handsomely accommodated at the historic Crosby House, which they leased from the Earl of Northampton at a yearly rental of two hundred pounds. They evidently became attached to this building, for they made efforts to renew the lease; and later, when they had decided to leave Lady Clitherow's house, they negotiated for a return to their former palatial quarters. But the price asked was more than they cared to pay, and accordingly, as we have seen, they moved next door, and stayed there until officially they died two hundred and ten years afterwards. There is an early allusion to Crosby House in the Company's records for the autumn of 1622, in which mention is made of 'the East India House, commonly called Crosby, in Bishopsgate Street.'

During this period the Company had a dockyard covering ten acres at Blackwall. They had also hired from the Crown a cordage-making establishment at Woolwich, but had thrown up the lease after three years' tenure. In 1626 they had been given a license to manufacture gunpowder; but this experiment also proved a failure, and was discontinued in 1627.

Where the Company transacted their business from 1608 to 1621 the present writer has been unable to discover. There is a tradition that at one time the meetings of the court of directors were held in the great room of the Nag's Head Inn, opposite Bishopsgate Church, where later there was a Quakers' Meeting-House or Institute, and this may have been the period in question. If tradition be founded on fact, there is indeed a distinction with a difference between the character of this early metropolitan centre from which the destinies of India were shaped and that of the present India Office. But the connection is not at all more incongruous than that of the Foreign Office, Privy Council, and War Office with the old Cockpit in Whitehall. The 'Nag's Head,' too, was doubtless a most reputable hostelry, corresponding, perhaps, in contemporary eyes with places like the present-day Cannon Street Hotel. In the latter building directors' meetings have been held which at any rate have disposed of a great deal more money than the early East India Company's Court ever handled, and possibly the ultimate result of the gatherings in question will be the addition of other jewels—though hardly of such size and lustre—to the British Crown.

Still working backwards, an entry in the Company's Court Minutes for February 1608, to the effect that 'Founders' Hall is not to be used after Lady Day next,' brings us to the last stage in our little chronicle. Founders' Hall, in which the Company was now holding its meetings, was not the later home of the Founders' Company in St Swithin's, but their previous local habitation in Lothbury. The Founders were not incorporated until 1614, and may not, before that date, have had their subsequently granted powers of testing all brass weights and brass and copper wares within the City and three miles round. But they were clearly an important guild, and the 'Adventurers for the East India Voyage,' who later blossomed out into the East India Company, probably accounted themselves fortunate in securing Founders' Hall as a temporary rendezvous. The first charter of the East India Company was, as most schoolboys know, granted by Queen Elizabeth in 1600, and one of the earliest of the Company's papers is a warrant dated 27th October of that year 'to summon all the Adventurers to meet on the 30th at Founders' Hall to take notice of the Queen's pleasure signified by a letter from the Privy Council.'

Our story ends here. It may not be a thrilling one, and there is at least one *hiatus valde deflendus* in it. But it represents an industrious effort to present in a compact form what at present can only be arrived at by a somewhat laborious collation of a number of books and pamphlets with the court minutes of the East India Company so admirably calendared in a series of volumes by the late Mr Sainsbury and his daughter. In passing, the hope may be expressed that the learned Registrar of the India Office, who has lately been editing the aforesaid Calendar of Court Minutes, may some day tell the tale summarised above in the expanded form in which it ought to be told by the light of special knowledge and privileged research.

OLD LAVERY'S MONEY.

CHAPTER II.

FOR the first time since making her plans Anne Lysaght was nervous and excited. Things had not turned out at all according to her calculations. However, it was now neck or nothing. On the departure of the doctor she returned to the sickroom. The patient was somewhat restless, but apparently not suffering much.

'Well, Anne,' she said, 'I fear I am going to be a trouble to you. You had enough to do without having the bother of nursing an old woman.'

'Now, Nell, you know very well you should not say that. Doctor Brand is sending an experienced nurse over as soon as he gets back, and you must not worry. All you have to do is to get well.'

After the arrival of the nurse, the old lady seemed to become more composed; but towards evening her temperature rose, and it was thought advisable that the doctor should see her again.

After the doctor's visit, he told Anne that the rise of temperature was only what might be expected, but that up to now it did not indicate any immediate danger. 'However,' said he, 'one can never be sure in pneumonia. I hope you have spoken to her about making any arrangements that might be necessary.'

'Well, no,' said Anne. 'The truth is, I did not wish to alarm her; but as you think it my duty, I will do so.'

'I certainly do think so,' said Doctor Brand; 'and Miss Lavery has always had much more than the average amount of common-sense, and will quite understand the necessity of settling her affairs, if they are not already settled.'

'Well, Nell dear,' said Anne on her return, 'is there anything you would wish to do in the way of giving any instructions? Sickness often takes queer turns, and the doctor thought there might be some little matters you would wish settled. But perhaps you have already done so.'

'No, indeed, Anne; though the last time Mr Mathews was with me over at Elmvale he advised me very strongly to make my will; but I have always put off doing so. But does it matter much? There is no relation of mine living that I know of, except Agatha and yourself, and, of course, you would share whatever I leave behind.'

'Good heavens!' thought Anne; 'this is awful! Can she be so ignorant as not to know that I have no claim to a penny? Or is she just torturing me? She would be quite capable of it.'

'However, Anne, perhaps you are right, and the proper thing would be for me to make my will. It is very unfortunate that Mr Mathews is in London. Lady Linley told me so yesterday.'

'I don't think, Nell, it matters much. Surely you know old John Devine. He was for many years a clerk of Mr Mathews's; and, indeed, Mr Mathews was most kind to him, and makes him an allowance that keeps him comfortably. Devine lives with his married daughter, the widow Mahony, below at the "cross," and he could do your business as well as the Lord Chancellor.'

'Very well, Anne, send for Devine. I feel rather drowsy, and will, perhaps, sleep a little.'

Old Devine came over about eight o'clock that evening, and was told by Mrs Lysaght the business on which he had been summoned.

'Well, Mrs Lysaght,' said he, 'there won't be, I suppose, much difficulty in doing what is needful. I take it the old lady is perfectly in possession of her senses?'

'Oh dear, yes!' said Anne. 'She is a bit drowsy, and requires rousing from time to time, but she is perfectly capable of making her will. I will go up and tell her you are here.'

When Anne Lysaght went into the sickroom she told the nurse she might go downstairs to her tea, and that she might take her time, as Miss Lavery had some business to transact with Mr Devine, who had just come.

'How is she going on, nurse?' said Anne in a low tone.

'Well,' whispered the nurse, 'I think she seems to be getting more drowsy; but I suppose Mr Devine's business will not take long.'

'Oh, not at all!' said Anne; whereupon the nurse left the room.—'Well, Nell, how have you been since I left you? John Devine is below, ready to take your instructions about the will.'

'The will!' said Nell. 'Oh yes, the will, to be sure! Are you going to make your will, Anne? Are you ill?'

'My God!' said Anne, 'she is rambling,' and hurried out of the room to summon Devine.

When they reached the bedroom door Anne hesitated for a moment. She then drew Devine into the adjoining room. 'John Devine'—— she said, and she had to sit down. She felt faint for a moment. 'John Devine, this old woman is fast losing her senses. She told me that she intended to leave me all she had, with the exception of two hundred pounds to her niece, Agatha Lavery. Sit down at that table and write that down as quickly as you can, and'——

'But, Mrs Lysaght, this is too serious a matter'——

'Don't be a fool; do as I tell you. I have fifty pounds in the house. This I will give you, and I will draw another hundred out of the bank in the morning, and that you shall have, too. Have what I told you written down by the time I come back with the money, and Tom Nolan to witness the will with you. Now, not another word!'

Devine sat down and began to write.

'I will give you ten minutes,' said Anne; 'surely that should be enough;' and she left the room.

She returned in a quarter of an hour with Tom Nolan, who had been appointed Miss Lavery's coachman, and addressed Devine.

'Well, Mr Devine, did the old lady give you her instructions?'

'Oh yes, Mrs Lysaght. A few minutes only were necessary. I have drafted the will. It's only a few lines. She simply left'——

'I would rather, Mr Devine, you did not tell me anything about it. Come, if you please, to her room.'

The three entered, and Anne Lysaght, approaching the sick woman, said, 'Now, Nell, Mr Devine has brought the will for your signature.' She raised Miss Nell up in the bed, and Devine placed the brief document, laid on a book, before her, and put the pen into her hand.

'This is to be signed, Anne, I think you said. Your will?'

'Yes, *your* will, Nell.'

The old woman wrote her name, Devine guiding her hand to the proper spot on the paper.

'Now, Tom,' said Devine to Nolan, 'this is Miss Lavery's will that you have seen her sign, and you and I have to sign here as witnesses.' They both signed their names. The will was perfected.

The witnesses left the room; and Anne said, 'Now you will be easier in your mind, Nell, that that is done; and when the nurse comes and gives you your medicine, you will have a good sleep, and wake up much better.'

Never was prophecy fulfilled less to the satisfaction of the prophet. When the doctor came next morning, Miss Nell was decidedly better, and in ten days more was enjoying her cup of tea, sitting in the drawing-room; while Doctor Brand promised her a short drive next day if the present beautiful weather kept up.

'And, indeed, Miss Lavery,' said the doctor, 'you are a pattern to the young people. I'd like to see the young lady of the present day who would be in bed on the fifth of May with bad pneumonia, and would be anxious for her drive on the eighteenth.'

Anne Lysaght had put in a bad fortnight. Did the old woman forget all about the will? She never made the faintest allusion to it. Or was she quite aware of the whole business, and satisfied with what she had done? If so, one would suppose she would have asked for the will, and sent it to her solicitor and general man of business, Mr Mathews. He had all her papers, even the certificates of her various investments. To him were sent the dividends as they accrued for lodgment in the bank in Cork, and such reinvestment as she should determine. Why should she keep him in ignorance of this most important disposal of her substance? The whole thing was most bewildering, and many times, when lying awake at night, Anne fully determined that the following day should see the end of her uncertainty, and that she would by some adroit allusion come at the truth. But daylight brought fresh courage, and she resolved to let sleeping dogs lie.

So things went on during the remaining days of May. The old lady's drives were always over to Elmvale, where she sat in the garden when the sun shone, and returned to Bawnmore within three or four hours. But when the long, fine days of June arrived, Doctor Brand considered that she might now begin to return the visits of the ladies who had called on her frequently during her convalescence.

There was a certain routine observed in these visits. Miss Lavery would leave home about midday, and call, perhaps, on her old friend, Lady Linley. Her coachman, Tom Nolan, on depositing her at Roxton, as Lady Linley's place was called, would go on to Elmvale, and put in two or three hours' work in the garden, returning for 'Miss Nell,' who might proceed home, or, perhaps, pay a visit to Elmvale before doing so.

About the middle of June she set out one day as usual, without indicating any particular person on whom she intended to call. This, indeed, was her usual custom, and she disliked very much that any questions should be asked as to her intended movements. Nor was there any reason why Anne Lysaght should be inquisitive, as she could always hear from Tom Nolan where they had been. Indeed, she seldom asked, as her mind was full of matters of much more importance than Nell's visits.

On the day in question the old lady had left Bawnmore about eleven o'clock, and when some half-mile from home she ordered Nolan to pull up. She then told him to get off the box, and stand at the side of the carriage to hear what she had to say.

'Tom Nolan,' she said when he had followed her instructions, 'I believe you are to be trusted.'

'Well, I hope so, miss,' said Tom, wondering what was to come next.

'And so,' she proceeded, 'I have made up my mind to trust you in a matter of very great importance. I want your solemn promise—I do

not ask you to swear—never, while I live, to betray the confidence I am about to place in you. Your doing what I am going to ask you to do will be the best day's work you ever did in your life—much better than you can imagine.'

'Well, miss, I most solemnly promise never to reveal whatever it is you wish me to keep secret; and that is as good as if I swore it on the Bible. But I will swear if you wish'——

'No, there is no need. Now listen. It is now a quarter-past eleven. I want you to drive me to Stonecross Station. That is, I suppose, about two miles beyond Elmvale?'

'Yes, miss, about that.'

'Very well. I want to be there at twelve o'clock.'

'Certainly, miss; there is plenty of time.'

'Get up, then, and I will give you the rest of your instructions as we go along.'

Tom Nolan resumed his seat on the box, and they proceeded on their way.

The old lady continued: 'Now, I want you, when you leave me at Stonecross, to go on as usual to Elmvale. There is no one there to ask you any questions. And I want you to meet me again at Stonecross at four o'clock exactly. I think that is all quite plain?'

'Surely, miss, nothing could be plainer.'

'And you will never, while I live, mention to any human being that you drove me to-day to Stonecross Station?'

'Never, miss, I promise you before God.'

Old Nell returned that evening to Bawnmore in time for dinner, having paid a short visit to Elmvale, and brought home an unusually large quantity of flowers, of which she was extremely fond.

Anne Lysaght had become somewhat calmer in mind. Of course, the perplexing puzzle about the will was never absent from her thoughts; but she tried to banish, so far as she could, the unsolvable question—Did the old woman forget all about it, or did she remember it, and feel satisfied with what had been done?

Old Nell entered on her eighty-second year in October, and as the weather was both cold and wet, she was confined a good deal to the house. For the first time, too, she ceased to take much interest in the reports which were brought daily from Elmvale.

The Lysaghts saw that she was much changed; and the change seemed to come all at once. During the early part of November she was confined to her room, and towards the end of the month to her bed.

On Christmas Eve the end came. Doctor Brand, who had been in attendance for more than a month, had warned Mrs Lysaght that the old lady's heart had become very weak, and might at any moment fail altogether. She had been sitting up for an hour; and when the nurse thought it time that she should go back to bed, it was found that she had died in her chair.

Well, it was all over now. The money, and Elmvale, and all the rest for which she had schemed, would be Anne's. And yet she did not feel safe. Would Mr Mathews make any very searching scrutiny into the circumstances under which the will was made which had been kept so secret? Would he advise Agatha to contest it? And if he did, was Tom Nolan to be depended on? He had no interest in telling anything but the truth. Would he be asked whether he thought the old lady knew what she was doing when she signed the will? Did he remember the words of old Nell: 'This is to be signed, Anne, I think you said. Your will?' And Anne's implied correction, 'Yes, *your* will, Nell'?

Devine, of course, was safe, and would swear that she was in her perfect senses; and surely his word would have more weight than that of an ignorant farm-hand like Nolan? And she herself! Suppose the will should be contested! She, too, would be examined and cross-examined. She had been present at a trial once, of a case in which George was interested. It was not nearly such a serious matter as this trial would be. George had taken her to Dublin with him as a treat. She had heard one witness rolling off his evidence so smoothly, so glibly, that the case seemed to Anne already settled. But, the cross-examination! Would she ever forget the big, burly barrister with the eyeglass who tackled that unfortunate man? Or how a pin might be heard drop in the silence of the court when he asked, shaking the eyeglass slowly, which he now held in his hand, like a ghostly truncheon, 'Now, remember, you are sworn to tell the truth! By the virtue of the solemn oath, for the truth of which you are answerable to God in heaven, *have* you told the truth?' No! she would die of fright before the trial came on.

And George! George had not the slightest suspicion of what had occurred. He had been told the fable of how Devine had taken his instructions from Miss Lavery herself. George Lysaght was an honest man, and would have his right hand cut off rather than stoop to any trickery of this kind. And now the truth would come out! Her own husband! Why, he would never again spend a day under the same roof with her!

Before night on Christmas Eve Doctor Brand was again in attendance at Bawnmore, this time on its mistress, and he pronounced her suffering from brain-fever. She was altogether incoherent and raving. It therefore fell to George to write to Agatha and Mr Mathews announcing the old lady's death, and asking Mr Mathews to telegraph as to whether the twenty-seventh of the month would suit them to attend the funeral.

The reply was in the affirmative, and added that they would come on the evening of the twenty-sixth. They were much shocked, on their arrival, to find that Anne's illness, of which George had informed them, had taken such a serious turn.

Agatha went up to see her at once, but found that Anne failed altogether to recognise her. Indeed, the nurse said that the doctor had grave fears that Mrs Lysaght might never return to her normal senses.

'No one,' the nurse added, 'would have thought that Miss Lavery's death could possibly be such a shock, as the doctor had for some time prepared them all for the possibility of a sudden termination.'

From the time the doctor had been called in, three days ago, her temperature had been increasing, and he said plainly that unless there was a decrease within the next twenty-four hours there would be a second funeral from Bawnmore.

Old Nell was laid beside John in the old graveyard at Doora, and on returning to Bawnmore Mr Mathews informed George Lysaght that under Miss Lavery's will he would benefit to the extent of a thousand pounds. Thomas Nolan, his man-servant, was down for five hundred pounds. It was also ordered that Mrs Lysaght should receive remuneration at the rate of four guineas per week for the time the testatrix should have been an inmate of the house at Bawnmore. There were various small legacies for charitable purposes, and the residue was bequeathed to Miss Agatha Lavery, who was also appointed executrix to the will.

'I will send you a copy of the will, Mr Lysaght, in due course.'

'Thank you, sir,' said George. 'May I ask you what is the date of the will of which you speak?'

'Certainly. It is dated the 17th of June of the present year, and was signed by the late Miss Lavery on that day in my office in Cork.'

George Lysaght had nothing further to say. He was out of his depth. One thing was certain: the will of the 4th of May—George remembered the date well; it was Anne's birthday—was waste-paper.

No hint was ever given by Mr Mathews—if, indeed, he was in a position to do so—as to the cause of Miss Lavery's sudden change of mind. The secret was never revealed.

. . . . . .

George Lysaght has been dead for more than twenty years now. Mrs Honan, formerly Miss Agatha Lavery, lives with her husband and children at Elmvale. She goes over often to Bawnmore to see a feeble old woman who lives there, and who sometimes recognises Agatha, but more often calls her 'Nell.' As a rule she gives little trouble; but if at any time she becomes restless, the nurse never fails to calm her with, 'Have patience now; we 'll go over to Elmvale to-morrow, and search for Miss Nell's will.'

THE END.

FORTUNES FROM WASTE PRODUCTS.

By 'B.Sc., F.I.C.'

IN the offices of a certain London chemical firm there is an attractive-looking diagram. It is a large tree; but upon close inspection it is plain that it is not an ordinary tree. Each branch is labelled with a chemical name, and many of them are coloured. Upon the trunk one may read 'coal-tar,' and the mysterious diagram is explained. Every branch represents a substance derived from coal-tar, and one is astonished at the large number of the branches, although as a matter of fact these branches represent only the main derivatives, and form a very small proportion of the total.

If we read carefully over the branches, we shall find examples of dyes (represented by the coloured ones), drugs, flavouring substances, disinfectants, photographic chemicals, explosives, solvents, &c.

At one time coal-tar was looked upon as an unpleasant by-product of gas-making, difficult to deal with, and difficult to get rid of. The number of chemists who have investigated this substance is of course enormous, and they have come from every country; but we are always proud to remember that it was an Englishman, W. H. Perkin, who produced the first dye that could be made on a technical scale. He was a business man as well as a chemist, and he ran a very successful factory for dye-making in England. Unfortunately we have been beaten in this industry, but there are signs that the coming of the war is effecting a renascence.

Tar must be looked upon as the king of the waste products. It is not likely that we shall find anything that will furnish such an enormous number of useful substances. But there are numerous interesting cases of waste products that have proved gold-mines to the men who have found ways of turning them to usefulness. The volatile substances given off in the making of charcoal from wood, for example, have become very important. In the old way of making charcoal all these valuable products (wood spirit, acetic acid, acetone, &c.) were entirely lost, but to-day they are the most important of the substances obtained.

All the great industries give us examples of the finding of uses for waste products. In the cotton trade we have the cotton waste, which consists of the short and unsuitable fibres left over from the spinning. At first this found very few uses, and could be obtained for next to nothing. Then, as more uses were found for it, its value went up. It was largely used as a packing and cleaning material for engines. At the present time it has an extremely important use in the making of gun-cotton. Baron von Lenk, in Austria (about 1847), was the first man to use cotton successfully on a large scale for making gun-cotton, although he was not the inventor of the process. The cotton was dipped in a mixture of strong sulphuric and nitric acids, and subsequently washed and dried. Sir Frederic Abel, in England, made many improvements upon this process, and since then cotton waste has been very largely used, and many explosives firms have got riches from it.

Silk waste, too, has proved very profitable, chiefly for working up into cheap silk materials. There was a paragraph recently in the daily papers reporting the death of Lord Masham of Swinton Park, Masham, Yorkshire. He was the son of the first baron, Samuel Lister, who made a large fortune from silk waste.

It is the agricultural world that seems to get the benefit (doubtful sometimes) of a large number of the odd and end waste substances of various industries. If you can find no other use for a waste material, you can probably work it off either as a cattle food or as a fertiliser. At least this is what one might be led to believe, after learning about the disposal of large numbers of waste materials.

Amongst the foods we have linseed cake (the waste after pressing out the oil from linseed); cotton cake, &c.; brewers' waste (brewers' grains, &c.); cocoa-shells (the waste husks got in the preparation of cocoa).

The most noteworthy of the waste products that have been used as chemical manures is that known as basic slag. In the early days of the famous Bessemer process for making steel great difficulty was experienced in removing the phosphorus, which, if present in more than extremely minute quantities, spoils the quality of the steel. Messrs Thomas and Gilchrist found a very simple method for removing it. They simply lined with magnesia and lime the vessel in which the molten steel was to be prepared. The phosphorus left the steel, and formed a compound with the lime and magnesia. When the lining was unable to take up any more phosphorus, it was removed and thrown away as waste, the accumulating heaps being a great nuisance. But it was discovered that this basic slag, as it was called, would make a very good artificial manure, as it contained phosphates in considerable quantity. It was ground fine, and sold for this purpose with very great success.

Sometimes waste products have become the salvation of the processes to which formerly they were great nuisances. A good example is found in what is called the Leblanc process for making soda. At one stage in this process hydrochloric acid gas is given off. This gas is very irritating and objectionable, and as it was allowed to escape into the air the neighbourhood of a soda factory was anything but a pleasant place. Actions were constantly being brought against the manufacturers, and great trouble was always occurring. Moreover, here was a valuable product going to waste. The problem was soon tackled, and ways of condensing the gas were found, and also methods for turning it into another gas—chlorine—that could be used to make bleaching-powder. This greatly increased the profits, besides doing away with the nuisance. Then, about fifty years after the introduction of the Leblanc process for making soda, a rival process sprang up, and has been very successful—so successful, in fact, that were it not for the former waste product, hydrochloric acid, it is doubtful whether the Leblanc process could survive.

The investigation of waste materials is often very fascinating, and sometimes leads to startling results. This was the case with the waste earths obtained in the making of incandescent mantles. Small mountains of these wastes were piling up, and Baron von Welsbach set himself to investigate them. By means of electricity he obtained lumps of metal from them. He was cutting one such lump with his knife, when he found that there was a remarkable sparking effect. He soon saw that this had commercial possibilities, and the outcome of it was the preparation of those wonderful lighters that have become so common now. Welsbach sold his German patent for thirty thousand pounds, and also got large sums for patents in other countries. This was truly a profitable waste product.

As the years go on waste products are constantly disappearing from industry. The great competition in trade and the lowering of prices have made it essential for factories to utilise or dispose of all their waste material, and processes that leave large margins for waste have not much chance of success. This is more than ever necessary now that we have to make up for the enormous wastage of war.

Perhaps most of what one may call the sensational discoveries with regard to waste substances have already been made, but there is still a great field for research-work, and a lot of money still to be made. There is the wood-pulp industry, for example. A Bulletin issued by the Forestry Branch of Ottawa in 1913 stated that over one hundred and forty-five thousand cords of pulpwood, valued at eight hundred thousand dollars, were lost annually in Canada, and also large

quantities of sulphur from the chemicals used. The waste liquors containing these substances have been discharged into rivers or the sea. A lot of work has been done, but the profitable working up of all this waste has still to come.

Then, again, there may be a good opportunity to utilise sawdust, and to get more value out of it than has been got in the past, especially in Britain. It has been used in America for making artificial silk, and also, curious as it may seem, for manufacturing alcohol. If alcohol should come to be used in place of petrol for motor-cars, this would in all probability prove a profitable means of obtaining it.

There is the tanning industry, too. It would be a very great advantage to this industry if really good uses could be found for the spent tan and the various waste liquors.

There are a great many more problems of a similar character; and it is certain that the future of industry in Britain depends largely upon reducing waste products to a minimum.

THE MESSAGE.

By G. Trevor Roller.

'HAVE a subaltern officer go out to-night and reconnoitre enemy's wire in front of your position AAA.* Report to be in by two-thirty AAA. Warn positions on your R. and L. not to draw Turk fire AAA. Headquarters —— Brigade Reserve Trench AAA.'

This had been buzzed along the wire that went along the communication-trench, and ended in the front-line fire trench signal-station; from thence it had been carried twenty yards or so to 'Lovers' Walk' by orderly, and into the hands of the Adjutant of the Blankshires. He was standing chatting to the ammunition-supply officer. They were in 'Lovers' Walk,' a front trench, so named because it was the last place in the world lovers would care to walk in.

The adjutant read the message, put it in his pocket, and said to the officer in charge of ammunitions, 'Well, anyway, for goodness' sake steal some more "Mills" bombs, if you can't draw 'em! We must have something to amuse the men with.' So saying, he turned and strolled to the regimental headquarters' dug-out. No, we will take back the word strolled; one does not stroll along a four-foot-six trench —one 'steals' along. Passing the colonel's dug-out, he told him the contents of the message.

The colonel said, 'Hang it! why do they always insist on sending out officers? I want my officers to lead my men when we push, not to go out sniffing round wire like a lot of rabbits —and get shot like 'em. However, they know best, and want the best information; so I mustn't grouse. It's these infernal flies.' He broke off and strafed round with his fly-switch, lit a cigarette (ration), and went on: 'Flies, and—er —other things, make this very beautiful spot quite unpleasant. Well, you'd better tell off somebody—somebody good.'

The adjutant went on his way, thinking whose turn it was to go out. As he reached his dug-out he remembered it was young Summers, a bit of a child; but he'd do the job. The adjutant sat on his sand-bag bed, and took the message from his pocket; then gazed at the sunset over the parados. His mind went back home —to home and Sylvia, the girl with the dreamy eyes and dimpling mouth; the girl he loved, and who loved him not. Oh, they were pals—frightfully good pals; but nothing else. Smiler Cray—he was the fly in the jam-tin. Smiler, with his everlasting grin, his perfect good nature, his most engaging manner. Win any girl. And yet there was nothing definite. Smiler possessed not a cent; so he never went ahead. The adjutant knew he was second best; and Smiler—— Suddenly his thoughts changed. A hard look came into his eyes. He spread the message over his knee, read it, and to himself he said, as the colonel had said not ten minutes before, 'Somebody good.'

Smiler happened to be in his regiment—a subaltern, and distinctly good when it came to a show. Smiler—— and he crumpled the message in his hand. Then for about ten minutes a whole lot of thinking went on in that particular dug-out.

Imagine a long pause, and then a short, 'Orderly!' answered by a boy—well, eighteen or nineteen, in a pair of slacks and a vest, neck and arms almost black from the sun. 'Send Mr Cray round here; and, I say, don't dodge across the open, but keep to the communication-trench up on to Green Hill.' And the boy went.

Time passed slowly, and the man of thoughts with the message crumpled in his left hand squirmed. He lit a pipe (Ocean Wave Ration, ounce one), and did a bit more thinking.

Then came Smiler. 'Hallo, adj.!' he grinned. 'Do you want me?'

The adjutant coughed. 'Yes,' he said. 'Sit down, old thing.'

'Where?' asked Smiler.

'Oh, on the floor, you ass, or the end of the bed; I only quoted a platitude.'

So Smiler sat.

'Look here,' said the adjutant, 'they want an

* AAA is the signalling way of ending a sentence; it means 'full stop.'

officer to go out to-night to find out something about the old Turks' wire. I spoke to the C.O., and he said, "Send somebody good." The most reliable man I could think of was yourself. I know it's not your turn; but I consider you are the best man for the stunt. So you're "for it."'

'Right-o!' grinned Smiler; 'but it's a blighted shame, 'cause old Mackay sent me a bottle of whisky from Mudros to-day, and we were going to have a beano to-night. However, duty comes before a "blind;" so get ahead with the details. Will the "bullet-food" each side of us know I'm out, or will they strafe and amuse themselves with star-shells?'

'Great Scott!' the adjutant cried; 'do you suppose I'm not going to warn these people and our own? Don't be a fool! I want the information the same as H.Q., because we may attack, and I want you to have every chance. It's all right for you,' he added; 'the Turks won't get busy unless we snipe, and I give you my word we won't.'

Then they went into details; and, everything settled, Smiler returned to his dug-out to prepare and wait for the dark.

. . . . . .

Seven-thirty, a sap; and at the end of it Smiler, wearing gloves, his face blacked, talking to the adjutant.

'I think it's dark enough,' he said.

'Yes, go ahead, and good luck, old thing,' said the adjutant.

'So-long!' said Smiler. 'Get the kettle boiling, and we'll have some toddy when I get back, and "thank your mother for the rabbits!"'

This last an insane remark, but quite like Smiler. He was off on a four-to-one chance of ever seeing the regiment again. So he talked drivel; but he was careful. He slid over the parapet lengthways, so as not to silhouette against the skyline behind him, and started to crawl. A random bullet went 'thug' beside him. He rolled laterally four times, and lay still. Nothing happened. He crawled again; then he reached scrub, and for fifty yards he walked, doubling himself. At the edge of the scrub he lay down. Before him was W Hill; he could see the shape of the W against the sky. The Turks' front-line trench lay at the foot, nearly one hundred yards from him; the wire would be only about twenty yards in front of them.

Smiler looked about him; he could distinctly see objects within twenty yards. It was not dark enough; he would wait till it was. He crawled a bit farther, and fell into a hole; not a big one, but an excellent place to find in 'No Man's Land' if you wanted to put in a spare twenty minutes or more.

So Smiler rolled over on his back, and gazed up into the glowing stars. His thoughts ran weirdly, as men's thoughts will run under peculiar circumstances. First he thought of 21st August; he had had a nasty reminder or two of that on his crawl out, which we won't talk about. Then his thoughts slipped to the dinner he would have when he got back; the much-prized bottle of whisky. Could he build a sand-bag bed like the adjutant had got? Fancy sleeping on sand-bags. By Jove! what would that bed at home feel like now, with the frilled pillow-cases—silly things, so womanish! Wonder if Sylvia has frilled pillow-cases! Wonder what Sylvia is doing now! What a shame he was not in a position to marry! But, hang it! everybody would be in a position to marry at the end of the war. Everything would be on a much lower standard; it would be one's duty to marry. Heavens! if he could get home for a month, that would be——

Then it started. Have you ever sat in a tent when the wind is really blowing, and heard the canvas flapping? If you have, multiply that sound by one thousand and you've got it. Officially it is called 'heavy rifle-fire.' Tommy calls it a 'blinky awful strafe.'

But it was coming from his, Smiler's, side; not from his regiment, but the What's-the-name-shires on his left. Of course, the Turks started at once, and a beautiful strafe ensued. Smiler lay low in his cubby-hole, while star-shells flew everywhere.

Meanwhile the adjutant was carefully writing a message to the units on each side of him to hold all fire, as a patrol was out. When the racket began he felt like a sick dog; but he sent the message out late.

The strafe lasted about fifteen minutes, and then silence. The adjutant walked down to the sap, feeling like nothing on earth. He knew he had done a real dirty trick, and he would have given his soul to take it back; but he thought it too late. He asked a sentry, 'Is Mr Cray in yet?'

'No, sir; he's only just gone out—at least, half-an-hour ago. He won't be back until he's done the job. That's to say, sir, if he dodged the firing.'

'Report to me if you hear anything,' said the adjutant, and went back to his dug-out.

Meanwhile Smiler was working. He crawled out, and found the wire, sideways; and every way he squirmed along, feeling with his gloved hands at the apron, lying on his side, and looking up to see the strands against the sky. When he was satisfied he started for 'home,' the dinner, and the priceless whisky. He felt pleased; he had attained his object in spite of the strafe, and now he was heading for home.

The adjutant was still feeling like mud.

Smiler reached the scrub, his slacks worn through, his knees bleeding, but quite 'bucked' with life. An occasional shot would come fairly near now and then, but he felt confident; that was the trouble—confidence. He got up on his

hind-legs, and walked right through the scrub, and to within twenty yards of the sap, when he suddenly fell forward on to his face, with a blow on his right shoulder that felt like a kick from a mule. He lay quiet, thinking—wondering, rather, if any more were coming; then he made inquiries with his left hand. He felt for his first-field dressing, got it out, and dropped it. He hunted for it, with no result; looked at the trench, and made a dash for it. A staggering dash, but he succeeded, rolled over the parapet, and fell on his hands and knees with a funny sort of grunt, because it had hurt him. He looked up, and saw the adjutant. The sentry grabbed him, and sat him on the fire-step.

The adjutant stood staring. Then he asked, 'How bad?'

Smiler had got his breath back; he was in no great pain now.

Somebody shouted, 'Stretch-er-bear-er!'

'Oh, shut up!' said Smiler; 'I can walk.—I'm not bad, adj.; shoulder somewhere. Give us your arm, and I'll push along to the dressing-station.'

So together they went slowly.

'I blame myself for this, old man,' said the adjutant.

'Oh, rot! Mind the step. Ugh, that hurt a bit!' and Smiler reeled. 'Don't you worry,' he went on; 'I'm all right. I never wanted to get hit. *Now* I am, I know it's a first-class ticket for home.—Hallo, doc.! I've stopped one.'

They reached the dressing-station, and for a while Smiler collapsed.

Then the adjutant put in a bit more thinking. For the smallest excuse he would have jumped over the parapet and got himself killed. He did not know which way to turn. He was feeling it; but Smiler, for the moment, was the chief thing to worry about, and between them—the doctor and the adjutant—they fixed him up.

Then they gave him a 'Gold Flake,' and that was a comfort to him. And as all men who are hit get a reaction, some minutes after he got the reaction too, and talked. He told them what he had done and found out. This was taken down, and reported to headquarters. Then he went on talking of what would happen—home, rest, a good time, and Sylvia.

'Of course,' he said, 'I shall have a free hand, and I have something to go on. She is sure to be sympathetic, and, after all, that is the chief thing; and in spite of the fact of my being a pauper, I think she will chance her luck and do the trick.'

The adjutant thought so too, and what he went through then was just as near the lower regions as any one can go. So they patched Smiler up, and sent him home. Down that horrible communication-trench from the front line to 'Chocolate Hill;' from there he went on an Indian mule-cart to Suvla Bay, and on to a hospital-ship. Then he was surrounded with comfort and full of smiles. He talked to the nurses about Sylvia and the heaven that was coming to him.

And the adjutant sat in his dug-out, gnawing his nails, and thinking what Hades was coming to him.

Some months later the Blankshires were back again in the front line.

The adjutant sat in his dug-out, strafing flies. A signaller entered with a private cable and an official message.

The cable read: 'Sylvia and I married to-day. Awful happy. Cheer-o everybody.—SMILER.'

And the message read: 'Turkish sap in front of your section; must be bombed and taken to-night AAA. Send one officer and thirty men AAA. They must be well supported if counter-attacked AAA. Brigade Headquarters AAA.'

'I'll tell myself off for that,' said the adjutant. Honour is satisfied; or, at least, atonement has been made.

MORE LINES TO MY MOTHER.

SOME days it's nice to be just eight,
And own a rabbit-hutch,
But oftener there are others when
I do not like it much;
When these are here I sit and think
How very nice 'twould be
If I could only just be you,
And you could just be me.

If I could say when nurse came round
With 'Seven o'clock, Miss Gwen,'
'She isn't here; please go away,
My time is half-past ten;'
Then you'd be me, and so, of course,
You'd have to go to bed,
While I'd put on an evening gown
And dine at eight instead.

When breakfast came I'd be myself
If we'd a holiday,
Then you would stay and mind the house
While I went out to play;
But later on, when school-time came,
I'd change, and I'd be you,
While you would go off with my books
And learn enough for two.

Whenever some one called to say,
'We hope you'll come to tea,'
Of course I'd want to go myself,
So then I'd just be me;
And I'd be me—oh, lots of times!—
Quite half the day, I think;
What fun to pop from me to you
As quick as any wink!

But things like that don't happen now.
Where have the fairies fled?
I don't believe what nursie says;
She says that they are dead.
I'm sure they're hiding out of sight;
Let's ask the honey-bee;
Perhaps he'd chase them out again
To change you into me.

Chambers's Journal
SEVENTH SERIES

THE LADY IN THE RED MASK.

By TAFFRAIL, Author of *Carry On! Stand By! Pincher Martin, O.D.*, &c.

I.

GEORGE PONSONBY BUCKLE, one of our junior midshipmen in the gunroom of the cruiser *Warwick* in China some years ago, was the smallest 'snotty' in the ship. I am not certain that he was not also the tiniest young officer of his rank in the Navy, for he must have stood barely more than five feet in his socks, while his hands and feet were small in proportion. He had curly, flaxen hair, blue eyes, and rather a penetrating voice, and had not even started to use a razor. He was nearly eighteen, but looked at least two years younger, and was one of those very rare, cherub-faced, angelic 'snotties' of fiction — not 'middies,' please—who are popularly supposed to break the hearts of every woman they meet. I am not aware how many feminine hearts Master George broke in his day, but I do know of one lady, an elderly spinster, who had the temerity to call him a 'little darling,' and added that he so reminded her of a nephew at a preparatory school at home in England. She, poor dear! received the shock of her life when the 'little darling' waxed indignant, and though she was not so much upset by what he said, it was the nasty way he said it which completely flattened her out. She never used endearing epithets to 'snotties' again. On the contrary, being a lady of strong religious convictions, she became convinced that they were brands to be snatched from the burning. I am not certain she was not right.

George was always touchy about his size and apparent age. In the gunroom they used to call him the 'White Maggot' when they wished to annoy him, and 'George' at other times. The first nickname riled him to the last degree, particularly as his chief enemy, a black-haired youth slightly larger than himself, named Moore, went by the name of the 'Black Maggot.' It was necessary for Moore to shave at least twice a week. It was unnecessary for George to use a razor twice a year. Hence the antipathy between them, and the gladiatorial combats which used occasionally to take place after dinner in the gunroom on guest nights.

I well remember the rage in the heart of George when he was arrested by the police in the railway station at Tokyo for smoking in public. There is a law in Japan under which nobody below the age of twenty is allowed to use tobacco, and though the regulation is generally waived so far as Europeans are concerned, the appearance of George was so extremely youthful that a rather officious policeman with a sword, apprehending him then and there, marched him off to the police station, with a large crowd following behind. On his arrival all his smoking utensils were confiscated, while before being liberated he was informed by an inspector in broken English that 'childrens ees not permeet to smoke in Cha-pan, so you mos' nod do eet again.'

The incident subsequently found its way into the English newspapers, where George, in rather inapt journalese, was referred to as 'a sucking Nelson through whose whiskers the wind did not whistle.'

'Poof!' snorted the hero of the story when he read of his doings months afterwards. 'What rot! Every one knows that Nelson hadn't a beard!' He could not see the joke; but we could, and he never heard the end of it.

But George, in spite of his cherubic appearance, was anything but a saint. He was about the most mischievous little imp imaginable, and well do I remember his bringing his cutter alongside under full sail bows on into the accommodation ladder. The forepart of the boat and the accommodation ladder broke into several pieces in righteous indignation; while the commander, in like condition and purple about the face, danced upon the quarter-deck.

'Please, sir, I couldn't help it,' explained the culprit when he came on board. 'The fore-halyards jammed.'

'Fore-halyards be jiggered, you silly little juggins!' spluttered the commander. 'Why didn't you let fly the fore-sheet and bring her into the wind? Why didn't you—— You've smashed up your boat; you've carved my brand-new accommodation ladder into chunks—— Oh, damn my whiskers! Lord knows what you haven't done! No wonder the naval estimates are so high, with young officers like you in the Service! I don't know what the deuce the Navy's coming to!'

'I'm sorry, sir,' piped the offender.

 [*All Rights Reserved.*]

'Sorry! I should think you were! You'll stay on board till the boat and the ladder are mended; and meanwhile you will go down to the gunroom, give the sub-lieutenant my compliments, and ask him from me to give you a dozen of the best! Understand?'

'Yes, sir.'

George got his dozen; though, as the sub. afterwards explained, he hadn't the heart to lay them on really hard.

On another occasion George caused some excitement by going ashore to a tennis-party in Hong-Kong in a pair of pink-striped pyjama trousers. He was soon discovered by the unmistakable cut of the garments; whereupon he explained his quaint attire to his astonished hostess by saying that he had two excellent reasons for appearing in such a garb. First, one of his messmates had offered to bet him the sum of five Mexican dollars that he dared not do it; and, second, his only respectable pair of flannel nether garments were in the wash, and he had been unable to borrow others. He added that he was quite certain that his hostess would prefer him to come *sans cérémonie* than that he should not come at all.

The lady, broad-minded and with sons of her own, was amused, and the young officer in night attire enjoyed his afternoon; but somehow the commander happened to hear of it, and George, who was really rather pleased at his own seaman-like ingenuity, was informed that he was a disgrace to the ship. The commander, one of the best of officers, whom we all loved, did not really mean to be severe. Indeed, he enjoyed the joke as much as any one, and I heard him telling the story soon afterwards in the smoking-room amidst shrieks of laughter on the part of the other wardroom officers. But, as the executive officer of the ship, he could not permit such goings-on on the part of the young gentlemen for whose upbringing he was primarily responsible.

There was no doubt that Mr Midshipman Buckle was the commander's *bête noire*, and taking all things into consideration, I hardly wonder at it. George, as I said before, was the wickedest little devil in creation. He was always in hot water, and even when his leave was stopped he used to while away many weary hours by shooting at scantily attired Chinese sampan-men through the gunroom ports with an air-gun or a catapult. It became quite a hobby of his, and his marksmanship was all that could be desired.

II.

We were spending the winter at Hong-Kong, and anybody who knows that most pleasant colony in winter will realise that we were having an excellent time. People fond of games played hockey, football, or golf; while the club habitués devoted themselves to billiards, bridge, or skittles in the American bowling-alley. The ladies' men, or 'poodle-fakers,' as we called them, had their tea-parties, dinner-parties, and dances oftener than was really good for them; while on Sundays there were the usual mixed picnics to neighbouring islands in one of the large steam-launches belonging to one or other of the big firms established in the place.

I remember that I, the junior watch-keeping lieutenant but one, was always trading on some one else's good nature to look out for my 'days on,' while every officer in the ship, the 'snotties' included, had numerous friends ashore. The people of Hong-Kong are nothing if not hospitable, and if one took them at their word and turned up to dinner without being asked, it was generally understood that one took one's suit-case and stayed the night. We were hard put to return their attentions, but did our best by giving concerts and dances on board, and became, I believe, rather a popular ship. At any rate, our entertainments were always well patronised.

St Andrew's Day, 30th November, was celebrated by the usual ball ashore, at which practically every British man and woman in the colony was present. The Scotsmen and pseudo-Scotsmen—there was a great deal of the 'pseudo' about some of them—appeared in kilts. The rest of us were in evening-dress, and we danced reels and generally enjoyed ourselves until the small hours of the morning. Certain members of the Highland fraternity continued their revels until long after the ladies had departed, and I still treasure the recollection of one elderly and portly Sassenach gentleman who was compelled, at three o'clock in the morning, to stand upon his head among the whisky-bottles on the bar counter, there to recite 'Scots wha hae' before he was allowed even so much as a glass of soda-water.

Then came Christmas, with all its usual gaiety; and six days later, on New Year's Eve, we arranged to give a masked ball on board the ship. It was to be a great affair, quite the largest and the most pretentious ball we had yet given, and for days beforehand we were busy preparing for it. There were pot-plants to be borrowed from the Botanical Gardens for decorative purposes; steam-launches to be chartered to assist the ship's boats in bringing off our guests; chairs to be hired for the sitting-out places; and arrangements to be made for supper, light refreshments, programmes, ladies' and gentlemen's cloakrooms, and a hundred and one other things. I verily believe we forgot nothing, and, as one of his Majesty's men-of-war does not carry such articles, we even went so far as to purchase a supply of powder and puffs, lip-salve, two pairs of long-handled hair-brushes, and packets of hair-pins and safety-pins of all colours and sizes. Neither did we forget to hire an *amah*, or Chinese maid, for duty in the ladies' cloakroom.

I did all the secretarial work, and a difficult job it was; for when I had arranged supper for

so many, officers were constantly coming to me to ask if I could manage just one more guest. If it was a man I hummed and hawed before consenting, for dancing ladies are comparatively rare in Hong-Kong, and we already had about three men to every one girl.

It was the commander and the fleet paymaster who really delighted my heart, however, for by dint of paying assiduous calls a few days before the ball, they collected no fewer than fourteen dancing ladies who had not already been invited. Even on the morning of 31st December the commander produced another, for soon after breakfast he bearded me with a note.

'Can you squeeze in another female, Carfax?' he wanted to know.

'Dancing or otherwise, sir?' I asked.

'Dancing,' he said. 'Here's the note. You might send her an invitation. She's a friend of the Stanley-Wetheralls, and has turned up at the last moment. They've been very civil to me, and I should like to oblige 'em.'

I acquiesced at once.

'DEAR CAPTAIN MOSTYN'—the missive ran—'My mother wonders if we could possibly bring another girl to your ball to-night. A cousin who is a very good dancer has just come to stay, and she would, I know, very much like to come. I have said nothing to her, of course, but we should so like to take her to a naval ball. She adores sailors.—Yours very sincerely,

'ENID STANLEY-WETHERALL.

'*P.S.*—Her name is Angela Rathbone, and she is quite young, and very pretty and fascinating.'

Enid was the elder of the two Miss Stanley-Wetheralls, whom I knew slightly. They were both nice girls and good dancers, so I repaired to my cabin, found a crested, printed invitation-card, filled in the name, sent it ashore by special messenger, and so informed Miss Angela Rathbone that the captain and officers of H.M.S. *Warwick* requested the pleasure of her company at a masked ball at 9 P.M. on 31st December. The card also told her that boats would be leaving the landing-place every five minutes between 8.35 and 9.30 P.M., and that ladies and gentlemen were desired to remove their masks at midnight.

Thirty heated bluejackets, spurred on by promises of liquid refreshment, scrubbed the quarter-deck until the teak planking was as white as driven snow. We planed off any knots and irregularities we could find in its surface, wiped it over with hot water and cloths, rubbed it with bottles, and finally powdered it with French chalk and induced the sailors to dance upon it in their socks to the wheezy strains of an accordion to rub it well in. A ship's deck is always trying to perform upon on account of its solidity, but ours, at any rate, was as slippery as ice.

We raised the canvas awning on spars until it was twenty feet off the deck, draped its underside with huge foreign ensigns, and set canvas screens, covered with more bunting, round the sides to keep out the draughts. With planks, biscuit-boxes, and capstan-bars we erected a dais in the stern for the dowagers and non-dancing chaperons; furnished it with sofas, arm-chairs, and carpets from the captain's cabin and wardroom; placed a zareba of pot-plants before it, and flanked the mass of greenery with a brightly polished Maxim on its tripod and a burnished 12-pounder on its field-carriage.

We made a bandstand on the top of the after turret, with its pair of gray-enamelled, burnished-muzzled 6-inch guns pointing mildly to the ceiling. With the assistance of the torpedo lieutenant and his myrmidons we placed coloured electric lights here, there, and everywhere. We gave the final instructions to the bandmaster; arranged the sitting-out places; supervised the supper, refreshment, and smoking arrangements; placed trays of programmes in conspicuous places; chided a Royal Marine corporal of the watch who was discovered pacing heavily up and down our ballroom floor in a pair of hob-nailed ammunition boots; and then, our preparations complete and our collars in a state of pulp, repaired to the wardroom in a condition of partial collapse to snatch a hasty dinner before going to our respective cabins to dress.

A GIGANTIC WORK COMPLETED.

THE TRUTH ABOUT THE MURMAN RAILWAY.

AS the result of a statement made to its Petrograd correspondent by the engineer-in-chief of that—for Russia—highly important artery, the Murman Railway, the Christiania paper, *Tidens Tegn*, has been enabled to publish the truth with regard to the line in question, and the extent to which it is now available for traffic. The following is the gist of the statement.

'The terminus of the Murman Railway,' began M. Gorjatchkovski, 'is not, as has been so frequently stated, either Kola or Alexandrowsk, but quite another spot on the same fjord, situated half-way between these two places. In the meantime, at least, it is known as Romanov.* It stands on the shore of ice-free water deep enough for the largest vessels. The first thing

* The name has now, it is reported, been changed to Murman.

we did was to lay out a regular plan for the town, with harbour lines and quays. Part of the town is already built, and more than half of the large quays have been completed and brought into use.

'The foundation-stone of the new town was laid by the then Minister of Communications, M. Trepov, in 1915. The climate there is not so severe as might be imagined. We have never had more than 22° of cold; and, owing to the proximity of the sea, we have even in the middle of winter periods of mild weather. The situation of the town is a sheltered one, and it is protected by ridges on both sides of the fjord. The railway, which connects Petrograd with the new town, may be divided into four sections. The first portion, from the capital to Petrosavodsk, on Lake Onega, already existed before the war. The remainder, which is of completely new construction, has a length of nine hundred and eighty-seven versts, or about six hundred and sixty miles. The section Petrosavodsk to Soroka is about two hundred and forty miles long. It was begun in March 1915, and was completed in December of the same year. The next section, from Soroka to Kandalax, passes along the shores of the White Sea, and has offered the greatest difficulties. It is nearly two hundred and fifty miles long, was begun in September 1915, and finished in November 1916. The most northern section is over one hundred and seventy miles long, and was constructed between June 1915 and April 1916.

'The first through-train to Petrograd ran at the end of November 1916. Traffic is now conducted over the whole length of the line, but only for military purposes; for ordinary traffic it will not be opened until after the war.

'On the Murman Railway the Russian broad gauge has been adopted, and the line is now completely finished in so far as the permanent way is concerned. It is anticipated that in summer a good many repairs will be required at different points, but the traffic can nevertheless be carried on without interruption. It thus appears that between March 1915 and November 1916 a line has been constructed which is nearly twice the length of that between London and Berwick. It is to be remembered, also, that the work has not been carried out under easy conditions. The climate is somewhat severe, and the line runs through desolate tracts without roads of any kind or other means of communication. Everything that we required we had to convey to the spot ourselves.

'The fact that the country is comparatively flat was of some advantage; even in the northern section, which is ridgy and recalls north Finmarken, we have been able to carry the railway along the bottom of the valleys. On the other hand, the vast tracts of bog often caused great difficulties. Under normal conditions the permanent way is built first, and then the rails are laid upon it; but, on account of the circumstances, we were obliged to lay the rails first! That is to say, we had to lay a field-railway along the future line in order to bring forward what we required—provisions, material, machinery, &c. The cold was of considerable assistance to us. We often laid the rails merely on the frozen earth; for months we had railway-lines on the ice of rivers and lakes; in the morasses we laid them on logs of wood, which were easily obtained in the forest districts. Never before, probably, have such huge quantities of material been transported by such provisional means.

'We began, of course, at the greatest possible number of places at the same time. From the south we got what our own industries could provide; along the whole of the White Sea we were in connection with Britain and America during the six summer months; while in the north we were in touch with the outer world throughout the entire year.

'The most important, and perhaps the most difficult, question was that of labour. In all, seventy thousand men have been constantly employed, and literally everything which they required had to be brought from Russia or from abroad. Most of the men were Russian workmen; but in addition there were people from our Asiatic possessions, who performed their military service as labourers. There were also thirty thousand German and Austrian prisoners, and nine thousand Chinese.

'We endeavoured to accommodate the various nationalities in accordance with the habits and customs of each. The Chinese, for instance, received all their requirements from China. It was awkward for the Mohammedans, who could not eat their principal meal until after sundown. By an unlucky chance they reached the Murman coast at the time of the midnight sun, and they suffered the most frightful religious qualms.

'From Siberia there were brought twenty thousand head of cattle; vast quantities of salted beef and pork came from America; while eight thousand horses were employed.

'We had a little scurvy, but not more than five hundred cases in all. Our own Russian people seemed assured that they were taking part in a great patriotic undertaking, and even the prisoners carried out their share of the work well. They were selected, powerful men, and they received exactly the same food and treatment as our own. They were paid in accordance with what they did, as it was necessary to get the line finished at any price. A prisoner of war could make as much as four roubles a day, in addition to receiving everything else free.

'The importance of the Murman Railway as regards imports to Russia during the war is so apparent that it would be superfluous to dilate upon it. The question as to whether it will be

of value in the future under peaceful conditions is one of no small interest. As to this, in my opinion,' said M. Gorjatchkovski, 'there can be no doubt whatever. The line passes through districts which possess many possibilities. There are vast forests of ancient growth, and waterfalls which can supply the power for exploiting them. For the conveyance inland of fish, too, the line will be of great assistance; while most important of all will be the existence of a first-class harbour for the export of Siberian butter.

'A connecting line with the Siberian railway system has already been planned, and is to be commenced next year. The route from Siberia to the new port is one hundred and ninety miles shorter than to Libau, while the voyage by steamer to New York occupies twenty-four hours less than the voyage from Libau. The new railway thus effects a real saving in distance.'

THE DEFINITE OBJECT.

CHAPTER XXIX.—IN WHICH HERMIONE MAKES A FATEFUL DECISION.

WHEN Mrs Trapes was gone, Hermione stood a long time to look at herself in her little mirror, viewing and examining each feature of her lovely, intent face more earnestly than she had ever done before; and sometimes she smiled and sometimes she frowned, and all her thought was, 'Shall I make him happy, I wonder? Can I be all he wants—all he thinks I am?'

So, after some while, she combed and brushed out her glorious hair, shyly glad because of its length and splendour; and, having crowned her shapely head with it, viewed the effect with cold, hypercritical eyes.

'Can I, oh, can I, ever be all he wants—all he thinks I am?'

And now she proceeded to dress. The holey stockings were replaced by others that had seen less service, the worn frills and laces were changed for others less threadbare; which done, Hermione, with many supple twists, wriggled dexterously into her best dress, pausing now and then to sigh mournfully and grieve over its many deficiencies and shortcomings, defects which only feminine eyes, so coldly critical, might hope to behold.

Scarcely was all this accomplished when she heard a soft knock at the outer door, and at the sound her heart leapt, she flushed and paled, and stood a while striving to stay the quick, heavy throbbing within her bosom; then breathlessly she hastened along the passage, and, opening the door with trembling hands, beheld Bud M'Ginnis.

While she yet stared dumb and amazed, he entered, and, closing the door, leaned his broad back against it. 'Goin' away, Hermy?' he inquired softly, looking her over with his slow gaze.

'Yes.'

'Goin' far, Hermy?'

'I don't know.'

'Goin'—alone, Hermy?'

'Why are you here? What do you want?'

'T' save ye from—hell!' he answered, his voice rising loud and harsh on the last word. 'Oh, I know,' he went on fiercely—'I know why you 're all dolled up in your best. I know as you mean t' go away to-night with—him. But you ain't goin', girl—you ain't.'

'To-night,' she said gently, 'is my wedding-night.'

M'Ginnis lifted a hand and wrenched at the silken neckerchief he wore, as though it choked him. 'No!' he cried, 'you ain't a-goin' t' get no weddin', Hermy. He don't mean t' give ye a square deal. He 's foolin' ye—foolin' ye, girl! Oh,' said he through shut teeth, 'ye thought I was safe out o' the way, I guess. You ought t' known better. Th' p'lice couldn't hold me; they never will. Anyway, I 've kept tabs on ye—I know as you 've been meetin' him—in a wood. I know '—here M'Ginnis seemed to choke again—'I know of you an' him—kissin' an' cuddlin'—oh, I've kept tabs on ye.'

'Yes,' she said gently, 'I saw your spy at work.'

'But ye can't deny it. Ye don't deny it! Say, what kind o' girl are you?'

'The kind that doesn't fear men like you.'

'But ye can't deny meetin' him,' he repeated, his hoarse voice quivering; 'you don't deny—kissin' him—in a wood! Only deny it, Hermy; only say you didn't, an' I 'll choke th' life out of any guy as says you did—only deny it, Hermy.'

'But I don't want to deny it. If your spy had ears he can tell you that we are going to be married. Now go.'

Once more M'Ginnis reached up to his throat and wrenched off the neckerchief altogether. 'Married!' he cried; 'an' t' him? He 's foolin' ye, Hermy; by God, he is! Girl, I 'm tellin' ye straight and true, he 'll never marry ye. His kind don't marry Tenth Av'ner girls—Nooport an' Fifth Av'ner 's a good way from Hell's Kitchen an' Tenth Av'ner, an' they can't never come t'gether, I reckon.'

'Ah!' sighed she, falling back a step, 'what do you mean?'

'Why, I mean,' said M'Ginnis, twisting the neckerchief in his powerful hands much as if it had been the neck of some enemy—'I mean as this guy as comes here bluffin' about bein' down an' out, this guy as plays at sellin' pea-nuts, is—Geoffrey Ravenslee the millionaire.'

'But—he is—Arthur's friend!'

'Friend—nothin',' said he, wringing and wrenching at the neckerchief. 'I guess you ain't found out how th' kid an' him came t' meet, eh? Well, I'll tell ye—listen! Your brother broke into this millionaire's swell house through the winder, an' this millionaire guy caught him.'

'Oh,' said she, smiling in bitter scorn, 'what a clumsy liar you are, Bud M'Ginnis!'

'No,' he cried eagerly; 'no, I ain't tellin' ye no lies—it's God's own truth I'm givin' ye.'

'No, you're just a liar, Bud M'Ginnis!' and she would have turned from him, but his savage grip stayed her.

'A liar, am I?' he cried. 'Why, then, you're sister to a crook, see! Your brother's a thief—a crook! You ain't got much t' be s' proud over.'

'Let me go!'

'Listen! Your brother got into this guy's house t' steal, an' this millionaire guy caught him—in the act! An' havin' nothin' better t' do, he makes young Spike bring him down here—just t' see th' kind o' folks as lives in Hell's Kitchen—see? Then he meets you—you look kind o' good t' him, so he says t' th' kid, "Look here," he says, "you help me game along with yer sister, and we'll call it quits."'

Breaking from his hold, Hermione entered the little parlour, and, sinking down beside the table, leaned there, hiding her face, while M'Ginnis, leaning in the doorway, watched her, his strong hands twisting and wrenching at the neckerchief.

'Ah, leave me now,' she pleaded; 'you've done enough, so—go now—go!'

'Oh, I'll go. I come here t' put ye wise—an' I have! You're on to it all now, I guess. Nooport an' Fifth Av'ner's a good way from Hell's Kitchen an' Tenth Av'ner, an' they can't never come t'gether, I guess; there's sure some difference between this swell guy with all his millions an' a Tenth Av'ner girl as is a—thief's sister.'

Slowly Hermione lifted her head and looked up at him, and M'Ginnis saw that in her face which struck him mute; the neckerchief fell from his nerveless fingers and lay there all unheeded.

'Hermione,' he muttered, 'I—girl, are ye—sick?'

'Go,' she whispered—'go!'

And, turning about, M'Ginnis stumbled out of the place and left her alone. For a long time she sat there motionless and crouched above the table, staring blindly before her, and in her eyes an agony beyond tears, heedless of the flight of time, conscious only of a pain sharper than flesh can know.

Suddenly a key was thrust in the lock of the outer door, footsteps sounded along the passage, accompanied by a merry whistling, and Spike appeared. 'Hello, Hermy, ain't tea ready yet?' he inquired, tossing aside his straw hat and opening a newspaper he carried. 'Say, the Giants are sure playin' great ball this season. What! are ye asleep?'

'No, dear!'

'Why, Hermy,' he exclaimed, dropping the paper and clasping an arm about her—'oh, Hermy—what is it?'

'Oh boy—dear, dear boy—you didn't, did you?' she cried feverishly. 'You are a little wild—sometimes, dear, just a little; but you are good—and honourable, aren't you?'

'Why, yes, Hermy, I—I try t' be,' he answered uneasily; 'but I don't know what you mean.'

'You're not a thief, are you? You're not a burglar? You never broke into any one's house? I know you didn't, but tell me you didn't—tell me you didn't!'

'No—no, 'course not,' stammered Spike, and, averting his head, tried to draw away; but she clung to him all the closer.

'Boy—boy dear,' she whispered breathlessly—'oh boy, look at me!'

But seeing he kept his face still turned from her, she set a hand to his cheek and very gently forced him to meet her look. For a long moment she gazed thus—saw how his eyes quailed, saw how his cheek blanched, and, as he cowered away, she rose slowly to her feet, and into her look came a growing horror; beholding which, Spike covered his face and shrank away from her.

'Oh boy'—her voice had sunk to a whisper now—'oh boy—say you didn't!'

'Hermy—I—can't!'

'Can't?'

'It's—it's all—true. Yes, I did! Oh Hermy, forgive me.'

'Tell me!'

'Oh, forgive me, Hermy! forgive me!' he cried, reaching out and trying to catch her hand. 'Yes, I'll tell ye. I—I got in—through th' winder, an' Geoff caught me. But he let me go again—he said he 'd never tell nobody if—— Ah, don't look at me like that!'

'If—what?'

'If I'd—bring him back here with me. Hermy, don't! Your eyes hurt me—don't look at me that way.'

'So it—is—all—true!'

'Oh, forgive me! forgive me!' he pleaded, throwing himself on his knees before her, and writhing in the anguish of remorse. 'They doped me, Hermy. I didn't know what I was doin'; they didn't give me no time t' think. Oh, forgive me, Hermy! Geoff forgave me, an' you must—oh, God, you must, Hermy!' Again he sought to reach her hand, but now it was she who shrank away.

'I loved you so! I—loved you so!' she said dully.

'Hermy, he cried, catching hold of her dress, 'forgive me—just this once, for God's sake! I ain't got nobody in the world but you. Forgive

me!' And now his pleading was broken by fierce sobs, and he sought to hide his tear-stained face in the folds of her dress, but she drew it from him, shrinking away almost as if she feared him.

'A thief!' she whispered. 'Oh God—my brother a thief! I don't seem—able to—think. Go away—go away; I—must be—alone!'

'Hermy dear, I swear—oh, I swear I 'll——

'Go away!'

'Oh Hermy, I didn't think you 'd ever—turn away—from me!'

'Go away!'

'Oh Hermy—won't you listen?'

'I can't! Not now. Go away.'

Sobbing, the boy got to his feet, and, taking his hat, crossed slow-footed to the door; there he paused to look back at her, but her staring eyes gazed through him, and, turning hopelessly away, he brushed his sleeve across his cheek, and treading slowly and heavily along the passage, was gone.

Dry-eyed, she stood a while, then sank again beside the table, and crouched there with face bowed between outstretched arms, and hands tight clenched.

Evening began to fall, but still she sat huddled there, motionless, and uttering no sound, and still her eyes were tearless. At last she stirred, conscious of a quick, firm step near by, and, thrilling to that sound, rose and stood with her back to the fading light as Ravenslee entered.

'Dear,' said he, tender and eager, 'I found the door open; did you leave it for me? Why, Hermione—oh, my love, what is it?' and he would have caught her to him, but she held him away, and questioned him, quick-breathing.

'You are—Geoffrey Ravenslee—the millionaire—aren't you?'

'Why—er—I—I 'm afraid I am,' he stammered. 'I 'm sorry you found it out so soon, dearest; I wanted to tell you after we'——

'Oh, why didn't you tell me before—why didn't you? No; please wait! You—you caught my—brother, didn't you?' she went on breathlessly. 'He had broken in—was burgling your house, wasn't he—wasn't he?'

'How in the world'—— began Ravenslee, flinching. 'Who told'——

'He broke into your house to—steal, didn't he—didn't he?'

'But, good heavens—that was all forgotten and done with long ago! They 'd made the poor chap drunk; he didn't know what he was doing. It 's all forgotten long ago! Dear heart, why are you so pale? God, Hermione, nothing can alter our love?'

'No, nothing can alter our love,' she repeated in the same dull tones; 'oh, no, nothing can ever alter that. Even though you deceived me, I shall always love you. I can't help it. And just because I do love you so, and because I am a thief's sister, I—oh, I can never be your wife—I couldn't, could I?'

'By God, Hermione, but you shall!' As he spoke he caught her in his arms—passionate arms that drew and held her close. Very still and unresisting she lay in his embrace, uttering no word; and, stooping, he kissed her fiercely—her lips, her eyes, her white throat, her hair; and, silent still, she yielded herself to his caresses.

'You are mine, Hermione—mine always and for ever! You are the one woman I long for—the wife nature intended for me! You are mine, Hermione!'

Very softly she answered, her eyes closed, 'I felt at the first there was a gulf dividing us—and now—this gulf is wider—so wide, it can never be crossed by either of us. Your world is not my world after all; you are Geoffrey Ravenslee, and I am only—what I am. Newport and Fifth Avenue are a long way from Hell's Kitchen and Tenth Avenue, and they can never—never come together. And I—am a thief's sister, so please, please loose me! Oh have mercy, and let me go!'

His arms fell from her, and, shivering, she sank beside the table, and the pale agony of her face smote him.

'But you love me, Hermione?' he pleaded.

'If I had only known,' she sighed, 'I might not have learned to love you—quite so much! If I had only known!' Her voice was soft and low, her blue eyes wide and tearless, and, because of this, he trembled.

'Hermione,' said he gently, 'all this week I have been planning for you and Arthur—I have been dreaming of our life together, yours and mine, a life so big, so wonderful, so full of happiness that I trembled sometimes, dreading it was only a dream. Dear, the gates of our paradise are open; will you shut me out? Must I go back to my loneliness?'

'I shall be lonely too,' she murmured brokenly; 'but better—oh, far better—loneliness than that some day'—— She paused, her lips quivering.

'Some day, Hermione?'

'You should find that you had married not only a scrub-woman, but—the sister of a—thief!' Suddenly she sprang to her feet, her clinging arms held him to her bosom, and, drawing down his head, she pressed her mouth to his; and, holding him thus, she spoke, her voice low and quick and passionate. 'Oh my love, my love! I do love you with every thought, with every part of me—so much, so very much, that my heart is breaking, I think. But, dearest, my love is such that I would be everything fair and beautiful for you, everything proud and good and noble for you, if I could. But I am only Hermy Chesterton, a Tenth Avenue girl, and—my brother—— So I 'm going to send you away back to your own world, back to your

own kind, because—because I do love you so! Ah, God, never doubt my love, but—you must go.'

'Never, Hermione—never!'

'You must! You will, I know, because your love is a big, generous love; because you are chivalrous and strong and gentle; because I beg and implore you, if you have any pity for me—go!'

'But why? Why?'

'Oh, must I tell you that—can't you understand?'

'Why must I go, Hermione?'

'Because,' she murmured, her yearning arms close about him, her face close hidden against his breast, 'because I'll never—marry you—now; but I love you—love you so much that I'm afraid—ah! not of you. So I must be alone—quite alone to fight my battle. And now—now that I've shown you all my heart, told you all my weakness, you'll go for my sake—just for my sake—won't you?'

'Yes—I'll—go!' he answered slowly.

'Away from here—to-night?'

'Yes,' he answered hoarsely—'yes!'

Then Hermione fell suddenly before him on her knees, and, before he could stay her, had caught his hands, kissing them, wetting them with her tears, and pressing them passionately to her bosom. 'I knew,' she cried—'I knew that you were strong and gentle and—good. Good-bye—oh, my love, good-bye!'

'Hermione,' said he, kissing her bowed head—'oh, my Hermione, I love you with a love that will die only when I do. I want you, and I'll never lose hope of winning you—some day, never give up my determination to marry you—never, so help me God!' Then swiftly he turned away, but, reaching the door, stooped and picked up M'Ginnis's neckerchief, and, recognising it, crumpled it in fierce hand. So, with it clenched in griping fingers, he hurried away, and left her there upon her knees.

THE WINES OF SPAIN.

By Bart Kennedy.

IF you are to get them at their best, you must drink them on the spot. Travel doesn't agree with them. They sulk and lose their delightful flavour. I have tasted Rioja in London, and I am bound to say that it is by no means so good as the Rioja in Spain. It is dearer, to be sure; but the dearest wine is by no means the best wine. The best red wine in the world is not for the rich man. It is for the peasant who makes it. If the rich man wants it, he must journey to the place of its birth. For no magic of the power of gold will transport it to his cellars. Travelling kills the delicacy of its flavour.

The best red wine that I have ever tasted I got for a penny a pint. It was full, and strong, and soft, and delicious. And at the same time its flavour was as clean as the flavour of spring water. A noble wine at a penny a pint! A stout old Spanish woman drew it for me from a black pigskin. And this wine had a name as fine and as glorious as itself. It was called Argando. You couldn't have got this wine in London for a sovereign—or even a hundred sovereigns—a pint. For if imported it would have to be fortified, and every one knows what the fortifying of red wine means. In this sense, fortification might well be likened to a sword that is double of edge. You get the wine, but you don't get the flavour.

You will look in vain on the map for the place where I got this wine. And still it is in Spain as indubitably as is Madrid. It is a little village in the province of Guadalajara, of the name of Torija. Three hundred people live in it, and there is in it the ruins of a splendid Moorish castle. Tourists don't get there, for it is saddled with none of the conveniences of civilisation. It is now even as it was centuries ago. The traveller would have to accommodate himself to the medieval manner and atmosphere. But—and it is a very big but on the right side—he would have the Argando.

The *posada* (inn) where I got this wine was little, and dark, and weird of aspect. It had in it but one feeble oil-lamp. Night was just closing in when I got there, after a tramp of twenty miles on a wet, gloomy day.

But the Argando changed everything. After a couple of pints of it, I began to see the world from a standpoint of light and cheer. The interior of the little *posada* lost its weirdness of aspect. The light of the oil-lamp took on a big glow of effulgence. O magical Argando! How you cheered me after that hard day's tramp through the gloom and the rain! It would be worth going forth again to far Torija to quaff you once more!

Of course, I am not going so far as to say that all the wines I encountered in Spain were as this Argando. But in life one must take the rough with the smooth. To have everything one's way would mean that one would have no enjoyment in life.

Some of the wines I met with in Spain were as rough as the edge of a rusty saw, and how the throats of the natives negotiated them puzzles me still. There was a wine in Castile that had the taste of particularly awful medicine. That it was wine was clear, for it came from the grape.

But the soil that the grape came from was soil that had in it rasping and acrid elements. The wine was said to be very healthful, but all that I can say was that a little of it went a long way—as far as I was concerned. I was pleased indeed when I got from out the radius of that fearsome wine.

I say radius, for as I went along, of course, the flavour of the wine was always changing. The end of a day's march meant the encountering of another kind of wine. Each day had its particular wine.

Perhaps on the whole I liked best the wines on the great plain in the province of Aragon. But I must confess that the Argando—the best wine of them all—belonged to the province of Castile.

In Catalonia the wines were rough, but they had a good flavour, and they had much power in them. Near Lerida I struck a wine of a particularly exalting character. After I had armed myself with a pint or so of it, I felt that I could perform deeds of valour. Though rough, it was noble and big. It was a wine with teeth in it; but, for all that, it was not unpleasant to negotiate. And, as I have suggested, after you had negotiated it, it made you feel that you were a person difficult to conquer. It was what might be described as a good, big, fighting wine.

The wines of the south of Spain were utterly different from the wines of the north. They were usually white, and had a kind of Sherry flavour. The wine that the people of Granada drank I did not care for very much. Its flavour was not defined enough. But I liked the Valdepeñas. It was smooth and well-defined of flavour, though not very strong. Its colour was near to the colour of Barsac. In character, however, it was in no way allied to it. There was no hint of sweetness, but it had a peculiarly nutty after-taste.

In Toledo I made the acquaintance of a wine that had the curious redness of colour characteristic of Hungarian claret. Its flavour was delicious, but it was very thin. It would have taken a good deal of it to impel one to the doing of deeds of valour. It was at the opposite pole from the big, rough, fighting wine that I got near Lerida, in Catalonia. Still it was well worth sampling, even though it was a wine eminently fitted for quiet, respectable persons. I remember it with interest as a wine at once delightful and safe. Its name I forget.

It must be said that the fact of wine being kept in a skin gave to it the suggestion of a certain flavour because of that. But the suggestion was very slight. One soon got used to it. And, in my view, the slight suggestion of this flavour, outside the wine, was more than made up for by a general roundness of flavour such as the wine would not have were it kept in bottles. My belief is that red wine, at least, is at its best when kept in a cask or in a skin. It retains its individuality better.

These fine and generous and wholesome wines of Spain! I will always remember them—from the white, or, rather, light-yellow, wines of Andalusia to the very dark-red wines of Catalonia. Going along, and sampling them, as they came after the march of the day, was most soothing and satisfying. To get them here in England would be impossible—impossible even though I possessed the wealth that I neither possess nor care to possess. To get them, I should have to go again and wander through delightful Spain. I should have to go again amongst the peasants.

Yes, again I would like to wander into Torija—Torija, the little place where lives the glorious Argando.

THE FAIR ROMAINE.

By B. Paul Neuman.

I.

ARTHUR ROMAINE had from his boyhood been a trouble and a puzzle to his family, or at any rate to his father. His physique had always been excellent, and he was quite good-looking, though Mr Romaine grumbled at his flaxen hair.

'It's the dark Romaines,' he said, 'that make money and do things. The fair ones—thank God, there aren't many of them!—are never any good. The eldest, too!' he would add, with a groan.

He himself was a dark Romaine, or, rather, had been, for his black hair was pretty well snowed under. True to his version of the Romaine tradition, he had made money; indeed, under him the family fortunes, prosperous for many generations, had reached their highest point so far. Oak Mount, his Wimbledon house, was a really imposing place, designed by a big architect, put up by a big builder, and furnished regardless of expense. Here he lived in great style, dispensing a wide but discriminating hospitality, and fulfilling, as he understood them, all the obligations of *noblesse oblige*.

To this successful, masterful man Arthur had been a heavy cross, though the trouble developed slowly. At his preparatory school the boy's reports were very satisfactory, though a certain slackness in games was noted and deplored. It

was at the public school that the real difficulties began.

'Your boy's all right in the big things, Mr Romaine,' said his house master. 'He's as straight as a dart, his work's not at all bad, and I don't believe he's ever had an evil thought. But he's so confoundedly cantankerous. It really seems as if he laid himself out to be unpopular. He calls himself a Radical Socialist, and a free churchman—so free that the other boys call him an atheist—a Home Ruler, and a Suffragist. Whatever the others abhor he stands up for, and the consequence is he has a pretty bad time. He's got plenty of pluck—I will say that for him; but he really brings his troubles upon himself. Then his attitude towards games is simply lamentable. He doesn't seem to know the meaning of *esprit de corps*. He could have been the slow bowler of the eleven if he would have taken the trouble—he's got a lovely action, and a faster ball that wants a rare lot of watching—but he prefers to mess about with his newspapers and magazines and reviews.'

'I'll have a straight talk to him,' said Mr Romaine; and he kept his word, and lost his temper, so stoutly did Arthur hold his own.

'Games are all very well,' said the young philosopher, 'but when they're made a fetish of, you can't help getting fed up with them. Half the boys and more than half the masters can't talk about anything else. To hear them, you'd think Lord's was the Holy of Holies.'

'When you go to Rome, you must do as the Romans do,' answered Mr Romaine. 'There's a time for everything, and at your age it's natural and right to be keen on games. The trouble with you is that you won't take trouble. It's easier to read those vile Radical rags, and stuff your vacant mind with their ribald rubbish. No wonder the boys send you to Coventry. I meant you to go to Oxford, but I tell you quite plainly that there's no Oxford for you unless you give me your word that you'll put aside all this nonsense, and behave like any other decent young Englishman of the upper classes.'

'I haven't the least wish to go to Oxford,' Arthur replied, in his eager, impulsive way that always annoyed his father, whose own manner was studiously deliberate and dignified. 'I'd ever so much rather take up stinks in London.'

Mr Romaine was disconcerted. He had kept the Oxford threat as his trump card, and to find it treated so cavalierly was an unpleasant surprise. He began to bluster—a rare occurrence, to do him justice.

'You really are a hopeless young fool,' he said angrily. 'What use would what you call stinks be in a profession like ours? The 'varsity polish might be a real asset; but I suppose we shall have to do without that. As soon as you leave school you shall come to the house in Mowbray Street. I'm not very sanguine about it, but, after all, you *are* the eldest son, and you shall have your chance.'

The 'profession' of which he spoke was that of a picture-dealer, and the big shop in Mowbray Street had been famous under three generations of Romaines, all of them astute, suave, dignified, and dark of hue. The 'house'—Mr Romaine never spoke or even thought of it as a shop—was to him what, according to his graceless son, Lord's was to the masters and the schoolboys—a holy place. Arthur's first suggestion was a shock; his second was an outrage.

'Do you know, father,' he said, looking that stately gentleman full in the face, 'I think I'd much rather take up something quite different. I'm sure I should never be happy spending my life in trying to get people to buy, for much more than they're worth, a lot of luxuries which they could just as well do without.'

At this speech, delivered with all the fervent solemnity of callous youth, the colour rose to Mr Romaine's cheeks; for the moment his dignity deserted him, and he fairly shouted, 'Go out of the room, you impertinent young cub! No—not another word, or I'll give you the thrashing you ought to have had, long ago, at school. And remember—the day after you leave school, you start at the house in Mowbray Street.'

II.

Mr Romaine had his way, and—after an interval of six months or so—Arthur had his. As soon as he left school, he was brought into the Mowbray Street 'house.' In some ways he surprised and pleased his father. He was extremely orderly, furiously energetic, and he showed a remarkable capacity for detail-work. This fair beginning, however, was soon clouded. When once he had fairly found his feet, he startled and dismayed his superiors by a series of the most unheard-of, revolutionary proposals, which he supported with a fluency and an ingenuity that drove them to distraction. This was bad enough; but when his conscience asserted itself, and he declared that some of the time-honoured practices of the firm were clear breaches of morality, and that it was quite impossible for him to adopt them, Mr Romaine thought it time to interfere.

'You have,' he told his son, 'the tongue and the brains of a tub-thumper, and I believe that's about the only business you'll ever make a living at. You won't do for the house, that's clear. Dick's three years younger than you, but he'll have your birthright—thank God, he's the right colour! They tell me he's just about as popular at school as you were the opposite, and that's saying a good deal.'

'Dick's jolly fine,' said his brother. 'He'll be a favourite wherever he goes.'

He spoke so heartily that his father was touched. 'You've got your good points too,' he said, 'if only you weren't so obstinate and so

ridiculously opinionated. Now what is it you want to do?'

'I'd like to work at science for a bit, and then try to do something practical with it.'

'Well,' said his father, 'young fools that won't learn in any other way must learn by experience, so you shall have your fling. But mark my words — you'll be another Uncle Charles.'

'Is he a fair Romaine?' asked Arthur, who had never seen Uncle Charles, but had occasionally heard him spoken of, always depreciatingly.

'No; I'm glad to say he isn't a Romaine at all. He's a relative of your mother's, and I'm really afraid you're a bit like him. He had a good business at one time—dyes, or something of that sort, and he'd always got a stock of wonderful ideas. He's been losing money as long as I've known him, and it's a wonder he's out of the workhouse—if he is. He's by way of being scientific too, now I come to think of it. He might really know something about where to go. I haven't seen the old man for years. He took offence in some absurd way. I'll go and see him. It'll be an excuse for breaking the ice.'

A few days afterwards, Mr Romaine returned to the subject at dinner. 'Arthur,' he said, 'I saw Uncle Charles to-day. I told him about you, and he seemed absurdly pleased at your showing a fancy for science. He wants you to go and see him. I've got his address—somewhere Regent's Park way. He says University College, Gower Street, is your place, and he has written a note to a friend of his, who is professor of physics, I think it is. He says that if you take it down with you and tell him what you want to do, you'll get the best advice in London.'

'Thank you, father,' said Arthur. 'I'll take it to-morrow.'

'Uncle Charles!' exclaimed Mrs Romaine. 'You don't mean to say he's buried the hatchet?'

'I didn't give him time to think about it. I started about Arthur at once, and as soon as he heard the word "science" he pricked up his ears, and in two or three minutes he was as keen as a boy.'

'How's his business getting on?'

'I didn't ask; but the look of the place was enough. It's big but ramshackle, and there's precious little doing. Under-staffed, under-manned, under-financed, I should say. But the old man was in high spirits. He thinks he's found out some of the German secrets, and he's going to make a huge fortune—after he's in the workhouse, I expect.'

III.

For three years Arthur worked hard at the college, specialising in physics and chemistry. Unfortunately, he developed a hypersensitive conscience with regard to examinations, declaring that competitive distinctions pandered to the worst vices of modern civilisation. On this ground he refused to try for class prizes or for honours in the university examinations. After a good many heart-searchings, he consented to sit for the pass degree, and took his B.Sc. with consummate ease. His father, of course, was intensely annoyed by his refusal to seek honours, but was a little comforted by hearing, through Uncle Charles, that at the college Arthur was considered one of the most brilliant students of his standing. Uncle Charles himself was delighted with what he called 'the great renunciation.' In his eyes the boy could do nothing wrong. The old gentleman, a childless widower, lived in a small house at the foot of Primrose Hill. Here Arthur was a constant visitor, and the two were the best of friends.

Just as Arthur finished his course at Gower Street, Uncle Charles fell ill, and passed away, cheered and sustained by the thought that his own forecast of the issue had been more correct than the doctor's. And when his will was discovered—in the receiver of a superannuated air-pump—it was found that all his property, including the dye-works at Shadwell, was left to his dear great-nephew, Arthur Romaine.

At first Mr Romaine was inclined to be facetious over the gift; but when it appeared that, apart from the Shadwell premises, the estate would realise at least ten thousand pounds, he changed his tone, went down to inspect the dye-works, and then issued his instructions.

'You're an exceedingly lucky young man,' he said, 'and I hope you appreciate your good fortune. I've been over those dye-works. They're practically moribund, but the site's valuable. Shut down the works at once, and sell the land. It'll bring in a very tidy sum.'

By this time Arthur was well over twenty-one, and even his father admitted that, but for his unfortunate hair and complexion, he would have been an uncommonly good-looking young fellow.

He hardly waited for his father to finish. 'Oh no,' he answered, 'I sha'n't do that. I couldn't throw all the work-people out. Besides, I feel sure that with some new plant I shall soon be able to make it a paying concern.'

'Why, you're as bad as the old man!' exclaimed Mr Romaine angrily. 'But if you choose to throw away as fine a chance as a boy ever had, mind you don't come to me for another start.'

'There'll be no need for that,' replied Arthur cheerfully. 'Uncle Charles was fine on the scientific side, but he'd no commercial instincts.'

'And you're fine on both sides, I suppose?'

'Passable, I hope,' Arthur returned, with a confident smile.

'If I did my duty, I should get you certified,' said his father, walking to the door. 'Any number of men would do it.'

This was meant to be a Parthian shaft, but Arthur just had time to answer it. 'Not when

we 've reformed the Lunacy Laws,' he called after the retreating figure.

IV.

When Arthur had been some three months at Shadwell, he announced his intention of leaving home and going to live nearer his business. By this time his face and manner had begun to show signs of hard work and anxiety. Shadwell had become a family joke, and his father's sarcastic inquiries tried his temper and sometimes provoked him to reprisals, of which he afterwards felt heartily ashamed. Mr Romaine strongly disapproved of the move, but he was too proud to own, what he felt to be the truth, that it was largely his own doing, and he had learned to respect the strength of his son's will, or rather, as he put it, to deplore his obstinacy.

Six months passed, with only a rare visit to Wimbledon, and an occasional letter or card. Then, one Sunday afternoon in May, the young man appeared, looking unusually smart, and radiantly happy. His shabby clothes had long been a joke against him, and Dick greeted him with an admiring scrutiny of his lounge suit.

'Is this the dye,' he asked—'the baffling, blue serge secret, wrung from the Shadwell vats by the Wimbledon B.Sc.? If the cut and fit were as good as the colour'——

'The things might be worn by a blood in the Sixth.' Arthur finished the sentence with perfect good humour.

'Well, how 's the business?' his father asked.

'Oh, hard work, and slow work; but I think we 're turning the corner.'

'Ah!' said his father, 'some people spend their lives turning the corner, and never get into the next street. What are you grinning at?'

'It 's such a glorious day, and things are so jolly,' answered Arthur, leaning back in his chair, with a broad and happy smile.

'I 'm glad you find them so,' said Mr Romaine, looking hard at him; 'but you might be a little more specific.'

'Well, I 'm introducing the co-operative system'——

'Good heavens! More madness!' ejaculated his father, with a groan.

'And I 'm going to get married.' A dye of a very becoming colour tinged Arthur's cheeks as he spoke.

'Married!' cried the family, with a rich variety of tone and expression.

'Who is the young lady, Arthur?' asked Mrs Romaine eagerly. 'Don't keep us on tenter-hooks, there 's a good boy.'

'Kitty Fairbanks, I say,' Dick interposed. 'I 've seen you, myself, making eyes at each other.'

Doris, aged fourteen, shook her head. 'No,' she said; 'she 's too frivolous.'

'Be quiet, children!' said Mrs Romaine. 'Now, Arthur.'

'The young woman'—— Arthur began.

'Oh Lord!' exclaimed Dick.

Mr Romaine stood up, his face tragic, his voice hollow. 'Arthur,' he said, 'come into my room, and tell me about it. Now then, who is she?' he demanded, as soon as they were alone. 'What is her name, first?'

'Her name is Sara Bolton.'

Just the faintest shake of the head was Mr Romaine's receipt for this piece of information. 'And what is her father?'

'She has none.'

'Her mother, then—what is her position? How does she live?'

'She is a most admirable woman,' said Arthur enthusiastically.

'What does she *do?*' thundered his father, losing hold of the reins for a moment. 'Does she keep a car, or does she take in washing?'

'Neither the one nor the other. She is caretaker at a Wesleyan chapel near the works.'

'And the young woman—it is your own expression—does she also scrub the floors?'

'No,' answered Arthur, still provokingly good-tempered. 'She has been attending on a sick lady. She loves nursing.'

'I hope she makes a speciality of mental cases,' said Mr Romaine, with a rather ghastly attempt at polite sarcasm. Then, before Arthur could say another word, he broke out, 'Now, look here. I 've had enough of this fooling. You 've been a vexation, a worry, and a disappointment from the first. I 've put up with what no other father would have tolerated for a moment. This is the end of the chapter, and, if you 're really as mad as you make out, we 'll close the book. If you choose to marry this servant-girl, neither you nor she shall ever cross this threshold. Now then, what do you say?'

'I 'm really awfully sorry you should take it like this, father,' said the young man; 'but, of course, I can't give up Sara. You 'd never have done it if you 'd been in my place.'

'Very well,' said his father, pointing to the door; 'take your hat and go straight out of the house.'

But Arthur drew himself up, and squared his big shoulders. 'No, father,' he answered, and there was a sterner note in his voice, 'I 'm hanged if I will! You 've got the right to forbid me the house, if you choose to, but I 'm not going without a good-bye to the others. You can come and hear whether I talk treason.'

He walked back into the drawing-room, followed, with some loss of dignity, by his father.

'Mother,' he said, 'and all of you, we 've got to part for the present. Father is angry because I can't give up the girl who has promised to marry me, and he forbids me to come to the house, but I couldn't go without saying good-bye.'

He kissed them all, except Dick, with whom

he shook hands. Then he held out his hand to his father, who, looking extremely uncomfortable, ignored the offer, and turned on his heel; Dick whistled 'Wait till the Clouds roll by;' and Mrs Romaine held her handkerchief to her eyes.

V.

'Who do you think I met to-day?' asked Dick.

'Whom,' corrected his mother, looking with pride on the fine, soldierly young figure in his O.T.C. uniform. 'Will Fortescue, was it?'

'No. It was dear old Art. Met him just outside the British Museum.'

Mrs Romaine glanced at her husband, whose eyes were on his coffee-cup.

'Was he in khaki?' she asked.

'No,' answered Dick. 'The silly juggins is a conscientious objector, and lives in hope of being a passive resister, or, better still, of being mobbed and put in prison. I thought he'd get his wish, too, by the way he shouted.'

Mr Romaine groaned. 'Good heavens! This is the crowning disgrace. Practically a bankrupt, married a servant-girl, a conscientious objector. Fancy, a Romaine!'

'I don't know about a bankrupt, sir,' said Dick. 'He didn't look like one, and he seemed in fine spirits. Going in for something outrageously unpopular has bucked him up, perhaps.'

'Unhappy boy!' sighed his father. 'I should have thought even he would have listened to the call of King and Country. "Fine spirits," you say. I hope they were assumed. If not, I am afraid his case is hopeless.'

'Well,' said Dick, 'perhaps the baby accounts for the spirits.'

'Baby!' screamed Doris ecstatically. 'Oh, how ripping! Fancy me an auntie! Oh, I *would* love to see it!'

'Silence!' said her father sternly. Then, turning to Dick, he asked, 'Did he say what —er—colour the unfortunate child is?'

Dick stared. 'A deepish purple, I should call it,' he answered.

'Have you seen it?' demanded Mr Romaine.

'Yes, sir.' Dick's manner was a little sheepish.

'Did you see the young—er—his wife, I suppose I must call her?'

'Yes. She's quite nice-looking, and she's got a pleasant way with her.'

'And how are they living?'

'They have rooms at the works. He's got some queer notion about the duty of employers to be at least as uncomfortable as their men.'

'Mad—mad as a March hare!' groaned Mr Romaine.

'"What's bred in the bone," though,' Dick went on. 'He's got some jolly little water-colours on the walls. He didn't get them for nothing, I know.'

'Student's rubbish, or futurist stuff—I know his taste,' said Mr Romaine contemptuously.

It was quite true. The Great War had come. The tide of patriotic enthusiasm flowed all around him, and Arthur's instinct for unpopularity interpreted it as a challenge. The pomp and glamour of war had always revolted him, and the attraction of being one in a hopeless minority was irresistible. He attended pacifist meetings, distributed pacifist literature, and, to his immense satisfaction, had his windows broken. But Mrs Arthur was a level-headed young person, devoted to her husband, though not to all his ideas, and before very long the fact that in this matter she was not with him began to modify his attitude. Then, cross-examining himself remorselessly, he forced from his own heart the admission that to leave Sara and the adorable babe for the blasted fields and sodden trenches of the Western front would have been a terrible ordeal. From that moment he began to waver. A visit to a hospital ward to see one of his workmen back from the fighting-line, maimed and crippled by a ghastly wound, settled the matter. As he saw the beds in the long ward filled with the battered, broken wrecks of the battlefield, he felt, not any eagerness for going into the strife, but only the impossibility of keeping out of it. That restless, quixotic, unappeasable conscience of his would always send him nosing after the most disagreeable job in the market.

'I'm going, after all,' he said to his wife that night.

She had well read his character. 'I knew you'd have to,' she answered, looking up at him proudly. 'It's too dreadful for you to keep out of.'

VI.

Some six months later, Mr Romaine found one morning on the breakfast-table an 'On Active Service' envelope addressed to him. He recognised the writing, snatched the letter, and, with fingers that trembled just a little, opened it, and pounced on the contents.

'Dear Father,—I dare say this will come to you as a great surprise. I ought to have told you, when I made up my mind that I couldn't keep out of this business, but I suppose pride and silly awkwardness kept me silent. I'm very sorry. I think, too, that I wasn't quite sure of myself—whether I could stick it, I mean. Dick frightened me—he seems just cut out for it, and I'm so utterly different. Dear old—or, rather, young—Dick! My stinks got me into the Engineers, and, more than that, they've actually got me a commission. But, just as I was beginning to feel my feet, a bit of shrapnel in the side knocked me off them. I've been on my back some time; but the worst is over, and in a few weeks I shall be in England again, on sick leave.

'I can't help worrying a bit about the business, though I have every confidence in my manager. But if you would look in, and go over the books

with him, I should feel ever so much easier. I would sooner trust your judgment than anybody else's. Hone, his name is. I've told him that if you do go, he's to give you every facility.

'My best love to mother and Doris and the rest. I've written to Dick.—Your affectionate son, ARTHUR.'

When he had read this through twice, Mr Romaine read it a third time—aloud.

'You will go, won't you, William?' asked his wife.

'Of course I will,' he answered indignantly. 'What do you think I'm made of? The—er—misunderstanding was not of my—well, it *was* a misunderstanding.'

'Do see the baby, dad!' said Doris.

The next day Mr Romaine spent three or four hours in Shadwell, and came home 'oozing satisfaction and benevolence,' so Doris wrote to Dick.

'I must admit,' he said to the assembled family, 'that I have hitherto grievously underrated our dear Arthur. I allowed—and I regret it—I allowed my judgment to be warped by irritation at certain unfortunate mannerisms, and I did not make sufficient allowance for the natural and indeed inevitable immaturity of youth. I have been astonished—yes, amazed—at the evidence of his really remarkable business capacity. In a year or two he has turned a moribund concern into a vigorous, active, effective organisation. The war has helped them, no doubt; but, as the manager put it, they are doing a roaring trade, in spite of that co-operative plan, which I still think a mistake. But really, in face of such a—er—brilliant success, I feel almost inclined to suspend my final judgment.'

'Did you see Arthur's wife?' asked Mrs Romaine.

'Oh yes, I did, my dear; and I must say that, on the whole, I was agreeably impressed. Lacking in polish, of course, but not to any painful extent; and a good girl, I'm sure. have asked her to come here for a few days.'

'And the baby, dad?' Doris inquired.

'A remarkably fine child, and very like what his father was, I'm glad to say.'

'What colour is he?' persisted Doris.

'Ah, my dear,' answered her father, with a tolerant smile, 'I remember asking Dick that very question myself. I dreaded the answer then, but I think I'm wiser now. The baby promises to be a fair Romaine, and I'm not sorry.'

DID SIR WALTER SCOTT KNOW WHO PICKLE THE SPY WAS?

By the Rev. JOHN OLIVER, M.A., V.D.

ONE day, in London, when passing through Leicester Square, I noticed at the entrance to a house formerly occupied by Sir Joshua Reynolds the painter, but now used as salerooms, a bill which stated that a library collection was being disposed of. I went into the place, where I observed, among other treasures, two autograph letters—the one signed Walter Scott; the other, Thomas Carlyle. They were soon put up for auction. I thought of bidding for them, but was deterred by the consideration that any offer of mine would be exceeded by those of relic-hunters who were present. The letters were knocked down at a certain price—to whom they fell I had not the slightest idea.

Next morning it occurred to me to take a stroll through Regent's Park from where I was staying in the Hampstead neighbourhood, and to call at the shop of a bookseller in Marylebone from whom I was wont to make purchases. On my inquiring if he had any book-plates, or what is technically termed *ex libris*, a goodly number were produced; and as I looked at them I chanced to say, 'Have you any autograph letters of Sir Walter Scott?' 'Yes,' replied the bookseller. To my surprise, he brought me the two identical letters I had seen in the saleroom. At the price he offered them, they passed into my possession.

It is the Scott letter which is of special interest in this article. It fills two quarto pages, and contains also three lines on the third, the remainder of which is occupied with a note by Mr J. H. Forbes, to whom the epistle was sent, and by whom it was forwarded on 19th February 1816 to 'Alex. Macdonell, Esq. of Glengarry, Garry Cottage, Perth.'

The letter is in these words:

'MY DEAR SIR,—As I know you are curious about subjects of antiquity, and especially such as relate to your own House, and as I have great pleasure in doing whatever I conceive would be agreeable to you, I beg to acquaint you that I have now in my possession, among other original papers concerning that period, an original letter from Charles II. to General Middleton, superscribed by the King, in which he acknowledges himself bound by promise to give Glengarry the Earldom of Rosse, but excuses himself on account of the Act of Annexation. He appears to have sent a gratification of some kind to Glengarry—it is called a warrant—as an earnest of his favour; but whether a grant of

honours, lands, or money does not appear. The letter is dated Cologne, 6th January 165$\frac{4}{5}$, and says many polite things of Glengarry's services. I think it may be interesting to you to know that your family at all times maintained their claim to the earldom, and were not therein opposed by the counter-claims of any other family, but only by the State jealousy which would interfere to prevent the re-establishment of so great an authority as was possessed by the Earls of Rosse.

'I was going to write out a copy of this curious document, but I thought you might like to have it transcribed in some more authentic manner. There is no question of its authenticity, as it bears the seal of Scotland as well as the signature of Charles. I am almost afraid to touch it, it is so frail, and I would wish you or any one you may commission to see it before it is patched or repaired in any way.

'If this should give you any interest or pleasure, as tending to show how early your family's claim was made to the title and estate of Rosse, it will be great pleasure to, my dear sir, your faithful servant, WALTER SCOTT.

'*P.S.*—I have been beating my brains lately to make words to what is called the music or set—that is, the tune, without the variations—of some of the best Highland pibrochs. I intend to give the words to Alastir Campbell, to whom they will be of use in his intended collection of Scottish music. Can you tell me any person in Edinburgh who is likely to give me the Glengarry Gathering in genuine purity?'

The note by the recipient, written on the same paper to Glengarry, is as follows:

'DEAR GLENGARRY,—Our friend Scott sent me this to seal and forward to you. It seems to be a most important document, and may assist your claim before the Lord Lyon. I shall get a copy of it immediately.

'You will be glad to hear that the Lady Lochgarry has gained her cause, altho' there are still some points to settle.—Yours affectly.,

'J. H. FORBES.'

One reason which the writer of this article has for drawing attention to the correspondence is that it reveals the deep interest Sir Walter felt in the Glengarry family. He was much attached to Alastair Macdonell, the last of them to hold the lands of the House, and the donor of Maida to Scott, who greatly prized the gift. When that chief died in January 1828 the Author of *Waverley* referred to him in his journal as 'warm-hearted, generous, friendly, beloved by those who knew him,' and recorded his own feeling by adding, 'To me he is a treasure.'

Another reason for drawing attention to the correspondence is that, in 1897, Mr Andrew Lang published a volume entitled *Pickle the Spy*, in which he maintains that the betrayer of Prince Charlie to the English Government was a Glengarry, that he was Alastair Ruadh Macdonell, who died unmarried on the 23rd of December 1761. He had 'the attraction,' says Mr Lang, 'of being eminently handsome. No statelier gentleman than Pickle, as his faded portrait shows him in full Highland costume, ever trod a measure at Holyrood. Tall, athletic, with a frank and pleasing face, Pickle could never be taken for a traitor and a spy. He seemed the fitting lord of that castellated palace of his race, which, beautiful and majestic in decay, mirrors itself in Loch Oich. Again, the man was brave, for he moved freely in France, England, and Scotland, well knowing that the *skian* was sharpened for his throat if he were detected. And the most extraordinary fact in an extraordinary story is that Pickle *was* detected, and denounced to the king over the water. . . . Yet the breach between James and his little Court on the one side, and Prince Charles on the other, was then so absolute that the Prince was dining with the Spy, chatting with him at the opera-ball, and presenting him with a gold snuff-box, at about the very time when Pickle's treachery was known in Rome. Afterwards, the knowledge of his infamy came too late, if it came at all.'

'His existence,' Mr Lang informs us, 'was suspected by Scott, if not clearly known and understood. . . . In him Scott, had he chosen, would have found a character very like Barry Lindon (but worse), and somewhat akin to the Master of Ballantrae. The cool, good-humoured, smiling, unscrupulous villain of high rank and noble lineage; the scoundrel, happily unconscious of his own unspeakable infamy, proud and sensitive upon the point of honour; the picturesque hypocrite in religion, is a being whom we do not meet in Sir Walter's romances. In Pickle he had such a character ready made to his hand; but in the time of Scott it would have been dangerous, as it is still disagreeable, to unravel this old mystery of iniquity. A friend of Sir Walter, a man very ready with the pistol, the last, as was commonly said, of the Highland chiefs, was of the name and blood of Pickle, and would have taken up Pickle's feud. Sir Walter was not to be moved by pistols, but not even for the sake of a good story would he hurt the sensibilities of a friend or tarnish the justly celebrated loyalty of the Highlands.'

So writes the author of *Pickle the Spy;* and the question naturally suggests itself whether it is likely that Scott suspected who Pickle was. Of this I am extremely doubtful. When reading Mr Lang's book I could not but think of how interested Scott was in the traditions of the Highlands, how devoted to the memory of Prince Charles, how warmly attached to the Glengarrys. I was unwilling to accept the statement that he even suspected who Pickle was.

On these grounds I, therefore, ventured to

draw Mr Lang's attention more particularly to the question, and received the following reply:

'1 Marloes Road, W.,
June 12 [1910].

'Dear Sir,—I am by no means certain that Sir Walter knew the identity of Pickle, though I think he did, for he had read much of the Stuart papers, and I know that the facts were familiar to some of the Skye Macdonalds.

'In any case, the knowledge would not affect Scott's friendship for the other Glengarrys, past or contemporary. There are black sheep in most folds, and if ever the Cumberland papers are published many things far from pleasant will come to light.—Believe me, faithfully yours,

'A. Lang.

'The Rev. John Oliver,
The Manse,
Maryhill, Glasgow.'

Need it be said that the effect of the reply was to incline the writer of this article more than ever to the conclusion that Sir Walter Scott did not know who Pickle the Spy was?

EL ARISH.

By C. T. A. H.

To one who has walked the one hundred miles of desert from Quantara and the Suez Canal, that is a dark saying of Napoleon's that to hold El Arish is to hold Egypt. How could he have held El Arish? With the aid of a railway and a pipe line we do it easily, but how in his day communications could have been maintained and a large army supplied with all its needs by camels alone across that grim tract of sandhills and dead salt lakes it is very hard to see. Certainly the Pharaohs never attempted a frontier here. Pelusium, not ten miles from the canal, was their most distant outpost. Nor could command of the sea have ever helped the problem. A stranded tug and an abortive pier are eloquent of our own failure here with marine transport. No breakwater can be built on these shifting sands. Not a single indentation occurs on this monotonous coast-line. When the storm rises, where are your lighters to shelter? El Arish has little use for the sea. The ship of the desert is the only craft that finds a port there, and it takes as many of these animals as the Government can buy to do a fraction of the transport work.

By its position El Arish is a more natural frontier town to Palestine than to Egypt, and such undoubtedly it once was. A visitor to the Governor's house recognises the hand of a Byzantine architect in part of its structure; and, again, a Gothic arch on the way to the fort suggests a Norman builder. A Greek governor no doubt once occupied the house; and subsequently, when Jerusalem was a Norman kingdom, a Norman soldier ruled from the fort.

As a town it is unlike anything in Egypt. The low, square-built houses are white and clean. One is reminded of Malta rather than of Egypt. The people in the streets are fairer, and there is something in the eye of the man you meet, in his bearing and the touch of colour in his clothing, that suggests a bolder, hardier race than the dejected felaheen. They are Arabs—Bedouins who have been tempted from their camps to settle in this favoured spot.

For certainly El Arish is favoured. Of water there is abundance, and for fruits of the earth there is the Wady, that narrow, level valley running inland far up amongst the hills. When the rains fall in the hills, the water comes down in a flood and irrigates the whole valley. The flood in February was so violent that it swept away the railway embankment and left the rails suspended and buckling in mid-air. It is an inundation as good as the Nile's, and in the spring the whole Wady is green, and El Arish has the promise of the barley, lentils, figs, and dates on which, with the trade of passing caravans, it lives and is content.

Thus, with an unnavigated sea to the north, and desert to the east, west, and south, for thousands of years—certainly since Abraham—El Arish has lived its own life, aloof and happy. Once in a century, perhaps, the dust of other people's quarrels has swept about its walls. Except for that, it has slept the sleep of rural seclusion, indifferent to the march of progress.

But this time along with the dust of war has come something that will stay. The shriek of the steam-engine is now heard in the streets. Surely El Arish will sleep no more.

SUMMER.

When sunlit hours, from wintry death upspringing,
Throw wide the doorway of the joyous days;
When at the dawn we hear the blithe birds singing,
And every sunset falls with happy praise;
When summer peace and summer glory filleth
The fleeting hours with hope and bliss divine,
May heaven's deep psalm, whose song each valley thrilleth,
Break with rich fullness on that soul of thine!

Lift up thine eyes; the wind all-glorious sweepeth
The Border Hills bedecked this day with flowers.
And while thy heart its tryst with Nature keepeth,
Thank God, thank God, for all His gracious hours.
Lift up thine heart! Behold! the days are olden
That held thee in their winter of despair;
Like dreams they passed—and, lo! with pinions golden
Fair summer, bride of joy, gleams everywhere.

THE PALAZZO VENEZIA.

By SALVATORE CORTESI.

'IT looks as though nearly five centuries of history had been opened before our eyes with the passing of the famous historic Palazzo Venezia to the Italian Government from the property of Austria, which for one hundred years had kept it closed.'

This was in my mind when visiting the imposing edifice of papal Rome together with Commendator Corrado Ricci, Director-General of Fine Arts, and Italy's most illustrious art critic.

On ascending the grand majestic staircase, the visitor at once notices the absence from its base of the bust representing the great Pope, Paul II., to whom the palace is due. He was one of the most interesting figures in the whole history of the papacy, and among the handsomest men of his time. The bust was long believed to be the work of an imitator of the divine Donatello, Vellano of Padua, who succeeded with this marble portrait in leaving to posterity a fine work of art and a worthy memento of his patron. The latter called him to Rome, and entrusted to him the portico enclosing the internal garden of the palace. Modern critics, however, see in the bust the hand of Mino da Fiesole, the great artist who, together with Paolo Romano, worked on the tomb of Paul II.

Until May 1915, when Italy declared war on Austria, this palace was the residence of the embassy of the Emperor Franz Joseph to the Holy See, and was considered as Austrian property, situated in the very heart of Rome. It was a thorn in the flesh of the Italians that this colossal structure, erected by an Italian Pope, conceived by Italian artists, having symbolised in the Eternal City for over two centuries Venice, the most glorious Italian republic, should remain in the hands of Austria, the country which they considered their traditional and irreconcilable enemy. Vienna had never been tactful in dealing with the Italians, and instead of taking advantage of the Triple Alliance, which lasted a third of a century, to extinguish the old feuds between the two nations, the Austrians seemed to seize any occasion to rub their Allies the wrong way. This was notably the case with the Palazzo Venezia. When, in 1870, the temporal power fell and Rome became the capital of United Italy, Austria was not in good relations with the Holy See. Notwithstanding this, as one of the many signs of contempt for the new kingdom, she kept the seat of her embassy to the Vatican in the Palazzo Venezia, thus giving to the ambassador to the Pope a much greater importance than to the one accredited to the king, as the latter ambassador lived in a hired apartment. Rightly or wrongly, the Italians interpreted this attitude as a mark of distrust towards the new order of things, which seemed to be considered by Austria as merely temporary, and as though they expected an early restoration of the papal state. Therefore the Palazzo Venezia became, and was for about half a century, the target of all anti-Austrian demonstrations, obliging the Italian Government to keep around it a special guard of policemen and carabineers, and having in troubled times its neighbourhood occupied by troops. It was most important for new Italy that no insult should be offered to the Palazzo Venezia, which represented both Austria and the Holy See. In fact, she could not afford to offend Austria in such a way as to come to war with her, and she desired to avoid any incident which might have offered an opportunity to the Vatican to claim before the world that the Pope and the diplomatic body accredited to him did not enjoy in Rome the liberty and respect which Italy had proclaimed and sanctioned by the Law of Guarantees in 1871.

When Italy in May 1915 first denounced the Triple Alliance, and later in the month decided to go to war with Austria, she was ready to allow the representative to the Vatican of the Hapsburg monarchy to remain in Rome, and was willing to look after his safety and complete independence. However, Austria and Germany, thinking to embarrass the Italian Government and create for them new difficulties by raising again the Roman question, decided that not only Prince Schönburg, the Austrian Ambassador, but also Baron von Ritter, the Bavarian Minister, and Dr von Mühlberg, the Prussian Minister, all accredited to the Vatican, should leave Rome. They were all sent to Switzerland, continuing to be accredited to the Pope from Lugano. Austrian interests in Italy were entrusted to Spain, which also had two ambassadors in Rome—one to the Quirinal, who undertook to look after Austrian

 [*All Rights Reserved.*]

civil affairs, and one to the Vatican, who became a kind of link between Prince Schönburg and the Holy See.

Two years have passed since Italy entered the war, and the demand of the people to answer Austria's many violations of all laws by occupying the Palazzo Venezia became so pressing that the Government decided in August 1916 to confiscate it. In so doing Italy was exercising her rights, since the historic building constructed by Paul II. was given by the papacy to the Republic of Venice, and was taken by Austria when Venice became hers; so that on the return of Venice to Italy her palace in Rome ought also to have been ceded.

The decree of confiscation was notified to Señor Piña y Millet, the Spanish Ambassador accredited to the Quirinal, and gave until 1st November for the removal of everything belonging to Austria, and especially the archives, which occupied several rooms. While the arrangements were being made for clearing the palace, Austria sent to Señor Piña, a true and loyal friend of the Allies, a protest against the confiscation, to be presented to the Italian Government, couched in such insulting and vulgar terms that the ambassador, before presenting it, requested the Vienna Government to reconsider the form in which it was drawn. Vienna answered that the form was no business of the Spanish Ambassador, whose duty was simply to fulfil his instructions, acting as intermediary in the transmission of documents between Austria and the Italian Government. Señor Piña obeyed, and the Italian Minister for Foreign Affairs, Baron Sonnino, gave Austria the lesson she deserved. He refused to receive the protest, which the most rudimentary laws of manners should have prevented the Austrians from asking the representative of Spain to present.

The clearing of the Palazzo Venezia was then entrusted almost entirely to Count de la Viñaza, Spanish Ambassador to the Vatican, who stripped the palace of everything which it contained, simply leaving the walls. In some rooms the frames of the doors and windows, and even the floors of ancient tiles, were removed, together with all the fixtures. Among these valuable objects, the bust of Paul II. was abstracted; but Commendator Ricci assured me that he knew where all the things had been stored, and that they were being watched by the Government, and would soon be returned to their rightful place.

The delivery of the palace in this condition was duly made to the Italian authorities, and the same day the Italian tricolour and the gilded flag with the Lion of St Mark waved again from the balcony of the historic palace, greeted by the enthusiastic cheers of the people of Rome.

The grand staircase of the Palazzo Venezia leads immediately into the largest hall, called the Sala Regia, about one hundred and fifty feet long, ninety feet wide, and sixty feet high, with a beautiful pointed roof with old beams, and lighted by five huge windows. The next, at the corner of the building, is the Consistorial Hall, so called because it was used by several Popes to hold their consistories for the creation of cardinals, beatifications, canonisations of saints, &c. The next large hall is called 'of the Mappamondo,' from a famous globe designed and illuminated on wood and canvas by the Venetian cosmographer, Gerolamo Bellavista, by order of Paul II., who decorated with it the main wall of this hall, which is now divided into two.

The adjacent hall is called after Hercules, from a large frieze at the top decorated with a fresco representing the Twelve Labours of Hercules, and with fountains, which, according to Leon Battista Alberti, were most useful paintings in rooms occupied by statesmen and potentates, as the mere sight of the water contributed to refresh their minds and quench the thirst due to excessive libations.

On the wall facing the two windows there is a fresco representing the Venetian Senate, which, in exchange for this palace presented to them by Pius IV. as the seat of the Venetian Ambassador, gave to the papal nuncio as his residence in Venice the old palace of the Doge Andrea Gritti.

The Hall of Audiences which follows is where the Venetian Ambassadors received their guests, and where Gregory XIV. died of stone in October 1591. Halls and rooms continue along three sides of the palace with more or less gorgeous appearance according to their purpose —some with beautiful coffered ceilings carved and gilded; others with artistic large marble mantelpieces, which, together with the rich marble doorways, have in the centre the coat of arms of the Barbo Pope, a rampant lion crossed by a band. One of the rooms looking out on the piazza is decorated by four medallions representing the personages who were chiefly connected with the history of the palace— Paul II., Cardinal Marco Barbo, Paul III., and Pius IV. An important discovery has been that of an ancient floor in beautiful old tiles of an Arab type, which are still manufactured in Naples, where Commendator Ricci will have them reproduced to match the character of the different halls.

To return to the founder of the palace, it will be interesting to recall that Paul II., born in 1418, belonged to the noble Venetian family of the Barbo, which, in that period of nepotism, gave besides this Pope many dignitaries to the Church. The Barbo family claimed to descend from the ancient Roman house of the Enobardus to which belonged the Emperor Nero. Paul II.'s mother was a most pious lady, Polissena Condulmieri, who was respectively mother, sister,

and niece of three different Popes; while her mother, Paul II.'s grandmother, was grandmother, mother, and sister of three pontiffs, besides being great-grandmother, grandmother, and aunt of nine cardinals, six patriarchs, and eleven bishops.

Paul II. was created cardinal at the age of twenty-three by his uncle, Eugene IV., and in that capacity in 1464 he accompanied Pope Pius II. to Ancona for the crusade against the Turks, which that pontiff intended to lead in person. Pius II., however, fell ill and died; while Cardinal Barbo himself, attacked by the plague, which was ravaging Ancona, took refuge in Loreto, the seat of the famous sanctuary, containing the House of Nazareth.

Eugene IV. had predicted that his nephew, Cardinal Barbo, would be the fourth pontiff after him—that is, the successor of Pius II. Cardinal Barbo, ill at Loreto, while placidly sleeping had a vision of the Virgin, who announced his recovery and his approaching election as Pope. As a thanksgiving, he promised to build, at his own expense, a sanctuary to replace that which for one hundred and forty years had held the House of the Virgin, and to continue the construction of the palace which he had already begun next to the Church of St Mark in Rome, the present Palazzo Venezia. The prediction was fulfilled, and on 30th August 1464 Cardinal Barbo became Pope at the age of forty-six.

Paul II. made his palace the centre of all the art treasures he could collect, and of all the amusements and festivals of that sumptuous period of papal Rome. The beautiful interior of the Palazzo Venezia, with its garden, which resembles a monastic cloister on account of the arcades which surround it, and the immense halls, painted by the Florentine Pollaiolo, still seem to recall the festivals given there by Pope Paul II., who, even when Head of the Church, continued the habit of being up the whole night, dining at sunset and supping at sunrise; so that his audiences were always given after dark.

In this palace, and in its garden, Paul II. gave banquets which remained famous through many of the succeeding pontificates, having as guests potentates and princes, and the most distinguished cardinals, including that Rodrigo Lenzuos, with his red stockings encrusted with pearls, who twenty years later became Alexander VI., and is better known as the Borgia Pope.

It was Paul II. who transferred the celebration of Carnival to the Corso, the main thoroughfare of modern Rome, almost facing his palace, where races of horses running riderless were instituted. They lasted every year seven successive days, presided over by Paul II. from the balcony of his palace, under which three heavy curtains were hung, one after the other, for the excited, and by that time unmanageable, horses to dash into, and they were thus stopped in their mad career.

Many bulls, briefs, and other papal documents were dated from the Palace of St Mark. From there Paul II. drafted the Constitution of Rome, and had the merit of encouraging the introduction of the art of printing into the papal states, which through his support took a wonderful development. The presses were brought to Rome from the Gutenberg printing-house in Mainz by Conrad Sweynheim and Arnold Pannartz, who, in 1467, were housed by Prince Pietro Massimi in his beautiful palace not far from the Palazzo Venezia. Their editions of Cicero and St Augustine were the first books published in Rome and in Italy, and through the patronage of this Pope, to whom most of them were dedicated, they succeeded in publishing twelve thousand four hundred and seventy-five volumes in seven years. Most of these precious volumes were lined along the walls of the then Palace of St Mark, together with the art collections which the magnificent Barbo Pope had gathered there.

Paul II. died suddenly, at the age of fifty-three, after having gaily supped in the garden. Some attributed his death to his having eaten two large water-melons, others to the little fish from the Tiber of which he had also eaten abundantly; but in reality it seems that he had a stroke of apoplexy.

It is much to be deplored that there is no possibility of ascertaining what the still unfinished palace was like, and what it contained at the death of its creator. The outside of the building is one of the best examples existing of Renaissance architecture in Italy, and a unique specimen in Rome of the Guelf square window divided by a cross.

The massive colossal structure devised by Paul II., covering an immense block and enclosed by four streets, has more the appearance of a castle than a palace. For the construction of the papal edifice, stone, marble columns, and other building requisites, together with architectonic ideas, were taken from ancient remains, and especially from the Colosseum, the Castel St Angelo, the Circus of Hadrian, &c., which were then looked upon as storehouses of materials. Most of the palaces in Rome of the fifteenth century and especially of the sixteenth were thus built; so that it is a wonder that anything at all is left of ancient Roman structures. The famous Palazzo Barberini, erected by Carlo Maderno for Urban VIII. of that family in 1628, gave rise to the saying, '*Quod non fecerunt barberi fecerunt Barberini*' ('What the barbarians did not do the Barberini did').

Paul II. evidently also intended that the surroundings of his palace should be fittingly decorated, and in 1467 had the square in front of it embellished by the erection of the colossal sarcophagus of red porphyry, the sepulchre of

Constance, daughter of the Emperor Constantine, which stood in its mausoleum on the Nomentana Way, where Sixtus IV., who was Paul II.'s successor, replaced it; but whence it was taken to the Vatican in 1791.

Strange as it may seem, the exact date when the palace was begun and the name of its architect are uncertain; but it is believed that it was started in 1455, this being the year on the medals cast to commemorate the foundation; and Gaspare of Verona, biographer of Paul II., attributes it to Francesco Burgense of San Sepolcro. Paul II. spent on the palace one hundred and seventy-five thousand gold ducats, which was then a colossal sum, without, however, finishing it. Perhaps more valuable than the palace itself was the priceless art collection, which by the time Paul II. died had reached proportions that no one can realise nowadays. It was undoubtedly the richest and most precious museum of ancient and contemporary works of art of which Europe could then boast.

Paul III., a Farnese, elected pontiff in 1534, not only took the same name as the Barbo Pope, but resumed his programme and completed the construction of the great palace, which had suffered much through being used as a barracks by the soldiers of Charles VIII. of France and of the Emperor Charles V.

Paul IV., the Neapolitan Carafa, elected in May 1555, ex-collector of Peter's pence in England, in the first consistory held in the Palace of St Mark, received the three English Ambassadors sent by Queen Mary to make the act of obedience and ask pardon for her father. Paul IV. raised the prostrated ambassadors, embraced them, absolved England from all ecclesiastic censure, and, further to increase the dignity of its sovereigns, issued a bull on 7th June by which Ireland was raised to a kingdom, a title which Henry VIII. and Parliament had already given it without the approbation of the Holy See. His successor, Pius IV., of the Milanese family of Medici, also lived in the Palace of St Mark, but by a brief of 10th June 1564 destined half of it as the residence of the cardinal titular of St Mark, and gave the other half to the Republic of Venice for her ambassador as a reward for her having willingly been the first to accept the Council of Trent.

To this period belongs a statue of the Republic of Venice with the Doge's Cap and the Lion of St Mark, which forms a fountain in the centre of the courtyard, and recalls the two hundred and thirty-three years of Venetian possession of the palace. This beautiful courtyard, of which only one side is finished, has Doric columns on the ground-floor and Corinthian columns on the first, as in the Colosseum, which served for its model. As the residence of the Venetian Ambassadors, the palace was in the eighteenth century the scene of most gorgeous receptions and festivals, which reached their climax on the occasion of the election in 1758 of Clement XIII., who was a Venetian of the Rezzonico family. The last ambassador of the Venetian Republic in Rome was the patrician Pietro Pesaro, appointed in August 1794. In May 1797 he was notified that the republic, which had lasted a thousand years and had passed into the hands of the French, existed no longer; and shortly after, the municipality of Venice ordered him to continue in his office in the name of the people, telling him to replace on the palace the arms of St Mark with the insignia of Liberty, to change his seals, and to wear in his hat the white-red-and-green national cockade. Pesaro obeyed in everything except in the coat of arms, as it must have seemed to him a sacrilege to remove that emblem of great patriotic memories. On 16th December he was informed of the Treaty of Campoformio and of the cession of Venice to Austria, and was therefore ordered to return home as a private citizen; but Pesaro remained tranquilly in the Palazzo San Marco, which only then began to be called Palazzo Venezia. He continued to send his reports to the Venetian authorities as though nothing had happened, in one of them making it understood that he did not wish to leave the palace for fear that the Vatican, which two centuries before had given it to Venice, might retake it. The Venetian authorities thought they would prevent this by appointing a keeper of the palace in the person of Abbé Parisi; but the ambassador refused to deliver it over, and remained at his post. He applied to Austria, which, it seems, had never thought of the palace in Rome, for the post of looking after it, and he then did for Austria what he had refused to do for the democratic Government: he replaced the coat of arms of St Mark by that of the Hapsburgs. General Wial French, Governor of Rome, protested, saying there was no word on the subject in the Treaty of Campoformio. Soon the position in Rome became untenable for Pesaro, who retired to England, and died in London in February 1830.

The first Austrian Ambassador sent to the Palazzo Venezia advised his Government to sell it, on account of the bad condition to which it had been reduced. In 1819 the Emperor Francis I. stayed there; in 1822–23 Frederick William, King of Prussia, resided in the palace. The Assembly of the Roman Republic of 1848–49 decreed that the palace should be returned to the people of Venice, and entrusted the Triumvir Giuseppe Mazzini to draft the address. Instead, with the restoration of Pius IX., it was again given to Austria, which kept it even after the Peace of Villafranca in 1866, by which the Venetian provinces passed to Italy.

On 25th August 1916 Italy took possession of the palace, as it 'historically appears an inseparable appendage of Venice.'

THE DEFINITE OBJECT.

CHAPTER XXX.—HOW GEOFFREY RAVENSLEE DEPARTED FROM HELL'S KITCHEN.

'WHAT! back again already, Mr Geoffrey?' exclaimed Mrs Trapes, poking her head round the kitchen door as Ravenslee entered the flat. 'Back so soon?'

'Only for a minute, Mrs Trapes.'

'Supper'll be ready soon—your wedding supper—eh, Mr Geoffrey? You'll have it here with me; you an' Hermy, o' course. Smells kind o' good, don't it?'

'Delicious, Mrs Trapes!'

'Delicious is the word, Mr Geoffrey—stooed beef with carrots'——

'And onions, Mrs Trapes—onions, I'm sure?'

'Well, I'll not deny a onion here an' there, Mr Geoffrey—a stoo needs 'em.'

'Ah, I knew it!' sighed Ravenslee. 'I grieve that I sha'n't be able to eat it.'

'Not eat—what, you? Say, ye ain't sick, are ye?'

'Not in body, Mrs Trapes.'

'Then why no stoo?'

'Because I sha'n't be here. I'm going, Mrs Trapes—I'm leaving Mulligan's now—for good.'

'Leavin'—ye mean with Hermy?'

'No—alone. Good-bye, Mrs Trapes!'

'My land!' gasped Mrs Trapes, 'what you tellin' me?'

'Good-bye, Mrs Trapes!'

'But why? Oh, dear Lord, what is it? Who'——

'I want to thank you for all your kindness. Good-bye!'

As one in a dream, Mrs Trapes extended a limp hand and stood wide of eye and pale of cheek to watch him go; and as he descended the stairs her look of helpless, pained surprise went with him. Swiftly he strode across that familiar court, shoulders squared, chin outthrust, and eyes that glowed ominously in his pale face beneath fierce scowling brows. As he turned into Tenth Avenue there met him the Spider.

'What you chasin' this time, bo'?' he inquired.

'M'Ginnis.'

'Then you're sure chasin' trouble.'

'That's what I want. D'you know where he is?'

'Sure I do, but'——

The Spider paused, drawing in his breath slowly, as with experienced gaze he viewed Ravenslee's pale, set face—the delicate nostrils wide and quivering, the relentless mouth and burning eyes, and all the repressed ferocity of him; and, drawing back a step, the Spider shook his head. 'Bo',' said he, 'that's jest what I ain't goin' t' tell ye.'

'Very well; I must find him.'

'Don't!' said the Spider, walking on beside him; 'if I didn't think a whole lot o' ye I'd lead ye to him.'

'Oh, I shall find him, if it takes me all night.'

'An' if ye do it'll be murder, I'm dead sure.'

'Murder!' said Ravenslee with a flash of white teeth. 'Well, I shall certainly kill him—this time!'

'Is it th' kid again?'

'No—oh no; it's just for my own satisfaction—and pleasure.'

'You ain't heeled, are ye? This ain't goin' t' be no gun-play—eh?'

'No, I haven't a gun, but I've brought his—neckerchief.'

'Sufferin' Pete!' murmured the Spider in a strangely awed voice, and walked on in silence, chewing viciously.

'Bo',' said he at last, 'I'm thinkin' th' kindest thing I could do would be t' slip one over t' your point while you wasn't lookin', an' put you t' sleep a bit—you want soothin'! Bud'll be too big for you or any other guy t' tackle now; ye see, his stock's rose; th' Noo Jersey p'lice wasn't strong enough t' hold him.'

'That's where I'm different—I can!' said Ravenslee, opening and shutting his right hand convulsively. 'Yes, I'll hold him till his last kick—and after!'

'My God!' exclaimed the Spider softly, and, beholding that clutching right hand, he edged away.

'Where you goin' t' look for him?' he inquired after a while.

'O'Rourke's!'

'Why not try Raynor's first?' and he nodded to a saloon on the adjacent corner.

'Because I'm not a fool.'

'Bo', I ain't s' sure o' that! O'Rourke's'll be full o' tough guys t'-night; all th' bunch'll be there; an' if Bud tips 'em the say-so they'll snuff your light out quicker 'n winkin'.'

'That wouldn't be such a hardship.'

'Oh, so that's it, hey? You got a kiss-me-an'-let-me-die sort o' feelin', hey? Some nice bit o' stuff been turnin' ye down, bo'?'

'That'll be about enough!' said Ravenslee, quick and fierce; and, meeting the flash of his eye, the Spider edged away again.

'Sufferin' Mike!' said he, 'you sure ain't doin' the affable chat stunt t'-night!'

But Ravenslee strode along in silence; and the Spider, heeding the pale, set ferocity of his expression, grew troubled. 'Say,' said he at last, 'this don't happen t' be th' night as you've fixed up t' smash th' gang, does it?'

'No—only M'Ginnis.'

'S'posin' he ain't at O'Rourke's?'

'He 'll be somewhere else.'

'Bo', if I was your ma I should be prayin' you don't find Bud; yes, sir! An' I should pray—damn hard!'

By this time they had reached Eleventh Avenue and were close upon the saloon, when Ravenslee halted suddenly, for beneath a lamp on the opposite side-walk he saw M'Ginnis in talk with two other men.

Drawing the neckerchief from his pocket, Ravenslee crossed over and tapped M'Ginnis on the arm, who, turning about, stared into a pallid face within a foot of his own.

'What th' hell'—— he began.

But Ravenslee cut him short. 'You left this behind you,' said he, thrusting forward the neckerchief, 'so I 've brought it to twist round that foul throat of yours. Now, M'Ginnis—fight!'

Thrusting the neckerchief into his pocket, Ravenslee clenched his fists, and, saying no word, they closed and fought—not as men, but rather as brute beasts eager to maim and rend. M'Ginnis's companions, dumbfounded by the sudden ferocity of it all, stayed a while inactive, staring at these two forms that lurched and swayed, that strove and panted grimly speechless. Then, closing in, they waited an opportunity to smite down M'Ginnis's foe from behind. But the Spider was watching, and, before either of them could kick or strike, his fists thudded home—twice, hard blows aimed with scientific precision; after which, having dragged the fallen away from these fierce trampling feet, he stood, quivering and tense, to watch that desperate encounter.

Once Ravenslee staggered back from a vicious flush-hit, and once M'Ginnis spun round, to fall upon hands and knees; then they clinched, and, coming to the ground together, fought there, rolling to and fro and hideously twisted together. But slowly Ravenslee's clean living began to tell; and M'Ginnis, wriggling beneath a merciless grip, uttered inarticulate cries and groaned aloud. And now the deadly neckerchief was about his gasping throat, and in his ears his conqueror's fierce laugh—lost all at once in a roar of voices, a rush of trampling feet.

Wrenched at by fierce hands, smitten by unseen fists, Ravenslee was beaten down—was dimly aware of the Spider's long legs bestriding him, and, staggering up through a tempest of blows, hurled himself among his crowding assailants, felled one with his right, stopped another with his left, and, as the press broke to the mad fury of his onslaught, felt his hand wrenched from a man's windpipe, and heard a frantic voice that panted, 'Leg it, bo'—leg it! Holy gee! ain't ye had enough?' So, mechanically, he set off at a run, with his arm still gripped by the Spider. 'Leg it, bo'—leg it good, or here 's where we snuff it sure! This way—round th' corner; only keep goin', bo'—keep goin'.'

Very fleetly they ran, with their pursuers close on their heels, across open lots, over fences, along tortuous alleys, until the rush and patter of the many feet died away, and the Spider, pulling up at the corner of a dismal narrow street hard by the river, stood a while to listen.

'Jiminy Christmas! but you 're some hot stuff at the swattin' business; you 're a glutton, you are, bo'. I been in one or two scraps meself, but I never seen a guy so hungry for'——

'Where are we?'

'Thirteenth an' Twentieth.'

'Are we safe?'

'F'r th' time, I reckon. But all Hell's Kitchen 'll be out after us t'-night, sure. So I guess it 's us f'r th' immediate hike.'

'Us? Will they be after you too?'

'Well,' said the Spider, smiling down grimly at his damaged knuckles, 'I guess, yes! Hell's Kitchen an' Tenth Av'ner 's got t' get along without me from now on, I reckon. They ain't losin' much, an' I ain't leavin' much; but'——

'What the devil had you got to follow me to-night for?' demanded Ravenslee, scowling.

'Bo',' said the Spider, as they went on again, 'there 's times when my likin' f'r you gets a pain; there 's times when yer talk gives me th' earache, an' yer lovin' looks the willies. I ain't lookin' f'r no gratitood, nor yet a gold dinner-set an' 'loominated address; but, not ownin' a hide like a sole-leather Saratoga, I 'll jest get on me way. S' long!'

'Where are you going?'

'I dunno; but—I 'm goin' there, right now.'

But as the Spider turned away his hand was caught and gripped, and Ravenslee was smiling; his features looked somewhat battered, but his smile was as pleasant as ever. 'Forgive my cursed temper, Spider. I owe you my life again, and—I ought to be grateful, I suppose. Forgive me; I 'm—not quite myself to-night.'

'Sure thing!' said the Spider, returning his grasp. 'But, bo', I 'm kind o' wonderin' in me little mind what Bud 's feelin' like! You sure swatted him good an' heavy. I never seen cleaner foot-work, an' them left jabs o' yours.'

'The question is, how do you feel, Spider, and what are you going to do?'

The pugilist scratched his big chin. 'Well, that 's what gets my goat; I dunno quite, bo'. Ye see, I sha'n't be able t' get no more fights here in the East now, not wi' Bud 'n' his old man against me; ye see, Bud's old man 's about the biggest'——

'I wonder if you 'd care to come with me?'

'Whaffor?'

'Well, for one thing, I need another chauffeur, and'——

'A—what?' The Spider halted under a lamp-post to stare at Ravenslee a little anxiously. 'Say now, take a holt of ye—see?—an' jest put that one over th' plate again. You need a—what?'

'Another chauffeur.'

'Another shuvver—another? Bo', ye didn't happen t' get a soak on th' bean just now, did ye?'

'No.'

'Well, then, I guess you 're some shook up; what you want 's food, right now!'

'Why, yes, now you mention it, I 'm devilish hungry.'

'Leave it t' me, bo'. I know a chewin'-joint close by—soup, joint, sweets, and coffee, an' only a quarter to throw—some feed, bo'! Shin right along; I 'll '——

'No; you shall come home and dine with me.'

'Home?' repeated the Spider, halting to stare again. 'You 're sure talkin' ramblin'.'

'We can discuss the chauffeur's job then.'

'Shuvver?' said the Spider uneasily. 'But what 's a guy like you want with a shuvver?'

'Well, to drive my car—and '——

'Car?' said the Spider, his uneasiness growing. 'Got a car now, have ye, bo'?'

'I rather think I've got six.'

'Sufferin' Sam!' The Spider scratched his big chin, while his keen eyes roved over Ravenslee's exterior apprehensively. 'Say, bo', you quite sure none o' th' bunch booted you on th' dome—eh?'

'Quite sure.'

'An' yet you got six autermobiles. I say—you think so.'

'Now I think again, they 're seven, with the newest racer.'

'Say now, jest holt still a minute! Now, swaller twice, think damn hard, an' tell me again! You got how many?'

'Seven!'

'Got anythin' else?'

'Oh yes, a few things.'

'Tell me jest one.'

'Well, a yacht.'

'Oh, a yacht?'

'A yacht.'

''S nuff, bo, 's nuff! But go on—go on; get it all off if you 'll feel better after. Anythin' more?'

'Why, yes; about twenty or thirty houses and castles and palaces and things.'

'That settles it sure!' sighed the Spider. 'You 're comin' t' see a doctor, that 's what! Your dome 's sure got bent in with a boot or somethin'.'

'No, Spider; I just happen to be born the son of a millionaire, that 's all.'

'Think o' that, now!' nodded the Spider; 'a millionaire, now—how nice! An' what do they call ye at home?'

'Geoffrey Ravenslee.'

'How much?' exclaimed the Spider, falling back a step. 'The guy as went ten rounds with Dick Dunoon at th' "National"? The guy as won th' autermobile race? Th' guy as bought up Mulligan's—you?'

'Why, yes. By the way, I sat in the front row and watched you lick Larry M'Kinnon at 'Frisco; I was afraid you were going to recognise me, once or twice.'

'Then you—you have got a yacht—th' big one as lays off Twenty-third Street?'

'Also seven cars; that 's why I want you for a chauffeur.'

'Ho-ly gee!' murmured the dazed Spider. 'Well, say, you sure have got me goin'! A millionaire! A pea-nut cart! A yacht! Well, say, I—I guess it 's time I got on me way. S' long!'

'No you don't, my Spider; you 're coming home with me.'

'What!—me? Not much I ain't—no, sir! I ain't no giddy gink t' go dinin' with millionaires in open-faced clo'es—not me!'

'But you 're coming to have dinner with that same pea-nut man who learned to respect you because you were a real white man, Spider Conolly. And that 's another reason why I want you for my chauffeur.'

'But—say, I—I can't shuv.'

'Joe shall teach you.'

'Joe? Ye mean Joe Madden?'

'He 'll be chauffeur No. 1; and there 's a cross-town car! Come on, Spider! Now, in with you!'

CHAPTER XXXI.—IN WHICH SOAPY TAKES A HAND.

O'ROURKE'S was full; its long bar, shaped something like the letter J, supported many lounging arms and elbows; its burnished foot-rail was scraped by boots of many shapes and sizes; its heavy air, thick with cigarette-smoke, hummed with many voices. In one corner, a corner remote where very few ventured to penetrate, Soapy leaned, as pallid and non-committal as ever, while Spike poured out to him the story of his woes.

'She drove me out, Soapy! She drove me away from her!' he repeated for the hundredth time. The boy was unnaturally flushed and bright of eye, and his voice was as shaky as the hand which fidgeted with his whisky-glass; and the sense of his wrongs was great, and growing greater with every sip.

'She told me t' leave her! She drove me away from her.'

'So you come here—eh, kid?' drawled Soapy, pendent cigarette smouldering. 'You shinned over here t' Bud f'r comfort, an' you 'll sure get it, kid—in a glass!'

'Bud 's always good t' me.'

''S right, kid, 's right; Bud 's a angel sure, though he ain't got no wings yet. Oh, Bud 'll comfort ye—frequent; an' by-an'-by he 'll take ye back t' Hermy good an' soused; you can get your own back that ways—eh, kid? It 'll sure make her sit up an' take notice when she sees ye come in reelin' an' staggerin'—eh, kid? An' to-morrow you 'll be sick mebbe, an' she 'll have ter nurse ye—eh? Bud 'll fix things for ye, I guess.'

Spike glowered and pushed his half-emptied glass farther away. 'I ain't goin' home soused!' he muttered.

'No?' said Soapy, faintly surprised. 'Bud 'll feel kind o' hurt, won't he?'

'I ain't goin' home soused—not for Bud nor nobody else!'

'Why then, if I was you, kid, I should beat it before Bud comes in.'

'I guess I will,' said Spike, rising.

(Continued on page 484.)

SCIENCE AND THE SOIL.

THIS year everybody with a little bit of garden is taking active steps to get the best out of it, and therefore it ought to be of interest to make a little study of the chemical nature of soils and of the ways in which they can be improved. Soil might perhaps be defined as 'the disintegrated top of the land,' and this 'top,' of course, consists of minute particles derived from the breaking up of rocks by the wearing effect of wind, water, frost, &c.

We can easily recognise three main kinds of soil—sandy, clayey, and chalky; but we should not look upon any one of these in its pure state as a good soil for growing purposes. Nor would simple mixtures of these be of much use. Something extra is required—namely, a material called *humus*, which is made by the decaying remains of plants and animals. Modern investigation has shown that this humus plays a very important part in connection with the fertility of the soil.

Formerly it was supposed that soil consisted of the inorganic particles formed by the breaking up of rocks, simply *mixed up* with the organic matter derived from the decaying of plants and animals; but lately it has been practically proved that the rock particles are covered with a sort of skin formed from the humus, together with some silica, alumina, &c. This skin has the power of holding up moisture and the various soluble compounds that are necessary for a plant's growth, and which, but for this, would be largely washed away.

Here we have an explanation of the very great benefit that a sandy soil derives from 'green manuring.' In the ordinary way it cannot retain sufficient moisture and salts; but when the green stuff is dug in and rots, it forms the humus which coats the particles, and greatly increases their power of retaining the necessary plant-food and moisture.

It is a curious fact that humus appears at first sight to act in an exactly opposite way upon very heavy clay soils. Clay is apt to retain too much water, and not to allow sufficient movement of the plant-foods towards the rootlets. The humus separates the clayey particles, and so 'opens out' a soil of this description.

If the proportion of humus gets too high the soil is likely to 'sour,' and then it is quite unsuitable for plant-growth. It is important, therefore, that manuring should not be overdone.

Although very many inorganic substances take part in a plant's growth, it has been found that only four classes of substances are likely to run short—namely, phosphates, potash compounds, nitrogen compounds, and lime compounds. If these materials get used up, most plants either refuse to grow at all or grow in a very poor way. It is rather strange that there may be an abundance of potash compounds or phosphates in a soil, and yet it may be incapable of sustaining a plant's proper growth. The explanation is that the compounds are not easily soluble ones, and the plant cannot get its food quickly enough. It is true that the action of air and moisture leads continually to the breaking down of the insoluble compounds into soluble ones, but the process is a very slow one. Plants may therefore get phosphate or potash or nitrogen starvation, and it is often necessary to add suitable fertilisers to supply their food.

Of the phosphate manures the chief are guano, superphosphate of lime, and basic slag.

Superphosphates are obtained by treating ground bones or phosphate rocks with sulphuric acid. By this means a proportion of the natural phosphate in the bones or rocks is made soluble, and is therefore available for immediate use by the plant.

Basic slag is obtained from the linings of the furnaces used in converting iron into steel.

Artificial potash manures are almost out of the question now, owing to the difficulty of getting any salts of potassium since the supply from Germany has been cut off. Before the war kainit was much used, and also muriate of potash (potassium chloride).

The most easily available source of potash at present is plant ashes. It is important, therefore, that all plant rubbish should be burned

and the residues dug into the garden. The 'oar weed' variety of seaweed, too, contains considerable supplies of potash.

The chief substances that have been used to supply nitrogen are sodium nitrate (nitrate of soda), obtained from Chili; saltpetre; ammonium sulphate (sulphate of ammonia), obtained from gas-liquor; and nitrolim, made from lime, coke, and nitrogen, or calcium carbide heated in an atmosphere of nitrogen.

Ammonium sulphate is especially valuable in light soils, as it is much less easily washed away than sodium nitrate. On this account, it does not penetrate very deeply if it is put on the top of the soil. If it is used for deep-rooted crops, it ought to be dug in.

Nitrolim is not so well known as any of the others, but seems to be a good fertiliser, and is useful when lime is wanted as well as nitrogen. It is not always easy to tell whether a particular soil is deficient in any of the essential foods, but the growth of most plants is improved by adding any mixture containing phosphates, nitrogen, and potash.

In recent years much attention has been given to the action of microbes in the soil. They appear to play a very important part in the growth of plants; in fact, if it were not for their activities, the organic matter in the soil would not be able to turn into plant-food. The varieties found in ordinary soil are very numerous, and they are not by any means all friendly. Some of them are capable of setting up diseases; others merely hinder the growth by their antagonism to the beneficial microbes. It has been discovered that, in general, the injurious microbes are more easily killed by heat than the others, and, therefore, if the soil is heated by means of steam and then allowed to cool, the friendly microbes that are left are able to multiply exceedingly. Experiments have been tried by taking small quantities of soil and comparing the growth of plants in portions previously heated with that in unheated portions, and in most cases very marked differences have been found—the growth is much more rapid and vigorous in the case of the soil that has been heated. Of course, it would be practically impossible to apply this to large scale growing, but it has been found that certain disinfectants, such as toluol and carbon bisulphide, have an action similar to that of heat; and it is probable that further developments in this direction will result.

It is important now that scientific methods of soil improvement should be studied, as so much depends upon getting the utmost growing value out of our soils.

THE LADY IN THE RED MASK.

III.

BUT it was well worth all the trouble, for I had never seen the quarter-deck looking better. It was a blaze of coloured lights, a vista of brilliant bunting and green foliage, with here and there the sheen of burnished steel and brass. The chorus of happy 'Oh's' and 'Ah's' when our guests came on board more than rewarded us for our labours.

Mrs Stanley-Wetherall, her two daughters, and Miss Angela Rathbone were among the first arrivals. They were masked, of course, and officially we were not supposed to know who they were, but no mask or domino could disguise the unmistakable figure of their chaperon, and no sooner had they reappeared from the cloak-room than they were set upon by a clamouring crowd eager for dances. In the forefront of the battle was the commander, and he, I noticed, scrawled his initials over fully two-thirds of Miss Stanley-Wetherall's programme. She did not seem to be the least put out about it, either.

'Oh, but I'm forgetting,' she said. 'Angie dear, may I introduce Captain Mostyn, Mr Carfax, Mr Piggott, Mr Harvey, and—er—everybody? Miss Rathbone. I quite forgot I wasn't really supposed to know who you all are,' she went on; 'but I hope you'll see that Angie's programme is filled up.'

We all bowed, and Miss Rathbone, covered in maidenly modesty, inclined her head and fidgeted with her fan.

I took a decided fancy to her from the very first moment I saw her. She was *petite* and golden-haired, exactly like Enid Stanley-Wetherall, and so far as their figures were concerned there was nothing to choose between them. Moreover, their dominoes were identical, their shoes and stockings a perfect match; they wore similar hair ornaments; and their dresses, or what little I could see of them, seemed precisely the same. So far as their appearance went the two girls might well have been twins, and the only way one could tell them apart was that Miss Stanley-Wetherall's mask was black, while Miss Rathbone's was scarlet. The glaring colour might not have suited some people, but it suited her.

I was not going to be cut out by any of the others; so, when the commander had done his duty and had asked for one dance, I produced my programme and demanded four. Miss Rathbone acquiesced without the least hesitation; whereupon I increased the number to five, greatly to the disgust of some of the others. I could not help their troubles.

Her programme was filled up in less than no

time, and when the other people arrived and the band started I saw her whirling round the floor in the arms of the fleet paymaster. She danced divinely.

I pirouetted with a number of different ladies that night, married women and girls, but I cannot remember who they all were or what I talked about. All I thought of was Miss Rathbone—Miss Rathbone—Angela. How the name suited her! I liked her figure, her hair, her tiny feet, and everything about her. Decidedly I must manage to see more of her, for I felt—well, it is difficult to describe it in cold blood, but I felt as if I should like to have her as a very dear friend. Purely platonic, of course. Platonic friendships between girls and bachelors are so beautiful and touching, are they not?

I could hardly control my impatience until the band struck up for the third dance—our dance. It may have been a waltz, a two-step, one-step, bunny-hug, or fox-trot, for all I can remember; but, whatever it was, she danced like a sprite. We got on splendidly, and so gave ourselves over to the enjoyment of it that we hardly spoke a word while it lasted.

But at last the band stopped, and, flushed and happy, I gently released her. 'Would you care for some refreshment?' I asked in the most approved society manner.

'Would I not?' she answered eagerly, fanning herself. 'I've a thirst on me like an elephant. I'm just pining for a drink.'

'Come along, then,' said I, leading her to the refreshment-buffet, and marvelling at her original way of expressing herself.

'What will you have? A little lemonade or claret cup, and an ice?'

She shook her head. 'What's that yellow stuff in the jug there?' she demanded, pointing.

'Cider cup,' I told her.

'What a pity! I thought it was shandy,' she said regretfully.

'Would you like shandy-gaff?' I asked, in mild astonishment, thinking it rather strange that a girl should exhibit a partiality for a mixture of beer and gingerbeer.

'Rather!' she replied. 'It's just the stuff to dance on. I could drink pints of it.'

I had to order the horrible brew specially, and when it arrived she drank it down in the most approved style. 'Ah!' she sighed contentedly; 'that's a good tipple! Now let's go and sit down somewhere.'

'Would you like to sit in my cabin?'

'Oh, any old place 'll do for me,' she answered, shrugging her slim shoulders.

So I took her to my cabin, sat her down in my best arm-chair, and fanned her gently.

'What a cosy little room!' she said, looking round approvingly. 'And how nicely you've decorated it! Are all these girls your sisters?'

She was eyeing my various photographs.

'No,' I was forced to admit. 'They're all relations or friends.'

'But what a lot of girl friends you seem to have!' she went on maliciously. 'How many times have you been in love, I wonder?'

I blushed furiously. 'Oh, not more often than most people.'

'Naughty boy!' she exclaimed roguishly, wagging an admonitory finger. 'You naval officers are all terrible. Are you in love with any one at the present moment?'

I shook my head. 'I used to fancy that fluffy-haired one,' I said, pointing to a photograph in a silver frame. 'But she's gone and got engaged to a major in a cavalry regiment.'

'But you oughtn't to keep her photo?'

'The place looks so bare without it,' I explained. 'I haven't another to put in the frame. I suppose,' I added, averting my eyes and gently stroking the arm of her chair—I wish it had been her arm—'I suppose that if I —er—were to ask you very nicely, you wouldn't take pity on me and give me one of yourself to fill up the gap?'

She gave a little squeak of surprise and sat bolt-upright. 'But, Mr Carfax, I've barely known you five minutes! It wouldn't be at all proper. Besides'—— She paused.

'Is there any reason why we shouldn't get to know each other better?' I interrupted, my heart going pit-a-pat.

'Ah, that depends,' she said archly. 'If you're good, all sorts of things might happen.'

'What d'you mean by that?'

'I think,' she said with mock severity—'I think we'd better change the subject. What beautiful weather we've been having, haven't we?'

'What a ripping pair of shoes you've got on!' I retaliated.

'Yes, they are rather nice,' she agreed, agitating one pretty foot, clad in its black-satin slipper, until the paste buckle shone and twinkled in the light. 'These buckles are real old French paste; they cost a hell—ahem, an awful lot. These stockings, too. They're real silk, you know; none of your imitation rubbish.'

'I don't doubt it,' said I, rather surprised that my fascinating companion should refer to the nether regions and go to the trouble of informing me that her stockings were real silk. I always understood that hell and ladies' stockings were banned in the conversation of polite society. To tell the truth, I felt distinctly embarrassed. Perhaps Miss Rathbone was merely rather outspoken and unconventional, but I had an awful thought at the back of my mind that the shandy-gaff might have gone to her head. Fool that I was! I should never have allowed it.

I glanced at her nervously, but she seemed all right.

'Now I've shocked you,' she declared with mock penitence. 'I'm so sorry. I've got an

awful habit of saying anything that comes into my head.'

'I'm not the least bit shocked.'

'Not the littlest, teeny-weeny bit?' she asked, leaning forward and looking into my eyes.

How tantalising her little pink cheek looked, and how I loved that little wisp of hair at the nape of her neck!

'No,' I said, 'I'm not in the least shocked. On the contrary, I like you'—— And just then the band started for the next dance.

'You can tell me afterwards,' she said, as we got up and left the cabin together. 'I love hearing people's secrets.'

How I whiled away the time until our next dance together I cannot remember. I glared with envy as she whirled round the deck in the arms of the subaltern of marines, the assistant-paymaster, the torpedo lieutenant, and the engineer commander; but at last my turn came again.

'What's this dance?' she asked, as the band started and I went forward to claim her.

'It's a two-step,' I told her.

'I'm sick to death of two-steps!'

'So am I,' I agreed willingly. 'Let's—er—go and sit it out.'

'Let's,' said she sweetly, taking my arm. 'Let's go to that nice little room of yours and talk comfortably.'

My heart gave a leap. I realised that the dear girl must love me already. Was ever a fellow so lucky?

'Half-a-'mo, though,' said Miss Rathbone. 'I'm beastly thirsty.'

My heart fell. 'D'you want more shandygaff?' I gasped.

'No-o,' she cooed. 'I've had three glasses of shandy already. Let's go along to the refreshment-place and see what they've got.'

'Perhaps you'd like some lemonade this time?' I suggested, as we approached the buffet, and I saw the waiter regarding my partner with a horny eye.

She shook her pretty head. 'No; lemonade's too much like water,' she announced. 'Water rots the soles of one's boots, so what the dev—on earth does it do to one's inside? There aren't any liqueurs here, I suppose?'

'No,' I answered firmly.

'I'm simply dying for a glass of that green, pepperminty stuff,' she sighed.

'What! crème de menthe?'

She nodded.

I was quite certain that beer, gingerbeer, crème de menthe, and anything else she may have had between-whiles would not mix; but what could I do? I could not refuse a deliberate request on the part of a lady. For all I knew, she may have wanted it as a medicine.

So I sent for the nauseous stuff, and she swallowed it with every symptom of appreciation.

'It warms the cockles of your heart, doesn't it?' she laughed, coughing slightly and patting her chest. 'Now, let's trot along to that little room of yours.'

We trotted.

'Now,' she said softly, relapsing into my armchair and fixing her eyes on mine, 'what was it you were going to say to me when the band started?'

'I—— Oh, I really can't remember,' I stuttered, blushing furiously.

'Are you quite sure?' she murmured, still eyeing me.

I placed a hand on the arm of her chair. 'I'm a fool,' I said nervously. 'But I—— Oh, I can't say it!'

'Try!' she urged, sliding her arm along until I felt its soft pressure against my hand. 'Do try!'

There was no ignoring her appeal, and I summoned up all my courage. 'I believe I—er—I mean,' I floundered hopelessly—'I mean, I know I love you!' There, I had said it.

She sat up and gazed at me in speechless astonishment, but only for a moment, for suddenly she burst out into shriek after shriek of laughter.

'Oh, ha, ha, ha, ha!' she gasped. 'How damned funny!'

'I beg your pardon?' said I severely, removing my hand. 'I was quite serious.'

'Were you really?' she asked with some show of surprise. 'Oh dear! Aren't I awful? I thought you were pulling my leg, and now I've put my foot in it. Will you ever forgive me?' She looked at me imploringly.

'Yes, if you give me a copy of your photograph and promise that we shall see some more of each other.'

She sighed. 'Do you really want me as a friend?'

'Of course I do!'

'Well, come to tea with the Stanley-Wetheralls on Sunday,' she said. 'Come early. Come at half-past three. I shall be there.'

'You can bet your bottom dollar I will!' said I fervently.

I cannot recollect what else we talked about besides ourselves, but I told her again how much I admired her; and she, like the pet that she was, admitting that the feeling was not altogether one-sided, allowed her little hand to remain in mine. It was obviously a case of love at first sight, and I was just summoning up my courage once more to embrace her, when—the band started again.

Soon afterwards came midnight and the last of the old year. Somebody struck the usual sixteen bells; every ship in the harbour blew her steam-whistle or siren until we could hardly hear ourselves speak; we all unmasked, joined hands in a huge circle, sang 'Auld Lang Syne,' and wished each other a happy New Year.

But I looked in vain for my little lady of the red mask.

'What's become of Ang—Miss Rathbone?' I asked Miss Stanley-Wetherall.

'Oh, it was so sad!' she answered. 'The poor little thing got one of her splitting headaches, and had to go home.'

'By George!' said I; 'I AM sorry!'

But I really did not wonder at it. Shandygaff and crème de menthe do not mix.

So, having lost my divinity, the ball fizzled out so far as I was concerned.

'I say, Carfax,' said the subaltern of marines when the last guests had gone, 'who was that skittish young friend of yours in the red mask? She was jolly hot stuff!'

'I'll thank you not to call my friends "hot stuff," soldier,' I said severely. 'I don't like it.'

'Sorry, old bird. I didn't know she was a particular friend of yours; but she is a bit of a fizzer, all the same.'

'Really?' I observed in my most frigid manner.

'Yes,' nodded the marine officer. 'She used the most peculiar language, and insisted on having a whisky-and-soda with me.'

'And do you know what she said to me?' broke in our engineer commander. 'I'm not a good dancer, as you know, and had the misfortune to tread on her toe; and what d'you think she called me?'

'I'm sure I don't know, sir.'

'She said I was a clumsy old blighter!' said the chief.

'The devil she did?' I gasped.

IV.

At 3.30 P.M. precisely the following Sunday I was shown into Mrs Stanley-Wetherall's drawing-room. Evidently Miss Rathbone was still upstairs enjoying her Sabbath afternoon's repose, for the room was empty. I felt vaguely disappointed. She might have taken the trouble to be punctual, after telling me particularly to come early.

'Wanchee see Missie Rathbone,' I told the Chinese 'boy' as he was disappearing with my cards.

He turned round, screwing up his yellow face.

'You savvy Missie Rathbone?' I repeated, speaking very distinctly.

He shook his head. 'My no savvy dat name,' he answered, looking very puzzled. 'Missie Lathbone no b'long dis house. Missie Wetherall an' Missie Enid b'long topside.'

'All right. Can do,' I said, imagining he must be making a mistake. 'You go tell Missie Enid.'

'I savvy,' he said, closing the door behind him.

At 3.34 by the drawing-room clock the door was opened to admit Jenkinson, a subaltern from the regiment quartered in the barracks below.

'Hallo, Carfax!' he grinned sheepishly. 'Paying calls?'

'Yes,' I nodded coldly. 'I've been asked to tea. Mrs and Miss Stanley-Wetherall won't be down just yet. I'm just—er—waiting for them.'

I half hoped he would take the hint and go away, as he must have seen from my manner that I regarded his arrival as an intrusion. But not a bit of it; he merely selected the most comfortable chair and sat down.

'I'll wait,' he announced. 'As a matter of fact, Miss Rathbone asked me to tea. Told me to come at half-past three.'

'Miss Rathbone?' I demanded, in surprise, very much annoyed that I was not to have my *tête-à-tête* conversation.

'Yes, Miss Rathbone,' he smirked. 'Why not?'

'Merely that she asked me to come here at the same time.'

It was his turn to be jealous, for his expression became most unpleasant. He sat up and glared at me—positively glared. 'She asked you!'

'Certainly,' said I, glaring back. 'She's a great friend of mine.'

'The devil she is!' he muttered. 'But you're not the only'——

Further conversation was interrupted by the arrival of Miss Stanley-Wetherall. She seemed rather perturbed, and had evidently dressed in a hurry. I noticed at once that the tip of her nose was imperfectly powdered.

'Good-afternoon,' Jenkinson and I said together. 'We've come to call.'

'How nice of you!' she said, glancing covertly at the clock. 'Do sit down. Mother will be here in a minute.'

I thought it advisable to explain why I had come so early. 'As a matter of fact,' I said, glaring at the soldier, 'Miss Rathbone asked me particularly to come at half-past three. I hope she is—er—quite well after her headache?'

The girl looked rather flustered. 'Oh yes—er—oh, I mean—well—I have very sad news.'

'What is it?' we both asked.

'Poor Angela had to go back to Singapore the day after the ball. An uncle of hers died. Isn't it sad?'

'Very,' I agreed, bitterly disappointed. 'She told me she was staying here for some time.'

'Y-yes, of course. She was to have stayed with us for a month. But she—she didn't know her father was going to die, did she?'

'Father!' I exclaimed.

'Y-yes,' stuttered Miss Stanley-Wetherall, crimson in the face and staring helplessly out of the window. 'They've both died. Cholera, I think she said. It was—er—terribly sudden, wasn't it?'

'Poor darling!' I murmured under my breath.

The door suddenly opened, and in came our commander and the torpedo lieutenant. The time was a quarter to four. My heart fell into my boots. They also had come at Miss Rathbone's invitation. The little minx seemed to

have asked every one she had danced with at our ball.

At 3.52, when Miss Stanley-Wetherall was in the midst of her explanation, our subaltern of marines was shown in. He was closely followed by a member of the staff of the Hong-Kong and Shanghai Bank, another officer of Jenkinson's regiment, and the deputy-manager of the Vacuum Oil Company. They, too, asked for Miss Rathbone, and once more the sad story had to be told.

At three minutes past four Mrs Stanley-Wetherall herself made her appearance. 'How nice of you all to call!' she said graciously, evidently prepared beforehand for the crowd which greeted her. 'I do hope Enid has been entertaining you. It's too sad about poor Angelina.'

'Angela, mother dear,' her daughter corrected.

'Angela, to be sure. I was forgetting. But it's so sad. The poor, dear girl so enjoyed the ball, and then the very next morning she got a wretched cable to say that her brother in Shanghai was dangerously ill'——

We stared at each other in mute astonishment.

'Oh!' squeaked the daughter, falling into a chair and covering her face with her handkerchief. 'I shall scream in a minute!'

We rushed to her assistance.

'Bring some water, quickly!' the commander ordered nobody in particular.

'Stand back, everybody! Give her air!' said the Vacuum Oil gentleman agitatedly, flourishing a purple silk handkerchief.

'Ring the bell for my smelling-salts!' shrilled the anxious mother. 'She's fainting!'

'Slap her hands and feet—hard,' advised the torpedo lieutenant. 'My sister often has these fits.'

'Oh, for goodness' sake leave me alone!' spluttered the invalid, sitting up and removing the handkerchief. 'Oh, it's too gorgeous!'

We stared at her in blank astonishment. She was shaking with laughter. The tears were actually running from her eyes.

'It's the funniest thing I've ever heard,' she went on breathlessly. 'To think how you've all been taken in! You badly wanted more girls, so mother and I'——

'I'm sure I had nothing to do with it!' snorted the elder lady.

'Yes, you had,' laughed her dutiful daughter. 'Well, mother and I thought we would do our best for you, so I lent my cousin my frock, and shoes, and everything. They fitted perfectly. I borrowed a transformation from—well, never mind whom—and told him'——

'Him!' we echoed.

She nodded feebly. 'Yes,' she said. 'H-I-M.'

'Who is he?' we demanded, grinding our respective teeth.

'Promise you won't hurt him if I tell you?' she asked, looking at each of us in turn.

We promised faithfully.

'His full name,' she giggled, 'is G-G-George Ponsonby Buckle. I think you must all have met him!'

George Ponsonby Buckle, Midshipman, R.N., the 'White Maggot' of H.M.S. *Warwick*. To think of it!

It was my turn to collapse into a chair.

THE END.

A VISIT TO A COPTIC MONASTERY.

THE Copts of Egypt, having for a number of centuries 'bowed low before the blast' of Mohammedan persecution, and later, with a similar obstinacy, withstood the well-meant assaults of Protestant missionaries, are now quarrelling vigorously among themselves. The questions at issue are quite unconnected with doctrine. £, *s. d.* is the cause of the ferment. The partisans are, on the one side, the clergy, who control the *wakfs* (religious endowments), and, on the other, the reform party, represented by the wealthy and educated Copts, who wish to take the administration of the Church property out of the hands of the clergy and place it upon a business footing under a representative body. The peasants remain, as usual, apathetic.

A more striking contrast than that presented by the opposing factions could not be imagined. The clergy, bearded, black-turbaned, and clothed in flowing robes, look exactly what they are—relics of a bygone age, or at any rate an age which is rapidly passing away. They might have stepped direct from a Bible picture. They are rarely possessed of any education beyond the ability to perform the priestly office and to repeat by rote passages of the Scriptures. Many of them are utterly illiterate

The opponent of this picturesque type presents a very different aspect. The modern Copt dresses in European clothes, retaining, however, the *tarboosh* as a head-dress. He is to be found following such vocations as lawyer, doctor, stock-broker, or money-lender. He also figures largely in the Government service, and not infrequently speaks both French and English as well as his own tongue.

Undoubtedly Lord Kitchener's bold stroke in taking the Mohammedan *wakfs* away from the khedivial influence, and placing them under a special Ministry, had a great deal of influence on Coptic opinion. The Copts aver that they appealed again and again to his lordship to organise a reform in their *wakfs*.

Various reasons are hazarded for his refusal. One is that the Patriarch of Alexandria, the head of the Coptic Church, is now a very old man. He wishes to leave the Church exactly as he found it. When he dies, and his successor is appointed, action will be taken. The fact is, something more than merely consulting the Patriarch would have to be done. With the introduction into the country of European business methods and a settled form of government, the various bishops and abbots have consolidated their position in the most surprising manner, and any attempt to dislodge them would probably provoke a contest, in which all the resources of the law would be played to the uttermost.

The first aim of the reformers' attack is the monasteries. The modern Copt—staunch in his orthodoxy—is nothing if not up to date, and history has taught him to raise the voice of accusation against these institutions, a number of which are enormously wealthy. Some of these monasteries are of great antiquity; several, surviving the Mohammedan invasion of the seventh century, go right back to the dim, far days of Hypatia. The most notable of these is the one dedicated to St Anthony of the Thebaid, situated in an isolated spot three days' journey across the eastern desert. It was here that the saint is said to have spent seventy years sitting on a rocky platform high up in the barren mountain-side. He earned a great reputation, and a regular caravan route for pilgrims was established from the Nile valley.

The monastery, which was built after his death, appears to have existed right down to the present day, with only one break, which occurred about four hundred years ago. The monks at that time, having apparently become rich and indolent, imported a number of Moslem slaves to do the menial work. The slaves were baptised and made nominal Christians. One night, however, they rose and massacred their masters; then, sacking the monastery, fled. After this the place was abandoned for a period of seventy years, all manuscripts and other objects of interest being destroyed by the wandering Arabs.

A visit made by the writer to this monastery may not be without interest. The first thing to be done was to secure a letter of introduction from the bishop. After this two Arabs of the Maazi—the tribe which inhabits that particular part of the desert—had to be engaged as guides.

This brings up a curious point in connection with desert travel. Take with you even one man of the tribe amongst whom you are going to travel, and you can go from Algiers to Persia without so much as a walking-stick in your hand. Go alone, or with strangers, and you will most certainly get your throat slit.

We commenced our journey early one morning from the east side of the Nile opposite the village of Busch. The November air was keen, the camels were swift, well-bred beasts, and we were travelling light. There was exhilaration in that morning ride; also, it was a relief to escape from the eternal green of the cultivated area, with the sense of confinement and flat monotony. The Nile valley grew dimmer and dimmer as we ascended the sandy slope, and finally became nothing but a misty gray expanse stretching away to the low hills of the Libyan Desert. This was the last impression gathered from a high shoulder on which we halted after some four hours of travel. Thenceforward the journey lay through the abomination of desolation—the rugged, burnt-up mountains, the dry, sandy watercourses, and the wind-swept plateaus of the region lying between the Nile and the Red Sea.

At noon we rested for an hour, without, however, removing the saddles, a precaution, the camelmen informed me, to prevent blistered backs. We travelled all through the afternoon, the scenery varying but little, and hardly meriting a description. During the latter part of the afternoon the track led over a high plateau covered with black, shiny pebbles. The distant hillocks were floating about in lakes of mirage, and a deadly stillness reigned over all. We met no one on the way. Apparently the track led only to the monastery.

Another hard day's travel brought us off the high plateau down through a rocky and precipitous gorge into the Wady-el-Araba, a valley about twenty miles broad, walled in by lofty ranges of barren mountains running east and west. A high promontory was pointed out to me as the Gebel-el-Der (Mountain of the Monastery). Of the monastery itself, however, nothing was visible. It was still a day's journey off.

We camped that night by some pools fed by brackish springs. It was the first water we had seen since leaving the Nile, and the camels were glad of a drink. Half-a-dozen date-palms of various sizes, and looking as though they had received the curse of barrenness from their very birth, reared their crests over this dismal spot.

The Arabs tell of many places in these wild, desolate ranges which mark the sites of former hermitages and monasteries. They are generally near a spring or group of pools. Their history is long buried in oblivion. The knowledge of their existence has been handed down by tradition amongst the nomad inhabitants. It was undoubtedly into these rocky fastnesses that the Christian hermits fled before the fierce onslaught of the Moslem invasion. Possibly the worshippers of Isis may have preceded them when Christianity became vigorous and aggressive. The whole of this region lying between the Nile and the Red Sea, and shimmering in the eternal heat-haze and silence, was once intersected with

highways and byways, and echoed the busy comings and goings of men.

A little to the south of our route are the once famous porphyry quarries. It was there that the columns were quarried for the temples of ancient Egypt, and later for those of Rome. The roads along which these huge blocks of stone were hauled, sometimes a hundred miles, as well as the stations where supplies of water were kept, are traceable to-day. One of these roads leading from Kena was under the special tutelage of a triad consisting of Amsu or Pan, Isis, and the infant Horus. Isis is described as 'the beautiful mother of the gods, the Queen of Heaven.' She is represented holding in her arms the divine infant. An inscription records that nearly ten thousand men were employed in one group of quarries alone. Their rude stone huts are standing to-day. The Romans used these roads as a line of communication to their colonies on the Red Sea, and in the year 1800 one of the routes was followed by our Indian army on its march to the Nile. A well dug by the sepoys on that occasion is still known as the Bir-el-Inglisi.

The last day's journey took us in a transverse direction right across the valley, heading always for the Gebel-el-Der, which, like all prominent landmarks, seemed to recede as we approached.

It was an hour before we got within appreciable distance of the monastery, and during this period it had vanished and reappeared several times as we dipped into the deep water-courses which score the valley. As we emerged from one of these, our low cemetery wall had magically grown into lofty battlements enclosing a large, irregular portion of the hillside. A dark embrasure indicated the entrance, and beside it stood two black-robed monks. They had seen us coming from afar, and had come out to welcome us.

Causing our camels to kneel, we exchanged greetings. One of the monks then pulled a bell-rope which was hanging down over the wall, and a bell high up in the turret tinkled. Presently the huge iron-studded door swung open, and we were admitted to the monastery.

The first thing which caught my eye was a large space filled with great stacks of firewood, which struck a strangely medieval and northern note in this hot land. The rest was a confused mass of houses of the Fellah type of unburned brick, with tiny streets not unlike those in an Earl's Court Exhibition village. The white cupolas of several churches rose up from this mêlée, and over all were the tossing plumes of a grove of date-palms. Of such height were the walls that none of these features had been visible from outside except the tops of the palm-trees.

Presently the senior monk, a sturdy old Fellah of Falstaffian proportions, came forward and took my letter of introduction. He opened it, squinted at it, and turned it all ways, pretending to read it. I suspected him, however, to be illiterate, an opinion which was confirmed later when I saw a young monk reading it over to him.

Satisfied as to my credentials, the old man conducted me to the guest-rooms, which, much to my surprise, were both clean and comfortable. I had anticipated hospitality, and had provided myself with several tins of Keating's powder. Be it recorded that I had not to open one. The rooms gave on to a terrace, from which there was access to the walls and also to a remarkably fine view right down to the valley to where a tiny strip of deep blue indicated the Gulf of Suez. On the other side of this loomed the misty outline of Mount Sinai.

That evening the old monk and I sat down to a most elaborate banquet which had been prepared in my honour; and when we had eaten we talked, and our talk was all about the kings and queens of Europe, in whom my host seemed to have the profoundest interest.

When I had given my personal assurance as to the health of King George and Queen Mary, we fell to mutually pounding the Young Turk party, and then passed gracefully on to the war, with speculation as to the probability of Mass being said once more in St Sophia. Nor did my host forget the polite hope, usually offered by Egyptians, that Egypt might always remain under the care of Great Britain. This was about the scope of our conversation.

By half-past eight the monastery was as silent as the grave, and the old man began to yawn, and presently bade me good-night.

The next morning I was awakened by the clanging of a bell. It was still dark, but I dressed and went out and made my way towards one of the churches. Dim, cowled figures were hurrying in from every direction. The monks left their shoes at the door, and each took a long-handled crutch upon which to lean during the service, for there were no seats. Inside, the building was divided into two portions by a high screen covered with icons. In the inner portion, upon a stone altar, two candles gave a fitful gleam which served to emphasise the surrounding gloom. Priests, turbaned and vested, were already chanting in a monotonous minor as they walked round the altar amidst clouds of incense. The service, which was the celebration of Communion, lasted over two hours. It was held in the ancient Coptic tongue. There was a rugged grandeur about it which harmonised well with the surroundings, and was strongly suggestive of early Christian days. At the conclusion blessed bread was handed round in substantial loaves, which were broken and eaten in the church.

Most of the day I spent idling about the garden, which was terraced out of the steep slopes of the hill. Besides date-palms, it possessed some very

fine olives, just then in full bearing, and a wonderful sight.

A crowd of monks followed me everywhere like a troop of children, pleased at having a stranger to talk to. From them I was able to gather something of their life. It certainly did not seem a hard one, and bore no relation whatever to the generally accepted ideas of monkish discipline. Each man had his little cottage, and was given his daily ration of food, which he could eat how and when he liked. No productive labour of any kind was done, nor did there appear to be any daily routine. Church services were held twice daily. The remainder of the time the monks seemed to spend loafing about smoking cigarettes. All these men were drawn from the Fellah class. Some were mere youths; others were old men with patriarchal beards. Several had not left the monastery for forty years. Having regard to the very uxorious nature of the Egyptian Fellah, who marries young, and who can but rarely be induced to leave his village and his land, the wonder is that any recruits for the monastic life can be obtained at all.

At the time of my visit there were only forty monks in the monastery, though there is accommodation for more than double that number. Eleven were priests, whilst three held the rank of *kommos*, or arch-priest. Down to recent times the Patriarch of Alexandria was always chosen from the monks of St Anthony, who enjoyed a particular reputation for sanctity.

The income of the monastery now amounts to something over twenty thousand pounds a year; and, as the only visible expenditure is the maintenance of the monks, whose dietary is mainly of a vegetarian nature, the Copts are beginning to ask what becomes of all the money. The funds are entirely under the control of the abbot, who resides on the estates at Busch, in the Beni Souef province.

The monks seem to be on the best of terms with the Arabs of the desert. A frequent occurrence during my stay was the ringing of the bell over the entrance-door, and on these occasions a monk would rush off to answer the summons. Opening a trap-door in the overhanging turret, he would shout down to inquire what was wanted. It was usually a demand from wandering Bedouins for flour, bread, or dates. Portions of these would be promptly lowered in a basket without any demand being made for payment. This charity was probably in the nature of a tax paid to the desert tribes, who are all Mohammedans, and who could easily make life impossible for the monks in this isolated spot. I was informed that, even as matters were, no monk would dare to make the journey to the Nile without a Bedouin escort.

One of the most interesting features of the place is the water-supply, which gushes in a fine strong stream from a rock at the top end of the garden. The rock has been excavated for some distance back to facilitate the flow, and the result is a most picturesque grotto covered with water-loving plants. The water, like all the water in the valley, is brackish, though in a much less degree than in other places.

Of the churches, only one is of interest from an archæological point of view. This is the original church of St Anthony, probably as old as the monastery itself. In form it is quite unlike the ordinary Coptic church, being long, narrow, and having an apse at the east end instead of the usual square portion cut off by the iconostasis. The walls are covered with rude frescoes, grimed with smoke, but still plainly discernible. The monks declare that St Anthony is buried in this church, though they profess to be ignorant of the exact spot.

The one other place of interest was the cave —a thousand feet up the face of the mountain— in which the saint passed his life. The spot is marked by a tiny natural platform of rock, and from this a winding tunnel of some thirty or forty yards leads to a dreadful hole right in the heart of the mountain. Here is shown the tiny space where the saint used to sleep, and the rough block of stone which he used as an altar. The platform at the entrance to the tunnel commands a really fine view over the wild and rugged valley. Doubtless it was here that the holy man sat whilst pilgrims from the far Nile valley climbed painfully up the steep face of the cliff to seek his blessing or to obtain absolution for some grievous fault, not forgetting to bring with them those substantial tokens of penitence without which even the holiest of men cannot sit upon a rock gazing ever upon the face of nature.

An old, old story. But to-day the pilgrims do not come. Instead, Coptic reformers, smug and bespectacled, meet in solemn conclave, debating as to whether it were not best to sweep this relic of the past from the face of the earth.

FIREFLIES.

Fireflies, out in the darkness glistening,
Tell me, oh, tell me, the way you came;
Was it through woods where the elves lie listening,
And shiver with fear at your passing flame?

Were you minted from fires of daffodil yellow,
Or born in the sedge by the haunted mere?
Was it April begat you, or autumn mellow
At the turn of the leaf and the fall of the year?

Did you drift from the curls of the babe Apollo
As he roamed unseen o'er the vales of Greece?
Or, stay, were you torn by a homing swallow
From the sun-kissed hills of the Chersonese?

Fireflies, out in the darkness glistening,
Tell me, oh, tell me, the way you came;
Was it through woods where the elves lie listening
With eyes aglimmer? Come, tell the name
Of the fairy furnace that forged the flame.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

NOW we see clearly that in former days the human imagination was much too timid in regarding the possibilities of life and the world's development. Despite science, despite thought and work, despite even the most tremendous politics and all-night sittings at Westminster upon the doubts and dangers of governmental measures that were proposed, there was such a conservatism of attitude towards the future as seemed to suggest the assumption that movement and development had almost stuck. Historic upheaval, so it appeared, had ceased—in Britain at all events; there would be no more changes in the scenes of civilisation; and with each London season the idea of the millennium became appreciably more abstract or even stupid. History and progress had reached, as it were, a *cul-de-sac*, in which everything was to be left to electricity, and the spirit seemed doomed to starve. If you will think closely upon it, many of you will agree that something like this represented in a large measure the general human attitude before the war. The world had fallen into a state of inertia; life, that had so slowly evolved through the æons from—from what did it evolve?—had come to a kind of stoppage that resembled finality. Men and women spoke lightly of 'perfection' having been attained, of the 'last word' having been said, of the uttermost discovery having been made, of nothing more being left to be done by marvellous man. A scientist would make some chemical discovery that would solve many mysteries which had baffled us for generations, and so now in this field there was completion, and nothing more remained to be done. An explorer would reach an extreme point, and so, the stars being forgotten, that was finished also. Men and women turned their minds to the past and did a sort of stock-taking and appraisement of merits, deciding who and what had been the greatest, and were to be classified as such for all time. There were no more possibilities, then; developments were apparently impossible. That fatal word had entered the mind, and it stayed. Having produced human life and continued to work upon it for very many thousands of years, with, as one must believe, some view of ultimately achieving a kind of perfection for this magnificent handiwork, the most marvellous thing we know of in the universe, the Creator was evidently supposed to have ceased this anxious endeavour upon arriving at our wonderful generation. That sense of future impossibilities was a deadening thing, and life was suffering severely for it. The war, of course, has made a change; and it is perhaps in this general attitude towards the possibilities of life and the future that the greatest change has been made in each one of us by the cataclysm of war. We hear continually of the differences that the struggle will make and has made—and we look around and find some people defining those differences chiefly in terms of food, and money, and minor conveniences. But that general sense of the greater, the spiritual change, the mental outlook, the sense of the possibilities and the meaning of life, and the scheme of the Creator, has been felt vaguely within us, and has been difficult to define, to seize upon. Is it not fairly well suggested in the simple idea that the barrier of impossibility which seemed to have arisen in people's minds and to have made a ring-fence round existence has been removed, that the conservative tendencies of thought have gone with it, and that now we see that all things such as were of dreams before *may* be, and that the world and life will go marching on? Minds are enlarged; the old pettiness of conception falls; and imagination soars again, leading effort on. To take but one instance, see what changes are being wrought in the British form of government, which seemed so stable and so settled; think what changes are coming on. It is from this disappearance of the formula of impossibility, and from the successful raids we are making already in the unknown worlds it hid from us, that life at present, for all its griefs and its horrors, its sufferings and its cruelties, is so thrilling. The world is on the road again, and there is a new scene at every turning.

* * *

It is certainly by the course of such a contemplation that many of us can best explain the peculiar strength and quality of our emotions as certain events happen in these times, which our improving intelligence enables us to understand in a way that not long since might have been hard. For example now, there was the

 [*All Rights Reserved.*]

case of the entry of the United States into the war, and the swift action that instantly spread over that golden land which many had imagined permanently settled for non-intervention. Here in some respects one of the impossibilities was removed, and a possibility for the progress of life that shone and glittered in its splendour was set up in its place. The emotional effect was remarkable. It was through this effect that many of the people came to a new understanding of possibility, knew that the world was started again in eagerness, and was no more like the lazy, careless world of the other time that seemed to have spent its effort in straining on to perfection, and to have retired to ease and comfort on a modest competency of self-satisfaction. The entry of the United States, the dominant force of the New World towards which all the forces of civilisation look more and more, was the signal of the progressive future, that which recognised no impossibility, pointing to a reconstruction of the world and of thought and a new advance towards the unseen goal which may yet be millions of years ahead, which the Master of the world must hold in the wonderful scheme of time. The old war craze, the instinct for the massing of armed legions, the mad ambitions of rival tribes, diplomatic chicaneries, and a gigantic system of international irritation and small-mindedness have spoiled Europe when her power for good was best. In this emergency it is essential for the advancement of the universal scheme of world progress that life should now push on from a new salient, and that the best of Europe should join up with the virile forces beyond the ocean within whose control so large a part of destiny seems to lie. It is not merely a matter of giving money, ships, and men to the fighting Allies, enormous as is the benefit of these things, and necessary even for the safety and preservation of what is left of good in Europe; it is the token of the future, the opening of one of the old gates of possibility that seemed for ever locked against us, and the beginning of the world anew. America can give much that is absolutely essential to us at present and in the future. She is rich; she has money and land, a fine hardy race of men and women that she is building up and improving on, generation after generation; she has noble ideals, and above all she has freedom in her soul and a cold contempt for the shams and hypocrisies of some dying forms of civilisation. That freedom of America is a very real and a very great thing. It is in some ways the most splendid thing in the development of the human mind and instincts that has ever been known. And those who have not spent time in the United States and wandered about that wondrous land cannot realise how this freedom is not only a thing for reflection, and moralising, and speaking or writing about, but is as real as the earth, as the sun and the clouds and the bodies of men. It is in the air that is breathed; one lives in it, feels it. America is still thousands of years, perhaps, from her own perfection, but she has made an enormous advance in the establishment of the principle of freedom and in the strenuous cultivation of it; and though she is still young, suffers from the faults of youth, finds continually that through selfishness of units specks of corruption and imperfection creep into her fabric —of which other jealous peoples have rarely failed to make the most by strenuous exaggeration—the principle is there, and works energetically always. For this glorious effort in reality, in sincerity, in truth, and in the resulting freedom, every man of heart and sense should salute the American eagle. Bettered, as we hope, through sadness and suffering in the war, we shall join this great people for the new effort in the task of the human race — the eradication of its faults. If, as we say, America can give us much in material, and much in principle and ideals, the good part of the Old World which joins hands with her gives something of great value to the common capital for the new adventure, something that not for ages, if ever, could America make for herself. It will give a peculiar refinement of mind which cannot be successfully imitated by others any more than rare and subtle Eastern scents can be concocted in a Piccadilly shop. The glories of the literature of France, of the art of Italy, and the peculiar pertinacious spirit of Britain are to be more intimately associated with America, to her infinite advantage. This new combination, judging by the standards we know and can think of, is so superb, so tremendous and encouraging in its possibility, that as we see it now it would have been a hard, sad thing for East and West to try to struggle on in independence of each other. The prospect would have been nearly as hopeless and demoralising for the whole of humanity as prospect could ever be. The human instinct is a wonderful thing, subtle and sure in the promptings given to it from secret sources, and, without troubling to work out the grand Possibility in any such logical way, mankind knew by a flooding joyous inspiration what the coming of America meant, how the world must be changed and made the better—not, as we say, for her assistance in the war, but for the new and earnest association afterwards. A certain elation, which was purer and nobler than any other emotion experienced since the struggle began, filled the hearts of the people. They had the feeling of an Impossibilty accomplished.

* * *

No man of thought and understanding who was in London on what we entitled 'America's Day' will ever forget the experience, purely emotional as it was. The day before, primroses had been laid at the foot of the statue of Lord Beaconsfield in Parliament Square, and the tribute to 'Peace with Honour' had been made.

This statue of the Victorian statesman bedecked with the frail blooms of a laggard spring looked out towards the Victoria Tower at what we think of as the Lords' end of the Houses of Parliament, the dominating pinnacle of the Westminster group. High upon the summit of the Tower there are at the four corners little crowns upon their separate spires, and from the middle there ascends the flag-staff, at the tip of which is another crown. From this crowned staff no other than our own dear flag had ever flown; tradition, use, and sentiment had consecrated the Victoria Tower with its crowned pride to Britain's own. But on America's Day old tradition and all its traps were flung aside; old prejudices, born of resentments and jealousies created more than a hundred years ago, were shovelled under; and the Stars and Stripes, the star-spangled banner of freedom, was sent aloft to the crowned staff along with the Union-Jack. One doubts if man will ever see a more significant omen in these modern times than that. Thousands of people of this city, and of strangers from the country, and those of foreign lands, and Americans, feeling those new emotions within them, gazed upon those twin flags, and, realising the mighty portent, felt a spell upon them. The flags were not above and below each other, nor in any form of separation. They were together; they took the breeze together; their folds wrapped and mingled with each other; and, as you watched them flutter, you saw a composite of the British and American, some stars in a corner and a diagonal red with a patch of blue in the opposite, but never did you see two separate flags. They flew together. On the Abbey, on St Margaret's, over at the Westminster City Hall, on the tops of Whitehall, Victoria Street, and all the thoroughfares of great London, the effect was repeated in a gentler tone. There was the dominant note on the Victoria Tower, and it echoed through the town. The Stars and Stripes on a sunny morning were welcomed in their proud appearance on the heights of the capital of empire, and against the pearly sky of that memorable day they made an overwhelming display. 'Lo!' thought some of those who looked; 'how fast has America galloped in history! Here is the Mother of Parliaments, scene of the deeds of Cromwell and the Stuarts and the rest, shrine of constitutional England, and here is the flag of America flying upon it, the America that began but yesterday!'

* * *

After all, in a considerable sense, very literal, these Stars and Stripes had but come home again. There are those who find flaws in the legend and the circumstances, as they do in all that is not ordinary and plain, but yet it is the truth that those Stars and Stripes came from Northamptonshire. Something of the kind was in the arms of the family of Washington that belongs to that good English shire, and when a national flag was adopted in June 1777—the War of Independence not yet being won, but victory being anticipated—the Stars and Stripes were adopted for the flag of the American republic. It is the belief of America that this was the origin, that it was a compliment to the leader who was forging the grand beginning of the new nation that was to take leadership in the world. The contrary theory is that the Stars and Stripes were adopted from the official emblem of the old East India Company, which consisted of thirteen alternate red and white stripes, with the combined crosses of St George and St Andrew in the canton. To me this seems most unlikely in comparison with the other view, and the single suggestion to support it is that the East India Company's emblem had the thirteen red and white stripes, as had the American flag. But the latter had thirteen because there were thirteen states to start with. What should the Congress of the new nation care for the East India Company and the exact characterisation of its emblem? Even if they had indeed borrowed the idea, surely that very fact would have led them to make such difference in detail as they could. On the other hand, George Washington was then the man—the one upon whom all the hopes of those who fought for freedom were reposed. So much was George Washington the man, that his officers in the field, believing more in him than they did in the political leaders, petitioned him to be their king! He was the first president, as he was the virtual creator, of the new republic. The new capital was christened with his name, a name that rose in an English midland county. George Washington revered the old English home. Family pride was a force in him.

* * *

Four years ago I wandered about Washington and Mount Vernon, where the first president lived and died, and one saw evidences of that reverence in many places. The short steamboat trip by river from the chief city to Mount Vernon is in many respects the most impressive, and at the same time the most delightful, that a stranger in the States may make. A glide upon the brown waters of the Potomac, and soon the long, low, white mansion is seen composed upon a ridge. The path to the height is steep and green, and in the early spring or after rain there is a smell of Nature, of the fresh country, that is grateful to the man who has lived many days and nights in those hurtling cities. About the house are wide lawns and clumps of trees, many of which were personally selected and planted by Washington himself, for he was particular in this matter of the adornment of Mount Vernon. There is a magnolia near the butler's house, which he brought from the James River in 1799, the last year of his life; and in one of the mounds near the entrance is an elm, a slip from the Washington elm in Cambridge, Massachusetts, which was sent to Mount Vernon by Miss Alice Longfellow, Vice-Regent for Massa-

chusetts. There are shrubs presented to the garden by other presidents; a hydrangea planted by Lafayette in 1824; and the Mary Washington rose, named by Washington for his mother. There is a willow that came from Napoleon's grave at St Helena, a German linden set up by Prince Henry of Prussia, and a British oak planted by request of our King Edward, when Prince of Wales, to replace the memorial tree which he himself planted during his visit to Mount Vernon in 1860, and which died. Some of these are near the tomb, upon which Marshal Joffre the other day laid a spray of bronze and Mr Balfour a wreath of laurel and lilies intertwined with the colours of the Allies, this inscription being on the wreath: 'Dedicated by the British mission to the immortal memory of George Washington, soldier, statesman, and patriot, who would have rejoiced to see the country of which he was by birth a citizen and the country which his genius called into existence fighting side by side to save mankind from subjection to military despotism.' That was the solemn, noble tribute laid on the tomb where lie the remains of Washington and his wife Martha. (The key of the vault was cast into the Potomac when the bodies were laid in it after being brought from the old tomb.) This simple, splendid tribute by Mr Balfour for his country was the right corollary to the flying of those brother-flags from the Victoria Tower at Westminster. Step across the threshold of the house at Mount Vernon, look from chamber to chamber, wonder and meditate, consider the meaning of character and the force of man, and among other things you will perceive that this was the home not only of a great soldier and statesman, who turned the path of history, but also of a fine gentleman with noble and yet simple tastes. For a score of good reasons I cannot bring myself to think that the early Americans did anything but make their compliment to George Washington the completest possible. They called their city after him, and surely they might choose also his own banner or one something like it for that of the new nation. 'Resolved,' said Congress, 'that the flag of the United States be thirteen stripes, alternate red and white; that the Union be thirteen stars, white in a blue field, representing a new constellation.' The thirteen, as we have suggested, were for the thirteen original colonies that revolted from the Mother Country under the leadership of Washington. It was the intention of Congress to add one more to the original thirteen stars and stripes whenever a new state was added, and soon Vermont and Kentucky caused additions; but when the total had come to twenty and there was a prospect of many more, there was fear of overcrowding with stripes, and Congress determined that for the future there should be only a new star for a new state, and that the stripes should go back to the original thirteen, the founders' stripes. Now there are forty-eight stars in six rows in the inner top corner of this mighty banner. Americans love this flag; they are proud of it; they have need to be. They call it 'Old Glory' affectionately. They think it is beautiful, and though few flags are dreams of art, there are here the emblems of truth, of sincerity, of love and endeavour, and those are the most beautiful things. The Federal law forbids that this great flag shall ever be used in trade-marks and advertising, and ordains that it shall 'never be allowed to touch the ground.' On Flag Day of 1914 (14th June) Mr Franklin K. Lane, the British-born Secretary of the Interior in the Wilson Cabinet, spoke to his staff at Washington these words: 'I swing before your eyes as a bright gleam of colour, a symbol of yourself, the pictured suggestion of that big thing which makes the nation. My stars and stripes are your dream and your labours. They are bright with cheer, brilliant with courage, firm with faith, because you have made them so out of your hearts. For you are the makers of the flag, and it is well that you glory in the making.' If ever there was reason for a studied lapse from old tradition, and for a friendly flag to flap with ours upon the topmost towers of Westminster, 'Old Glory' was the rightful flag.

THE DEFINITE OBJECT.

CHAPTER XXXI.—*continued.*

BUT now was sudden uproar of voices in the street hard by, a running and trampling of feet, and, the swing-doors opening, a group of men appeared, bearing among them a heavy burden, and coming to the quiet corner, they laid M'Ginnis there. Battered, bloody, and torn he lay, his handsome features swollen and disfigured, his clothes dusty and dishevelled, while above him and around him men stooped and peered and whispered.

'Why, it's—it's—Bud!' stammered Spike, shrinking away from that inanimate form. 'My God! it's Bud!'

''S right, kid!' nodded Soapy imperturbably, hands in pockets; and, though his voice sounded listless as ever, his eyes gleamed evilly, and the dangling cigarette quivered and stirred.

'Ain't—dead, is he?' some one questioned.

'Dead—not much!' answered Soapy; 'guess it's goin' to take more'n that to make Bud a stiff un. Besides, Bud ain't goin' t'die that way; no, not that way, I reckon. Dead? Watch

this!' So saying, he reached Spike's half-emptied glass from the bar, and, not troubling to stoop, poured the raw spirit down upon M'Ginnis's pale, blood-smirched face.

'Dead?' said Soapy. 'Well, I guess not; look at him!' And, sure enough, M'Ginnis stirred, groaned, opened swollen eyelids, and, aided by some ready arm, sat up feebly. Then he glanced up at the ring of peering faces and down upon his rent and dusty person, and fell to a sudden fierce torrent of curses; and, cursing thus, his strength seemed to return all at once, for he sprang to his feet, and with clenched fists drove through the crowd, and, lifting a flap in the bar, opened a door beyond and was gone.

'No,' said Soapy, shaking his head, 'I guess Bud ain't dead—yet, fellers. I wonder who gave him that eye, kid? An' his mouth too? Did ye pipe them split lips? Kind o' painful, I guess. An' a couple o' teeth knocked out too? Some punchin', kid! An' Bud kind o' fancied them nice white teeth o' his a whole heap!'

Here the bar-tender glanced toward the corner where they stood, and, lifting an eyebrow, jerked his thumb at the door behind him with the words, 'Kid, I reckon Bud wants ye.'

For a moment Spike hesitated; then, lifting the mahogany flap, he crossed the bar with familiar foot, and opened the door.

'Guess I'll come along, kid;' and, hands in pockets, Soapy followed.

They found M'Ginnis sprawling at a table and scowling at the broken knuckles of his bruised right hand, while at his elbow were a bottle and two glasses. He had washed the blood and dirt from him, had brushed and straightened his dusty garments, but he couldn't hide the cuts and bruises that disfigured his face, or his scratched and swollen throat.

'What you here for?' he demanded, as Soapy closed the door. 'Didn't send for you, did I?'

'No; that 's why I come, Bud.'

'But say, Bud, what—what 's been th' matter?' stammered Spike, his gaze upon M'Ginnis's battered face. 'Who 's been'——

'Matter? Nothin'! I had a bit of a rough-house as I come along.'

''S right,' nodded Soapy; 'you sure look it! Never seen a fatter eye.'

'Well, what you got t' beef about?'

'Nothin', Bud; only'——

'Only what?'

'It 's kind o' tough you losin' them couple o' teeth—or is it three?'

M'Ginnis turned on him with a snarl. 'A-r-r-, you! Some day I 'm goin' t' kick the insides out o' ye!'

'Some day, Bud, sure. I'll be waitin'! Meantime, why not get some doctor-guy t' put yer face back in shape? Gee, I hate t' see ye—ye look like a butcher's shop! An' them split lips pains some, I guess!'

Here, while M'Ginnis choked in impotent rage, Soapy lit a fresh cigarette from the butt of the last, and held out the packet. 'Try a coffin-nail, Bud? No? Well, I guess ye couldn't smoke good with a mouth on ye like that.'

'Who did it, Bud?' questioned Spike eagerly. 'Who was it?'

'Hush up, kid; hush up!' said Soapy, viewing M'Ginnis's cuts and bruises with glistening eyes; 'I guess that guy 's layin' around somewheres waitin' f'r th' coroner. Bud wouldn't let him make such a holy mess o' his face an' get away with it—not much! Bud 's a killer; I know that.—Don't I, Bud?'

'You close up that dog's head o' yours, Soapy, or, by'——

''S all right, Bud—'s all right. Don't get peeved. I'll close up tighter 'n a clam; only—it 's kinder tough about them teeth.'

'Are ye goin' t' cut it out, or shall'——

'Aw, calm down, Bud—calm down! Take a drink; it 'll do ye good.' And, filling a glass with rye whisky, Soapy set it before M'Ginnis, who cursed him, took it up, and turned to Spike.—'Fill it up, kid,' he commanded.

'Not me, Bud; I—I ain't here for that,' said Spike. 'I come t' tell ye as some dirty guy 's been an' blown the game on me t' Hermy. She—she knows everything, an' to-night she drove me away from her.'

'Did she, kid, eh—did she?' said M'Ginnis, a new note of eagerness in his voice. 'Drove ye out onto the streets, kid? That 's damn hard on you!'

'Yes, Bud, I—guess she—don't want me around.'

'Kind o' looks that way!' nodded M'Ginnis; and, filling Spike's glass, he put it into the boy's unwilling fingers. 'Take a drink, kid; ye sure need it!' said he.

''S right,' murmured Soapy; 'told ye Bud 'u'd comfort ye, didn't I, kid?'

'So Hermy 's drove ye away?' said M'Ginnis; 'throwed ye out—eh?'

'She sure has, Bud, an' I—oh, I 'm miserable as hell!'

'Why, then, get some o' Bud's comfort into ye, kid,' murmured Soapy; 'lap it up good, kid; there 's plenty more—in th' bottle!'

'Let him alone,' growled M'Ginnis; 'he don't want you buttin' in!'

''S right too, Bud!' nodded Soapy; 'he 's got you, ain't he? An' you—got him, ain't you?'

'I didn't think Hermy 'u'd ever treat me—like this!' said Spike tearfully.

'You mean—throwin' ye out onto th' streets, kid? Why, I been expectin' it!' said M'Ginnis.

'Expectin' it?' repeated Spike, setting down his glass and staring. 'Why?'

'Well, she 's a girl, ain't she? an' they 're all th' same, I reckon.'

'An' Bud knows all about girls, kid!' murmured Soapy. 'Bud 's wise t' all their tricks. Ain't yer, Bud?'

'But whatcher mean?' cried Spike. 'What ye mean about expectin' it?'

'Well, she don't want ye no more, does she?' answered M'Ginnis, his bruised hands fierce clenched, his voice hoarse and thick with passion. 'She 's got some one else now—ain't she? She 's—in love—ain't she? She 's all waked up an' palpitatin' for—for that damn '—— He choked, and set one hand to his scratched throat.

'What d' ye mean, Bud?'

'Ah!' said Soapy, softer than before, 'I 'm on, Bud; you put me wise!—He means, kid, as Hermy 's in love with th' guy as has just been punchin' hell out o' him—he means your pal Geoff.'

With a hoarse, strangling cry M'Ginnis leapt up, his hand flashed behind him, and—he stood suddenly very still, staring into the muzzle of the weapon Soapy had levelled from his hip.

'Aw, quit it, Bud; quit it,' he sighed; 'it ain't come t' that yet. Besides, the kid 's here, so loose yer gun, Bud—no, give it t' me; you 're a bit on edge t'-night, I guess, an' it might go off an' break a glass or somethin'. So gimme yer gun, Bud; that 's it! Now we can sit an' talk real sociable, can't we? Now listen, Bud. What ye want is t' get your own back on this guy Geoff, an' what the kid wants is t' show his sister as he ain't a kid, an' what I want is t' give ye both a helpin' hand.'

But while M'Ginnis stood scowling at the imperturbable speaker, Spike rose, a little unsteadily, and turned to the door. 'I 'll be gettin' on me way, Bud,' said he.

'Where to?'

'Home.'

'What! back t' Hermy? After she turned ye out?'

'But I—I got t' go somewheres.'

'Well, you stay right here with me, kid. I 'll fix ye up all right.'

''S right, kid!' nodded Soapy. 'Bud 'll fix ye up all right. We 'll have in another bottle when that 's empty!'

'What about your sister, kid?' demanded M'Ginnis fiercely. 'What about Hermy an' this swell guy? Are ye goin' t' sit around an' do nothin'?'

'But Geoff 's goin' t' marry her.'

'Marry her! What! him? A millionaire marry your sister? You think so, an' she thinks so, but I know different!'

'But Hermy ain't that sort; Hermy 's—good.'

'Sure; but this guy 's got her fazed; she thinks he 's square all right—she 'll trust him; an' then, s'posin' he ain't?'

'I—I ain't s'posin' nothin' like that!' said Spike, gulping his whisky.

'Well, s'posin' he 's been meetin' her—in a wood—on the sly—eh? S'posin' they been huggin' an' kissin''——

'Say now—you cut that out,' stammered Spike, his voice thick. 'I tell ye—she ain't—that kind.'

'S'posin',' continued Bud, refilling the lad's glass—'s'posin' I could show 'em to ye in a wood—eh? Ah! What she want t' meet him in a wood for, anyway—nice an' quiet, eh?'

'Say now, Bud, I—I ain't goin' t' listen t' no more!' said Spike, rising and clutching at the table. 'I—I 'm goin' home!' and, swaying on unsteady feet, he turned to the door.

But M'Ginnis gripped his shoulders. 'Wait a bit, kid.'

'N-o; I 'm—goin' home—see!' said Spike, setting his jaw obstinately. 'I 'm goin'—right now!'

'That 's just what you ain't!' snarled M'Ginnis. 'Sit down! Hermy 's only a work-girl—don't forget that, kid—an' this guy 's a millionaire. I guess he thinks Hermy 'll do—till he gets tired o' her, an'—then what?'

'He—told me he 's goin' t' marry her!' said Spike slowly, speaking with an effort, 'an' I guess Geoff ain't a liar. An' I wanter—go home.'

'Home—after she throwed ye out? Ain't ye got no pride?'

'Aw, say, Bud,' sighed Soapy, 'I guess d' kid ain't soused enough for pride yet; sling another glass int' him—that 'll fix him good, I reckon.'

'I ain't g-goin' t' drink no more,' said Spike, resting heavy head between his hands. 'I guess I 'll b-beat it home, f'lers.'

'Bud,' suggested Soapy, 'ain't it about time you rang in little Maggie on him?'

M'Ginnis whirled upon the speaker, snarling; but Soapy, having lighted another cigarette, nudged Spike with a sharp elbow. 'Kid,' said he, 'Bud 's goin' t' remind ye o' little Maggie Finlay—you remember little Maggie as drowned herself?'

Spike lifted a pale face and stared from the placid Soapy to scowling Bud, and shrank away. 'Yes,' he whispered hoarsely; 'yes—I 'll never forget how she looked—pale, so pale an' still, an' th' water runnin' out o' her brown curls. I—I 'll never forget.'

'Well,' growled M'Ginnis, 'watch out Hermy don't end th' same way.'

'No!' cried Spike; 'oh my God—no!'

'What 's she meetin' this millionaire in a wood for—on the sly?'

'She don't! Hermy ain't like that.'

'I tell ye she does!' cried M'Ginnis; 'an' him kissin' an' squeezin' her, an'—nobody by.'

'It 's a lie, Bud; she—she wouldn't!'

'S'posin' I could show ye? S'pose you see him there waitin' for her?'

'If—if he means any harm t' Hermy I—I 'll kill him!'

'Aw—you wouldn't have the nerve, kid!'

'I 'd shoot him dead—by God, I would!'

'You ain't man enough, kid.'

'You g-give me a gun an' see. I 'd shoot any

one t' save my sister from—th' river. Oh my God—I—I 'd die for her, an' she don't love me no more!' And, leaning his head upon his arm, Spike burst into a passion of tears.

M'Ginnis watched him a while; then, filling the boy's glass, clapped him on the shoulder and held it to his lips. 'Neck this, kid,' said he; 'neck it all—so. That 's good, ain't it? To-morrow evenin' I 'll take ye where they meet. Maybe you 'll ketch him waitin' for her; but instead o' Hermy and kisses there 'll be you an' me—hey? Will ye come?'

'S-sure I will if—you 'll gimme—your gun.'

'Pshaw, kid! what 's a kid like you want with a gun?'

'T' shoot him.'

'Eh? What d' ye mean?'

'If he 's after my sister I 'll—kill him. I will; by God, I will!'

''S right,' nodded Soapy, staring into the boy's drawn face. ''S right, Bud; if ever I see a killer, th' kid 's sure it!' Slowly the glare died out of Spike's eyes, his body drooped, and, sighing, he pillowed his heavy head upon the table and fell into a drunken slumber. For a while the two men sat there hearkening to his stertorous breathing; then Soapy laughed softly and mirthlessly. 'You sure got th' kid all worked up an' mad enough t'—kill—eh, Bud? If he does get up against this guy Geoff, this guy Geoff 's sure goin' t' cash in—sudden. Consequently, I guess you 'll be wantin' paper an' pencil—both here!'

'What th' hell'—— began M'Ginnis.

'Telegram, Bud. You 're goin' t' frame up a nice little telegram t' this guy Geoff—eh, you sure are th' fly gazebo'! A nice little message: "Meet me t'-morrow in the wood at sunset.—HERMY." Somethin' nice 'n' romantic like that 'll bring him on th' run—eh, Bud? Then, 'stead o' Hermy, comes you an' th' kid—eh, Bud? An' 'stead o' kisses this guy Geoff gets a lead pill—eh, Bud? Th' kid can't miss if you get him close enough. It sure is some scheme, Bud. I couldn't have thought it out better myself. Paper 'n' pencil, Bud—get busy, an' I 'll sashay over an' send it off for ye—t'-night.'

During Soapy's unusually long speech M'Ginnis sat staring at him under frowning brows, but now he turned and scowled down at the sheet of paper, picked up the pencil, laid it by again, and sat opening and shutting his big hands, while Soapy, lighting another cigarette, watched him furtive-eyed. When at last he spoke his voice was thick, and he didn't lift his scowling gaze.

'Send that kid Larry t' me—an' say—you don't have t' come back.'

'All right, Bud—all right; only, you 'd best send two telegrams t' make sure—one t' Fift' Av., 'n' one t' his place up th' river. S' long, Buddy!'

Some fifteen minutes later, the boy Larry, stepping out of O'Rourke's, was swung to the wall in Soapy's grip.

'Aw—say, cheese it now! Is that you, Soapy?'

''S right, my bucko. Fork out that telegram—quick!'

'Aw, say, whatcher mean? 'N' say, Bud told me to hustle; 'n' say'——

'Dig it out—quick!' said Soapy, the dangling cigarette glowing fiercely. 'I want it—see?'

'But say,' whimpered Larry, 'what 'll Bud say?'

'Nothin'! Bud ain't goin' t' know. You take this instead; take it!' And Soapy thrust another folded paper into the boy's limp hand, who took it whimpering.

'Bud tol' me t' bring it back.'

'Well, you tell him you lost it.'

'Not much. I 'll shin right back an' tell him you pinched it.'

'You won't, my sport—you won't!' said Soapy, and, speaking, moved suddenly; and the boy, uttering a gasp of terror, shrank cowering with the muzzle of Soapy's deadly weapon against the pit of his stomach. 'You ain't goin' t' say a word t' Bud nor nobody else, are ye, Larry boy—are ye?'

'No, no!'

'Because, if ye ever did, old sport, I should give it ye there—right there in the tum-tum—see? Now, chase off, an' see ye get them addresses right. S' long, Larry boy; be good now!'

When the boy had scudded away, Soapy opened the paper and scanned the words of M'Ginnis's telegram, and, being alone, smiled as he glanced through it.

'You got th' kid, Bud,' he murmured; 'you got th' kid; but if th' kid gets the guy Geoff, why—I 've sure got you, Bud; got ye sure as hell, Bud!'

(Continued on page 501.)

CHARCOAL.

By F. ROWLINSON.

THE process of converting wood into charcoal has been known for many centuries; but so simple and ingenious was the process as originally carried out that modern theory has made little or no essential improvement on time-honoured practice. How the mode of charring wood was first discovered, or to what uses the charred product was first put, we have no means of knowing. Possibly some prehistoric man sought to stifle the smoke and blaze of his fire by cover-

ing it with turf, so as to hide his whereabouts from his enemies. On the next morning he raked over the embers of his previous night's fire, and, behold! they glowed, giving out an intense heat, but without smoke or blaze. The new fuel, probably accidentally discovered after this manner, soon became of great importance as one of the steps in the advancement of civilisation. With the aid of charcoal, metals could be worked, smiths could forge weapons and rude instruments, earthenware utensils could be fashioned from clay and used to contain and convey liquids. Industry in almost all its branches must have received a mighty impetus from the discovery of charcoal-burning.

Of the metals extracted from their ores by the aid of charcoal, iron was the most useful and important. The primitive method of the early smelters was to select a level spot on a draughty, wind-swept hill. On this was lighted a fire of wood, and on this again were piled thin alternate layers of iron ore and charcoal. The whole was covered with clay, vent-holes being left on the windward side, through which the prevailing wind roared. After some time the clay covering was removed, and a white-hot 'bloom' or spongy ball of very pure iron was taken out and forged into shape. The quality of this old charcoal iron was so good that analyses of such samples as survive show no inferiority to the very best of modern makes. Further progress resulted in the application of blast from leathern bellows, driven by foot or by water-power. This step abolished the uncertainty which must have resulted from the fickleness of the winds. Simultaneously the open hearths were replaced by conical brick furnaces, the charcoal and the ore being charged at the top, and the rough 'bloom' being removed at the bottom. Such were the widely used German *Stückofen*, which utilised the ores and abundant charcoal-supplies of the great German forests. As the demand for iron became more and more insistent, furnaces were built of continually increasing size, until the iron remained so long in the furnace in contact with the white-hot charcoal that it began to absorb it. This alloy, as it were, of iron and charcoal (carbon) melted at the high temperature, and instead of a rough ball of spongy metal being removed at the end, a continuous supply of fluid cast-iron was available. With this new development the demand for iron increased more rapidly than before. Cannon of considerable size were cast; iron began to be used as a substitute for wood in constructional works. The whole of the rapidly increasing iron industry now rested upon the labours of the charcoal-burners. These auxiliaries took advantage of their indispensability to secure for themselves advantages shared by the miners and the smelters. They assumed a sturdy independence of spirit, fostered alike by their restless, wandering, open-air life, and the keen demand for the produce of their labours. To the extent of this independence the old French proverb, *Charbonnier est maître chez-lui*, testifies. The amount of sound timber consumed by the blast-furnaces of this period was enormous. There were about this time (1550) in England one hundred and forty forges, each using three loads of best charcoal per day, or about one million cubic feet per furnace per year. The Forest of Dean held a monopoly at first, but later Kent and Sussex became formidable rivals owing to their proximity to London. Such were the demands of these places for charcoal that, together with the need of timber consequent upon our extended commercial enterprise, they began to cause grave fears for our timber-supplies. Restrictive legislation was introduced by Elizabeth at various times from 1558 to 1584 to prevent the wholesale destruction of the great English forests. The erection of works in new districts was entirely prohibited, whilst those already existing were severely controlled. Hampered by these laws, the demand for charcoal suffered no increase, until in the eighteenth century mineral coal, and later coke, began to oust it from its place as the sole fuel employed in iron-smelting. The invention of the hot-blast stove by Neilson, a Scotsman, was the death-knell of the charcoal-burner. The last Sussex furnace was blown out in 1827, and the centre of the iron industry shifted north. The last charcoal furnaces remaining in the United Kingdom are at Ulverston in Lancashire, these having been working for almost two centuries.

The invention of gunpowder, of which charcoal is an essential constituent, altered the whole art and science of warfare. From the first use at Crécy in 1346 until the abandonment in quite modern times, charcoal made by the old heap-burning methods was by far the best for use in gunpowder. Where wood was scarce, attempts to preserve the volatile products which are unfortunately lost in the heap process resulted in the development of closed-retort processes, by which these by-products are recovered. Such processes, though successful in their aims, do not yield a charcoal of the old-fashioned high quality; it is both softer and less reliable. Hence the retort process is used primarily for the production of wood-spirit, acetic acid, &c., charcoal being looked upon only as a by-product. Thus it comes about that, just as charcoal was used to make gunpowder, these more modern processes aim at the production of acetone and gray acetate of lime, which are both of exceedingly great importance in the manufacture of propellent explosives. As in many well-known instances, the by-products, at one time utterly wasted, have now become the *raison d'être* of the process. For this reason the manufacture of charcoal, long discontinued in this country through the decline of the charcoal furnace, has been re-established, but in such a modified form

that it is not at first sight identifiable with the original process.

The only variety of charcoal so far discussed has been wood charcoal. There are, however, other varieties known as animal charcoal. These, as their name indicates, are made from animal products, and the most important of them are bone charcoal and blood charcoal. Animal charcoal possesses in a remarkable degree a property which renders it exceedingly useful in the arts and manufactures. This property, which is also found in wood charcoal, but in a much less active form, is the power of absorbing gases, vapours, and colouring matter with which it is in contact. A striking illustration of this is afforded by dark wines, such as port, which, on filtration through bone charcoal, come through quite clear and colourless. This property was formerly made use of in the sugar industry to decolourise raw-sugar juice, but this method is now superseded by others. Amongst the gases and vapours absorbed by charcoal, noxious effluvia resulting from putrefaction and decay are noteworthy. This characteristic property of absorption is retained for a considerable period, and may at any time be restored by strongly heating the charcoal. For this reason trays containing charcoal are largely used in hospitals, and in respirators and ventilators to prevent the egress of unpleasant odours from sewers. Powdered charcoal and crisp biscuits of charcoal are taken internally in certain forms of dyspepsia. The idea of filtering discoloured drinking-water through charcoal is dependent upon this property of absorption, though it must be borne in mind that such treatment by no means eliminates from the water any harmful bacilli which it may contain. In countries where mineral fuel is scarce and where wood is abundant—for example, France—wood charcoal is largely used as a fuel by the peasantry. Its use is attended by some element of danger if a proper supply of air be not maintained. The half-burned fuel gives off a most poisonous gas, which is particularly insidious in that it is odourless, so that the unsuspecting victim has no warning that the atmosphere is deadly. A noted French man of letters met his death in this manner some years ago. But with proper arrangements charcoal is quite safe as a fuel, and is far more cleanly and pleasant than coal.

From this brief consideration it will be seen that, although the day when charcoal was the principal industrial fuel is long since past, the substance is still of importance in many minor ways. In several manufacturing processes, and particularly in hygiene, charcoal yet plays a very useful part; so that a half-historical glance at this once valuable substance may not prove wholly uninteresting and unprofitable.

EVENING ON A TROUT-STREAM.

THE warm summer evenings find many a fisherman loitering beside the flowing river until such time as the twilight hatch of sedges shall once more put life into the trout, and he bides his time as patiently as the classic yokel waiting for the water to flow by that he may cross dry-shod. Not in all the angling year is there an hour in which the fisherman's patience is more sorely tried or less surely rewarded. All through the long summer day, when the river is low and stale, the indifferent, sleepy trout are such as might have inspired that hopeless couplet of Bunyan:

> Yet fish there be that neither hook nor line
> Nor snare nor net nor engine can make thine.

The only way to put a trout in the basket on such dazzling days is with a dry fly or up-stream worm. Even so, success is in the balance, for the trout, knowing they need only wait till the evening sedges come out in their thousands, are in no hurry to feed on meaner fare. So they wait, and the fisherman must wait with them, full of hope, and at least heartened by Max Müller's axiom that the future can never be worse than the past.

Trout or no trout, it is witching business, and not its least charm is the absence of all hurry. The fisherman, having made up a cast of fernweb, sedge, and alder, lets it soak in the shallows while he smokes a quiet pipe and lazily watches the last of the swallows and the first of the bats wheeling in shrill rivalry among the butterflies and midges of the sunset hour. A little later the neighbouring village clock gives out the hour of eight, and still the figure on the bank is motionless. In strenuous times like these there is, perhaps, something contemptible about such contentment beside the river; but, with no other company than his own thoughts, his is at least an innocent vigil. As soon as the light fails, he waits for something to happen, and, sure enough, from the heavy shadows under the far bank comes the plosh that betokens the rise of a good trout. Gulp goes another fish a little distance down-stream; bang goes a third right opposite. The evening rise is on in earnest, and he must be up and doing.

Encased in waders and brogues, welcome even on these summer nights, particularly if he has passed life's half-way house, he steps out into the swift stream, and perhaps, in his keenness to throw over an outlying fish, goes in over his waders, proving once more the truth of the Spanish proverb that one cannot catch fish without getting wet. It is no easy work striking fish

that he cannot see, but by throwing a short line, which is far more deadly under such conditions than any attempt at exhibition casting, he manages to hook a fair proportion of those which rise. These evening trout have noticeably the trick of coming short at the fly, and striking is guesswork in every case, for it must be instantaneous in rapid water, and not the deliberate performance that answers on sluggish chalk-streams like the Test or the Itchen. Once the fish is hooked, the play 's the thing, and tackling a pound trout in the darkness calls for much diplomacy and judgment, for the fish circles unseen at the end of the fine cast, and the final act of coaxing a big trout into a small net, neither of them visible at the time, is a severe test of the angler's skill.

This fishing in the late evenings does not commend itself to those who like their sport enlivened by sunshine and the song of birds, but these late-rising trout are particularly welcome to hard-worked men who are not free to seek the river during the day. The slow setting of the summer sun, with the evening fishing yet to come, marks an hour of severe repression that is an education in itself. To cast his flies over the fish before the light fails is to give the game away, putting them on their guard and spoiling the water for the evening. The brief spell of the evening rise is blind man's holiday. Hidden bushes await careless casts; hidden holes yawn for unwary feet. It is obvious that conditions so severe do not, perhaps, make for unalloyed delight. Nor is the reward of so much patience by any means assured. Most things come to those who wait, but not always evening trout. Yet, for all the drawbacks and uncertainties, these summer evenings are not the least treasured memories of any one who takes patience and philosophy with him to the river.

THE UP-TO-DATE WAR MAP.

By A. Hilliard Atteridge.

IN most of our little wars on the borders of the Empire we have had to fight in countries where either very defective maps were available, or there were none at all on any useful scale, so that the country had to be mapped as our troops advanced. But on the Western front in the present great war we have found ourselves, for the first time in the history of our army, fighting in a country where an abundance of accurate large-scale maps are available. The Belgian and French official maps corresponding to those of our own Ordnance Survey are admirable, and range in scale from general maps of about three and a half miles to the inch up to maps of rather more than six inches to the mile. These large-scale maps are detailed enough to show every clump of trees, every house in the villages, every rise and fall of the ground, every ridge and hollow. There was, therefore, no need to make new maps of the country; but we find in Sir Douglas Haig's despatches a testimony to the excellent work done by the survey companies of the Royal Engineers, and, as a matter of fact, an immense amount of highly skilled work is being continually done to get the utmost value out of the existing maps. Two different organisations are engaged on this task, and mutually co-operating in it—one under the direction of the French Staff, the other under our own. The task of these combined organisations is to show on the maps the endless changes effected by the modern system of elaborately entrenching the fighting front, and to keep this information continually up to date.

One of the large-scale maps of a section of the fighting front in France, as prepared for use by our own troops, looks very different from the same map as it was issued by the French Government in the peaceful days before the war. Over the original map there stretches what looks at first sight an irregular lacework of red lines—broken zigzag lines, continuous lines, lines of dots, lines of little red crosses, and here and there spaces covered by small red dots, and in others large patches of red print. Each of these signs has its special meaning. The red markings are a large-scale map of the enemy's trenches printed over the original map; and studying it with the help of the key printed in the margin, one can make out the successive lines of fighting-trenches, the communication-trenches linking them together, the zones of wire entanglements marked by red crosses, the redoubts and gun positions—in a word, all the details of the enemy's defensive organisation.

There are indications which show if a trench has been abandoned, or if it is still kept in good order for fighting. Crowds of red dots here and there mark the effect of bombardment, for they indicate ground extensively cratered by shell-fire. How is it all this information is obtained, and that it is possible to mark the enemy's entrenchments so fully, not only in the first line, but in line after line behind it, perhaps for the depth of several miles?

These results are due to a skilful application to war purposes of two inventions of the last few years—the aeroplane, and the camera which is used for producing cinematograph films. No sooner had the aeroplane come into existence than its value for military reconnaissance was recognised. But even the most skilful observer flying rapidly over an enemy's lines could not collect the detailed information now shown on

the maps. He collects it by using the eye of the camera. The instrument is of the same general type as that used for cinematograph work. During the flight over the trenches the camera, pointed downwards, with the film running past its lens, supplies a negative which is brought back to our lines and handed over to experts in the work of development. In a few minutes it is developed and a proof printed off. To most of us this picture would not give much information, but it is put into the hands of men who have had long practice in interpreting the details shown on aerial photographs. The first step is to compare it with the large-scale map. Roads and villages are picked out on the photograph, a comparison with the map shows their precise position, and then it is possible to transfer to the map the details of the enemy's trenches between these points as revealed by the photograph. The fact that much of the fighting has taken place in chalk districts facilitates the work, for the trenches appear as well-marked white lines in sharp contrast to the unbroken ground around them. By taking a succession of photographs day after day, the enemy's positions can be watched to see how this or that part of the line is being strengthened, or reserve-trenches are being constructed behind it, and new communication-trenches opened from front to rear. Note can also be taken of the cutting down of woods, the destruction of buildings, the laying down of new branch-railways, the making of stations, the formation of depots and ammunition-dumps—all useful information for the attacks of our airmen. The work is heavy, because it is not a case of making a trench map once for all, but the map has to be continually revised and kept up to date.

The work of collecting the material for the map-maker entails a certain amount of fighting in the air. The aeroplane which carries the photographer and his camera has to be protected by fighting-aeroplanes armed with machine-guns and ready to attack and drive down any hostile aircraft that attempt to interfere with the reconnaissance. Indeed, those aerial surveys could not be regularly and effectively carried out unless we held a more or less complete command of the air. There is also the danger of coming under the fire of anti-aircraft guns. In the early days of the war, before this kind of gun became very effective, aerial reconnaissance was carried out at two thousand or three thousand feet from the ground; but before the end of the first year the development of anti-aircraft guns forced the aeroplanes to fly higher, and aerial photographs are now taken at a height of five thousand or six thousand feet, or even at still greater heights. The photographic apparatus available gives so much detail and such perfect definition, even on a very narrow band of film, that an enlargement can be secured after development and all the details brought out.

The placing on the map of the information collected by the airmen is only one part of its preparation for practical use. It is important to find ways for describing accurately the precise position on the ground of guns, troops in movement, &c., in giving orders, and selecting the targets for artillery fire. Before the war, in our peace manœuvres very rough-and-ready methods were used for describing points on the map—'so far and in such a direction from a farm or cross-road,' or, again, some chance letter on the map would be taken and the distance and direction from it given. One found in orders and reports such expressions as 'Four hundred yards north of the "L" in "Blackwater."' Much more precise methods are now adopted. The system had already been in use in most countries for directing the fire of coast-defence guns. The sea on a coast map is mostly a blank; so, in order to signal to the gunners the exact position of a hostile ship, the sea spaces on the maps used in the batteries were divided by a system of squares. This system of squares is now used on the war maps in a very elaborate form. First there are large squares marked with a capital letter. These are subdivided into smaller squares denoted by a number, these squares being one thousand yards long and wide; these are again divided into quarters—squares of five hundred yards—always described by the letters *a*, *b*, *c*, *d*. Transparent celluloid scales are provided with the five hundred yards square ruled on them, and divided into ten rows of ten little squares each. By laying this on the map and counting the small squares from the lower left-hand corner, one can tell, for instance, that there is a battery in the fifth square of the sixth row. This defines the position within fifty yards, and one can be still more precise by noting that the guns are in the middle of the square or in one of its corners, or at some point between these. Thus a position can be described with quite sufficient accuracy for opening fire upon it even at long range, the further regulation of the fire being carried out by 'spotting' from an aeroplane or an anchored balloon.

The maps give a further aid towards a more general description of places upon it. Provisional names are given to every isolated clump of wood, every rise and fall of the ground, to supplement the names already marked on the map for the more important woods and hills. One may give some instances from the maps of the Somme front, which have been so largely reproduced that they are now public property. The hollows north and south of La Boiselle village, which had no name, are described on the maps as 'Mash Valley' and 'Sausage Valley.' Clumps of wood to the east of the village, too small to have any local name, appear with the names given them by the airmen—names sometimes derived from their shape, as seen from above—'Acid Drop Copse,' an oval clump of trees;

'Caterpillar Wood,' half a mile of bushes and scrub following the curve of a hollow; and 'Canoe Wood,' whose outline on the map is that of an Indian canoe. Sometimes the names reveal the nationality of their inventor. Thus, 'Usna Hill' and 'Tara Hill,' west of La Boiselle, show that an Irish map-maker was at work. These names for hill-tops and ridges are an improvement on the French method of describing hills by their height in metres, as we talk, for instance, of the famous 'Hill 70' near Loos, and 'Hill 60' near Ypres. The drawback of this method of describing hills is that in broken, undulating country there are likely to be several hill-tops on the map which have about the same height.

It is obvious that these detailed maps, with their elaborate system of squaring, are of the greatest use in planning the heavy bombardment which precedes an assault, and in the actual attack. But they have an equally important use in the direction of long-range fire from day to day. The heavy artillery in action at the front works at ranges which until the present war had never been used in land warfare. There are guns on both sides which can throw a shell over twenty miles. These extreme ranges are not used, for one can regard as something like a freak in artillery work the German exploit of pitching a few shells into Dunkirk at a range of twenty-two miles. It was obviously an experiment, and so far it has not been repeated. But ranges of five or six miles are quite common, and guns have been in action up to ten miles. At such ranges the gunner does not see his target. In fact, indirect fire at unseen targets is in frequent use at comparatively moderate ranges. It is essential to conceal the position of the guns, and they are brought into action from behind buildings, woods, rises of the ground, or artificial screens, the rapid rise of the trajectory of the shell carrying it well over the obstacle that screens the guns. The gunner knows his precise position on the large-scale map, and aerial reconnaissance enables him in the same way to fix the exact position, direction, and distance of the target. His range-tables give him the exact line of flight of his shell at every range, and from the map, which shows the precise form of the ground, he can rapidly construct a section of it, and be quite sure that the flight of the shell will not only clear all intervening obstacles, but also in its descent reach hostile positions even behind ridges or other obstacles which conceal them from view. The gunner relies upon an observer, usually in the air, watching the effect of his fire, correcting the range, and letting him know the result. It is the elaborate map that enables the gun to be laid so as to reach the unseen target. At shorter ranges, from one thousand five hundred up to three thousand yards, machine-gun fire is used in the same way. Wireless telegraphy enables the aerial observer to signal the results of the fire very rapidly. In a letter from the front, describing the firing of one of our giant howitzers, which was published in the newspapers not long ago, the writer tells how, beside the gun position, a signaller was seated on the ground with the wireless receiver near him, and two discs, like those of a telephone, attached to his ears, while far away to the front an aeroplane was hovering in the sky, and how it seemed that the shot had hardly been fired when the signaller looked up and said, 'About fifty yards over,' and the gunner corrected the elevation of the gun so as to shorten the range to that extent.

It is this new art of long-range shooting by the map at unseen targets that has made permanent fortifications erected in peace-time comparatively useless. The position of works of this kind cannot be concealed, and in fact one finds them marked even on maps freely sold for motoring purposes. The result is that, with long-range artillery, smokeless powder, and indirect fire, an attacking army can choose positions for its guns from which fire can be brought to bear upon the known position of the fort or battery, while the gunners in the fort cannot find out where the attacking batteries are. In the first days of the war, the German gunners put the southern forts of Liège out of action in a few hours by long-range fire from unseen positions screened by the hills and woods south of the city. Verdun was saved in the first months of the war by taking the heavy guns out of the permanent forts and mounting them in concealed batteries in the surrounding woods, where it was difficult even for the German aircraft to discover exactly where they were.

THE MONTH: SCIENCE AND ARTS.

PANAMÁ CANAL LIMITS THE SIZE OF UNITED STATES BATTLESHIPS.

IN our February 'Science and Arts' notes particulars were given of some colossal battle-cruisers for the United States Navy. Since then an investigation has been carried out to ascertain the limit of size for an American battleship. In the construction of very large vessels the depth of water in the harbours and the facilities for 'dry-docking' have to be considered. In this case the Panamá Canal was found to be the limiting factor. The limit, however, is a very high one, for the canal can

accommodate a battleship of a size which, it is to be hoped, will never be exceeded. This vessel could be nine hundred and seventy-five feet in length, with a breadth of one hundred and eight feet, and a draught of thirty-four feet, with a displacement (weight) of eighty thousand tons. For main armament fifteen guns of eighteen-inch calibre, mounted in five triple-gun barbettes, are suggested, together with a secondary armament of twenty-one six-inch guns. A belt of armour sixteen inches thick would be provided right round the ship, while special protection against torpedoes below the water-line is contemplated. The estimated speed of such a vessel is forty miles an hour, and the cost fifty million dollars.

EASILY MADE TRANSPARENT MATERIAL.

According to *Popular Science Siftings*, sheets of waterproof transparent material can be prepared by applying glue to ordinary mosquito netting. One part of glue is allowed to stand in sixteen parts of water for half-an-hour. The vessel containing this mixture is then placed in boiling water until the glue is melted. After being strained through wet cheese-cloth into a heated tray, the liquid is ready for application to the mosquito netting. This operation is performed by passing the fabric through the glue solution and hanging it up to dry. To render the material waterproof it is treated in a bath of 40 per cent. formaldehyde and water. The resulting sheets are fireproof, pliable, and semi-transparent, and they can be coloured with aniline dyes for use in windows and lanterns and for other ornamental purposes.

COLLAPSIBLE PNEUMATIC LIFE-RAFT.

The invention of a life-saving raft by a German, Herr Meyer, of Berlin, will come rather as a surprise to many of us, in view of the efforts of German naval gunners and airmen to prevent the rescue of their own men by the British in several sea-fights. In form the new device resembles the link of a chain, with a light wooden hinged diaphragm across the aperture. The part corresponding to the link is made of canvas and rubber, and is distended with air. Its surface is protected by stout cord netting, and there is a rope running round the outer periphery, to which are attached the usual loops for persons in the water to catch hold of. Collapsibility and lightness are the main features of the appliance, which can be folded up and carried on the back, its weight being only fifteen pounds. When blown out it measures six feet in length, and will safely support six hundred-weights. A larger size measures twenty feet in length and will carry fifty people inboard, while another hundred can sit on the top of the 'link' or hang on to the loops. This model weighs about two hundredweights. Both sides of the device are exactly alike, so that it matters nothing which side floats uppermost.

HOW THE JAPANESE KEEP THEMSELVES WARM WITH POCKET STOVES.

Japanese pocket heaters are described by N. Kawaguchi in the *English Mechanic*, from which it appears that our allies in the far East are accustomed to carry about their persons in cold weather what are practically miniature slow-combustion stoves. The fuel used in these appliances, known as *kwairo-bai*, must burn slowly without giving off smoke or fumes, and great ingenuity has been exercised in producing suitable substances for this purpose. Hemp-stalks, mulberry-leaves, the kozu and the catalpa plants, corn-cobs, nut-rinds, and other waste products, together with a vegetable oil, are all used to provide this fuel. A small quantity of saltpetre is added, while the leaves of a certain tree are employed to cause the powdered materials to stick together. The best fuel basis is said to be hemp-stalks from which the fibre has been extracted, these being burnt into charcoal and afterwards pulverised. When the various ingredients have been carefully mixed to the right consistency, they are made into rolls, two qualities being produced—one soft, for 'bosom-stoves;' the other hard, for uses such as hot-water bottles are put to in other countries. The bosom-stoves resemble metal cigar-cases, whilst those for burning the hard fuel are somewhat larger. One charge of fuel in the former, at an almost infinitesimal cost, will last for three hours. The Japanese use these heaters when travelling, when sitting in unheated rooms, and at other times. Thousands were carried by the soldiers in the Russo-Japanese war. In the present war also large numbers have been used by the Russian troops, and a considerable demand exists for them in France, into which country they were introduced by French missionaries from Japan.

DOES MEAT-EATING INCREASE THE LIABILITY TO CANCER?

Some interesting facts tending to show a close relation between meat-eating and cancer have been collected by the editor of the *Golden Age*. For instance, no case of this disease has occurred among the Russian Dukhobors in Canada, who number seven thousand, and whose tenets forbid them to eat meat. The immunity of vegetarians from cancer is also confirmed by the absence of it in two Benedictine monasteries, while the lowest death-rate from this cause in any European country is to be found in Italy, where less meat per head is consumed than in any other state. On the other hand, the greatest increases in the number of victims to this complaint in America have occurred in Chicago and San Francisco, where extravagance in diet is rampant. The above evidence is, however,

rather discounted by the admitted fact that gout and cancer seldom occur together, and that a plentiful diet of meat is generally supposed to encourage a tendency towards the former complaint, if indeed it is not often the direct cause of it.

ANILINE DYES AS ANTISEPTICS.

A Prussian surgeon, Dr Erwin Baumann, is using large quantities of aniline dyes for curative purposes, says *Popular Science Siftings*. Methyl violet was found to give the best results, a 4 per cent. dye solution being used. For superficial wounds dye in the form of powder is employed, while a paste consisting of the powder mixed with glycerine and alcohol is introduced into deep wounds. Another plan sometimes adopted is to put into the wound antiseptic gauze saturated with a solution of the dye. The effects are also found to be beneficial in cases of osseous suppurations, ventrical ulcers, abscesses, appendicitis, and other diseases. Reference was made in this Journal (May 1917) to the investigations carried out at the Bland-Sutton Institute of Pathology into the merits of the yellow dye called flavine. 'Brilliant green' has also been used there, as well as on the field, as a valuable antiseptic.

PORTABLE MOTOR OUTFITS FOR INCREASING THE CARRYING CAPACITY OF CANAL BOATS.

Owing to the shortage of labour and rolling stock upon our railways, together with the heavy traffic in munitions and war material, great difficulty is being experienced in the transport of goods needed for the carrying on of ordinary industries. Any means, therefore, which will augment other methods of conveying merchandise should prove particularly beneficial at the present time. As is known to most people, the boats on our canals are mainly hauled by horses at a very slow speed. Before the war the horse was being gradually ousted by the oil-engine, but this process was a slow one, as new boats had to be built especially for propulsion by motors. Neither time nor labour is now available to increase the carrying-power of canals in this way; but the difficulty has been overcome by Mr Arthur E. Hooke, of Birmingham, who has designed a motor and propeller outfit which can be attached to an ordinary 'horse' boat in half-an-hour. The motor, which develops seventeen horse-power, is mounted upon the top of the cabin at the stern of the boat; whilst the rudder is unhooked, and in its place is put a propeller working between two plates, which form a double rudder. A vertical spindle drives the propeller through bevel gear which will transmit power from one spindle to another at right angles to it. This, of course, is necessary, as the propeller shaft must be horizontal. At the top of the vertical spindle is another bevel gear to connect to a horizontal spindle from the engine on the cabin-top. Universal joints allow the propeller to be swivelled round for steering the boat, while the transmission spindle from the engine runs in a tube, as otherwise it might catch on the jacket of the man steering, who has to stand close beside it. This device has proved exceedingly successful, and it is capable of propelling a loaded boat with another towed behind it at, roughly, double the speed that a horse is able to haul one only. Moreover, the apparatus can be quickly changed from one boat to another; so that it is always doing useful work, and on the average one equipment will keep two or three boats working at their utmost capacity. Incidentally, Mr Hooke not only designed the first apparatus, but also did most of the work of making it, owing to the difficulty of obtaining skilled labour, and he has been especially exempted from military duty in order to extend the scheme, which is considered to be of national importance. Great credit is also due to Messrs Coggins & Arthur, an enterprising firm of merchants and canal-boat owners of Birmingham, who have backed up Mr Hooke throughout.

NEW PLAN FOR ALTERING CLOCKS FOR 'SUMMER TIME.'

In a letter to *Nature*, Dr P. E. Shaw suggests a novel method of altering our clocks to suit 'summer time' without moving the hands. According to Dr Shaw's plan, clock-dials should be so fixed that at the commencement of 'summer time' they can be turned backwards five minutes, which would have a similar effect to putting the hands forward an hour. By this means the hour-hand would coincide with the sun as for Greenwich time; that is to say, at noon it would be at the top of the dial, while the rising and setting of the sun at the equinoxes would occur with the hour-hand pointing straight downwards. Another advantage would be a clear indication that in summer the real time was an hour behind that shown by the hands. When normal time was resumed the dial could, of course, be readily altered to its original position. New clocks could very easily be constructed to conform to this method of adjustment.

NEW CHEAP PROCESS FOR OBTAINING NITRATES FROM THE AIR WITHOUT ELECTRICITY.

From time to time references have been made in this Journal to the extraction from the air of nitrates for use in fertilising the land and for other purposes. Hitherto the processes of extraction have depended upon large supplies of electric current, which can only be produced at a low enough cost in countries where water-power can be cheaply developed. According to the *Scientific American*, a chemical process has recently been discovered by Professor John E. Bucher, of Brown University, which bids fair to revolutionise this industry. The new method consists in heating a mixture of powdered coke, soda-ash, and powdered iron or iron ore in a

furnace, and passing air over it, the result being the formation of cyanide of soda. Curiously enough, the iron is not affected in any way, but the process cannot be carried out in its absence. Cyanide of soda may be turned into ammonia (with bicarbonate of soda as a by-product) easily enough, and at a low cost. Instead of doing this, however, Professor Bucher treats it with part of the waste carbon dioxide gas from the furnace, which has the effect of producing urea, a substance richer in nitrogen than the ordinary ammonium compounds, and therefore a much more effective fertiliser.

CHEAP NON-RETURNABLE PAPER MILK-BOTTLES.

The delivery of milk to the consumer is carried out on two systems in this country. According to one, which is prevalent in London and some provincial cities and towns, the dairies supply the milk in their own containers, which are returned when empty. The alternative plan is for the consumer to supply the receptacle. With the former system the milk cans or bottles must often go into infected houses, and it is difficult to guarantee their complete sterilisation before being used for the delivery of milk to other customers. A safer and more economical plan, it will be generally admitted, is to carry the milk to each customer in a closed vessel of which the cost is less than that of collecting and cleaning the usual cans or bottles. This problem has been very carefully studied in the United States, where milk is delivered in glass bottles. According to the *Scientific American*, the Health Department Advisory Council of Pennsylvania are so convinced of the dangers that they have issued an order prohibiting this practice. Paper milk-bottles are to be used as an alternative, and a machine has recently been invented capable of making five thousand an hour. Wood-pulp, which may be of inferior quality to that used for paper, is the material employed, and it is untouched by hand throughout the process. The pulp is pressed into the correct form round a steel core, and is then passed through a drier. The name of the milk-dealer and its capacity are subsequently stamped upon it. After its removal from the core, the bottom and the top are crimped on in a special machine. Finally, the bottles are soaked in hot paraffin wax, which makes them waterproof, and automatically packed for delivery to the dairies. One ton of pulp is enough for sixty thousand bottles, while each machine for making them is nearly one hundred feet in length, and costs four thousand pounds.

ELECTRIC FARMING.

Already electricity is an important factor in many industries, and the present crisis in the food-supplies of the British Isles makes its application to agriculture a matter of great interest. The Development Commissioners, having obtained a grant from the Treasury, have taken over Huntington Court Farm, near Hereford, for the purpose of thoroughly testing the use of electricity as an aid to food production. The idea is to discharge electricity from a system of thin wire spread over the areas to be treated. The wire network is supported on insulators connected to poles, with a span of thirty feet or so between every two supports, and is high enough to enable farming operations to be carried on without interference with the apparatus. A high-tension alternating supply of electricity is used, and this, together with a small transformer of valves for rectifying and an automatic time-switch for controlling, forms a system less costly than any previously in use. Moreover, it is so laid down as to be practically 'fool-proof.' The current-consumption is not great, and the anticipated increased yield per acre of spring wheat, barley, oats, clover, and certain root crops will be eagerly welcomed. The use of electricity in British agriculture has aroused much interest in scientific farming circles for the last fifteen years, and this latest action of the Government is distinctly helpful. So far back as the seventies of last century Professor Lemström of Stockholm noticed that plants seemed to thrive better as the result of the electrification of the air around them. Since then it has been repeatedly proved, especially on farms fitted up with the Lodge-Newman apparatus, that cereal crops are markedly increased in yield. The ratio of increase is even greater in the case of vegetables, potatoes and artichokes growing to a great size without their edible qualities being at all impaired. In Germany, where the use of electricity in agriculture has also been introduced in the hope of securing a greater food-supply, it has been found that in dry weather the electrical discharge does not benefit the crops, so spraying with electrified water has been tried. So far as British agriculture is concerned, the Development Commissioners have set out to give the project a fair trial for a period of not less than three years, and, in addition to employing the highest experts in electricity and farming, are obtaining the supervision of the Board of Inventions and Research.

RESULTS OF ELECTRIFYING CROPS.

Since the foregoing paragraph was written, the Board of Agriculture has published in its *Journal* a report of a valuable experiment in electric farming which was carried out at Lincluden Mains Farm, Dumfries, during the year 1916. An acre of suitable ground sown with oats was subjected to electric treatment for eight hundred and forty-eight hours during the season; an equal acreage in other portions of the same large field, also sown with oats, was not so treated. When the crops were gathered in, it was found that the yield of grain from the electrified area was 49 per cent. larger than that from the unelectrified portions, while the yield

of straw was 88 per cent. larger. At the prices current when the crop was reaped, the increased value works out at six pounds seven shillings per acre, thus providing an ample margin of profit after due allowance is made for the cost of the current used, which, at the rate of a penny per Board of Trade unit, would amount to about eleven shillings. Certain observations made at Lincluden Mains would also appear to indicate that the benefit of an electric discharge is not confined to the first year, but may extend to a second year at least. Thus a field which had been electrically treated in 1915 produced a much heavier crop of clover in 1916 than a similar field which had not been so treated. If further observations and experiments show that, in addition to an immediate increase of the treated crop, the electric discharge may also benefit a succeeding crop, it is obvious that the agricultural value of the process is very much enhanced.

A NEW DUPLICATOR.

The restrictions placed by the Government upon the sale of glycerine and gelatine have rendered impossible the manufacture of those forms of duplicating apparatus in which these substances are used. A draughtsman in the west of Scotland has, however, discovered a suitable substitute, the supply of which is entirely unrestricted and practically unlimited, and he has now devised a form of duplicator quite as cheap and serviceable as the old gelatine tray. In one respect, indeed, it is said to be superior, for it is claimed that the convex surface of the new duplicator will greatly prolong its life, a flat surface being much more liable to wear away in the centre. By means of this apparatus, to which the name of 'The Impactor Convex Duplicator' has been given, a large number of copies may readily be obtained of any document or drawing done originally in good copying-ink.

AN ANCIENT ARMOURY.

A recent fall of cliff near Scarborough, on the coast of Yorkshire, has brought to light a collection of some twenty bronze weapons, which probably formed the stock-in-trade of a worker in metals a thousand years or more before Julius Cæsar first set foot on our shores. Though battle-axes form the larger part of the collection, portions of a sword, spears, chisels, and gouges are also included. Twelve of the axes, of the socketed type, are quite perfect. Some of them betray signs of use; others are in the rough state, as if they had just been turned out of the mould. When found, one of the axes still contained part of the original wooden shaft; another varied from the ordinary pattern in having a rivet-hole instead of a loop for the purpose of keeping the handle firm. The whole collection, which has been lodged in the Hull Museum, is full of interest to the antiquarian, and especially to students of the 'Bronze Age' of our national story.

AN OLD-TIME 'SUBSTITUTE' FOR FLOUR.

Attention has been drawn to a paragraph in this Journal published seventy years ago, which is of peculiar interest at the present time. It is headed, 'The Cheapest Bread Yet,' and runs as follows: 'We have been favoured by Mr S. Brown, of Finedon, near Higham Ferrers, with a sample of bread which he states is in constant use on his farm. It is made of flour and mangel, in equal quantities by weight. The mangel-wurzel is pared, cut into slices, and boiled so as to mash well. The usual quantity of yeast must be used, and little or no water is required. The dough must stand some time after being mixed, and must then be baked in the ordinary way. If the loaf sent to us be a fair sample, we should call it good household bread.' The apparent saving is very marked, the price of mangel-wurzel being only a halfpenny per pound, as compared with seven or eight times that amount for flour. It should be pointed out, however, that the food value of mangel-wurzel is very much less than that of wheat-flour; hence the saving is not nearly so great as appears on the surface.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A LOST STAR.

THE velvet blackness, like a pall,
Hung breathless in the vast profound,
Letting its sable fringes fall
On earth around.

When sudden through the hollow night
A great white star resplendent shone;
It filled the firmament with light,
Blazed—and was gone!

So a great Thought insistent came
To move men as by magic spell:
It fired their minds with mighty flame—
Then flashed and fell!

Orion, Mars, the Bear I trace,
But that Lost Star no more returns.
And yet in interstellar space
Somewhere it burns!

J. CUTHBERT SCOTT.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

JOHN CORNELIUS COMES HOME.

By Ashmore Russan.

CHAPTER I.—HOW THE NEWS CAME TO MARAVILLAS.

A HEAVY downpour had fallen on Mount Tacana, and in consequence the Rio Grande was in flood. Fortunately for Davison, John Cornelius, intending to cross at the ford, was waiting on the opposite bank for the stream to drop until a certain mark on a certain boulder should show above water; and, more fortunately still, John Cornelius had a lariat coiled on his saddle-bow. That he should have been there was equally fortunate for John Cornelius.

Davison knew nothing about the warning mark on the boulder, or of the boulder's special usefulness. To him it was just a rock in the middle of the ford, and to be avoided. Once before he had crossed the Rio Grande at this particular spot, but that had been some years back and in the dry season. Although swollen and turgid, the stream did not look out of the way dangerous, and he spurred into it, his horse willing enough. A mule would have refused with all the obstinacy of its kind.

Half-way through, just above the guiding boulder, the horse was swept off its legs, and Davison was swung out of the saddle. Swirled by the current against the great stone, he clung to a projection with all his strength; while, at the mercy of the flood, the horse continued its irresponsible career down-stream, struggling hard amongst the rocks and occasionally swimming.

John Cornelius was the only witness of the mishap. He had shouted to deter the traveller from making the attempt, but his voice had been drowned in the roar of the waters. As he swung the coiled lariat round his head, he shouted again, louder, 'Let go one hand and hold up an arm!' Being an expert with the rope, he knew the danger of lassoing the unfortunate traveller by the neck in such a whirling torrent.

Davison heard, and obeyed. Next moment the noose of the lariat dropped over the uplifted arm as neatly as could be, and tightened. At once John Cornelius turned his horse from the river, and very quickly Davison stood beside him, shaking himself like a drenched spaniel.

'Good man!' he panted. 'You 've—saved—my life—I reckon.'

'So do I,' returned John Cornelius. 'Lucky for you I happened to be here. Whatever possessed you to try to cross with the boulder-mark under water?'

'Never—heard—of any—boulder-mark. Only—been this road—once before—years ago. Has my horse—got out?'

John Cornelius raised his six feet of height in the stirrups and glanced down-stream. 'He's out all right, about half a mile away. Seems to be limping a bit. Sure to be cut more or less and bruised a lot. Rocks down there pretty ragged. But come with me to Maravillas and get a change and a feed. I 'll send a *mozo* for your horse.'

Half-an-hour later, in a rig belonging to John Cornelius, which, as the wearer was short and plump, and John Cornelius long and rather thin, fitted tightly where it touched, and met scarcely anywhere in its circumference, Davison was lounging in an easy-chair on the veranda of the *Casa Grande* at the Maravillas coffee *finca*, a good cigar between his teeth and a long drink beside him.

'I 've been up to Guatimoc,' he was saying. 'Coffee-machinery 's my line—Davison & Co.'s. It 's ten years since my last run round this part of Mexico. Been here long, Mr Cornelius?'

'Nearly eight years.'

'Funny I haven't your name on my list of coffee-planters. Whose machinery do you use?'

'Murray's—what I have.'

'H'm!' Davison blew a cloud of smoke to the veranda roof, bursting off a button in so doing. 'Oddest thing,' he went on, 'is that your name 's quite familiar to me—in the old country, but I never heard of it in Mexico before to-day. Our squire at home was a John Cornelius, Torringham Hall, Worcestershire. Died some years ago. Was he a relation of yours?'

John Cornelius yawned. 'I believe so,' he answered. 'My uncle. Never saw him. Never wanted. Never was at Torringham.'

Davison laid his cigar down carefully on an arm of his chair and sat up—cautiously. 'Did you know he was dead—defunct—gone to glory?' he asked.

'No. He was nothing to me. Family quarrel. John is the family name—eldest boy. Dare say

 [*All Rights Reserved.*]

I yelled when they gave it me, but I couldn't stop them doing it, anyway, and I've got to stick to it. I'm Don *Wan* amongst these people—which is a satisfaction.'

'Any more Johns in the family?' Davison continued, still alert.

'Not that I know of. Believe I'm the last, and likely to remain so.' And John Cornelius yawned again.

Davison took up his cigar and smoked in silence for half-a-minute. 'I'll be hanged if this isn't the rummiest thing that ever came my way!' he burst out suddenly. 'The old squire may have been nothing to you, but you or some other John Cornelius was a lot to him. He left all his property to a John Cornelius—a nephew—wait a bit—to the son of his dear brother.—What the dickens was the brother's name?—I have it—"John Cornelius, the son of my dear brother Andrew, of St Mary Axe in the City of London, and Clapham Common in the county of Surrey." That was it.'

'"*His* dear brother,"' repeated John Cornelius. 'Well, that's news.' And he lit a fresh cigar.

Davison got to his feet, losing another button. In his excitement he also upset the long drink and broke the glass. 'Is it *you*, man?' he cried, vainly trying to pick up the fragments. 'Are you the Cornelius that's wanted?'

John Cornelius smoked on placidly. 'Never mind the breakage,' he said presently, ignoring the question. 'Here, Pedro,' calling to a *mozo* a little distance away, 'bring a broom and another glass.'

'But are you Andrew's son?' Davison persisted.

'I am. Where did you get that yarn?' asked John Cornelius.

'That *yarn?*' Davison repeated disgustedly. 'Well, if you aren't a coffee-cooler, and no mistake! Look here! My people live at Torringham. I, Jimmy Davison, was born there. I knew the old squire as well as he'd let anybody know him. He died about seven years back. Lawyer Jones advertised for you—for a John Cornelius, anyway—a month or two, perhaps longer, and I think he went to America. I saw the particulars of your uncle's will in the newspapers, and I saw Lawyer Jones's ad.—"U.S. and Colonial papers please copy." You know the sort of thing? It's a miracle to me that you never saw it.'

'It would have been rather a miracle if I had,' said John Cornelius. 'I've been busy making this *finca*. I've planted three thousand acres of coffee, and built this place. You have seen something of what it's like, and it has taken some doing, what with two or three revolutions a year and about every other sort of trouble. Besides, when I came to Mexico I cut myself adrift from England altogether. My father was dead. My mother died when I was a boy. I haven't seen an English or American newspaper in five or six years. Wouldn't have had time to read 'em, anyway.' He turned to the *mozo*, who had brought another glass. 'Sweep up the pieces, Pedro, and don't cut your fingers.—Help yourself, Mr Davison. Your yarn will keep. Dinner's ready, and that won't. Drink up and come along.'

'Well, I'll be shot!' muttered Davison under his breath.

During the meal—of chickens, rice, and red pepper; of *carne seco*, rice, and red pepper; of *tamales* and red pepper, washed down with good *vino tinto*—John Cornelius said no word of the astonishing news Davison had brought him. He was full of his coffee *finca*, of the new drying *patios* he intended to cut out of the slope of the hill leading to the Rio Grande. He asked to see Davison's catalogues. Having been in the river, they were soaking wet. He had them dried carefully, and gave an order for two pulpers and a separator. Pea-berry beans were in fashion again, and he was very particular about the separator—that it should be able to pick them out.

The traveller in coffee-machinery was amazed.

Several times he tried without success to turn the conversation to the fortune waiting an heir in England, and finally concluded that his story had not been believed. That spurred him.

'Look here, Mr Cornelius,' he said; 'suppose we chuck this coffee talk *hasta mañana*. What are you going to do? Do you know the Torringham Hall property's worth the best part of a quarter of a million, and that there's a lot of loose cash and other things?'

'Yes,' said John Cornelius. 'I should think, from what my father told me, that the property's worth all that; but I'm not going to do anything—in a hurry. I'm going to think it over *hasta mañana*, and longer. Who's living at the Hall?'

'Lawyer Jones and his daughters—pretty girls both, especially Rosa. He's the squire. He's lived there for years. Looks on the place as his own, the Torringham folks say.'

'The devil he does!' said John Cornelius, and lit a candle. 'Have another drink? No? Well, you must be tired. Your horse will be all right to-morrow. You know your room. Second door from here on the veranda. Here's a candle. No mosquitoes at Maravillas. Good-night, Mr Davison. Lucky for you I was down by the river this afternoon.'

'Well, of all the cool customers!' exclaimed Davison when he had closed the door of his chamber. 'Lucky for me he was down by the river, eh? Well, so it was; but most folks would say it was lucky for him.'

Davison's horse not being quite fit for the road, his master remained at the coffee *finca* until the afternoon of the next day. John

Cornelius mounted him and took him over a great part of his three-thousand-acre plantation. He was going to try more drastic pruning. Intended to plant *robusta* on the lower lands. Advised Davison to cable and have the pulpers and separator put in hand at once if they were not in stock. Asked to be informed as soon as possible when the machinery could be shipped. Not a word of the fortune in England. Not a word until Davison was starting on his way. Then, as they shook hands, 'Well, good-bye, Mr Davison. I really think it was lucky for you I was down by the river. Say, when you send that cable home, you have no need to mention anything about what you've been telling me, nor when you confirm it. I make a point of it. But mind you hurry up the machinery.'

'All right,' said Davison. And as he rode off he once more prophesied his ultimate ending, 'I'll be shot!' adding, 'Rum customer for Archibald to tackle, what-ho!'

(*Continued on page 521.*)

THE SHRINE OF THE PEACE OF GOD.

By R. COURTIER-FORSTER.

AMONG the mountains of Abkhasia in Transcaucasia there stands an old sixth-century Iberian shrine perched high on a pinnacle of rock some thousands of feet above a sweeping bay of the Black Sea. My fellow-pilgrims in the great Caucasian monastery at Novi Affon told me of it; of the four monks who lived there still, like hermits; of the tiny chapel of the Icon with Three Faces; of open vaults and bleaching skulls; of jackals and bears in the forests below, and wolves that slunk among the trees watching their prey; and of the wonderful peace which any one who reached the shrine found within its narrow walls.

The old pilgrim who had been there sat under the palms in the shade of the white wall of the monastery, looking out over a sapphire sea, and talked of the shrine. The Chapel of the Peace of God he called it, and sighed, for never again could he make the journey and climb the rough and steep mountain-road up to the crags where the four hermits dwelt. While he talked he cracked baked sunflower-seeds between his teeth until the ground was white with tiny husks. As the bells of the monastery church broke the stillness of the summer afternoon, he stood up and shook the seedlets from the folds of his long coat. 'It lies away to the west,' he said, pointing to the mountains which rose higher and higher as they stretched upwards towards the untrodden mysteries of Nachar's snowy heights; and he turned and walked up the path past the cedar grove, in through the open doors of the gray old church, where the lamps gleamed before the icons of the saints.

That night, as I lay in my cell watching through the open window the stars float high over the mountains, I thought of the pilgrim's progress to the old Chapel of the Peace of God. When the brother came down the monastery corridor at half-past two in the morning, ringing his bell to call us to the night office in the church in the garden, my mind was made up; I also would go where the old pilgrim had been, and make the journey up to the shrine in the Abkhasia Mountains.

The old man walked with me to the confines of the monastery domain through long alleys of dark cypress-trees which edged the silver sheen of the monks' olive-orchards. At the Fountain of the Life-Giving Cross by the little stream which forms the boundary of the abbey lands he blessed me, and sat down to rest and pray; while I went on, over the wooden bridge, and turned my face to the mountains and the west.

The roads in Transcaucasia, except over the great passes, seem to be more the work of nature than of man. The positions for the roads in the mountains of Abkhasia have been selected by the mules, who first choose a way up or down a mountain-side. Other mules follow in the wake of the first, and so a track is made. Man came after the mules, and called the work of the beasts a mountain-road, and a mountain-road it remains, unsullied by the hand of man. It was such an Abkhasian road that led up the mountains to the Chapel of the Peace of God. It wandered through steep forests of wild plum and apple trees laden with ripe fruits. Great raspberries hung in clusters by the wayside among trailing vines and giant ferns; the blossoms of the Judas trees flamed like scarlet cups above bushes of soft blue hydrangeas; iridescent dragon-flies darted among the sun-shafts which fell through the lofty forest trees; while, far below, the summer sea lay gleaming with the colours of a peacock's throat.

Perhaps this was the road the first Iberian monks had trod, ascending higher and higher to make their home in the Peace of God. Not a leaf stirred in the noonday heat. The road, rough as the bed of a mountain-stream, climbed painfully towards the burning sky. Backwards and forwards it twisted and turned up the mountain-side, past the thick walls and crumbling towers of a ruined castle. Soft ferns carpeted the lofty, roofless halls where once Mingrelian nobles stood. It must have been a place of great strength in the fierce centuries of the proud Caucasian kingdoms. Now its annals are powdered into dust, its very name is forgotten, and the names of the princes who

raised it tower by tower. Some peasants passing called it just 'the Castle,' 'our Castle.' All else has faded from man's memory with the lapse of centuries. I sat alone at one of the deep embrasured windows, gazing down into the silent, forested depths below, speculating as to who had been the last of the forgotten owners to stand there for the final farewell in the fierce frays of the wars with Karthlia, and what was the manner of his going. With high hopes and lofty intent, or broken and ruined in the last agony of a lost cause, or perhaps fighting inch by inch, driven back, and still farther back, nearer and nearer to that very window above the precipice—and death?

There lies buried in the heart of the great Caucasus the romance of a lost world. People speak of the Caucasus as they speak of the Alps or the Pyrenees, but this vast viceroyalty covers over a hundred and eighty-one thousand square miles, and back in the early centuries was the home of great Christian states and cultivated civilisation, when much of the higher life and art of Europe lay crushed and dying before the savage oncoming of the German tribes.

The quest of the Shrine of the Peace of God was arduous, the way long and toilsome, and fair flowers and luscious fruits lure the pilgrim from the path. But the goal became ever nearer, and at last the forest broke before an open door in a high, moss-grown wall beside a giant tree of ripe golden plums. I was at the gate where the four monks dwelt. Within rose a medley of ruined towers and walls and old arches perched on the very summit of the rock. A little gray stone building stood against an ancient battlemented wall beside a crumbling tower. At one end of the enclosure worn stone steps lead up to what remains of the walls and sanctuary of the first Byzantine hermitage. At the other end, behind a thick medieval embattlement, a narrow path and other steps passed up to the little chapel containing the holy Icon of the Three Faces. The outer walls encircled all the summit of the mountain-top. Away to the north lay deep forested valleys thousands of feet below, twisting and turning between the tumbled masses of the huge Caucasian mountains; and clear against the sky towered the rocky, snow-swept mass of Mount Kluchor. Beneath me to the east lay a white settlement shining like a toy village among the cypress and olive trees, and the curving bays of the Black Sea coast for a hundred versts where the Abkhasia Mountains sweep down into the shimmering sea.

A young peasant man and woman, hot and dusty, were sitting at a trestle table in the grateful shade of the wall, sipping tumblers of pale amber tea. A distinctly warm and bedraggled monk was filling a tin kettle at a large wooden barrel in the corner. All three looked up as I entered, and bowed to me with friendly kindliness.

'Tea?' queried the monk, with the pleased air of one offering hospitality with the certainty of giving pleasure.

I accepted the kindly offer gladly, and sat down on the bench by the trestle table. I was very hot and tired.

'How nice a little red wine would be!' I remarked longingly, fanning myself with my hat.

Their faces lighted up with a quiet smile, and they looked at me appreciatively.

'What an excellent idea!' the young woman said enthusiastically. The young peasant smiled approval.

When the monk returned with a tumbler in a saucer for me, I ventured meekly to suggest that a little red wine would be much appreciated and liberally paid for.

'Certainly not,' said the monk reprovingly, but with a twinkle in his eye; 'you cannot have red wine here. This is a hermitage. There is sugar for your tea. Nice lump-sugar.' And he placed a few pieces on a little plate before me.

I praised the sugar—it was so beautifully clean—and continued fanning myself. In the Caucasus the sugar offered you is not always clean. Often it has been kept in a box with bits of string, loose copper coins, old corks, and other useful articles.

The monk went back to his kitchen.

'Are you sure there is no red wine?' asked the young woman of the young man, in the tone in which a woman always gets what she wants if the man can procure it for her. 'Red wine would be very good,' she added, gazing coldly at the water-barrel in the corner of the little yard, as though it deserved a snub.

'No,' answered the young man, with a grin, 'I am not at all sure. I will go and see.'

A whispered altercation took place in the kitchen at the side, where the monk was boiling water for the tea in a huge copper.

Presently the young man returned with a triumphant smile. 'There will be red wine,' he said joyfully.

The young woman rewarded him with frank approval, and he sat down boldly nearer to her on the bench than he had been before.

In a minute or two the monk appeared with a small teapot, which he set down solemnly in front of the young man.

'Why do you not bring it in a bottle or a carafe?' queried my neighbour simply.

'He who drinks red wine here drinks it out of a teapot,' retorted the monk severely, and stalked virtuously away.

The young man poured some into the young woman's tea, and then into his own. 'Help yourself,' he said hospitably, passing the teapot to me.

I thanked him, and helped myself. The wine was sour and biting, but mixed in a tumbler of

weak tea was extraordinarily refreshing after the journey in the heat.

We refilled our tumblers several times with mingled tea and wine—it was astonishing how thirsty we all were; and the monk brought us a plate of bread that was almost white.

Tea ended, we rose together and crossed ourselves. I went up past the empty uncovered graves hewn in the rock, where the monks who trod these paths long centuries ago had been tenderly laid to rest by their brethren. Now their empty resting-places were lined with clustering maidenhair fern and soft green moss. The old Iberian chapel, ruined and roofless, had great clusters of the same ferns growing from the mouldering walls, among worn Byzantine carvings. A little shrine had been rebuilt within the iconostasis on the site of the ancient altar, and furnished with icons and little lamps. Behind a grating in the right-hand wall there lay arranged on shelves the remains of those monks who had been buried in the rock graves of the little sanctuary. It seemed so unreasonable to have disturbed their bones after centuries of rest in the silence of the mountains they had loved so well, in order to place them in a grotto for the idle curiosity of chance mountaineers and wandering pilgrims. There were not many of them—less than a dozen all told. Their skulls lay in a row on the top shelf. The big arm, leg, and thigh bones were placed on the second shelf, and the rest lay all jumbled up together on the third. The sightless eyes were turned towards the deep valleys and dizzy heights of white-robed Nachar. The Shrine of the Peace of God had been sadly changed by the passing of the centuries. Great Caucasian kingdoms and dynasties had moved across earth's stage to nothingness since first those faithful eyes watched the sun sink into the snows, and knelt here seeking the Peace of God. The immense distances and vast spaces of the mighty Caucasian ranges witnessed still in silent splendour to the majesty of their Creator, and out of the evening breeze the solitaries heard the still, small voice of God. For a thousand years the night-wind had sighed around the hermits' cells, and the lamps had burnt low before the icons of the saints.

I passed into the other carefully preserved old church. Within the minute chapel knelt an aged white-haired monk at prayer, where for a hundred generations hermits have never ceased to pray for the Peace of God. On the wall was the Icon of the Three Faces, and it really had three faces. Looked at directly in front, it showed the Holy Birthgiver of God and the Divine Child; when standing a few feet to the left one saw a picture of St Nicholas the Wonder-Worker with his hand raised in blessing; from the right it was an icon of God the Father holding God the Son, with God the Holy Ghost in the form of a dove flying forth. It was a strange and curious icon, but it was not before that that the old monk was praying. He knelt by a little window, and his eyes gazed out over the deep valleys to the pinnacles and walls of snow turning to pink and gold as the sun went down in the west. The day was nearly done. In the stillness of the gathering gloom the dim forms of other monks stood up to pray. A great silence lay over the hermitage of the Peace of God.

The floating wick of an icon lamp flamed up brightly for an instant, flickering feebly, rose and fell, died down to a minute spark of light, and ceased to be. Soft purple shadows were slowly drawn over the snow like a velvet pall. A pale star shone from the gathering night above the fading peaks, and still the bowed white-haired figure knelt on, and the darkness fell.

There was rest eternal in the Shrine of the Peace of God.

THE DEFINITE OBJECT.

By Jeffery Farnol.

CHAPTER XXXII.—OF HARMONY AND DISCORD.

MR BRIMBERLY, comfortably ensconced in Young R.'s favourite arm-chair, nodded ponderously and beat time to the twang of Mr Jenkins's banjo, whereto Mr Stevens sang in a high-pitched and rather shaky tenor the latest musical success, yclept 'Sammy.' Thus, Mr Jenkins strummed, Mr Stevens trilled, and Mr Brimberly alternately beat the *tempo* with a plump white finger and sipped his master's champagne, until, having emptied his glass, he turned to the bottle on the table beside him, found that empty also, crossed to the two bottles on the mantel, found them likewise void, and had tried the two upon the piano with no better success, when, the song being ended, Mr Jenkins struck in with, 'All dead men, Brim! Six of 'em between us—not bad goin'—what?'

'And very good fizz too, on the whole!' added Mr Stevens. 'I always sing better on champagne. But come, Brim, my boy, I've obliged with everythin' I know, an' Jenk 'e's played everythin' 'e knows, an', I must say, with great delicacy an' feelin'; now it's your turn—sing somethin'.'

'Well,' answered Mr Brimberly, squinting at an empty bottle, 'I used to know a very good

song once, called "Let's drownd all our Sorrers an' Cares." But, good 'eavens! we can't drownd 'em in empty bottles, can we?'

'Oh, very good!' chuckled Mr Jenkins. 'Oh, very prime! If I might suggest, there's nothin' like port—port's excellent tipple for drowndin' sorrer an' downin' care—what?'

'Port, sir!' repeated Mr Brimberly. 'We 'ave enough port in our cellars to drownd every sorrer an' care in Noo York City. I'm proud of our port, sir, an' I'm reckoned a bit of a connysoor.'

'Ah, it takes a eddicated palate to appreciate good port!' nodded Mr Jenkins loftily—'a eddicated palate—what?'

'Cert'nly!' added Mr Stevens. 'An' here's two palates waitin', waitin' an' ready to appreciate till daylight doth appear.'

'There's nothin' like port!' sighed Mr Brimberly, setting aside the empty champagne bottle—'nothin' like port; an' there's Young Har 'ardly can tell it from sherry—oh the Goth! the Vandyle! All this good stuff would be layin' idle if it wasn't for me! Young Har ain't got no right to be a millionaire; 'is money's wasted on 'im—'e neglects 'is opportoonities shameful—oh, shameful! What I say is—what's the use o' bein' a millionaire if you don't air your millions?'

Hereupon Mr Jenkins rocked himself to and fro over his banjo in a polite ecstasy of mirth. 'Oh, by Jove!' he gasped, 'if that ain't infernal clever I'll be shot! Oh, doocid clever I call it—what?'

'Er—by the way, Brim,' said Mr Stevens, his glance roving towards the open window, 'where does he happen to be to-night?'

'Where?' repeated Mr Brimberly, fingering a slightly agitated whisker—'where is Young Har, sir? Lord, Mr Stevens, if you ask me that I throws up my 'ands an' I answers you—'eavens knows! Young Har is a unknown quantity, sir—a will o' the wisp, or, as you might say, a ignus-fattus. At this pre-cise moment 'e may be in Jerusalem or Jericho, or—a-sittin' outside on the lawn—which Gawd forbid! But there, don't let's talk of it. Come on down into the cellars, an' we'll bring up enough port to drownd sorrer an' care all night.'

'With all my heart!' said Mr Jenkins, laying aside his banjo.

'Ditto, indeed!' nodded Mr Stevens, slipping a hand in his host's arm, and thus linked together they made their way out of the room.

Scarcely had their hilarious voices died away when a muscular brown hand parted the hangings of a certain window, and Geoffrey Ravenslee climbed into the room. His rough clothes and shabby hat were powdered with dust, and he looked very much out of place amid his luxurious surroundings as he paused to glance swiftly from the bottles that decorated the carved mantel to those on table and piano. Then, light treading, he crossed the room, and, as the hilarious three were heard approaching, vanished in his turn.

'Ere we are—Jubilee port!' exclaimed Mr Brimberly, setting down two cobwebbed bottles with elaborate care. 'Obleege me with the corkscrew, somebody.'

'Won't forget as you promised us a song, Brim?' said Mr Jenkins, passing the necessary implement.

'Oh, I won't disappoint ye,' answered Mr Brimberly, drawing the cork with a practised hand; 'my father were a regular songster, a fair carollin' bird 'e were, sir.'

''Ow about "Knocked 'Em in the Old Kent Road"?' Mr Stevens suggested.

'Sir!' exclaimed Mr Brimberly, pausing in the act of filling the glasses, 'that's rather a—a low song, ain't it?—What do you think, Mr Jenkins?'

'Low?' answered Mr Jenkins. 'It's as low as—as mud, sir. I might say it's infernal vulgar—what?'

'Why, I don't care for it myself,' Mr Stevens admitted rather humbly; 'it was merely a suggestion.'

'With your good favour,' said Mr Brimberly, after a tentative sip at his glass, 'I'll sing you a old song as was a rare favourite of my father's.'

'Why, then,' said Mr Jenkins, taking up his banjo, 'oblige us with the key.'

'The key, sir?' answered Mr Brimberly, pulling down his waistcoat. 'What key might you mean?'

'The key of the note dominant, Brim.'

Mr Brimberly stared and felt for his whisker. 'Note dominant,' he murmured. 'I don't think my song has anything of that sort, sir.'

'Oh, well, just whistle a couple o' bars.'

'Bars,' said Mr Brimberly, shaking his head—'bars, sir, is things wherewith I do not 'old; bars are the 'aunt o' the 'umble 'erd, sir.'

'No, no, Brim,' explained Mr Stevens; 'Jenk merely means you to 'um the air.'

'Ah, to be sure; now I appre'end! I'll 'um you the hair with pleasure.'

Having said which, Mr Brimberly cleared his throat vigorously, and thereafter emitted certain rumbling noises, whereat Mr Jenkins cocked a knowing head. 'B sharp, I think?' he announced.

'Not much, Jenk!' said Mr Stevens decidedly; 'it was C flat—as flat a C as ever I heard!'

'It was B!' Mr Jenkins maintained. 'I appeal to Brim.'

'Well,' said Mr Brimberly ponderously, 'I'm reether inclined to think I made it a D—if it wasn't D it was F nat'ral. But if it's all the same to you, I'll accompany myself at the piano-forty.'

'What,' exclaimed Mr Stevens, emptying and refilling his glass; seeing which, Mr Jenkins did the same—'what—do you play, Brim?'

'By hear, sir—only by hear,' said Mr Brimberly modestly, as, having placed bottle and glass upon the piano within convenient reach, he

seated himself upon the stool, struck three or four stumbling chords, and then, vamping an accompaniment a trifle monotonous as to bass, burst forth into song:

'It was a rich merchant that in London did dwell,
He had but one daughter, a beautiful gell,
Which her name it was Dinah, scarce sixteen years old,
She'd a very large fortune in silver and gold.
Chorus—Ri tooral, ri tooral, ri tooral i-day,
Ri tooral, ri tooral, ri tooral i-day.'

(It was now that Mr Ravenslee, his rough clothes replaced by immaculate attire, entered unostentatiously, and, wholly unobserved by the company, seated himself and lounged there while Mr Brimberly sang blithely on.)

'As Dinah was a-walking in her garden one day,
Her father came to her and thus he did say:
"Come wed yourself, Dinah, to your nearest of kin,
Or you sha'n't have the benefit of one single pin!"
Ri tooral, ri too'——

Here Mr Jenkins, chancing to catch sight of that unobtrusive figure, let fall his banjo with a clatter; whereupon Mr Brimberly, glancing round, stopped short in the middle of a note, and sat open-mouthed, staring at his master.

'Enjoying a musical evening, Brimberly?'

Mr Brimberly blundered to his feet, choked, gasped, groped for his whiskers, and finally spoke. 'Why, sir, I—I'm afraid I—we are.'

'I didn't know you were such an accomplished musician, Brimberly.'

'Mu-sician, sir?' Brimberly stammered, his eyes goggling. ''Ardly that, sir—oh, 'ardly that. I—I venture to—to tinkle a bit now an' then, sir. No offence, I 'ope, sir?'

'Friends musical too, it seems?'

'Y-es, sir; music do affect em, sir, uncommonly, sir.'

'Yes; makes them thirsty, doesn't it?'

'Why, Mr Ravenslee, sir, I—that is, we did so far venture to—er—I mean—oh lord!' and, mopping perspiring brow, Mr Brimberly groaned, and goggled helplessly from Mr Jenkins, who stood fumbling with his banjo, to Mr Stevens, who gaped fish-like.

'And now,' said Young R., having viewed them each in turn, 'if these—er—very thirsty musicians have had enough of—er—my wine to—er—drink, perhaps you'll be so obliging as to see them—off the premises?'

'I—I beg parding, sir?'

'Please escort your friends off the premises.'

'Certingly, sir—at once, sir.'

'Unless you think you ought to give them each a handful of my cigars.'

But Mr Brimberly had already bundled his dazed guests to the door, out of the door, and out of the house with very little ceremony. It was a very deferential and officiously eager Brimberly who presently knocked, and, bowing very frequently, begged to know how he might be of further service.

'Might I get you a little supper, sir? We 'ave 'am, sir, we 'ave beef, cold, salmon and cucumber likewise cold, a ditto chicken'——

'That sounds rather a quaint bird,' said Ravenslee.

'Yes, sir; very good, sir; chicken an' a nice slice of 'am, sir, say, and'——

'Thank you, Brimberly; I dined late in New York.'

'Why, then, sir, a sandwich or so; pray permit me, sir; cut nice an' thin, sir.'

'Thank you—no.'

'Dear, dear! Why, then, sir, whisky, brandy, a lickyour?'

'Nothing.'

'A cigar, sir?'

'H'm! Have we any of the Garcias left?'

'Y-es, sir. Ho, certingly, sir. Shall I'——

'Don't bother; I prefer my pipe; only, let me know when we get short, Brimberly, and we'll order more; or perhaps you have a favourite brand?'

'Brand, sir?' murmured Brimberly—'a—er—certingly, sir.'

'Good-night, Brimberly.'

'Good-night, sir; but first can't I do—hanything?'

'Oh yes, you do me, of course. You do me so consistently and well that I really ought to raise your wages. I'll think about it.'

Mr Brimberly stared, coughed, and fumbled for his whisker, whence his hand wandered to his brow and hovered there. 'I—I bid you good-night, sir!'

'Oh, by the way, bring me the letters.'

'Certingly, sir!' and, crossing the room, Mr Brimberly returned bearing a salver piled high with letters, which he set at his master's elbow; this done, he bowed and went from the room, one hand still at his dazed brow.

Left alone, Ravenslee took up the letters one by one. Some he threw aside, some few he opened and glanced at carelessly; among these last was a telegram, and the words he saw were these:

'Meet me to-morrow, sunset, in wood. All shall be explained.—HERMY.'

For a while he sat staring at this; then, laying it by, drew out a letter-case, from which he took another telegram bearing precisely the same message. Having compared them, he thrust them into his pocket, and, filling his pipe, sat a while smoking and lost in thought. At last, his pipe being out, he rose, stretched, and turned toward the door, but, in the act of leaving the room, paused to take out and compare the telegrams again, and so stood with puckered brows.

'Hermy!' he said softly. 'Hermione is so much prettier. "All shall be explained." A little trite perhaps! Oh, well'—— So saying, he folded up the telegrams, switched off the lights, and went to bed.

SCIENCE AND INDUSTRY.

By E. Fearon.

THAT there will be for years to come great need of all the energy and resource the nation possesses if it is to regain and extend the trade lost during the war is a self-evident fact; but whether we realise what the task that confronts us really amounts to is not so certain. There is, however, *one* certainty of which we can rest assured, and that is that Germany will leave no stone unturned in her efforts to regain her former markets, and it behoves us to take time by the forelock, and see what we can do to utilise to the utmost the brains, commercial methods, and materials of Great Britain and her dependencies.

In addressing a meeting at Leeds University a short time ago, Professor Foster, of London, remarked upon the ignorance of the average man in this country with regard to the application of science to industry, as follows: 'The so-called educated man in Germany had an entirely different intellectual stock-in-trade from the so-called educated man in this country. If a German read in the newspapers about nitric acid, T.N.T., or picric acid, he read about materials of which he had some idea. In this country nobody except those who had a knowledge of the inside of a chemical laboratory had the faintest idea of what those words meant; and in consequence of this hiatus in the training of the so-called educated man, any chemical enterprise which came forward for financial support came to the notice of people who had no idea of its bearing on the national economy.'

That these remarks are warranted is brought home to us if we study some of the preposterous advertisements that appear from time to time in the press—a typical one, for instance, asserting that by adding some mysterious chemical substance to coal it lasts longer, gives out more heat, and so on, and so forth. These precious assertions are generally backed up by 'testimonials' from dukes and earls, bishops and other dignified people, who, like Oliver Twist, usually write asking for more! Although these and similar claims are exposed every now and then in the technical press, it is evident that there is a market for such rubbish, or it would not pay to advertise the things so widely and at such a big cost. 'A little learning' may be 'a dangerous thing,' but there is no doubt that the absolute ignorance of scientific knowledge on the part of the public is a good thing for the people who are cute enough to take advantage of it. A want of scientific knowledge did not matter so very much a hundred, or even fifty, years ago, but it is patent to every one who looks ahead at all that the nation which neglects scientific methods at the present time is going to be left behind in the race for supremacy. Great Britain has the men and the brains to keep her in the forefront, but unless those brains are used to the very best advantage, other nations, more virile and more energetic, will take the lead from her, and signs are not wanting that this is already taking place. The great strides made by Germany in recent years in trade and scientific attainments have aroused the attention of the world, and if we can get any hints from our opponents how to increase our efficiency, it is as well to take them and profit thereby.

Taking the question of education first, we find that, generally speaking, elementary education follows similar lines to those in England up to the age of fourteen, although the average attendance is higher—94 per cent. against 88¾ per cent.

But after the age of fourteen the German boy must attend continuation schools, a law being passed in 1900 compelling employers to allow all employees under eighteen years of age to continue their education. There are minor differences throughout the country, but if we take Berlin as being typical of the whole, we find that every male worker employeed within the boundaries of the city must, as soon as he has passed through the elementary school, attend regularly the municipal continuation school until the end of the school half-year in which his seventeenth birthday occurs. This includes all sorts of workers — the skilled workman, the labourer, the clerk, the shopkeeper, and others—so that the subjects taught are very varied, ranging from mensuration and geometrical drawing to business correspondence and methods. The maximum hours of instruction (for which no fee is charged) are three hundred per annum, and the minimum two hundred; and the employer must provide the necessary books and instruments, and allow the pupil to leave his work in time to attend the classes. There are also what may be called 'trade schools' for cabinet-makers, joiners, plumbers, harness-makers, and so on, which an apprentice may attend instead of the municipal school. The training given is extremely good, the workshops are equipped with modern machinery, and everything is done to turn out a well-trained workman. The apprentices are generally 'bound' at fourteen years of age for a period of four years, the hours of work being nine to ten daily for six days a week. At the end of his apprenticeship the future artisan must attend an examination in the theory and practice of his trade, and must submit a specimen of his work, called the *Gesellenstück*. If he passes this examination

satisfactorily, he becomes what we should term a journeyman, and can earn about eightpence an hour. After some years of practical experience, he may sit for further examination, and, if successful, becomes *Meister*, or master, and may start in business for himself or work for an employer.

For those in a higher social scale there are various gymnasia and other institutions which supply specialised instruction, the *Lehrer-Seminarien* and *Fachschulen* being among the latter, while *Oberrealschulen* and *Realschulen* make a special feature of modern languages. We have no desire to belittle in any way the wonderful progress the British nation has made in the past, but there appears to be a lack of method in her educational system, a lack of *real* teachers—that is, teachers who can impart the knowledge they possess and not merely pass examinations in it—and a lack of wishing to gain knowledge for its own sake.

Although we have many brilliant scientists, the nation as a whole cannot be called well educated, and one cannot but feel that the Germans and the Americans will eventually beat us commercially unless a great change is effected, for America spends far more on education than we do, and her inhabitants are far less hidebound by tradition and custom than we are. A manufacturer in America will not hesitate to scrap an obsolete piece of plant if he can obtain better results by installing a modern one, whereas in Britain the tendency is to avoid installing new machines, &c., because of the first cost, although the increased production and diminished wage-sheet would pay for the initial expenditure many times over.

With regard to chemical control of industry in Britain, there is a lamentable lack of appreciation of the possibilities of more economical working of plants, and a want of scientific research. Generally speaking, the chemist is one of the worst-paid men on the staff of most works, his remuneration being on a par with a rather superior fitter or foreman; whereas, if chemical control of industrial operations was carried out as it should be, great economies could undoubtedly be effected. Germany realised this a good many years ago, and there you will find a hundred chemists to one in Britain, with the result that costs of manufacture have been reduced to a minimum, and her trade for twenty years had expanded enormously.

Take one instance, that of coal carbonisation. The tar and ammonia resulting from this in coke-ovens and gas-works are now recovered to the value of millions sterling each year, but until the chemist began to investigate these by-products, they were simply looked upon as waste to be got rid of by any means available. From coal used for metallurgical purposes, it is only recently that Britain began to save these valuable by-products; and as late as 1913, out of twenty million tons of coal used in this way no less than six and a half millions were consumed in the old beehive ovens in which the gas, tar, ammonia, benzol, &c. were absolutely lost to the value of over two million pounds.

In the iron and steel industries, our exports are not growing as they should do. Forty years ago Great Britain produced more than America, Germany, France, and Belgium together; to-day America heads the list with a production of twenty-seven million tons of pig-iron, Germany comes second with fourteen million five hundred thousand tons, and Great Britain third with just over ten million tons; and of steel, America again comes first with an output of twenty-six million tons, Germany follows with thirteen million five hundred tons, and Great Britain a bad third with only six million tons.

The figures relating to the exports of iron and steel goods show conclusively how America and Germany have overtaken us. In 1890 we exported thirty-one million pounds' worth; America, one million eight hundred thousand pounds' worth; and Germany, eleven million three hundred thousand pounds' worth. Twenty-one years later, in 1911, we exported forty-three million five hundred thousand pounds' worth. Germany has nearly quadrupled her exports in the same time to forty-one million three hundred thousand pounds, and America has increased hers to twenty-three million five hundred thousand pounds.

Another industry which we have allowed Germany and Austria to capture is the glass trade. In 1910 we exported glass to the value of one million five hundred and seventy-two thousand pounds, and Germany very nearly five million pounds' worth.

Now, without labouring the point, it is quite evident that there is a reason for the way in which our two great rivals have gone ahead lately, and we may discover something of the facts of the case if we care to. They may be summed up as follows: chemical control, commercial methods, freightage, and a higher standard of education.

With reference to the first-named, research-work has been left very largely to men (often with a private income) imbued with a love for it, men who demanded little or no remuneration, but who had a passion for discovering new truths, and industry, as a whole, owes more than it can ever repay to the scientists who have so willingly spent their lives in this manner; but the problems requiring solution are increasing too quickly for the few men who can thus afford to spend laborious days, and the time has come when the various industries must spend some of their wealth in endowing research scholarships and laboratories on a lavish scale in order to solve the numerous problems that confront them. The capital of the various industries throughout Great Britain is almost inconceivable, and a very small percentage on that capital would yield funds that would be ample for such research, and there is no doubt

that the results would be far-reaching in their effects.

Turning to the question of commercial methods, we find that Germany has obtained an immense volume of trade, not only on the Continent, but even in Great Britain and our own colonies, that we shall have great difficulty in wresting from her. She has done this largely by what we may term scientific advertising, for she sends out large numbers of commercial travellers who are familiar with the customs, the language, and the trade of the country they visit, while the few we condescend to send are often *not;* her catalogues and printed matter are in the language of the country to which they are sent, as are the prices and terms of discount, &c.

Here is a little sidelight on this subject. Switzerland takes the trouble to publish the number of commercial travellers who visit her each year; the following are the figures for a year a little prior to the war:

Country.	Goods sold in Switzerland.	No. of Travellers.
Germany . .	£21,520,000	4711
France . .	12,720,000	1531
Italy . . .	8,160,000	1405
United Kingdom.	3,640,000	61

As the proportion probably holds good for other countries similarly situated, we begin to see why Germany has doubled her exports in the last fifteen years or so to the nations round about her, while Great Britain has gained very little in the European markets. There is also more co-operation among manufacturers; consequently they are better able to regulate and increase the output, and to organise an industrial plan of campaign.

Freightage enters very largely into the question of costs, especially in the transport of heavy materials such as iron and steel, coke, &c. Comparing the three countries, we find that in England iron products cost about three halfpence per ton-mile, whereas in America the cost is only about a farthing to a halfpenny, and in Germany from a halfpenny to three farthings; or, to put it another way, it costs eight shillings to send iron from Staffordshire to Liverpool, a distance of about seventy miles, and only six shillings and eightpence to eight shillings from Pittsburg to New York, a distance of four hundred and sixty miles. The German manufacturer can send his iron and steel products from Westphalia to Amsterdam—one hundred and forty-seven miles—for six shillings and fourpence. A good deal of the heavy freightage in England is due to over-capitalisation; thus, for the same mileage, English capital is thirteen hundred million pounds, and Prussian only four hundred and fifty million pounds; and in the case of the German railways, over 90 per cent. are owned by the State, which profits to the extent of fifty million pounds sterling each year, in addition to giving such low transport rates.

In Britain the canal system of transporting heavy goods has been very greatly neglected, whereas on the Continent it has been increasingly used. Prussia alone has spent twenty-seven million pounds in constructing and improving her waterways. Between 1875 and 1905 German water traffic increased from thirteen million six hundred thousand tons per annum to sixty-seven million tons per annum. Our canal traffic is practically stagnant, and only small boats are used, compared with the three-hundred-ton boats used on the German canals. A scheme was submitted to Parliament years ago to canalise England at a cost of some thirty million pounds, but nothing came of it; yet the benefits to trade would be enormous, as freightage would be reduced to about one-third of rail charge; and we may be sure that Germany would not spend the huge sums she is doing if no advantages are to accrue!

Much more might be written about this important subject; one could easily fill in the foregoing almost *ad nauseam*, but it is to be hoped it is not necessary. Surely we shall never again allow ourselves to be thrust into the background in so many vital industries as we have been in the past.

Germany's control of the steel and iron and chemical industries, if allowed to proceed unchallenged, will be a menace to the peace of the whole world, and in our own interests, if for no other reason, it is essential that we should have a bigger say in matters such as these in the future, but we cannot accomplish this without an immense amount of real hard work on the part of every fit person in the kingdom.

THE RAID.

By O. C. Platoon.

'YOU are to have a rest this time up,' said O. C. Company. 'You're for a sort of course; attached to the artillery for information, the order says. Anyway, you're not for the front line. You've eight clear days, and a bed at the end of every one of them. You lucky blighter!'

'Sounds all right,' said Second-Lieutenant Penne. 'Wonder what "attached to the artillery" means!'

'When I was attached to the artillery,' said O. C. Company, 'it chiefly meant that I turned up at the battery about eleven o'clock, and went down to the O.P. with the observing-officer; at twelve o'clock I came back with the officer he'd relieved, and stayed to lunch. In the afternoons

I used to contrive to be invited to tea at C Battery; they have an excellent gramophone.'

'What made them choose me for this great honour?'

'Well, you've been doing your share lately, you know. We're all to have a turn out some day.'

Penne wandered away to his own billet. He had few illusions about the favour he was receiving.

Timeo Danaos et dona ferentes is an excellent rule of conduct, and applies equally well to orderly-rooms which grant unasked-for periods of rest. Really, he did not want the rest. Every one would be in the front line, save one or two others who had also received the unexpected favour. Altogether he found there would be six of them, two from each of A, B, and C Companies.

'Shall I put your equipment together, sir?'

'No; we're not going up this time.'

Harris, Penne's batman, stared. 'Not goin' up, sir? Ain't the battalion goin'?'

'Yes, they're going all right; but you and I and five other officers and their batmen are staying behind—for a rest.'

Harris had no answer to this save a soft whistle. Then, after a while, he said, 'It's a stunt, isn't is, sir?'

'I hope so,' said Penne.

'You'll take me, sir?'

'We'll see, Harris. Time enough for that when it comes off.'

For six days the six subalterns had a delightful time. After breakfast at the comfortable hour of nine, they sallied forth to shop in the village. They bought plums, salad, fresh vegetables, and French bread, which they later took up to the officers in the line. After that they split up among the various batteries in the neighbourhood, and from various O.P.'s studied No Man's Land diligently through a telescope. At night they gathered in their temporary mess and swopped lies which they had collected from the artillery during the day.

On the night of the sixth day they were sitting down to dinner when an orderly arrived. 'Second-Lieutenants Hudson and Williams will report to Major Wilson by 9 A.M. to-morrow the 6th inst.'

'Six little subalterns
Far from battle's roar;
Down came an orderly,
And then there were four,'

said Penne. 'Wonder what's up!'

Before dinner was over the two B Company subalterns had also received a similar notice, and by the time coffee arrived a runner from A Company presented Penne with a chit requesting the pleasure of his company *chez* Major Wilson on the morrow.

'Second-Lieutenant P. Fletcher Carr,' said Penne, 'you are hereby requested to accompany me to the abode of one hight Major Wilson on the morrow to receive instructions.'

'Oh! am I?' said that worthy. 'And I was going to lunch with D Battery to-morrow!'

'I think some one ought to make a speech on this auspicious occasion,' said Hudson. 'Something is going to happen. I think we ought to celebrate.'

'By going to bed early,' put in Carr.—'Prior?'

Prior, his batman, appeared from the kitchen.

'Call me early'——

'Mother dear, for I'm to be queen of the May,' suggested Hudson.

——'About seven, I think. Breakfast at half-past, and have everything ready to move off by a quarter-past eight.'

'And before you go, gentlemen,' said Penne, 'I'll trouble you for a little item of thirty francs apiece for messing expenses.'

'If that's your sole contribution to the evening's gaiety,' said Williams, 'it's about time this little haven of rest was broken up.'

. . . . . .

Major Wilson's headquarters were in a large, airy cellar in the reserve billets. The six subalterns sat round on boxes and chairs, while the three company sergeant-majors stood near the door.

'Briefly,' said the major, 'there is to be a raid to-morrow night. Penne and Carr are to take one party, and Hudson and Williams another. Carson and Holmes are to have a reserve-party to cover the others and lend a hand in case of accidents. The spots you are to raid are marked on that map over there, and here are aeroplane photographs of the section of trench, so that you'll know what to expect. Your parties will be thirty strong, and each of you will have two runners. The idea is to do as much damage as possible, and, if possible, bring back prisoners.'

'What about the wire?' said Hudson.

'Each of the two parties will be preceded by a party of six men and two R.E.'s, who will place a Bangalore torpedo under the German wire. Penne, you will see to your torpedo, and Hudson will look after his own. You'll get them from the R.E. dump to-morrow not later than 5 P.M. You will superintend the fixing of them in the wire also.'

'To-morrow night is going to be a pleasant little outing, I can see,' whispered Penne to Carr. 'Ever seen a Bangalore?'

'No.'

'Charming things, I assure you. Buy them by the yard from the R.E. We'll want about thirty feet of it.'

'As regards the disposition of your parties, I leave you to make your own—subject, of course, to criticism from me. You can also decide what equipment you will carry. There is one more thing. Each party will carry a mobile charge,

also supplied by the R.E., with which to blow up emplacements or dug-outs.'

'What time does the balloon—I mean the Bangalore—go up, sir?' asked Carr.

'Eleven o'clock. You must be in position and ready to rush the gap by ten minutes to eleven at the latest. Any questions?'

'Where are reports to be sent?'

'Where will you be, sir?'

'How long is it to last?'

'Who's going to fire the torpedo?'

'Suppose there's nobody there when we get there?'

'Are we to have a password?'

'Is there to be any artillery preparation?'

They fired questions one after the other for the best part of an hour. Sketches were made from the maps, and positions noted. The C.S.M.'s noted details in their pocket-books for the edification of their men. Finally everybody was satisfied.

'To-night, of course, you six will spend up here. There'll be all kinds of details to settle, and you'd better be on the spot. We might all have dinner together here. I think the larder will about run to it.'

'Sergeant-major,' said Penne, 'we'll fix up which men we're having now. Come on to the other room.'

Penne, Carr, and the A Company sergeant-major went into the adjoining cellar, and squatted on the remains of a bed.

'Best fix up the orderlies first. I want Scott and Harris for mine.'

'And I want Prior and Ward.'

'Warn those four to meet us here at eight o'clock to-morrow morning.'

Then they went through their platoons, discussing the merits of '82 Smith and '74 Jones, and their suitability for the work in hand.

'What about equipment, sir?' said the C.S.M. when the lists were completed.

'Rifle and bayonet, skeleton order, and bombs, eh?'

'How many bombs each, sir?'

'Every man to carry six, and one man in six to have a bomb-bucket with twenty-four bombs. That ought to be enough.'

The thirty men were divided into three groups of six and an N.C.O., and one group of eight and an N.C.O., and the exact work of each was carefully detailed. The C.S.M. departed, and Carr and Penne discussed their own part in the operations. Carr was to enter the trench, while Penne looked after matters on top, disposed of prisoners, and, in case of accidents, took command.

In the other cellar, Hudson and Williams were likewise busy arranging matters. Carson and Holmes were cursing their uninteresting reserve position, and deciding on the best tactical position. Major Wilson was writing out a report in triplicate for the orderly-room, the three C.S.M.'s were making arrangements for the supply of bombs, and away at the back three sappers of the R.E. were working overtime on long lengths of Bangalore torpedo.

. . . . . .

'Well, Scott,' said Penne the following day, 'there's going to be a stunt. We're going to wake Fritz up a little—a raid to-night. I want you to be my orderly along with Harris. All right?'

'Yessir,' said Scott.

'Your job is to look after me; see that I don't get into trouble. You may have to take messages, but in the main you will be with me. Job suit you?'

'Yessir,' said Scott.

Harris was delighted. Prior and Ward said very much the same as Scott. In fact, they didn't understand why they were asked about it at all. Ward asked anxiously if he would see any of the fun.

'Fun!' said Carr. 'You'll be right in the middle of it. There'll be enough to satisfy anybody.'

The other men were also warned, and for the rest of the day they sang loudly in their billets or cheered derisively when an occasional shell plumped down among the houses.

'Goin' to be a proper rough 'ouse this evenin',' said one.

'Yes, we'll give 'em little 'amlet. I'm goin' to nab a 'elmet, I am.'

'What cher want a 'elmet for?'

'Old girl in the billet in the village arsked me for one, an' I promised 'er she should 'ave it.'

Others took the unnecessary precaution of sharpening their bayonets on the window-sills. One and all were highly excited, and delighted at the idea of getting to close quarters. The Bangalore torpedoes arrived, and were stored in the company office. The mobile charge also came up, and Harris was deputed to carry it. As it weighed some seven pounds, he was not pleased.

Penne moved off at 9.15 with the six men and the two sappers. The torpedo was carried in three sections, each ten feet long. Penne carried the detonator, and the two sappers had the coil of wire and the firing-lever. Everything was quiet in No Man's Land as they crept over the parapet. Odd shots from fixed rifles plumped into the ground here and there, but no one was hit on the way across. The three sections were fitted together, and the pointed end inserted under the wire. This was one of the most dangerous parts of the raid, for the torpedo nosing through the wire made a considerable noise, and took some twenty minutes to fix. An unlucky Verey light might betray the whole party, and the raid have to be abandoned. At last it was fixed, and Penne carefully put in the detonator; the electric wires were attached, and the party made for home. A hap-hazard bullet

from one of the rifles broke one of the fingers of Scott's left hand as they returned, but he continued with the raid as though nothing had happened. Hudson had fixed his torpedo farther down on the right; it was twenty minutes to eleven when they met the raiding-parties coming to join them.

Penne led the way, crawling on his belly, and by ten minutes to the hour every one was in position some thirty yards from the torpedoes to allow for the effect of the explosion. Thirty yards is about the minimum of safety to allow. If you are any nearer, there is danger of shell-shock as well as from flying bits of wire. It is essential to get as close as possible in order to take full advantage of the surprise effect. The judging of that minimum safety distance gave Penne more trouble than anything else. It had to be done in an instant, practically in the dark, and without any means of verification. This was 'judging distance,' and no mistake!

Every one lay flat, awaiting the firing of the torpedo. There was a long silence, the night-wind creeping coldly through the grasses. Nothing happened. Carr, in rear, began to grow uneasy at the long wait, and crept back to find out the cause of the delay. Penne lay flat, clutching his revolver, wondering vaguely what he was doing out there at all. Before the war he had been an assistant-manager in a suburban bank, knowing nothing of explosives. Now he was lying out there, in that perilous strip of country, waiting for that long tube of ammonal to explode; he had with him some thirty men carrying bombs; and Harris, at his side, carried the mobile charge which was to blow something or other sky-high. He remembered an officer he had once known who had told him that explosives sometimes go off by a sort of sympathetic action. Suppose his mobile charge went off in sympathy with the torpedo? He wondered why it was so long. The sound of a dog barking a great distance away came down the wind. Some of the men fidgeted behind him. One of them spat. Then Carr came running back to his place, casting caution to the winds. He shouted at the top of his voice, 'Look out, Penne. It 's going up!'

With a terrifying roar the Boche wire leapt into the air. Penne rose to his feet and ran swiftly forward into a moving cloud of smoke, through which fragments of wire, wood, and iron flew. The men raced behind him. Down on the right another explosion shook the ground, while from all sides Verey lights swished and curved. But Penne was already in the trench, and two of his parties of six with him.

When Hudson's torpedo burst, Hudson and his men also ran forward; but something had gone wrong, for Hudson stumbled and fell. There was trip-wire here, all unsuspected and uncut. The first seven went down in the gap like nine-pins, while bombs rained over on to them from the trench. One dropped full on Hudson's orderly, killing him almost instantly; pieces of it also tore strips from Hudson's leg, and one pierced his knee, so that he could not walk.

'Find Mr Williams quickly,' he said to his remaining orderly. 'Tell him I 'm wounded, and he is to take over.'

But Williams, knowing something had gone amiss, had worked up towards the front, and found out for himself the trouble. It was almost as light as day with Verey lights, and bombs were still raining over.

'Give 'em hell, boys, and don't show yourselves,' he shouted; and the men, hearing his voice, lay close in to the edge of the wire and pitched bombs into the trench in front of them. Williams crawled up into the gap to look for Hudson. There was no sign of him. Bombs were still dropping there. There were several wounded men crawling painfully back home. One of them stopped crawling, and did not move. He went across, and found a dead body. The bombs were lessening now, but as he looked along there was a line of fire splashing through the wire. The Boches were abandoning their front line, and firing on them from the support line. On his left there was a continual bursting of bombs. The other party had evidently succeeded.

He investigated the gap again, only to find that the front section of the torpedo had worked loose and failed to explode, so that some seven feet of wire remained to be cut. He cursed his luck, and set about the difficult task of getting his men home, taking with them the bodies of the two men who had been killed. Hudson had managed to crawl in unaided.

In the meantime, Penne, on leaping into the trench, found himself opposite the entrance to a dug-out. He heard footsteps on the stairs, and fired a Verey pistol down the entrance. He followed this up with two shots with his revolver. His men had followed him by this time. One party immediately worked to the left, and the second party to the right, bombing round the traverses as they went. Scott and Harris heaved three or four bombs down the dug-out stairs, until the arrival of the third party, who were instructed to hold the top of the dug-out and prevent any one from coming out. Penne then followed swiftly on the heels of the first party. He passed the bodies of three Germans, and finding them dead, swiftly detached their numerals and identification discs. Then he came upon his own party halting at the junction of a communication-trench with the front line. Here they had raised a temporary barricade. As Penne reached the spot a German officer appeared, running up the communication-trench toward them.

'Surrender!' shouted Penne.

The only answer was a revolver-shot, which

clipped a piece from the side of the trench. The two German orderlies bolted.

'Surrender!' shouted Penne once more.

The German officer attempted to fire again, but his pistol jammed. He made a swift movement as though to pick up a bomb; but Penne's revolver spat twice, and he fell dead.

'Get him and bring him along,' he said, and pushed back rapidly to the other party. Outside the dug-out he found four men left.

'Three prisoners, sir,' they told him. 'We've sent them off.'

He pushed on, recalled the right-hand party, and, returning, heard Carr's party on the top firing furiously over them at a party of Germans who were trying to cross the ground between the support-trench and front line to bomb the raiders from above.

'Hold up. We're coming out.'

Carr's men continued firing on either side, leaving a space through which the men clambered out, two of them carrying the dead officer, others with caps and souvenirs of various kinds. The last man out, Penne took the mobile charge from Harris, and pulling out the pin that ignited the fuse, thrust the charge down the dug-out steps.

'Now get out quickly.'

They were through the wire, when another violent explosion told them that the dug-out was no more.

On the way back they passed the reserve-party, who were only too glad to see them come in, for any minute No Man's Land might be covered by shrapnel. As it was, there was quite a lot of machine-gun fire.

'Is the right-hand party in?' asked Penne of Carson.

'Yes. They reported about five minutes ago.'

'All right. Follow us in. We're the last.'

The souvenirs and the prisoners were sent down to headquarters, and the wounded (there were four, all slight, in Penne's party) to the aid post; the roll was called, and the men dismissed.

'A reg'lar little outin' we've had, an' no mistake,' said one.

'Yes; an' I only wrote 'ome this mornin', and told my missus that we was 'avin' a very quiet time. If she only knew the larks we was gettin' up to, eh?'

Three hours later Penne and Carr lay sound asleep on the sand-bags in the company office cellar. Major Wilson was writing a report. 'One officer (dead), three unwounded prisoners, and a number of identifications were obtained. Many casualties were inflicted on the enemy.'

Carr stirred uneasily in his sleep. Suddenly he stiffened. 'Look out, Penne. It's going up,' he shouted. He half awoke, then muttering, fell asleep again. Major Wilson looked at him for a minute, and then wrote on: 'I beg to bring to your notice the determination and coolness which marked the conduct of Second-Lieutenant Penne and of Second-Lieutenant P. Fletcher Carr.'

DUST FROM AN ENGLISH LAWYER'S PAPERS.

By G. H. Browning, Author of *A Will o' the Wisp Happiness*, *That Love is Blind*, *Compromising with Fate*, &c.

I.

ANY road, if it do but continue long enough, will sooner or later involve itself in twists and bends, and perhaps even double on its own track in its efforts to bewilder the innocent traveller. The strongest wind that ever blew will presently forget its stride and fall into raging confusion in some sudden hollow of the hills. Life itself is a maze of inconsistencies, of actions and reactions, and rock-firm principles that eventually dissolve like trodden snow, soiling their white vesture in the process. So it is not surprising, but rather to be expected, that the law of England, which has had its growth for more than a thousand years, should be fruitful of amazing anomalies and twisted inconsistencies.

The old system which bound landed property to the family tree—the law of entail, as it is called—was prolific of bizarre situations and dubious shifts. It was the custom of the great families to tie up their estates in such a way that the head of the house for the time being should be entitled for his life to the use of the family mansion with its appurtenant demesne, and the enjoyment of the rents of such of the lands as were let to their tenants; but he had no power to sell the family property, which it was intended to preserve intact for the delight of his successor, who in turn would enjoy its benefits for his life, and so *ad infinitum*.

As a result of this system there was often much conflict and bitterness of heart between the life-tenant, as he was called, and his heir, who was generally his eldest son. For, on the one hand, the father would often depreciate the value of the estate by neglect and mismanagement, and sometimes downright spoliation; and, on the other hand, the son, be he ever so wild and prodigal, could pursue his career of license and rebellion to the large measure of his content, defying the authority of his irascible and outraged parent in the comfortable knowledge that nothing he could do had power to take away the inheritance that would fall to the

young scamp so soon as his sire put off the mortal flesh.

During one period of history there arose from time to time a complication so amazing that we should be fully justified in disbelieving it were the tale not supported by the weight of divers heavy legal tomes. Suppose Lord Upways to be the life-tenant of the family estates of Blankdown, and thus entitled to the use of them for his life. Now so long as he lived he could dwell in the mansion, or, if he so preferred, spend a merry life away up in London on the income of the estate. But suppose, as often happened, the swift pace of life in the capital outran the slow steps of his rents, there was another course open to him if he were sufficiently deep in folly or debt to adopt it, which was to sell his life-interest. That is to say, he might go to a business acquaintance, Mr Grinder, and say, 'See here, fellow; I have a most prosperous estate in the county of Sussex that yieldeth me nigh on a thousand pounds a year. A thousand pounds every year, mark you! In sooth, a goodly sum. But, by Heaven! 'tis not enough for me, for what with the life at Court, and the state which I fain must maintain, i' faith I am a full three years' rents overspent. Now, sirrah! mark what I say. This estate is mine so long as I live, and that should be a long time yet—unless some knave worsts me in fight, which God forbid! Ha! ha! my heir will have a good thirty years to wait before he takes my place. So there—if fortune favours me—are thirty years at a thousand pounds a year. What make you of that, sirrah? What would you give for it?' And after a certain amount of haggling, which the impatient aristocrat would quickly terminate, a bargain would be struck. Lord Upways executes a deed conveying his interest to Mr Grinder, and Mr Grinder, having paid over his gold, is entitled to the income of the estate so long as Lord Upways lives. But the ways of life are uncertain, and no manifestation of it more so than its termination; and so Mr Grinder, being an elderly man, dies before the impecunious lord. Never mind; he has paid his money, and if he cannot live to enjoy his pound of flesh, the just law decrees that his heir shall finish the meal, or, in other words, shall follow in the steps of his deceased father by receiving the rents of the estate until Lord Upways's career of debauchery shall terminate.

All very well and good. Or at least it was so when the deed of sale was properly drawn, and to that end it was essential that in the wordy mazes of that yellow parchment Lord Upways should convey his life-interest to Mr Grinder '*and his heirs.*' If those three vital words should by design, inadvertence, or ignorance be omitted, Mr Grinder's heir could have no part or lot in the spoils, and the Grinder family disappeared from the play. Remains but one actor, Lord Upways. But his lordship has received the full price of his inheritance, and the law will not permit him to take advantage of an error to re-enter into the enjoyment of his bartered estates. Thus is the stage clear, and the estate awaits a claimant to collect and spend its accumulating rents. Who is entitled? Who shall profit by the omission of those three fateful words 'and his heirs'? Not Lord Upways's heir, for he has no right to the property so long as his lordship lives.

The English judicial system rose equal to the occasion, and solved the riddle in its characteristic, masterful fashion. And this is what it decreed. The first person, be he rich or poor, noble or mean, to set foot upon the estate and claim it for his own was to be entitled to the full use and enjoyment thereof so long as Lord Upways should live!

Thus did the English law overcome a difficulty which to any less powerful and self-confident system might have seemed insuperable, save through the expedient of seizing the property for itself.

II.

If a man desire to effect any transactions with property, let him see to it that he first consults his lawyer; for, though he may have to pay what seems a heavy fee for the privilege, it is more than probable that if he neglects this step, he, or those whom he intends to benefit, will pay a heavier price in the end for having their affairs extricated from the tangle into which the short-sighted act of economy has involved them. Indeed, the snares and pitfalls that beset the inexperienced traveller along the legal way are so cunning and so deep that one can fully sympathise with the injured sufferer as he furiously declares they were deliberately contrived for his downfall.

There is no better illustration of these dangers than the innumerable technical terms that are employed in almost every legal document—terms which, having through hundreds of years received special construction from the legislature or the courts, have acquired a meaning that is all-unknown to the layman. And yet when common prudence waves a warning light the foolish man ignores the danger-signal, and plunges heedlessly into the unknown darkness, which seems to draw him onwards with an irresistible fascination. This is particularly the case with the expression 'in trust.' It is such a fine-sounding phrase to employ; it looks so well in your will—'I give all my property to my son John in trust.' But the testator must be extremely careful how it is used, or he will find that instead of giving his property to his son John free and unfettered, as he intended, he has merely left behind him an unintelligible document, which the courts will have to construe in the best way they can; while poor John may be disappointed of his inheritance, and see his father's property shrink alarmingly under the process of the law.

There are many peculiarities to be met with in the description of a house and its adjoining grounds which one is conveying by deed, and, fortunately for themselves, very few people attempt the task of drawing such a deed without legal advice. It is the rule in these cases to describe not the house so much as the piece of land on which it stands, for a conveyance of land passes everything that is below or above it, from the centre of the earth to the heavens. And in connection with this, it is clear that, in the absence of special powers, a telegraph company commits a trespass whenever it carries its wires across a man's property; and it is probable that an aviator perpetrates the same offence over and over again every time he wings his way into the blue. It is a curious circumstance, by the way, that the legal description of a lake is 'a piece of land covered with water.'

To revert, however, to the subject of trespass, it is not generally known that thousands of people, whilst indulging in their annual holiday by the sea, innocently infringe the rights of a person whose existence is probably quite unknown to them—to wit, the owner of the shore. It seems such a natural thing that every one should be at liberty to have access to the sea that it never occurs to them that the shore may be the exclusive property of some private owner. Yet this is frequently the case, and the outraged proprietor can, if he so desires, take measures to exclude the public from his property. Of course, in the popular seaside resorts the local authorities have themselves acquired the ownership of, or rights over, most of the shore, and in this way the public is spared any interruption of its pleasures.

III.

There is a good deal of satisfaction in finality as regards business affairs. Most of us find it a disturbing circumstance to have such matters trailing their ragged ends across our minds; and of all the tasks which clamour for completion, the making of a will is perhaps one of the most insistent. It is a disturbing subject, that question of a will—a subject unpleasantly suggestive of a time in which we shall play no part; but it has to be tackled, and the sooner the better. So we brace ourselves to the effort, and face the disagreeable necessity; the disposal of our goods—which gives us a hand in the turning of the wheel of fortune even when we are done with life—is settled. And then follows the satisfaction of the *fait accompli*. 'Ha!' we exclaim; 'thank goodness, that's done! That matter's settled for good.'

But is it? There are many things arising from time to time that can alter the effect of a will—judicial decisions, new enactments, and the like. But one rule of law in particular should be more generally known than it is, a rule which concerns all manner of men and women. And the rule is this: if you make your will and subsequently marry, your work is entirely undone, for marriage revokes all previous testamentary dispositions.

The advent of aircraft has introduced an element of doubt into the liability of a tenant to his landlord for making good damage caused by these manifestations of Teutonic might. Some question arises over even a short and simple tenancy; but where a man holding a long lease has agreed to maintain his landlord's property in full repair, and to deliver it up in that state at the end of the term, he certainly ought to weigh his obligations, for the judges have imposed very heavy burdens upon the shoulders of tenants. It is perfectly clear that, in cases of the kind referred to, a man would be liable to rebuild a property which had been destroyed by fire or tempest, because the law declares that when the tenant signed his lease he must have been aware of the vicissitudes of life, including such things as fires and tempests and the unnamed disasters comprised in the lawyer's term 'acts of God,' which, though distinctly unpleasant facts, were nevertheless within the scope of his possible contemplation. But it is a different thing with Zeppelin damage, because, assuming that the lease was granted before these monsters invaded the sky, he could not possibly have intended to load himself with the responsibility of making good their damage, since they then had no existence. However, paradoxically enough, the only thing certain about the point is the doubt, and, until the law has resolved it, every tenant who holds a full repairing lease should protect himself by insurance, or he may live to rue his neglect.

This law of England is a queer thing indeed, a system full of inconsistencies and bizarre results, and yet one that in the main is continually striving after justice. But it needs deep and careful study for a right understanding of its manifold complexities, and the layman, in his dealings with its mysteries, chafe and declaim as he may, will not, if he be wise, venture to act upon that little learning which is a dangerous thing.

SONNET.—TO THE CLYDE.

If aught should mar the sense whereby I view
The green and gracious earth and fair blue sea,
And ne'er again through flesh should come to me
More than remembrance garlanded with rue,
What should I treasure most, of all the free,
The blest, the beauteous, the glad, the true
Scenes my unfettered youth and manhood knew?
What, save the bliss-brimmed moments born of thee?

Of thee, O Clyde, whose ever-noble stream
Floods through my being in a vision of truth,
Ever unveiling in unaging dream
Some new enchantment of eternal youth—
Whether proud Tinto mark thine upland flow,
Or 'mong rich orchard haughs thy waters glow.

SEVENTH SERIES

THE DOG-WATCHES.

By TAFFRAIL, Author of *Carry On! Stand By! Pincher Martin, O.D.*, &c.

I.

IT was the last time I was on leave in London —I forget how many months ago—that I sat in a drawing-room not so very far from the Marble Arch, and listened to two ladies discussing the war.

'My dear, I'm sure I don't know what I shall do,' said the first, with a gesture of despair. 'The war is being terribly brought home to me. Only last week my cook gave notice because I asked why Cuthbert's porridge was burnt—the dear fellow has it with cream for his breakfast—and I'm sure I don't know where on earth I shall get another like her. I've tried all the registry-offices; but it's perfectly hopeless!'

I did not know the speaker personally, though I had been introduced without hearing her name. But I rather envied Cuthbert, who had cream with his porridge. The milk they give me with mine generally comes out of a tin.

The other lady, a middle-aged woman, whose husband was serving his country as a 'dug-out' colonel, and all of whose three sons were in the navy or the army, snorted indignantly.

'My dear Amelia,' she said, with her eyes flashing, 'it's high time you gave up living in the lap of luxury. The first thing you'd better do is to get rid of your pack of yapping curs. They eat far too much, and aren't the least use to any one.'

Amelia raised her eyebrows in mild surprise. 'My dear Connie, they're not curs, and have all got the most excellent pedigrees. Just think of what I paid for them. I couldn't possibly get rid of the poor little darlings! I'm sure the Food Controller doesn't mind my having them.'

'If I were the Food Controller I'd have them all destroyed,' the lady called Connie retorted with acerbity.

'But they eat so little, the pets,' came the reply. 'Of course, if I had half-a-dozen dogs, like some people, it would be very wrong. But I've only got four: Fluffy, the Pekinese; Blogg and Snog, the two Poms; and my angelic Cuthbert, the Yorkshire terrier.'

So Cuthbert was a dog. He ate cream with his porridge, did he? I longed to kick the pampered little beast—to kick him really hard.

'I don't agree with you,' snapped the austere lady. 'It's not right for any decent-minded woman to keep four dogs—useless dogs—in wartime.'

'But think of what my dear doggies have done for their country!' Amelia wailed. 'At our last Red Cross bazaar they wore the sweetest little collecting-boxes, and made no end of money.'

'Pish!' sniffed Constance.

Amelia bridled. 'You needn't say "Pish!" in that nasty, vulgar way!' she retorted. 'Even though I am your sister, it's not my fault I haven't a husband and children, like you. I love my doggies. And think how many of their dear brothers are fighting in the trenches! I know for certain, too, that they keep watches on board the battleships in the North Sea when they anchor for the night, and the poor, tired sailors are allowed to sleep in their bunks. The dogs warn them by barking when the Germans are coming, like the dear white mice they have in submarines.—Isn't that so, Mr Tadpole?' she asked, turning to me.

I was glad that she knew enough about naval uniforms to realise that I was not a sleeping-car attendant, a cinema-man, or yet a glorified railway porter.

(It may be rather a sore point, for it was at Newcastle railway station, in the early days of the war, that I had been accosted by an elderly woman in a bonnet who thrust a small hand-bag at me.

'Young man,' she had said, 'take me to the train for South Shields.'

I took the bag and conducted the lady to a third-class carriage, receiving two coppers, which I was too flabbergasted to refuse. It was only after the train steamed out of the station that I discovered it went to *North* Shields.)

Nevertheless, I most strongly object to being called 'Tadpole' when my proper name is 'Taffrail.' Who would not?'

Also, I did not quite understand what the lady named Amelia was driving at, for, though I believe they used to keep white mice in the earliest submarines for detecting the escape of dangerous petrol-fumes, I had never heard of their barking.

 [*All Rights Reserved.*]

'What is it you wish to know, Miss—er—Hum—hum?' I asked, slurring over her unknown name and putting on my sweetest society smile.

'I was only asking about the dear doggies on board the men-of-war, Mr Tadpole,' she said. 'I thought you would be sure to know.'

'Taffrail, please,' I corrected feebly. 'Of course we do have dogs on board men-of-war—all sorts of dogs. They generally belong to the officers, and are looked upon as pets.'

'Ah, I thought so,' said Amelia triumphantly, glancing at her sister. 'I knew they had them at sea, the dear, dear doggies!'

'But I'm afraid they don't bark when the Germans are coming,' said I with a grin.

Is that so?' she cried. 'I was given to understand that they did.'

I shook my head. 'Who told you?' I demanded.

'I have a nephew who is a sub-lieutenant on a torpedo,' she told me. 'He said they always had dog-watches on his ship.'

I blew my nose hastily, for it was all I could do to conceal my amusement. I proceeded to explain, but I could see that she did not believe a word I said. Moreover, her manner was distinctly frigid, and the more her married sister laughed the more Amelia glared. In fact, there was what one might call a distinct frost. It was a terrible experience.

II.

But, if the truth be known, I have never really discovered why, in nautical language, the four hours between four and eight P.M. are referred to as the 'dog'-watches. We have the 'first' watch, from eight P.M. till midnight; the 'middle,' midnight till four A.M.; the 'morning,' four till eight A.M.; 'forenoon,' eight A.M. till noon; and the 'afternoon,' noon till four P.M. These names are quite understandable. But for some inexplicable reason the period between four and six P.M. is the 'first dog'-watch, and that between six and eight the 'last dog,' not the 'second' dog, as some un-nautical people would have us believe.

It does not require very much ingenuity to realise why these two-hour watches exist. They divide the day into seven watches instead of six, and were introduced so that seamen who kept 'watch and watch,' or 'watch on and watch off,' should not have the same period of vigil day after day. For instance, if a man kept the morning, afternoon, and last dog-watches one day, he had the middle, forenoon, first dog, and first the next, and so on.

What I am rather puzzled about, however, is to find some reason for our ancient seafaring forefathers rushing into zoology for the naming of their watches. Moreover, why, of all the animals in existence, did they select the dog, a creature which never took kindly to the sea, and which, so far as I can find out, rarely went afloat in medieval days? Why did they not choose the cat, the cow, the elephant, the porpoise, or the turtle, either of which animals, mammal, or reptile they surely must have met with during their travels?

Honestly, I do not know; but while we still have ships that sail the sea, I suppose the period between four and eight P.M. will still be known as the 'dog-watches.' He would be a very brave man who tried to call it by some other name.

In the Royal Navy of the present year of grace the dog-watches represent the slackest portion of a busy day. Even if his ship is in harbour, the sailor is rousted out of his hammock at some unearthly hour of the morning, while no small proportion of the ship's company will be keeping regular watch, day and night, as quartermasters, sentries, messengers, signalmen, telegraphists, and in the engine-room and stokeholds.

So from cockcrow until four P.M., except for Sunday afternoon and one other weekly half-holiday which is nominally set apart for making and mending clothes, but is really spent in 'caulking' or sleeping, the bluejacket is hard at work. He gets his forty-five minutes or so for breakfast, and an hour and ten minutes for dinner in the middle of the day, but at four in the afternoon, after 'Evening quarters,' or parade, he has his tea, and is supposed to be more or less free for the rest of the day except for such duties as are really necessary. But even then it is the unwritten law of the Service that the 'watch below' shall not be disturbed during the dog-watches if it can possibly be avoided, and that what work has to be done is carried out with the minimum number of men belonging to the 'watch on deck.'

With the ship at sea in war conditions watch-keeping is far and away more rigorous and employs more men, while even the watch below must be instantly available at any time of the day or night. But the bluejacket is nothing if not a past-master in the art of sleeping, and during the afternoon at sea the tables and stools on the mess-decks will be covered with figures enjoying their afternoon caulk. Most of the officers, moreover, except those actually on duty on deck, will be indulging in a similar occupation in their cabins, for practically every soul in the ship will have had four or more hours out of his bunk the night before.

But at four o'clock the ship wakes up. No self-respecting naval man sleeps during the dog-watches, and then is the time when he sits down to write his letters and occupies himself with his hobbies or amusements. And how diverse and varied the hobbies are! You may see men doing fancy wool-work, wood-carving, manufacturing gaudy hearthrugs out of canvas and bunches of wool, or cutting jig-saw puzzles

or knick-knacks with a fret-saw; while I even know of one seaman who sketches in water-colours, and right well he does it. The blue-jacket is also a great reader, and, contrary to popular belief, he does not always read trash. I once came upon an A.B. perusing Gibbon's *Decline and Fall of the Roman Empire.*

Card-playing is also permitted provided there is no gambling, while the barbers will be busy shaving the faces and cutting the hair of their shipmates, for a consideration; the 'snobs,' or bootmakers, will be mending boots, also for a consideration; and the tailors will be earning money with their sewing-machines in mending or making their friends' garments. The men have generally taught themselves these trades, and, besides being of great use in a ship, they amass no small sums by their labours.

When the ship is in harbour it is no unusual sight in the dog-watches to see men roller-skating on deck, boxing, fencing, wrestling, or otherwise taking exercise. It is the time, too, when the ship's company have their weekly or bi-weekly 'all over' baths in hot water, and when the schoolmaster, a specially selected man of superior knowledge, retires with his pupils to some remote flat below the water-line, and instructs the young idea in academic learning with the help of a blackboard and chalk. The padre, moreover, holds his choir practices and his Bible-classes at the same time of day; while the pierrot troupe or nigger minstrels—for no self-respecting battleship or cruiser is without her 'funny party'—will muster in some secluded spot to rehearse their gags and ditties for the next sing-song.

And the officers. Their hobbies and amusements are every bit as diverse as those of their men. They may play a blood-thirsty game of deck hockey with a chunk of wood or a rope grummet instead of a ball, or keep in their hands at golf by addressing and smiting a captive ball or a harmless cork. Others may be reading or writing letters in the fastnesses of their cabins, or hurling a huge 'medicine ball' about the quarter-deck. Then for some time there was a revival of that long-defunct game ping-pong; while many of the battleships of the Grand Fleet have their billiard-tables. Billiards at sea are naturally out of the question; but the ships are not always at sea. There is always bridge, while the engineer-commander and the fleet paymaster of one ship I have in my mind have spent the dog-watches of the last two years in playing chess. All this, of course, if they cannot get ashore.

But there are occasions when leave is granted provided officers and men do not go far from the ship and are available for immediate recall. Some of them may have their wives living in the locality; while the elder bachelors will retire to the nearest golf-links, or to the club to read the papers and to meet their friends from other ships. The more juvenile officers may visit a restaurant for tea, and to gladden their tired eyes with the sight of something fluffy and feminine in petticoats; while another shore occupation beloved of all N.O.'s is being shampooed and having their hair cut. Another ship has what it calls a 'Guzzle Club.' There are six members, and each one is bound by the rules of the fraternity to produce something edible and tasty whenever he returns to the ship from 'the beach.' It may be anchovies in oil, salted almonds, some rather 'ormolu' brand of sardines, or anything unusual in the gastronomic line. Only once have the members of the Guzzle Club ever passed a vote of censure, and that was when its junior member appeared on board with six packets of American chewing-gum.

(The word 'ormolu,' by the same token, is not used in its dictionary sense. It is a recently coined naval word meaning 'recherché.')

In a certain port not so very far from where I am now we have our 'Klondyke.' This is not its real name. Our Klondyke is a four-acre field, which is in the process of being turned into allotments for the cultivation of the chief of vegetables, the highly popular but rather scarce potato. On fine afternoons, crowded with earnest amateur gardeners of all shapes and sizes, and of both sexes, the scene rather reminds one of the gold-diggings, and hence its name.

Klondyke is quite a fashionable rendezvous. Many of the allotments have been taken by naval officers, a captain, several commanders, and some lieutenant-commanders and lieutenants among them, and they spend their afternoons ashore in digging, delving, and trenching, as if their very lives depended on it. So we frequently go there to pass the time of day with our friends, to discuss the merits of top-dressings of soot or sulphate of ammonia, and to inquire after the health of their cabbages and early potatoes. We are all very keen gardeners, though we do not know much about it. Last year I planted several stones of seed-potatoes; but something happened, with the result that I didn't get a single potato larger than a walnut. Moreover, an army of Hunnish slugs came out at night and devoured my lettuces and mustard and cress; but the spinach grew very well. I made one mistake, however. I planted about one square yard of it—there was no room for any more—whereas I believe market-gardeners sow it by the acre. Nevertheless, it was a success. The seed cost two shillings, and the result provided us with two dishes.

But well I remember a certain naval officer coming home to his wife after a strenuous time at sea.

'Jim dear,' she said, 'I have rented you an allotment, bought a spade and a fork, and now you can spend your afternoons in growing potatoes.'

So Jim, with mingled feelings, went off to look at his domain of fifty by thirty feet, and found a

patch of ground covered with stones and rank, firmly rooted grass. He gazed at it, scratched his head, thought a great deal, stuck in a peg at each corner, and—went home to tea.

The sight had so depressed him that for ten days he never ventured near the spot again; but then, seized by a sudden fit of enthusiasm, he shouldered his implements and sallied forth. For an hour or more, watched by his wife, he dug as he had never dug before. The perspiration rolled off his face as he shed his garments one by one, but still he dug. Then arrived the inevitable small boy with his mother.

'Ow!' shrieked the young hopeful delightedly. 'Come 'ere, ma! Come and look at this bloke a-diggin' 'is grave!'

History does not relate what the exhausted digger did to the small boy, but I should have been sorely tempted to kill him on the spot, and to use him as fertiliser.

Thus, thus, and thus do we spend our dog-watches.

THE DEFINITE OBJECT.

CHAPTER XXXIII.—OF TRAGEDY.

IT was close on the hour of sunset when Ravenslee stopped his car before a quiet hotel in Englewood and sprang out.

'Will you be long, sir?' inquired Joe, seating himself at the wheel and preparing to turn into the garage.

'Probably an hour, Joe.'

'Very good, sir.'

But, as the big car turned, Ravenslee spoke over his shoulder. 'By the way, if I shouldn't be back in an hour, come and meet me.' Then, having given Joe full and particular directions as to the little wood, he turned and went upon his way.

It had been a stifling day, and even now, though a soft air was abroad, tempering the humid heat, when this light wind languished there was over all things a brooding stillness foreboding storm. But Ravenslee strode on, unheeding dust and heat, hasting on to that which awaited him, full of strength and life and the zest of life, glad-hearted and with pulses that throbbed in expectation. Thus, as the sun sank in fiery splendour, he reached the little wood. Evening was falling, and already, among the trees, shadows were deepening to twilight, but in the west was a flaming glory; and upon the edge of the wood he turned to glance back at this radiance, splashes of gold and pink flushing to an ominous red. For a long moment he stood thus, to stare round about the solitary countryside, joying in life and the glory of it. Then he turned, and, with a smile on his lips, stepped into the gloom of the wood. On he went, forcing his way through the underbrush, until, reaching the clearing, he halted suddenly and faced about, fancying he had heard a rustle in the leaves hard by; and Spike, cowering behind a bush, with M'Ginnis's fingers gripping his arm, shivered and sweated and held his breath until Ravenslee moved on again, and, coming to a fallen tree, seated himself there, and sat chin on fist, expectation in every tense line of him.

'Now!' whispered M'Ginnis hoarsely. 'Get him now—before Hermy comes t' him!'

Shuddering, Spike levelled the weapon he held, but at that moment Ravenslee was filling his pipe, and something in this homely action checked the lad, paralysed finger on trigger, and, shrinking, he cowered down upon the grass despite the fierce hand that gripped him.

'Get him now, kid—get him now! Aim f'r his chest; ye can't miss at this distance.'

'I—I can't, Bud!' gasped the boy, writhing. 'I can't do it—I can't!' Dropping the revolver, he hid his face in sweating hands, and shivered.

From somewhere near by a woodpecker was tapping busily; but save for this no sound broke the pervading stillness, for the gentle wind had died away. But suddenly the quiet was rent and shivered, and Spike, deafened by the report, glanced up to see Ravenslee rise to his feet, stagger forward blindly, then, with arms outflung, pitch forward upon his face and lie there.

'By God, you—you've shot him, Bud!' he whimpered. 'You—you've killed dear old Geoff! Oh, my God!'

'Aw, quit—quit all that!' whispered M'Ginnis breathlessly. 'That's what we came for, ain't it? What you lookin' at?'

'It lays so—still; so awful still!' Spike gasped.

'Well, what ye got t' go starin' at it that ways for? Come on—let's beat it; it's us for th' quick get-away, in case any one heard. Come on, kid!'

'But you've killed Geoff!'

'I guess he don't need no more. 'N' say, kid, you're in on this job too, don't forget! Come on; it's little old N' York for ours!'

But though M'Ginnis dragged at him, Spike huddled limply on his knees, his glaring eyes always staring in the one direction; whereupon M'Ginnis cursed and left him.

And now, all at once, finding himself alone, to horror came fear; and, stumbling to his feet, Spike began to draw away from that awful thing that held his gaze; slowly he retreated, always going backwards; and, though he stumbled often against tree and sapling, yet so long as it was in sight needs must he walk backwards. When

at last a kindly bush hid it from his sight he turned and ran—ran until, panting and wild-eyed, he burst from the wood and was out upon the open road. Even then he paused to stare back into that leafy gloom, but saw and heard nothing. Then, uttering a moan, he turned and ran sobbing along the darkening road.

But within that place of shadows, from amid the leaves of a certain great tree, dropped one who, coming beside that motionless form, knelt there a while. When at last he rose a ring lay upon his open palm—a ring in the shape of two hands clasping each other; then, with this clenched in a pallid fist, he also turned and left that still and awful thing with its face hidden in last year's dead and rotting leaves.

CHAPTER XXXIV.—OF REMORSE.

FOR three miserable days Spike had remained indoors, eating little, sleeping less, venturing abroad only at dusk to hurry back with the latest paper, and locked within his bedroom to scan every scare-head and column with eyes dilating in dreadful expectation of beholding the awful word MURDER.

For three interminable days Hermione, going about her many duties slow of foot and listless, had scarcely heeded him, conscious only of her own pain, the agony of longing, the yearning ache that filled her throbbing in every heart-beat—an ache that would not be satisfied. Thus, lost in her own new sorrow, she spoke seldom, sighed often, and sang not at all; often sitting at her sewing-machine with hands strangely idle and gaze abstracted. Often Spike, watching furtively, had seen her eyes brim over with great, slow-falling tears; more than once he had heard her bitter weeping in the dawn. At such times he had yearned to comfort her; but between them was memory dividing them like a wall—the memory of a still form with arms wide-tossed and face hidden among dead leaves; and at such times Spike writhed in the grip of horror, and groaned under the gnawing fangs of remorse; and sometimes he prayed wild passionate prayers, and sometimes he wetted his pillow with unavailing tears, while in his ears, like a small voice soft and insistent, repeated over and over again, was the dread word MURDER. By day it haunted him also; it stared up at him from the white cloth of the breakfast-table, forbidding him to eat; he read it on floor and walls and ceiling; he saw it in bloody characters that straggled across the very sky; wherever he turned his haggard gaze, there he needs must read it.

And then there were the footsteps. All day long they tramped up and down the stairs outside, everyday sounds that he had never heeded before; but now they were warnings to hearken to and shudder at; and he would sit pretending to read, but with ears straining for the sound of feet upon the landing or on the stair. Now they were feet that crept—the stealthy steps of one that lurked to catch him unaware; or, again, they were the loud tramp of those who came with authority to drag him to doom; and, staring wide-eyed, he would watch the door, waiting for the thundering knock he expected, yet which never came. All day long they haunted him; and at night, locked within his bedroom, he must needs lift heavy head from the pillow to hearken with ears straining even yet, until, haggard and worn, he had shivered and groaned and wept himself to sleep, only to awake and start up in sweating terror, thinking he heard a fierce hand knocking, knocking upon the outer door.

Thus, for three long days, Spike had lived in torment; and to-night, as he leaned throbbing head between clutching hands, his haggard eyes sought vainly for that fell word which he could read everywhere except in the newspaper before him; his sufferings had grown almost beyond his strength, for to his old torments was added harrowing suspense.

Why? why? Why was the word that stared at him from ceiling and walls and blue expanse of heaven, why was it there and not in the news-sheets? Could it be that it was lying there yet, that awful still thing, lying as he remembered it, as he could see it now, its ghastly features hidden among the leaves that rotted, its long arms outflung and strong hands that gripped among the grass with clutching fingers? Could it be?

'Arthur—boy—what 's the matter?'

Spike started and looked up to find Hermione beside him, and instinctively he shrank away.

'Arthur—oh, what is it? Are you sick?'

'N-o; why?'

'You were moaning.'

'Oh, well, I—I 'm all right, I guess. Got a headache, that 's all.'

'Why have you avoided me lately, Arthur? I 'm not angry any more; I 'm only disappointed.'

'Ye mean because I lost me job? They don't want my kind, I—oh, I 'm too mean—too rotten, I guess.'

'I heard you cry out in the night, Arthur. What was it?'

'Nothin'—I didn't cry out las' night, I tell ye.'

'I heard you!'

'Oh, well, I—I was only dreamin', I guess.'

'Why have you acted so strangely lately? You don't eat; you don't go out; you sit around staring big-eyed, and seem to be listening—almost as if you were afraid.'

'I ain't—I ain't afraid. Who says I 'm afraid? An' I don't want you to go worryin' yourself sick over me. I ain't a kid no more.'

'No, I 'm afraid you 're not;' and, sighing, she turned away.

But now, as she crossed the room, her step

slow and listless, he spoke, his head down-bent and face hidden between clenched hands, voicing, almost despite himself, the questions that had tortured him so long. 'Say, Hermy, where 's Geoff? How is he? I mean, you—you ain't heard anythin', have you?'

'No,' she answered softly without turning; 'what should I hear? I only know he 's—gone. How should I hope to hear anything any more?'

'I—I thought he was—goin' t' marry you.'

'So he was, but I—couldn't let him—marry—a thief's sister,' she said in the same low, even voice.

'Ah!' cried Spike, writhing. 'Why did he go an' tell ye about me after he told me he never would? Why did he tell ye?'

'He didn't tell me!' cried Hermione with curling lip.

'Didn't he? Oh, didn't he?' said Spike, his voice high and quivering. 'Didn't Geoff tell ye? Then, say, Hermy, who—who did?'

'It was Bud M'Ginnis, and for once it seems he told the truth!'

'Bud!' cried Spike, stumbling to his feet. 'Oh, my God!'

At sound of his voice she turned, and, seeing his face, cried out in sudden fear, 'Arthur—oh Arthur! what is it?'

'Bud told ye?' he gasped. 'Wasn't it Geoff—oh, wasn't it Geoff?'

'No.'

Spike was down on his knees. 'Oh God! Oh Geoff—dear old Geoff, forgive me!'

Spike was huddled upon the floor, his face pressed to the worn rug, his clenched fingers buried in his curls, while from his lips issued gasping sobs harshly dry and awful to hear. 'Forgive me, Geoff—forgive me! I thought you told her! I thought you meant t' steal her from me! Oh, forgive me, Geoff; I wish I was dead like you.'

'Arthur!' She was down beside him on her knees, shaking him with desperate hands. 'Arthur! oh Arthur—what—what are you saying?'

'Nothin'—nothin'!' he stammered, staring up into her face, suddenly afraid of her. 'Nothin'. I—I was only—thinkin'. I'——

'What did you mean?' she cried, her grasp tightening. 'Tell me what you meant—tell me, tell me!'

'Nothin',' he mumbled, trying to break her hold. 'Lemme go; I—I didn't mean anything.'

'Tell me what you meant—tell me, tell me!'

'No, I can't—I'——

His voice failed suddenly, his whole frame grew tense and rigid, and, lifting a stiff arm, he pointed a trembling finger towards the open doorway.

'Hush! hush!' he panted. 'Oh, for God's sake, hush! There 's—don't you hear?—there 's some one outside on th' landin'—footsteps—hark! They 're comin' to our door! They 're stoppin' outside. Oh, my God, it 's come at'——

The word ended in a scream, drowned all at once in a thunderous knocking on the outer door; and Spike, crouching upon his knees, clutched at her as she rose.

'Don't—don't open—the door!' he gasped, while Hermione gazed at him, terrified by his terror, as again the thunderous summons was heard. Then, despite the boy's passionate prayers and desperate clutching hands, she broke from him, and, hasting into the little passage, opened the door.

Upon the threshold stood a little old man, very smartly dressed, who saluted her with a gallant flourish of his dapper straw hat, and bowed with his two small and glittering patent-leather shoes posed at position No. One in waltzing. 'Ma'am,' said he, 'miss, respectful greetin's. Your name 's Hermione, ain't it?'

'Yes,' she answered, wondering.

'Knowed it was. An' a partic'ler fine gal, too! Though not 'oldin' wi' marridge, I don't blame the guv—'e always 'ad a quick eye for beauty—like me.'

'But who are you? What do you want?'

'Miss, I want you—leastways, 'e does. Been callin' for you the last three days 'e 'as, ever since 'e ketched one as fair doubled 'im up.'

'I—I don't understand. Who are you?'

'A admirer of the guv, ma'am. A trusted friend of 'is, miss, come t' take ye to 'is poor yearnin' arms, lady.'

'But who—oh, what do you mean?'

'Mr Ravenslee, ma'am.'

'Mr Ravenslee!' she echoed, her colour changing.

'Yes. Ye see, he 's dyin', miss!'

Hermione gasped and leaned against the wall as if suddenly faint and sick; perceiving which, the Old Un promptly set his arm about her waist and led her unresisting into the parlour. There, having aided her tenderly into a chair and nodded to pale-faced Spike, he sighed, shook his ancient head, and continued: 'Ho, lor lumme, lady, it fair wrung my old 'eart to 'ave to tell ye; but, 'avin' to tell ye (Joe couldn't), I told ye almighty quick to get it over—sharp an' quick 's my motter. Fate 's crool 'ard when Fate takes the gloves off, miss, an' I know as Fate 's been an' took ye one in the wind wot 's fair doubled ye up; but take time, ma'am, take time—throw back your pretty 'ead, breathe deep an' reg'lar, an' you 'll soon be strong enough to go another round. If I 'd got a towel handy I 'd fan ye a bit; not 'avin' none, no matter. Fate 's 'ard on you, so fair an' young, miss; but Fate 's been 'arder on the guv—ketched the poor young guv a fair spiflicator.'

'Oh, please—please,' cried Hermione, reaching out appealing hands—'oh, tell me, is he hurt—sick—dying? Oh, quick, quick, tell me!'

'Lady, ma'am—my pretty dear,' said the Old Un, taking those pleading hands to pat them tenderly, 'that's what I'm tryin' to do. The guv ain't dead yet—no, not yet.'

'You mean, he's—dying?'

'My dear,' said the old man, blinking at her through sudden tears, 'that's what the doctors say.' Here he loosed one hand to rub at each bright eye with a bony knuckle, 'an' 'im so young, so game an' strong, three days ago.'

'How—did it—happen?' she questioned, her voice low and steady.

'It was Fate!' said the old man, taking her hand again. 'Three days ago, Fate (the perisher) sends 'im a telegram—two on 'em—tellin' 'im to meet you in a wood, an' signed with—with your name, both on 'em.'

At this she cried out and would have risen, but his kindly clasp checked her.

'I sent no telegram!' she whispered.

'Me an' Joe an' the Spider know that now, miss. But, anyway, to this 'ere wood the guv do 'aste away, an' in this wood Fate's a-layin' for 'im wi' a gun, an' down goes the poor guv wi' a perishin' bullet in 'is gizzard. An' there Joe finds 'im, an' 'ome Joe brings 'im in the car, an' Joe an' me an' the Spider 'ushes things up. An' now in bed lays the guv, with nurses an' doctors 'angin' over 'im, a-callin' for you—I mean the guv, d'ye see? So now for you I've come. I've brought Joe an' the car for you. Joe's across wi' Mrs Trapes, an' the car's below—both waitin'. So you'll come t' th' pore young guv, ma'am, won't ye, lady?'

'Have you—any idea—who—did it?' she questioned, speaking as if with an effort.

'We got our suspicions, ho yus!' the Old Un nodded. 'Joe's got a wonnerful gift o' suspicion—oh, a rare 'ead 'as my lad Joe. Joe an' th' Spider's on th' track, an' they're goin' to track Fate to doom, ma'am—to perishin' doom! Ye see'—here the old man leaned suddenly nearer—'ye see, Joe's found a cloo!'

'A clue! Yes, yes!' she whispered breathlessly, moistening lips suddenly dry, and conscious that Spike's lax form had stiffened to painful alertness.

'Well, ma'am, Joe an' th' Spider's been a-seekin' an' a-searchin' of that there wood, an' they found'—here the Old Un leaned nearer yet and whispered harshly, 'they found—a coat-button! Lorgorramighty!' he exclaimed suddenly, pointing a trembling bony finger, 'what's took th' lad? Look!'

Spike had risen, and now stood breathing loud, one hand clenched upon his breast, and, turning swiftly, he took a stumbling pace toward the open window, tripped, and fell prone upon his face.

'Oh, poor lad! poor lad!' cried the Old Un, rising hastily. 'Fate's been an' ketched 'im one too—a fair knock-out! Leave 'im to me, ma'am; I'll bring 'im round. Bitin' 'is years is good, or vinegar on a sponge. Leave 'im to a old fightin'-man.'

'No!' cried Hermione passionately; 'no, I say! Leave him to me!'

Quelled by something in her tone and manner, the old man sank back in his chair, while she, kneeling beside Spike, lifted him in her strong young arms so that he was hidden from the Old Un's bright, piercing eyes. Holding him thus, she loosed Spike's rigid fingers and drew away that clutching hand; then, seeing what that hand had striven to hide, she blenched suddenly away, letting the boy's inanimate form slip from her clasp; and, as she knelt there above him, her shapely body was seized with fierce tremors. So she knelt for a long moment until Spike sighed, shivered, sat up; but, beholding the look in her wide eyes, he uttered a hoarse sound that was like a cry of fear, and, starting from her nearness, crouched down, huddled upon his knees.

Then Hermione rose, and, turning to the old man, smiled with pallid lips. 'You see—he's all right—now!' she said. 'If you'll please go and tell Mrs Trapes I'm leaving, I'll get ready'

Obediently the Old Un rose. 'Mrs Trapes is a-gettin' into her bonnet to come along wi' us!' said he, and putting on his hat with a flourish, took his departure. When he was gone, Hermione turned and looked down at Spike, who, meeting her eyes, flinched as from a blow, and made no effort to rise from his knees. So she packed her grip and dressed for the journey, while he watched her with eyes of mute appeal; twice he would have spoken, but her look smote him to silence. At last, as she took up her suit-case and turned to go, he implored her in a hoarse whisper, reaching out his arms to her, 'Hermy!'

But she shrank from his contact, and, hastening from the room and along the little passage, closed the door and left him to his hopeless misery.

As one in a dream she followed the old man down the stairs, was aware of his ushering her through the crowd of women and children who thronged about the big car; as one in a dream she found herself seated beside Mrs Trapes, whose motherly solicitude she heeded no more than the bustle and traffic of the streets through which the swift car whirled her on and on until, turning, it swung in between massive gates, and pulled up before a great, gloomy house; as one in a dream she ascended the broad steps, crossed a stately hall, was ushered up a noble stairway and along thick-carpeted corridors until, at last, she found herself in a darkened chamber, where, his dark head conspicuous upon the white pillow, he lay. A nurse rose from beside the bed as Hermione entered and softly withdrew. Left alone, she stood for a long moment utterly still, her hands tight-clasped, her breath in check, gazing at that dark head upon the pillow, at that outstretched form lying so silent and so very still.

'Hermione!'

A feeble whisper, a sigh faintly breathed; but at the sound she had crossed the wide chamber on feet swift and noiseless, had sunk upon her knees beside the low bed to lean above him all murmurous love and sighing tenderness, while she stole a timid hand to touch the hair that curled upon his pallid brow; then, for all his helplessness, she flushed beneath his look.

'How beautiful—you are!' he said faintly, 'and I—weak as—confounded rat! Hermione—love, they tell me I—must die. But first I want you for—my very own, if only for a little while!'

'Oh my dear,' she whispered, soft mouth against his pale cheek, 'I always was yours—yours from the very first; I always shall be.'

'Then you 'll—marry me?'

'Yes, dear.'

'Now?'

'Yes, dear.'

'I—hoped you would, so—I arranged—minister's waiting now. Will you—ring?' And he motioned feebly towards an electric bell-push that stood upon a small table beside the bed. And now once again, as one in a dream, she obeyed, and was presently aware of soft-treading figures about her in the dim chamber—among them the Old Un, whose shoes for once creaked not at all; as one in a dream she made the responses, felt the feeble clasp of that hand whose strength and masterful power had thrilled her, heard the faint echo of that loved voice that had wooed her so passionately once, yet wooed in vain; while now——

She was alone again, alone with him who lay so very still and pale, with eyes closed wearily; from him she glanced to that which gleamed so bright and new upon her finger; and, bending her head, she pressed the wedding-ring to her lips.

'Wife!' he whispered; the weary eyes were open and his look drew her. So she knelt beside the bed again, stooping above him low and lower until her head lay beside his upon the pillow. Slowly, slowly his feeble hand crept up to her glowing cheek, to the soft waves of her hair, and to the little curl that wantoned above her eyebrows. 'Hermione—wife—kiss me!'

Tenderly her arms enfolded him, and with a soft little cry that was half a sob she kissed him—his brows, his hair, his lips—kissed him even while she wetted him with her falling tears.

'Beloved,' he murmured, 'my glorious—scrub-woman—if I must—leave you—those dear hands need never—never slave again. Never—any—more, my Hermione.'

Long after he had fallen to sleep she knelt there, cradling his weakness in her arms, looking down on him with eyes bright with love.

After this were days and nights when the soul of him wandered in dark places filled with chaotic dreams and wild fancies; but there was ever one beside him whose gentle voice reached him in the darkness, and whose tender hands hushed his delirium and soothed his woes and troubles.

(*Continued on page 530.*)

A PERTHSHIRE COVENANTER.

By R. W. Reid.

MANY singularly erroneous conceptions are met with in these times concerning the views of life and the habits of our Scottish ancestors. The Scots of, say, two hundred years ago are supposed to have been all Covenanters, and are invariably described as a type of humanity at once grim and repellent. Scotland in olden times, many people still believe, was a desperately melancholy and vastly disagreeable place wherein to live. This strange conclusion seems to have been reached by a remarkable and almost unaccountable inversion of our ordinary methods of deductive reasoning. Innumerable sermons and exhortations of divines are extant in which the games, the frivolities, the light-heartedness of the people are strenuously railed against, and at times most sternly denounced. This interesting circumstance is apparently responsible for the belief that, not so very long ago, the Scottish were a heavy, sour, and joyless people. The truth is that they were quite the opposite. Had the nation consisted of solemn individuals—all sad, dull, and decorous—little need would have existed, one would think, for the ministerial reproofs which appear to have been forthcoming in great and uninterrupted abundance. The Scots of whom we read to-day undoubtedly possessed a happy and contented disposition; their sense of humour was keen; their estimate of personal independence was high; they cherished profound religious convictions.

This introduction I have deemed necessary to a brief recital of certain simple incidents in the life of one of my ancestors, a Perthshire Scot, who still clung to the faith of his Covenanter forefathers. He was born, so far as I may determine, about 1750, and died when not far from his hundredth year. All his life was spent on the farm of Whinnyknowe, near to the junction of the Isla and the Tay, in the fair valley of Strathmore. For three hundred years and more members of the family were buried in the old churchyard of Kinclaven. The family

was a branch of the Clan Macdonald, possibly the Macdonalds of Glengarry.

A perusal of Sir Alexander Muir Mackenzie's vivid sketches of old rural life in this very part of Scotland always leaves the writer wondering whether the observant baronet knew of this Perthshire Covenanter who lived so near, if not actually upon, the Delvine estates.

William Reid was a tenant-farmer, as his forebears had been for many generations. No picture remains of the man or of his home, but both may be imagined without difficulty. The man was of middle height, inclined to be thin, with white hair that once was fair, and open blue eyes that betokened ready speech and kindly thoughts. The abode would be one storey, built of dark-blue stone and heavily slated. South of the dwelling, at the base of a green bank that sloped to the extent of about a hundred feet from the front-door, swirled the bright waters of the newly united Tay and Isla. The steading, or farm buildings, was in rear of the old home, and to the west was, first, a garden, and then an extensive orchard. At the far end of the orchard, and almost concealed from view, stood the farmer's famous 'fog house.' This was a small circular building, its roof thatched with reeds, its walls composed of intertwined willow-wands and moss.

To this quiet retreat among the apple-trees every morning at daybreak, save in the winter months, William Reid repaired, and there, until it was time to begin the labours of the day, he closely studied one or more chapters of the Bible. When the snow lay thick around, and the Tay was a roaring flood, in the dark mornings while northern blasts rocked the high woods of Delvine, the Covenanter read the old Book at the ingle-side by the dim light of fire and 'crusie.'

No great imagination is required to vision the white-haired, patriarchal figure seated with open Book in the early morning sunshine, the green leaves and the white blossoms overhead; or by his fireside with 'crusie' near, intent on the sacred page, the inky darkness and the howling tempest without. Such as this is the glimpse we have of a Scottish Covenanter at home a hundred years ago.

In time came the railway, and among the first lines laid down in North Britain—if it was not the very first—was that which connected the ancient city of Perth with the northern capital, Aberdeen. This railway passed either through part of the old orchard or so near to it that the occupant of Whinnyknowe was subjected to an inconvenience or a loss that called for compensation. William Reid, there is no reason to doubt, gave the question of injury careful consideration, for by the time a railway official waited upon him, he had decided the exact value of the damage inflicted.

The affable official informed the farmer that his directors had agreed to allow him the sum of one hundred pounds by way of recompense.

'A hundred pounds!' exclaimed the old Covenanter. 'I winna touch it. I have considered the matter, and I have made up my mind as to what I should get. I winna tak' a hunder.'

'I would strongly advise you to accept,' replied the official. 'You are not likely to get more. The directors, I think, have been quite generous towards you.'

'Too much so—too much so,' was the startling reply. 'I winna tak' the hunder; I'll hae forty pounds, and not a penny more.'

'Oh, is that your trouble?' was doubtless the official's laughing response. 'Here is the order for one hundred pounds, which amount you will receive on calling at the office in Perth.'

William Reid accepted the order, and a week later presented it at the company's head office. A clerk asked him to sign a receipt, and this the farmer did, for forty pounds.

'You receive one hundred pounds, not forty pounds,' said the clerk, counting out the money.

The old farmer was angry, and looked it.

'I told your man,' he cried, 'that I would tak' forty, and not a penny more; and I will not hae it. I want nae man's siller that I've nae richt to.' And William Reid, after twice counting his forty pounds, pushed the remainder back across the counter, and walked into the street.

In what light would the world to-day look upon a man like this Perthshire Covenanter?

JOHN CORNELIUS COMES HOME.

CHAPTER II.—HOW JOHN CORNELIUS WAS RECEIVED AT BIFORD AND TORRINGHAM.

AS might be supposed, John Cornelius, or Handsome Johnnie, by which sobriquet he had been known in Arizona, Texas, and sundry other states of the Union, seldom did things like other people. Although he had experienced a severe financial storm whilst waiting for his coffee-plantation to bear crops, and needed every *centavo* he was able to lay his hands on, he did not write to Lawyer Jones, and he did not hasten home. He just went about his work as if nothing had happened—put down concrete floors, and cut water-channels for the new pulpers; erected a building for the new separator; coached the most intelligent Mexican *empleddo* in his service in the management of the *finca*. Then, as soon as he had received a telegram from Davison that the new machinery had been shipped, he rode down from the foot-

hills of the Sierra Madre to the Pan American Railroad, and started homewards.

Arrived in London, he visited Somerset House, paid his shilling, and committed his uncle's will to memory; that is, he read it through a dozen times at least. As Davison had declared, John Cornelius the elder had left him the whole of his property, with the exception of a few legacies to old servants and an annuity to a Mrs Charteris, his housekeeper, whose name John Cornelius the younger remembered. The sole executor was Archibald Jones, the testator's 'trusted legal adviser.'

'Smart fellow, Squire Jones,' reflected John Cornelius. 'Put that in himself.'

His next step was to take a ticket to Biford, in Worcestershire, that being the nearest railway station to Torringham Hall, and about six miles distant. Essaying to hire a fly and drive to the Hall—there were no taxis at Biford—he met with his first experience as an unknown and much-doubted owner of landed estate.

'You 'm wantin' Squire Jones's place, bain't ye, sir?' said the flyman. 'They calls it Archibald's Hall now, an' if you was to wait half-an-hour or so, you might get a lift in tha squire 's own motor-car. I be told he 'm comin' down from Lunnon this arternoon.'

'I prefer not to wait,' said John Cornelius.

'As you says, sir. I jest mentioned it like, it bein' a longish way there an' back, an' my old 'oss not bein' a very good un.'

'He 'll do it,' said John Cornelius. 'Put my bags in the fly and let us be off.'

The ancient jarvey obeyed, and in so doing chanced to read an address label on one of the bags: 'John Cornelius, passenger to Biford.'

'Lordy—lordy!' he cried. 'You bain't—sure-*lie* you bain't goin' to say as you 'm tha old Squire Cornelius's missin' nevvy?'

'I certainly am,' replied John Cornelius; 'no longer missing, though.'

The ancient flyman stood for a moment bewildered. Finally he said, 'Then I darsn't drive you, sir. Squire Jones be my landlord, an' nobody 'll believe ye. You don't feature tha old squire nohow.' Glancing up at the sunburnt, dark face, he added, 'He hadn't no looks to speak on,' which was by way of being a compliment.

'Were you a tenant of his?' asked John Cornelius.

'I were, sir.'

'Then I am your landlord. Get up on the box, and don't be an old fool.'

By this time a small crowd had collected. The alarmed jarvey appealed to it. 'Says his name 's John Cornelius,' he said, 'an' wants me to drive 'im to the 'All, an' he not a bit like tha old un.'

'An' lose yer cottage an' bit o' land,' said one, addressing the flyman.

'Nobody here 'll drive you,' said another, addressing John Cornelius.

'Then I 'll walk.—Here, porter! Take my things to the cloakroom. Bring me the ticket;' which obtained, John Cornelius set out on foot, quite unruffled.

It was his first visit to Biford, or Torringham by Biford, but he had only found it necessary to make one inquiry before he arrived at a pair of very ornate wrought-iron gates, opening into a park, with a trim lodge on the park side. He noticed that the terminals of the upright bars had been newly gilded, as also the family coat of arms. Pushing open the gate, he entered, to be immediately accosted by the lodge-keeper, a woman.

'Wheer be you a-goin', sir?' she asked.

'To the Hall,' said John Cornelius. 'This is the way, isn't it?'

'It be one way, but only the family an' the carriage folks uses on it. You mun goa a bit farther up the road, to a wicket.'

'Oh, indeed!' said John Cornelius; 'and who are the family?'

'Squire Jones's family, sir.'

'And the carriage folks?'

'Well, there be Lord Oventry, an' Sir Harry Verner, an' Squire Bamford, an' a lot more, sir.'

'Thank you. Well, Mrs—— What is your name?'

'Badger, sir.'

'Well, Mrs Badger, I'm much obliged for your information, but my name 's John Cornelius, and I am going to the Hall this way, like the family and the carriage folks. Been here long, Mrs Badger?'

But Mrs Badger was quite unable to reply. She could only stare in amazement. The gamekeeper's wife, she and her husband had lived on the estate thirty years.

John Cornelius tramped on. He was beginning to enjoy himself. Presently he arrived in front of the Hall, a great, oblong, thirty-roomed mansion. He remembered having been told that John Cornelius the elder, a money-grubbing curmudgeon, according to Andrew Cornelius, had allowed the place to get into disrepair, but a glance showed him that everything now was in spick-and-span condition. The broad lawn was beautifully kept. The rhododendrons bordering it were in full blossom, but not a stray petal lay on the close-trimmed grass.

'Good steward, Squire Jones,' reflected John Cornelius.

Catching sight of an expanse of glass near the southern wing of the house, John Cornelius skirted the lawn, passed by the great front-door with its gilded knob, knocker, and engraved plate, and made his way to the conservatories. A gardener who was at work on a border stared, but said nothing, not even when John Cornelius bade him a cheery 'Good-afternoon.'

Entering the first conservatory he came to, John Cornelius found himself in a 'hot' orchid-

house, full of Cattleyas, Vandas, Peristerias, Angræcums, and their heat-loving like.

'Shut that door, confound yer!' shouted a gruff voice from somewhere amongst the massed loveliness.

John Cornelius knew very little of orchids, except as parasites which burdened most of the trees in the open spaces in his part of Mexico, and even infested the older coffee-plants; but he closed the door carefully as ordered, and proceeded along the water-channelled pathway between the banked-up bulbs and flowers.

'Expensive tastes, Squire Jones,' he said to himself, and halted in front of a beautiful blue Vanda, to observe and to admire.

Again the gruff voice greeted him: 'Who be you, and what be you doing here?'

The speaker, perched on a step-ladder, was the man who had so unceremoniously ordered him to close the door. As he was working near the glass roof, he had escaped observation.

'Answering your last question first,' John Cornelius replied, 'I am admiring these beautiful flowers and wondering how much they cost.'

'Does the squire know you be here?'

'Eh? Oh, I suppose so. Oh, certainly he does,' said John Cornelius.

'You 'm a foreigner friend of his, I reckon, but I don't know your face—I ain't seen you before—an' nobody ain't allowed in here when the squire be away 'cept the family.'

'Oh! Then what the dickens are *you* doing here?' countered John Cornelius.

The man nearly fell off the step-ladder. 'Me!' he cried. 'Why, I 'm the gardener from Kew. I 'm in charge of the squire's collection.

'That 's odd,' returned John Cornelius. 'I don't know *your* face. I haven't seen *you* before. Didn't know I had an orchid collection. Didn't know I had a family. How much do I pay you a week?'

The gardener from Kew promptly descended from his perch. He did it in a hurry. His cheeks were very red, but that may have been owing to their recent proximity to the glass roof. 'Who d'ye think you 're getting at?' he demanded with unmistakable bellicosity.

'I am trying to get at the score you run me into a week by way of wages,' replied John Cornelius.

That answer was too much for the Kew gardener. 'Me—you!' he blurted out angrily. 'Who d'ye reckon you are, then?'

'My name is John Cornelius,' was the reply.

The gardener was comparatively a new man, but he had heard of the old squire. He strode to the door and flung it wide open, regardless of the current of cold air so admitted and the damage it might do. 'Hi!—you—Mole!' he shouted to the man working on the border. 'You was born here, wasn't you? Here 's a foreigner fellow as says his name 's John Cornelius.'

'Take him to Poyke,' Mole replied, and went on forking manure into the border.

'Sounds a pleasant place, Poyke,' commented John Cornelius. 'Well, good-afternoon, Mr Gardener from Kew. I 'll look you up to-morrow. By the way, I think you had better let a little more air into this place. It 's frightfully hot and stuffy. These plants must have cost a lot, and I hate to lose money.' And he walked away smiling. Certainly he was enjoying himself finely.

'Hinsultin' hignoramus!' muttered the gardener from Kew. 'Cost him a lot, I don't think.'

Repassing Mr Mole, John Cornelius halted. 'Can you direct me to Poyke,' he asked; 'and are there any people named Davison living about here?'

'Ay,' replied Mr Mole. 'They 'm Hagricultural Himplementers in the village; and the first bobby you meets 'll take you to Poyke.'

'Thank you,' said John Cornelius. 'May I ask why Poyke is so well known, and apparently such a popular place of resort?'

'County Lunatic Asylum,' answered Mr Mole, with a guffaw.

John Cornelius, who could not be expected to know that Poyke was the local way of pronouncing Powick, strolled on, still smiling. He certainly was enjoying himself. No doubt about that.

Again approaching the ornate door of the mansion, he decided not to call at present, but to continue his very enlightening and entertaining walk. A quarter of an hour's tramp across a well-timbered park took him to a house and buildings on what he correctly judged was the home farm.

It should be remarked that the clothes worn by John Cornelius had been made in Mexico, while his hat was a Stetson from the States; consequently there was an outlandish look about him likely to provoke derision amongst rustics and suspicion amongst dogs.

From the park a small gate led into an apple-orchard, laden with rosy fruit. He had scarcely taken a dozen steps in the orchard, however, when from somewhere or other a large, gray, bob-tailed sheep-dog sprang at him with a growl. John Cornelius placed a hand on his hip-pocket, but stood still to await the onset, which, however, was not continued. A tall man in corduroys, who also seemed to have sprung from nowhere, intervened.

'Come here, Bob!—D'ye know you 're trespassing?' he called nastily.

'I know that I am not,' said John Cornelius.

'But I say you are,' retorted the man. 'My name 's Martin, and I 'm the squire's bailiff. He don't like tramps and strangers. I don't, neither. Better get back the way you came, and be quick about it—— But there, you 'd be trespassing again. You 'll find a gate into the

road the other side of this orchard. That's your place, and for such as you.'

'I prefer to return the way I came,' said John Cornelius.

'If you do, I'll have to take your name and address,' rejoined Mr Martin, 'and that'll mean a summons and a fine—pound and costs at the lowest. Besides, I'm not blooming well going to let you go back through the park. If you tries it on, I'll set the dog on you.—Mind him, Bob!'

The sheep-dog, which had lain down during the colloquy, sprang to its feet and growled, while the hairs on its back rose up like a hogged mane.

'I'll give you my name and address now with pleasure,' said John Cornelius. 'As I intend to return across the park, you had better write them down in case of an accident to your valuable and very obedient dog. The name is John Cornelius, and the address is Torringham Hall by Biford. Got them?'

The farm-bailiff stared at John Cornelius, and his eyes narrowed. 'I've a dashed good mind to set the dog on you now for that lie,' he growled.

'Where I come from,' rejoined John Cornelius equably, 'it is the custom to carry a revolver. I have one in my hip-pocket. If you were to set your dog on me, I should be under the painful necessity of shooting it.' And John Cornelius produced a wicked-looking black Colt. 'In fifteen minutes, Mr Martin,' he went on, 'I shall be at the Hall, where I shall remain. You will find me there, if you want me. To-morrow I shall want you.' And, revolver still in hand, John Cornelius backed out through the small gate and walked away towards the Hall, unsmilingly. There is a limit to everything except eternity, and he had reached the end of his patience. Look at this last encounter how he would, he could extract no enjoyment out of it—no exhilaration at all.

(*Continued on page 535.*)

NITRO-GLYCERINE.

SOME few years ago, when the Suffragette campaign was in its most vigorous stage, it will be remembered that a well-known analyst was arrested for helping the militants to make bombs. He was sent to prison, and his laboratory was disposed of. Among the articles found there was a large piece of wood with a big hole in it, and a label stating that the hole had been made by the accidental explosion of a few drops of nitro-glycerine.

This 'explosive oil,' as it used to be called, is not a substance that can be handled with impunity. Slight shocks will sometimes set it off, and when not quite pure it has even been known to go off spontaneously.

But in the early days of its manufacture its bad habits were not so well known, and the Swedish chemist Nobel—the first man to make it on the large scale—actually sent it in tins to various parts of the world. Many of these tins exploded either on the voyage or upon reaching their destinations.

One such accident occurred in the office of a San Francisco carriers' agency. A clerk noticed that a small quantity of oil was oozing from a wooden package where one of the sides had become loosened, and thinking to stop the flow, he took a nail and a hammer and commenced to close up the side of the box; but he never finished, for the 'oil' exploded and killed him.

It is rather wonderful that the manufacture was continued after such accidents as this, and especially so as one of Nobel's sons was killed by an explosion in the factory. Nobel himself, indeed, would probably have given it up; but his other son, the famous Alfred Nobel, who subsequently made so many great discoveries in connection with explosives, was not deterred, and resolved to go on and make the explosive safer to handle.

In this he was quite successful. His first discovery was that nitro-glycerine could be absorbed by a certain earthy substance formed from the remains of sea-animalculæ, and called Kieselguhr. When so absorbed it became much less sensitive to shock. This mixture is now known as common dynamite. But common dynamite is not much used now, for later on Alfred Nobel discovered that a sort of jelly could be made by gently warming nitro-glycerine with nitro-cotton (gun-cotton)—a substance made by the action of nitric and sulphuric acids upon ordinary cotton.

This jelly is very convenient to handle, and much safer than either nitro-glycerine or dynamite. It received the name of 'blasting gelatine,' and has been very largely used in mining operations, either by itself or mixed with fillers to tone down its action.

Nitro-glycerine has never been displaced from its high position, and nearly all the powerful mining explosives contain it.

We are more interested, however, just now in the explosive cordite, which is a mixture of nitro-glycerine, gun-cotton, and vaseline, worked into the form of sticks or cords, that are done up in bundles, and are used to send our shells on their deadly mission to the Germans.

There is a great advantage in having the explosive in this form, for the velocity imparted to the shell is regulated by the thickness and length of the sticks—the fatter the sticks the less the velocity. The action of the vaseline is

rather curious. Both nitro-glycerine and gun-cotton by themselves are extremely rapid and shattering in their effects. The addition of 5 per cent. of vaseline slows down their action very considerably. There is very little loss of power, but the power is exerted more slowly and regularly.

There was a great discussion in the daily papers some time ago as to whether it was correct to say that our high explosives depended upon glycerine for their manufacture, and there was at first a considerable amount of misunderstanding. The facts are that nitro-glycerine is the main ingredient in all the *propelling* explosives, but not in the high explosive of the shells themselves. It would not be safe to have nitro-glycerine in the latter, because the shell would then probably explode in the gun.

It has been pointed out that most of the animal and vegetable oils and fats are capable of yielding glycerine, and that it is extremely important that we should do our utmost to prevent such oils and fats from passing into Germany.

It is curious how great a change takes place in the quiet substance glycerine when it is acted upon by the nitric and sulphuric acids used in the making of nitro-glycerine.

Very great precautions have to be taken in its manufacture. The buildings are very light in character, and each is surrounded by substantial grass-covered mounds, so that if an explosion occurs the shock will be prevented to some extent from spreading to other houses; and these houses are always placed at suitable distances from one another.

All sorts of strict rules and regulations are enforced, and inspectors visit the factories to see that they are carried out. No matches are allowed to be taken into the danger area, and in the houses the men wear special clothes and boots. Sometimes during the operations it may be noticed that red fumes are commencing to form, and show themselves through the small show-glass that is always fixed at the top of the apparatus. Then is the time to be active, and if the man in charge finds that the thermometer in his apparatus rises ominously, he opens a special cock and lets the whole of his charge run into a drowning-tank that is generally fixed somewhere below the building and contains a large volume of cold water. After he has turned the cock, one may be pretty certain that he will remove himself as far as possible from the house, because even the running of the charge into the cold water does not always prevent an explosion.

But as a general rule things go quite smoothly; the nitro-glycerine, after it is made, is separated from the acids and very carefully washed in large lead tanks, where it is stirred up with water and carbonate of soda by means of compressed air that is made to bubble through. When the washing is finished the nitro-glycerine is filtered and tested, and is then ready to be sent out into other parts of the factory, after being mixed with gun-cotton or other materials. Nitro-glycerine itself is usually carried about and measured or weighed in rubber buckets, in order to lessen the chance of explosion by shock.

One of the great difficulties connected with the manufacture is found in the easiness with which nitro-glycerine freezes. Not only is it a slow and difficult matter to thaw it again, but the frozen material has certain properties that may lead to an explosion; for example, explosions have been known to occur through the jerking of frozen taps. In cold weather, therefore, it is necessary to surround all tanks and vessels with warm water.

The men who make nitro-glycerine are not only exposed to great danger, but often suffer severely from headache and sickness. Most of them get more or less immune after a while; but a number are very sensitive. Some of the men will get a bad attack merely from the effect of a drop of the oil on their hands, or from breathing the vapour; and a really bad attack is a thing never to be forgotten. But many of these men have the knowledge that they are doing something to help their comrades at the front, and go along quite cheerfully.

One wonders what the ghost of the elder Nobel would think of the use of explosive oil to send huge shells ten miles or more. It is rather curious to note that one of the Nobel awards that are given periodically is for him who has done most to further the cause of peace.

ROBERT LOUIS STEVENSON AT BARBIZON.

By A. J. Daplyn.

THE memory of Robert Louis Stevenson is still cherished with peculiar affection, and it is not difficult to account for this, as the great writer had a delightful way of making friends with the public, of taking it into his confidence, frankly avowing his little weaknesses and accounting for his prejudices. It was done in so unaffected and natural a manner that all felt it an honour to be thus taken into the confidence of this man of genius.

Though more than twenty years have elapsed since his untimely death, his memory is still green, and he continues to be the theme of innumerable memoirs, biographies, letters, &c. He has told us himself much that concerns his childhood and youth, and others have written

of his philosophy, his religion, travels, and style. We know of his constant ill-health, his long sojourns in the land of counterpane, and of the brave spirit that sustained him under these depressing circumstances. But it was my privilege to make his acquaintance when, in good health and spirits, he was enjoying himself in congenial society at Barbizon about the year 1875.

This little village, now celebrated in connection with so many great painters, was not at that time known to the public. It is situated on the edge of the forest of Fontainebleau, many miles from a railway station, and was the happy hunting-ground of impecunious art-students and painters, and the Auberge Siron had become their headquarters. This old inn was originally a farmhouse, and still bore traces of its origin; the entrance was by a gateway, over which was seen the sign done by a celebrated painter; this led to a courtyard, in one corner of which stood a new wing used as a dining-room; it also served as an art gallery, for round its panelled walls were placed the works contributed by well-known painters. It was in this room over forty years ago that the writer met Robert Louis Stevenson. Here is a description of the place by the master: 'The old familiar room with the tables like a Greek P, and the sideboard and the aphasic piano, and the panels on the wall, Romeo and Juliet, Antwerp from the River, Enfield's Ships among the Ice, and the huge huntsman winding a huge horn. The lamps are lit, the soup served, the company are all at table, and the room sounds with multitudinous talk.' Again he tells us, when speaking of Siron's inn, 'That excellent barrack was managed upon easy principles. At any hour of the night, when you returned from wandering in the forest, you went to the billiard-room and helped yourself to liquors, descended to the cellar and returned laden with beer or wines. Theoretically the house was open to all comers, practically it was a kind of club. The guests protected themselves, and in so doing protected Siron. Formal manners being laid aside, essential courtesy was the more rigidly enacted; the new arrival had to feel the pulse of the society, and a breach of its undefined observances was promptly punished. I have seen people driven forth from Barbizon; it would be difficult to say what they had done, but they deserved their fate.'

I am told Siron's inn is a thing of the past. A large modern hotel stands in its place, where may be found every luxury and convenience; but one thing it lacks—the memories of times past. Some day perhaps the new inn, becoming old, will have its own memories, but assuredly the list of names will not contain greater ones than those who have 'heard the chimes at midnight' in the old Auberge. Delacroix, Corot, Diaz, Rousseau, Millet, and a host of men known to fame have made merry in its dingy parlour, and last, but not least, Robert Louis Stevenson.

On entering the dining-room at Siron's one evening I caught sight of a stranger, and as he appeared to have for companion my friend the late R. A. M. Stevenson, the well-known art critic and author of the *Life of Velazquez*, I made my way to his side, and was duly introduced to his cousin, Robert Louis.

The cousins resembled each other greatly, but Robert Louis was a few years the younger, being about five-and-twenty. Though he was somewhat slight of build, his face showed no signs of ill-health; long, fair hair fell on either side of a high forehead, and his bright eyes sparkled with wit and humour. His dress anywhere else would have attracted attention, as it consisted of an old boating-jacket, and round his neck was knotted a black-silk handkerchief, which concealed the absence of the conventional white collar. This article of dress seems to have been discarded at an early age, for I remember, on the mail-boat going to Australia, hearing a discussion on the literary merits of R. L. S. 'I can't stand his books,' said a young exquisite. 'I was at college with him, but of course I couldn't know him, he wore such horrid clothes and no collar.' This unconventional attire did not indicate that its wearer had ideas of social equality not generally accepted, but was his manner of offering a protest against the humdrum monotony of bourgeois existence. It was to escape this that he paid his first visit to Barbizon, and fell into its ways as if to the manner born.

The practice of the fine arts develops originality, and causes its followers to depart from convention and be a law unto themselves—in other words, to become 'Bohemians.' Robert Louis, perhaps without knowing it, had practised the cult in his native Edinburgh, and had tried to induce his friends to do so; but the good seed fell on stony ground, and he realised the truth of the old saying, 'A prophet has no honour in his own country.' But to the Anglo-Saxon community of Barbizon, which had put into practice his doctrines without waiting to hear them preached, this eloquent young fellow came as a revelation, and before dinner was finished we were all his sworn disciples.

He touched on all things between heaven and earth, but his principal theme was the rights of youth. It seemed that the world was created for the young, that the rôle of the middle-aged and elderly consisted in forming a sort of background for glorious youth. This was a doctrine that appealed to us all; and the speaker proceeded to demonstrate that all the wise laws and musty proverbs heard from generation to generation were inventions of the aged, for the purpose of casting contumely on the natural aspirations of generous youth. With this end in view, they had certain hackneyed phrases descriptive of all youthful pleasures. For instance, the ennobling

passion of love was called 'silly nonsense;' the disinclination for continuous work, 'incorrigible idleness;' the cultivation of high spirits, 'deplorable levity;' delight in the companionship of one's fellows, 'love of bad company;' in short, every attempt was made to destroy every generous impulse or elevated idea. And what, after all, are the faults of which so much is made? Merely virtues in disguise, not to be compared with the excesses of crabbed age. Has youth that sordid love of pelf for its own sake, that willingness to cringe for the sake of place and power, or the pandering to the lower appetite in the indulgence of the table or the weakness for strong drink? 'And note,' said the young philosopher, 'the aged cannot plead inexperience, for they are only too familiar with the consequences of their indiscretions in the shape of gout and other maladies. Can it be that these constant sermons on youthful weaknesses are used as a cloak to cover their own lapses from virtue, and thus add to their other vices that of hypocrisy? Alas! I much fear it to be the case, for it was only a short while back, in my native city of Edinburgh, that an incident occurred which illustrates my point.

'You must know that I have the honour to be an humble member of the Scottish Bar, and it is an unwritten law of that honourable body that none of its members shall appear in the street unless dressed in the regulation black coat and tall hat. Now from my earliest youth I have objected to all laws made in the interest of uniformity in costume, and have honoured them more in the breach than the observance, thereby giving great offence to many grave and reverend seigniors, who were apt to regard my dilapidated straw hat and well-worn boating jacket almost as signs of original sin. A certain worthy judge was tireless in his endeavours to induce a reformation, and when by accident we encountered each other in the street, would take me by the button, and with grave face inquire if I thought my costume suitable to a member of an honourable profession? Was it calculated to inspire the populace with proper respect; was it not, in fact, more suitable for a law-breaker than for one of its upholders? This deluge of "wise saws and modern instances," while boring me extremely, had the effect of making me use my best endeavours to avoid meeting with the worthy judge, but it was not always possible.

'One day, in a narrow lane in one of the worst parts of Edinburgh, his portly figure loomed in sight. To escape the threatened homily, I rushed down the steps of a cellar into a whisky shop. It had all the characteristics of a den of thieves, but was, nevertheless, more to my taste than a lecture from the Philistine. I was congratulating myself on the escape, when, to my astonishment, the door opened and the portly figure of my enemy appeared. Resigning myself to listen to the impending sermon, I awaited the interview with something nearly approaching admiration for a man so greatly in earnest that he thought nothing of entering a thieves' den for the purpose of delivering a lecture on dress. In the prevailing obscurity it was difficult to decipher faces, but the judge did not waste time in that way, but walked straight to the bar, and with a familiar nod to the keeper, called for a noggin of whisky. This was quickly followed by another; then, wiping his mouth, the old gentleman departed, apparently much refreshed. The scales fell from my eyes and any admiration I might have had for the judge's tenacity vanished, for it was not in the character of mentor to careless youth that the old man had sought this den, but rather to indulge his depraved taste for strong drink in freedom. In his own quarter of the town there were better hotels and better liquor, but it would hardly do for one of Her Majesty's judges to be seen there at a public bar. "Do you often have customers like that?" I inquired of the barkeeper. "Dod, mon, I'd like to have mair; he's taken his whisky here regular for years."'

All the young fellows seemed to derive great satisfaction from these strictures on their elders, but Macfarlane from Aberdeen gave it as his opinion that it was bad for an advocate to fa' out wi' a judge before whom he might have to plead. This view was fiercely condemned by others as bowing to the mammon of unrighteousness, but Stevenson ended the discussion by owning that he had appeared before the judge. 'And how did he receive you?' cried Mac. 'Ah! that's a long story,' said Stevenson. 'Strange to relate, for certain unknown reasons a confiding firm entrusted me with a brief. I was very proud of it, for, in fact, it was my first—and probably my last. "A poor thing, but mine own." Much valuable time was spent in absorbing its contents—time, alas! that I might have spent in profitable idleness. In spite of a slipshod style that set my teeth on edge, ungrammatical construction, and complete absence of punctuation, I gathered from its contents that at a certain hour on a certain day I was to attend at the court-house, and on the calling of my case, arise and exclaim, "Your honour, I appear for the Plaintiff in the matter of X. Y. Z." This just amounted to putting in an appearance, and seemed well within the scope of my abilities. So on the eventful morning, clothed for once in my right mind—that is, dressed in the garb of the Philistine—I, full of confidence, made my way to the court.

'It was a lovely morning in early summer, and the cool breeze that fanned my cheeks seemed to bring a message from the distant hills, bidding me quit the dusty town with all its abominations, and seek peace in their quiet depths. But it was not to be, and with a sigh

I turned towards the hall of justice and entered its gloomy portals; not leaving hope behind, but hugging it to my bosom in the shape of my first brief.

'Seated among my fellow-advocates, I glanced round the dingy court, and was disagreeably surprised to see that the judge's bench was occupied by my old enemy, the lecturer on deportment.

'The proceedings were not calculated to enhance my respect for the majesty of the law, consisting as they did of meaningless formalities, which, with the musty atmosphere of the court and the fearful monotony, quickly induced slumber. "Sleep, gentle sleep, did weigh mine eyelids down and steep my senses in forgetfulness." But I was soon brought to life by my neighbour digging me in the ribs, and, half awake, I started to my feet crying, "My Lord! Your honour! I appear! I appear!" "Well, sir," snapped the judge, "you must not waste the court's time; go on." But, alas! my mind was a blank, and I had forgotten whether I was for the plaintiff or the defendant, and even the names of the parties to the suit. All, all had faded like the baseless fabric of a vision.

'But though an ancient judge frown, shall there be no more cakes and ale? Let us drink, boys. Here 's to youth—eternal youth; but such a toast demands a rare vintage, so let our host set before us of his best.'

Our host Siron, his face beaming with satisfaction, soon appeared, bearing in his arms numerous bottles, and the toast was duly honoured. After this the conversation became very animated, some one having started a discussion on the merits of the various schools of art. The Impressionists, who had numerous representatives among the younger artists, put forth their doctrine at great length, and Manet, Courbet, Monet, &c. seemed to be names to conjure with. The students of the École des Beaux Arts replied with the names of their professors—Jerome, Cabanel, Ivon, &c.—and complained bitterly of the absence of any high ideal in the work of the Impressionists, and still less in that of the Realists. Stevenson, of course, took no part in this discussion, as he made no pretensions to a knowledge of art, but his receptive mind must have retained the greater part, for we find reminiscences of it in that admirable account of art-student life contained in *The Wrecker*. It is easy to trace the original of Loudan Dodd and the prototype of Broken-Stool Pinkerton and the Armenian student who objected so fiercely to be hazed. Nobody suspected then that there was a chiel among them taking notes, for Stevenson had not at that time published anything of importance.

The earnestness of the artists in discussing the value of the different schools, their excited tones and furious gestures, interested Stevenson greatly; but the novelty soon wore off, and he grew restless, and, of course, his proposal to quit the heated room and go for a walk in the moonlight was accepted with alacrity by his cousin and myself.

THE BABYLON ROAD.

HEAPS and ages of years ago, before I was really born,
We both woke up together one day and we heard the Hunting Horn.
You were the Boy who Comes in Dreams, and you shouted to me, 'Come on!
We 're going to hunt the Bad People on the road to Babylon.'

Up we jumped on our fiery steeds and rode for a hundred miles
Over ditches and dikes and fences, hedges and gates and stiles;
And first we came to the Red River, where the Prince was changed to a toad,
And the bridge fell down, but we swam it through, and there was the Babylon Road.

And on it were ever so many people going that very way—
The White Knight and the Brushwood Boy and the Emperor of Cathay,
All of them riding their fiery steeds, for they 'd heard the Hunting Horn,
And they said we should catch the Bad People before next Midsummer Morn.

But Babylon was a long way off, with adventures thick between,
And we came to the Lodestone Mountain and the house of the Serpent Queen;
But the Third Calendar met us there, and *he* knew a wonderful charm,
For he turned his ring and he said The Word, and nothing could do us harm.

The Djinns came flying to catch us then, but the Calendar killed them dead,
And the Brushwood Boy turned round and cried, 'Look out for the Gorgon's Head!'
And we *almost* saw it—and that was *fine*—but we managed to look away,
And the good ship *Argo* came up in time and took us across the Bay.

We were chased by wolves and witches, but always we raced them done;
And once we were caught by pirates, who were hiding behind the sun,
But it turned out to be Silver, and he gallantly cheered us on,
Crying, 'Send 'em along, my hearties; it 's a year to Babylon.'

And then it was awf'ly fright'ning and everything awf'ly queer,
For we knew, though we couldn't see them, that the People were near as near;
And Peter Pan cried, 'Now, my lads, we must strike for England's sake!'
And *then* we came to the People; and that 's where I always wake.

And I think it 's perfectly dreadful to feel I must wait and wait,
For that was ages and ages ago, and still I am only eight;
And I want to get back to the Babylon Road and hear the Hunting Horn,
And be in at the death of the Bad People before next Midsummer Morn.

THE ARAB REVOLT AND ITS ADVANTAGES TO THE BRITISH EMPIRE.

By TANKERVILLE CHAMBERLAINE BEY.

ON the 27th of June 1916 El Hussein-Ali, Grand Shereef of Mecca, and guardian of the Seat and the Shrines of Islam, proclaimed to the Moslem world his independence of Turkish rule. This event is of great importance in its bearing on the conflict between Turkey and the Allies, and on the position of the British Empire in the Mohammedan world.

Enver Bey, now Enver Pasha, the ex-military attaché at Berlin, and to-day War Minister in Turkey, is an unscrupulous, wily, and conceited person. This evil genius of Turkey received his military training in Germany, and became the active tool of the Kaiser and his military caste, with the object of paving the way to an alliance with Turkey. At the head of the Young Turk party he commenced his scheme of operations by deposing Abdul Hamid. Mohammed V., a weak tool in the hands of the Young Turk party, a man of no brain, will, or capacity, was named Sultan, and by his position was recognised Caliph of Islam. Then by his violent and sanguinary acts, both before and after the Balkan war, Enver Pasha crushed the Old Turk party, which, owing to the trend of our policy in the Near East, had been friendly to us for years. He took advantage of the disturbed state of affairs both to foster a German alliance and to further his own ambitious schemes by 'removing' many who were likely to prove obstacles in his path, including Prince Izzadeen, the presumptive heir to the throne.

Enver Pasha's principles are similar to those of the Huns—namely, to surmount obstacles by any means, caring nothing about laws, human or divine, so long as the goal is reached. The Arabs in the Yemen and the Hedjas, headed by the Grand Shereef of Mecca, who had been shocked by the impious sentiments, atrocities, and actions of Enver Pasha, and by his contempt for Islamic laws and tenets, determined to put an end, once for all, to the Turkish cruelty and injustice which had so long oppressed them. The Grand Shereef piloted, with his son, a general uprising which overthrew the Turkish garrisons, and proclaimed himself an independent king, thus casting off the yoke of Turkish sovereignty. It may be remarked in passing that although the Young Turk party, in conjunction with Mohammed V., at that moment Caliph in full power, had proclaimed a 'Jehad' (Holy War) against the Entente nations, considered in Turkey as 'Jawars' (infidels), the Mohammedan world of two hundred and twenty millions had never responded to their appeal. The only adherents of the new policy, and that mainly through fear, were confined to Constantinople.

In considering the Shereef's revolt it must not be forgotten that the Arabs are not restricted to the country we call Arabia. Oman, El Hasa, and Mesopotamia; the Yemen and the Hedjas; Syria and Palestine; Tripoli, Tunis, Algeria, and Morocco, all contain men of Arab blood. The majority profess Islam, and are of the Sunnite sect, which the Mohammedans of that persuasion believe to be the true and orthodox Islam as taught by their prophet according to the Sunna.

In the year 622 (the year 1 of the Mohammedan calendar) occurred the Hegira, the flight of Mohammed, a pure Arab of the Koreishite tribe, and the founder of the religion that bears his name. For centuries the Mohammedan faith has continued to spread, especially in Southern Asia and in Northern Africa. In Persia a schism took place through the Persians refusing to accept the successor of Mohammed named by the Arabs. The contention of the Persians was that the succession should be by inheritance and not by election—that, Mohammed being the head of their religion by divine right, the succession was inherent in the members of his family. The Sunnites dissented, and the Persians became Shiites, followers of Ali, Mohammed's cousin and son-in-law. Although this divergence exists, the Shiites, like the Sunnites, regard it as a religious duty to perform the pilgrimage to the shrine of Mohammed at Mecca.

One of the differences between the two sects is that the Sunnites perform their ablutions downwards from the elbow to the wrist, whilst the Shiites, on the contrary, perform theirs from the wrist upwards to the elbow.

It has long been the policy of our Empire to

 [*All Rights Reserved.*]

afford religious freedom within its bounds, and amongst our subjects we have a large number of Mohammedans in India, in Zanzibar, in Egypt, in the Soudan, in Nigeria, and elsewhere. Mesopotamia is inhabited by an Arab race, and their Arabic is somewhat similar to the language written in Egypt. The Egyptian oral Arabic differs from this, the differences being analogous to those between Spanish and Portuguese. The Portuguese understand Spanish, but the Spanish have some difficulty in understanding Portuguese, owing to the pronunciation. Both these languages, it may be noted, have letters and words derived from Arabic, incorporated during the Saracenic period of occupation.

Now my reason for detailing the above facts is to show how the Shereef's successful revolt will favour our Empire. The British Empire, with its policy of freedom to religious belief, having been treacherously treated by the Young Turk Government, the ally of our bitterest enemy, will protect the Arabs from the cruel domination of the Turk which has lasted for centuries, and which has prevented the development of an intelligent and hardy race. Every country which has been in the grasp of the Turk has been misgoverned, misruled, cruelly persecuted, even if not completely ruined. The British Government, in protecting this regenerated nation, will receive advantages as well as give them, and will strengthen and increase its moral and political power, and confirm its reputation as the protector of free nationalities. Consider only the influence over the Arab territories enjoyed by the Entente—a cemented British Empire, a reunited France, a free Russia, and an aggrandised Italy. Turkey being conquered by the Entente, the Caliphate will pass from Mohammed V. to the Grand Shereef of Mecca, who has stigmatised in his proclamation the profanations, murders, and infringements of the laws, tenets, and principles of the Koran, to which Mohammed V. consented through the influence of Enver and Jemal Pashas and Talát Bey. The fact of Mohammedans not taking any notice of the Sultan's call to the faithful for a holy war shows the contempt in which they hold Mohammed V. and his advisers as representatives of Islam. There is no doubt that after the war the Caliphate will pass to the Arab race, as the Caliphate was wrested from them by the conquest of their territories by the Turks.

THE DEFINITE OBJECT.

CHAPTER XXXV.—HOW GEOFFREY RAVENSLEE CAME OUT OF THE DARK.

SHE was knitting; and, opening sleepy eyes, he watched drowsily and wondered what it might be, and was minded to inquire, but sighed instead and fell asleep again.

She was knitting—knitting something in red wool; and, opening his eyes again, he lay watching awhile, and pondered dreamily as to what it could be she wrought at so busily, for the wool was so very red and so extremely woolly.

Her chin was set at an angle somewhat grim; she was sitting very upright in her chair; and, though scrupulously hidden from sight, her elbows—truly how portentous were the undisguisable points of those elbows! And she was knitting fiercely in wool that was so remarkably red and woolly.

'Pray, what is it, Mrs Trapes?'

A feeble whisper; but at the sound, faint though it was, Mrs Trapes started, half rose from her chair, sank down again heavily, and letting fall her knitting, stared at the invalid. 'Land sakes alive!' she gasped.

'Now you've dropped it!' said Ravenslee, his voice a little stronger.

'Oh, dear beloved land o' my fathers—it's come!' she exclaimed, clasping her hands. 'The Lord be praised for evermore; it's come!'

'What has?'

'The turn! An' you've took it! Dr Dennison says last night as you'd take it soon one way or t'other. But all night long, while they waited an' watched, here you've laid so pale an' still as a corp'. An' now, while I'm a-settin' here, you go an' take th' turn so sudden as fair takes my breath away. Lord be praised! I mean—I mean—oh, I guess I'll go an' wake the doctor.'

'But you haven't told me what it is,' said Ravenslee drowsily.

'What what is?'

'That very peculiar—woolly thing.'

'This?' said Mrs Trapes, picking up the object in question. 'This is my knittin'. Doctor said t'call him th' moment th' turn came.' Her voice seemed to sink to a slumberous murmur as, having smoothed his pillow, she crossed the room and very softly closed the door behind her; wherefore Ravenslee blinked sleepily at the door until its panels seemed slowly to become confused and merge one into another, changing gradually to a cloud, soft, billowy, and ever growing until it had engulfed him altogether, and he sank down and down into unknown deeps of forgetfulness and blessed quietude.

. . . . . .

She was knitting—knitting a shapeless something in red wool, and Ravenslee thought he had never known her elbows more threatening of aspect or seen wool quite so red and woolly; wherefore he presently spoke, and his voice was

no longer a feeble croak. 'Pray, what is it, Mrs Trapes?'

Mrs Trapes jumped. 'Well, for th' love o' heaven!' she exclaimed, and down fell her knitting.

'Now you 've dropped it!' said Ravenslee a little petulantly.

'Your very—identical words!' said Mrs Trapes in awed tones. 'Nacher sure moves in a mysterious way her wonders to perform!'

'What do you mean?'

'I mean as them was the identical words as you addressed to me when you took th' turn two days ago!'

'Two days!' exclaimed Ravenslee, staring at her.

'Ever since you did take the turn two days ago you 've laid there so quiet an' peaceful—no more dreams an' ravin'—you 've jest laid there "wrapped in infant slumbers pure an' light," Mr Geoffrey—Ravenslee, I mean.'

'Why, then, it 's about time I got up. If you 'll kindly—er—retire and send Patterson I 'll get dressed.'

'Dressed?' echoed Mrs Trapes, hollow-voiced and grim. 'Get up? Lord, Mr Geoffrey!'

'Certainly. Why not?'

'What! you—you as is only jest out o' the valley o' th' shadder! You as we 've all give up for dead over an' over! You get up! Lord, Mr Geoffrey—I mean Ravenslee!'

'Oh!' said Ravenslee, knitting his dark brows thoughtfully, 'have I been sick long?'

'Four weeks.'

'Weeks!' he exclaimed, staring incredulously.

'Four weeks an' a bit! For four weary, woeful weeks you 've been layin' here with death hoverin' over you, Mr Geoffrey. For four long weeks we 've been waitin' for ye t' draw your las' breath, Mr Ravenslee. For four 'eart-rendin' weeks your servants has been carryin' on below stairs an' robbin' you somethin' shameful.'

'My servants? Oh yes, they generally do. But tell me'——

'The amount o' food as they consoom constant! The waste! The extravagance! The beer an' wine an' sperrits they swaller! Them is sure the thirstiest menials ever I heard tell of! An' the butler—such airs; such a appetite! An' sherry an' bitters t' make it worse! Lord, Mr Geoffrey, your servants sure is a ravenin' horde!'

'Don't be too hard on 'em, Mrs Trapes,' he answered gravely. 'I 'm afraid I 've neglected them quite a good deal. But it 's a woman's hand they need over them.'

'It 's a pleeceman's club they need on 'em—frequent! I 'd learn 'em different, I guess.'

'So you shall, Mrs Trapes, if you will. You are precisely the kind of housekeeper I need.'

'What! me?'

'You, Mrs Trapes. A lonely bachelor needs some one to—er—take care of his servants for him, to see they don't overeat themselves too often, or—er—strain themselves spring-cleaning out of season, or'——

'But you got a wife t' do all that for you. I guess Hermy 'll know how to manage.'

'Hermione!' said Ravenslee, starting. 'Wife! Am I really—married?'

'Sure! Didn't she go an' let you wed 'er when we all thought you was dyin'?'

'Oh, did she?' said he very gently. 'Why, then, it—it—wasn't all a dream?'

'Mr Geoffrey, Hermy 's been Mrs Ravenslee, your lawful wedded wife, just exactly four weeks.'

Ravenslee stared up at the ceiling dreamy-eyed. 'Good heavens!' he murmured, 'I thought I 'd only dreamed it.'

'Hermy 's watched over you night an' day almost—like th' guardian angel she is—prayin' f'r you, workin' f'r you, fightin' death away from you. Oh, I guess it 's her fault as you 're alive this day! Anyway, 'er an' you 's man an' wife till death do you part.'

'But death—hasn't, you see.'

'An' death sure ain't goin' to—yet.'

'No; I 'm—I 'm very much alive still, it seems.'

'You sure are, glory be t' th' Lord of Hosts, to who I have also petitioned frequent on your behoof. An' now I 'll call th' doctor.'

'No, no—not Dennison. Let me see her first. Can't I speak to Hermione first, Mrs Trapes?'

'She was up with you all las' night, sweet lamb! It 'd be a shame to wake 'er.'

'So it would. Don't disturb her.'

'But I guess she 'd never forgive me if I didn't wake 'er. So, if you 'll promise t' be good'——

'I will!'

'An' not go gettin' all worked up an' excited?'

'I will not!'

'Why, then, perhaps ten minutes wouldn't 'urt.'

'God bless you, Mrs Trapes!'

Left alone, he tried to sit up, and finding this strangely difficult, examined his hands and arms, scowling to find himself so weak. Then he clapped hand to bony jaw, and was shocked to feel thereon a growth of ragged beard, and then she was before him. Fresh from her slumbers she came, wrapped in a scanty kimono, whose thin, clinging folds revealed more of her shapely beauty than he had ever seen, as she hurried across the wide chamber.

'Hermione!' he said, and reached out his hands to her. And his voice was no longer the feeble echo it had been; the hand that clasped hers, though still thin and weak, thrilled her anew with its masterful touch; and, because of

all this, her words of tender greeting remained unspoken, the arms which had been eager to cradle his helplessness crossed themselves on her bosom. She became aware of naked ankles and of bare feet thrust into bedroom slippers, and needs must hide them, and, the better to do so, sank upon the bed, her feet tucked under her. So she sat just beyond his reach, and, conscious of scanty draperies, shook her shining hair about her, veiling herself in its glory.

'Hermione,' he said unsteadily, 'I—I never knew quite how beautiful you were—and we—we are married, it seems!'

'Yes,' she said softly.

'And now I'm—I'm afraid I'm going to—live!'

'Afraid?'

'It—it almost seems as though I had married you under false pretences, doesn't it? But the doctors and everybody were so certain I was to die that I thought so too. And now—we're married and I'm going to live, it seems.'

She was silent, and slowly his hand went out to her again, and slowly hers went to meet it; but though her fingers clasped and twined, thrilling in mute passion to his touch, she came no nearer, and watched him from the shadow of her hair with great troubled eyes.

'Dear,' he said, very humbly, 'you do—love me still, don't you?'

'More than ever.'

'Then you're not—sorry to be my wife?'

'No—ah no, no!' she whispered; 'never that!'

'Then, dear, won't you—will you kiss me?' Seeing she hesitated, he sank back on his pillow and laughed a little ruefully. 'I forgot those confounded whiskers; I must look an unholy object. Patterson shall shave me, and then perhaps'—— But sudden and warm and soft her arms were about him, and her eyes, troubled no longer, gazed into his, brimful of yearning tenderness.

'Oh my dear, my dear,' she murmured, quick and passionate, 'as if I should ever care how you looked as long as you were—just you. My dear, my dear, you have come back to me from the very gates of death because I—I'——

'Because you nursed me so tenderly!'

'Ah, no! there were others to do that. No; God gave you back to me because He is merciful, and because I love you—want you—need you so much!'

'Oh my Hermione—kiss me!'

A knock at the door, and, quick-breathing, she drew from him as the voice of Mrs Trapes reached them. 'Ten minutes is up!' she announced as she entered; 'and, Hermy, if you don't want th' doctor t' see you in your night-dress an' that'——

'Ann!' gasped Hermione, drawing the folds of her kimono about her.

'Anyway, 'e 's comin'.'

Up sprang Hermione, in doing which she lost a slipper.

'Give it me!' she pleaded, for Ravenslee had caught it up.

'Dear, you have one—be content,' he answered. 'And surely I may kiss my wife's slipper without you having to blush so—so deliciously, Hermione?'

'It 's so—old and shabby!' said she faintly.

'That 's why I kiss it.'

'An' 'ere comes th' doctor!' said Mrs Trapes. Whereat Hermione incontinently fled away, white foot agleam. Then Ravenslee, having kissed the little slipper quite brazenly under Mrs Trapes's staring eyes, tucked it beneath his pillow.

'Why, Mr Geoffrey!' said Mrs Trapes.

(*Continued on page 548.*)

THE PASSING OF THE KANGAROO.

By Story Whiting.

IN the oblivion of the Australian post-pliocene and cretaceous graveyards lie the bones of the Palorchestes—the old jumpers—enormous primitive kangaroos which weighed about a ton, and stood fourteen feet in height. They were the marsupial representatives of the pachydermal order of other continents. The modern palæontologist treads his way through the labyrinth of broken bones and scattered teeth with his magic-lantern of comparative anatomy, bridging over the countless ages, and projects on the canvas of the present the phantom forms of extinct races long buried in the unknown past of that vast continent under the Southern Cross.

It is, however, principally with the present-day kangaroo (*Macropus giganteus*) that we have to deal in this article.

In the log-book of Captain Cook's first voyage around the world we find this entry, under date 14th July 1770: 'Mr Gore, who went out this day with his gun, had the good fortune to kill one of the animals which had been so much the subject of our speculation, . . . and which is called by the natives kangaroo.'

This specimen was probably the first kangaroo shot by the gun of a white man; but apart from the question of its priority, the circumstance could scarcely have been otherwise remarkable, for at that period Australia literally swarmed with countless millions of these curious crea-

tures. Not one of its desolate plains or ghostly eucalyptus glades but was dotted more or less thickly with some of the many species of Macropodidæ; and it is safe to say that never in any other country in the world has any animal been so widely disseminated or so numerous as was the kangaroo in primeval Australia.

The advent of the white man and a hundred years of civilisation have, however, wrought a change; and the great marsupial has almost disappeared from the most settled portions of the country. For this state of affairs the kangaroo has primarily only to thank his own abnormal appetite. In the early days he was not only tolerated by the colonists, but was even regarded with a certain degree of favour as a harmless creature who could be relied upon to furnish them with a never-failing supply of fresh meat; but when a little closer acquaintance discovered the fact that he was a most voracious feeder, that one kangaroo devoured as much grass as four or five sheep, the squatters declared war upon the whole stupid, mild-eyed tribe, and inaugurated a system of extermination whose relentless prosecution has only been too thoroughly carried out.

Old shepherds have told me that in Victoria they formerly outnumbered the sheep by two to one, and that it was quite a common thing to see the sheep and the kangaroos feeding together upon the plains, as many as two or three thousand kangaroos frequently accompanying a flock of a thousand sheep. Thus it will be seen that a station which in 1850 could barely graze five thousand sheep can now be made to carry forty thousand without any danger of overstocking. Hence the very natural desire of the squatters to rid the country of so formidable a competitor.

The work of extermination was at first prosecuted by means of great stockaded kangaroo pens or yards, which were built with a wide, funnel-shaped entrance, the flanges of which extended out a mile or two into the adjacent country. These were erected at intervals wherever the kangaroos were most numerous, and once a month or so all the neighbouring squatters would join in a grand kangaroo drive. Fifteen or twenty square miles of country would be surrounded, and all the animals within this radius urged gently into the wide mouth of the enclosure, and then forced into the pen at its farther extremity. From three thousand to five thousand kangaroos were frequently secured at a single drive, the sheep, of course, having been the previous day driven out of the region of the proposed battue. When the quarry were all within the pen, the gates were closed, and the dangerous 'old men' shot down with the rifle, the rest being then slaughtered with 'waddies.'

When the kangaroos became so scarce that these drives could no longer be continued with advantage, the scattered survivors were hunted down with dogs and horses. This was a somewhat dangerous but very fascinating form of sport, requiring highly trained horses and the most expert horsemanship; for the kangaroos, when disturbed, always make for the thickest scrub in the region, and if the rider who follows is inexpert in the ways of bush horsemanship he stands an excellent chance of having his brains dashed out against an overhanging limb, or his legs crushed against the trunk of a tree. Sometimes the mild and gentle kangaroo himself becomes a serious source of danger, for an 'old man,' when wounded and brought to bay, frequently proves himself a most redoubtable enemy. When thus cornered he will generally turn fiercely upon his pursuers, and as the dogs attack him he will clasp them one by one in his fore-paws, and disembowel them with a single downward stroke of his sharp and powerful hind-claw. When his only aggressor happens to be a man on horseback, he has been known to leap upon the horse's haunches, seize the rider about the neck from behind, and drag him from his seat; and then woe betide the unfortunate hunter, for his chances are small indeed!

In certain parts of Queensland and Northern Australia this wild style of kangaroo-hunting is still indulged in by the stockmen, boundary-riders, and station-hands of the back blocks; but the day is past in Victoria and New South Wales when that or any other systematic method of extermination was found necessary. The day has not yet come for that leisured class of ardent sportsmen who will one day preserve the kangaroo for hunting purposes as the deer and the wild boar are to-day preserved in the state forests of France and Germany.

The kangaroo is a marsupial or pouch-bearer, the females of the species being provided with a peculiar furry sack under the belly, in which they dispose their young in case of sudden attack or need of hasty flight. It has long been a moot point, and has given rise to interminable arguments among bushmen, as to when and how the young ones first enter the pouch. They can be found there practically from the embryo stage, firmly attached to the nipple, up to the time when their size seriously impedes the mother's movements.

As nearly all the other native mammals of Australia are also marsupial, naturalists have been sorely puzzled to place each specimen in its own proper niche; and he would be a bold man of science who would to-day assert positively that some specious stranger had not been allowed to slip unawares into the family group, and some true, though distant, relative had not been unduly excluded therefrom. However, the naturalists have agreed that there are about thirty distinct varieties of the kangaroo proper,

ranging in size from the big red kangaroo of Queensland, which averages eight feet in height, down to the kangaroo-rat, which is little more than eight inches. But, leaving on one side the Queensland giant and the various species of wallaby, wallaroo, &c., it may be stated in general terms that the true kangaroo, the fellow to whom the term belongs *par excellence*, is the one commonly known as the gray kangaroo.

This is a smooth-haired, mouse-coloured animal, which usually stands about six feet high, and only very occasionally attains to the proportions of its Queensland cousin. The word 'stands' employed in the preceding sentence is used advisedly, and is intended to carry the fullest and most exact meaning of the term, for another singular characteristic of the kangaroo is the biped habit. Save when feeding or lying down, it always maintains an upright position; and the small fore-paws, which closely resemble a pair of diminutive hands, are never used as a means of progression.

This peculiarity of the kangaroo renders it one of the most difficult animals in the world to stalk successfully, for in every feeding herd there is sure to be at least one vigilant 'old man' always standing upon guard, and his upright position, of course, enables him to survey the whole horizon round about him, and to note any unusual object long before it could approach within decent range. When feeding quietly they sometimes drag themselves along on all-fours, but their usual gait is a series of quick hops or undulating bounds, every one of which covers twenty or thirty feet of ground; and when the occasion demands it, a full-grown animal can speed across country at a pace which would try the mettle of the fleetest horse. It is commonly supposed that the kangaroo mainly owes its extreme fleetness to the aid it receives from its muscular caudal appendage; but this is not so. Many opportunities for observation have convinced me that the only use the animal makes of its tail—which is held straight out behind it—is to act as a sort of rudder, and, if further proof were needed, when it is following up a drove in full flight over muddy soil the only imprints to be found will be those of the sharp-pointed claws of the hind-feet.

An 'old man's' pelt is worth considerably over a pound sterling in the colonial market, for kangaroo leather is in great demand for the higher grades of bookbinding and kindred purposes. Such is the irony of fate—the much-hated pest of fifty years ago has become the much-prized rarity of to-day, and the hide alone of one kangaroo is worth the price of several fine sheep.

The older generation of Australians have the strongest objection to consuming the flesh of the kangaroo in any shape or form, a prejudice only to be accounted for by supposing that they must have suffered from a surfeit of this form of diet in their youth, for the younger generation are rather partial to kangaroo-flesh than otherwise. It has a delicate gamey flavour, something between that of venison and grouse, and, like venison, it is better for a week's hanging before being eaten. The best part of the animal—the especial delicacy—is the great fleshy tail. This is excellent, prepared in any of the various styles known to the art of cookery; but it is more especially to be recommended in the form of soup. Kangaroo-tail soup is a sort of glorified ox-tail and turtle rolled into one, and will tickle the jaded palate of the veriest old epicure.

Kangaroos make delightful pets. They are very easily domesticated, and when tamed are full of pretty, affectionate ways. Although not especially clever in the way of tricks, they are possessed of very retentive memories, and never forget or forgive any injury in the form of ill-treatment.

The only natural enemy the kangaroo has to contend with is the dingo, or wild dog of Australia, and naturalists believe this dog was one of the most ancient of the indigenous mammals of the country. It seems almost incredible that this comparatively slow-footed animal could run down and catch the speedier kangaroo, but such is the case. Old bushmen will tell you that when once the dingo is on the scent of some particular kangaroo he will follow him for days and nights on end, giving him no rest or time for feeding, and sooner or later the terror-stricken marsupial will have to succumb to the inevitable.

If the colonisation of Australia continues at the same pace at which it is now proceeding, and the laws enacted for the preservation of the kangaroo are not more rigidly enforced, it is hardly too much to say that in a comparatively few years this gentle and interesting animal will only be known as a domestic pet, or preserved, perhaps, upon some gentleman's private estate, like the deer in the royal park at Windsor. Its place will then be taken by the red deer and the foxes, which have during the past decade increased so enormously as to indicate that transportation to the southern hemisphere has augmented their vitality and increased their procreative energy.

JOHN CORNELIUS COMES HOME.

CHAPTER III.—ARABELLA.

JOHN CORNELIUS felt that he did well to be angry, and the sharp walk across the park had little effect in soothing his ruffled feelings. Threats and a savage sheep-dog—ordered off his own land as a tramp—called a liar! On Maravillas he would have shot any insubordinate *mozo*, drunk or sober, who had dared to do the last, and the district *jefé* would have held him justified, *extranjero* though he was.

At the vagaries of the flymen at Biford, at the insults of Mole and the gardener from Kew, he could laugh, knowing well that the ultimate laugh would be his; but Martin's brutal insolence continued to rankle, so that when he arrived at the mansion's massive front-door he carried out with a vengeance the instructions engraved on the gilded plate attached thereto. He knocked and rang as loudly as he could, and the knock was still echoing and the distant bell pealing when the door suddenly opened.

'Yes, sir?' questioned a very astonished footman in a smart livery. 'Whom do you wish to see?'

The man's tone was perfectly civil, and his speech as perfectly grammatical, notwithstanding the thundering knock, and the resounding ring, still audible somewhere far away.

'Is Mr Jones at home?' asked John Cornelius, surprised in his turn at the unlooked-for civility.

'No, sir; I am sorry to say he isn't,' the man replied in the colourless voice of the well-trained domestic. 'He was expected home this afternoon, but he has telegraphed to say that he will be detained until to-morrow. Have you an appointment?'

'No; and he doesn't expect me. Any of the family at home?'

'Only Miss Arabella, sir.'

'Very well, I will see her.'

'I will ask her, sir,' rejoined the man, with just a shade of reproof. 'What name shall I say, sir?'

'John Cornelius.'

Afterwards John Cornelius learned that Smithson had been a house-boy at the Hall in the old squire's time, but for all the signs he showed, he might never before have heard the name.

'Very good, sir,' he replied. 'Will you take a seat? I think Miss Arabella is in the blue drawing-room. I will tell her at once.'

Proverbially the soft answer turneth away wrath. Not invariably, perhaps, and only partially in the case of John Cornelius. Unbending, he accepted the proffered chair in the great house of his ancestors—in a hall well stocked with trophies—and the footman disappeared with noiseless steps along a corridor. The sound of a piano could be heard from the direction he had taken, and John Cornelius knew that the player, whoever it might be, was a skilful musician. Suddenly the music stopped, and presently the footman returned.

'Miss Arabella will see you, sir,' he said. 'Will you please to come this way?'

John Cornelius followed his guide, who opened a door and announced the visitor. The next moment John Cornelius found himself face to face with a flushed and evidently startled, but exceedingly pretty, young lady.

'Oh!' she cried. 'I beg your pardon; but did Smithson give the right name? Do you say it is John Cornelius?'

'I do, and it is,' he replied rather defiantly. The words 'Do you say' had rekindled his anger. 'I didn't have time in London to get any cards printed, or a birth certificate,' he added. 'Shouldn't have done, either, if I had.'

'Oh!' she cried again, evidently distressed; 'but do you mean to say that you are the nephew of the Mr John Cornelius who died when I was a little girl?'

'I haven't said so yet. I say it now. I certainly am,' he answered, still more defiantly.

'Have you come to—to'——

'Take possession of what belongs to me? No doubt about it, Miss—Miss Jones.'

'Arabella,' she corrected. 'My sister is with father in London. Please excuse me. I must ring for Mrs Charteris—— Oh, here she is,' as a very old lady entered the room, clad in the exceedingly stiff, rustling, black silk of the mid-Victorian lady housekeeper. She glanced at the girl's flushed face, and then at John Cornelius, standing stiffly, cold and stern, broad-brimmed Stetson in hand. The girl was prettier, as he thought afterwards, than the prettiest *señorita* he had ever seen in Mexico; but the bailiff and his sheep-dog had soured him, and blinded him also.

'Why, Andrew,' cried the old lady, 'you have come at last!—too late to make it up. John is long dead. What am I talking about? Andrew is dead too, and Lucy—all dead. I am getting old and forgetful.'

'I am Andrew's son, Mrs Charteris,' said John Cornelius quickly. 'I remember your name well. My father often spoke of you as his only friend at Torringham.'

'You are John! Of course you are John—the image of your father. John, come home at last! I always said you would. But how did you come? I didn't hear a conveyance.'

'I walked from Biford.'

'Oh, then you must be hungry.—Arabella, my dear, John has walked from Biford. I will order tea at once.'

'I'd rather have a whisky-and-soda—a long one, if I may. I want a cooler badly,' said John Cornelius. 'We are not great tea-drinkers in Mexico,' he added.

'Mexico!' exclaimed the girl. 'I know a Mr Davison who has been to Mexico recently.'

'Yes. He got in a river. I pulled him out. Then he told me about this. Curious, wasn't it?' said John Cornelius, thawing.

'I will order the whisky at once,' rejoined the girl, and rang a bell. 'Do please sit down!' she went on, having given the order. 'I am so sorry I said—that I seemed to doubt. I hope you will forgive me. I am sorry that father is absent. I will telegraph to his hotel.'

John Cornelius sat down facing the girl.

'Will Mr Jones be pleased to see me?' he asked. 'Will he be likely to question my identity?'

'Oh, I—don't—know,' she cried hesitantly. 'Rosa and I have lived here so long. It will be a shock.'

'Archibald and Rosa Jones will welcome you whether they are pleased or not,' said the old lady very determinedly. 'I shall make a point of being at the railway station when they arrive. But where is your luggage?'

John Cornelius explained, but said nothing about the flymen.

'It shall be sent for,' said the girl, and turned to Smithson, who had brought in a tantalus and a siphon of soda-water. 'Send Thomas in the runabout to Biford for Mr Cornelius's things.—Tell him to hurry,' she added.

'Take the ticket—two bags,' said John Cornelius, with a long glass near his lips. 'Are you going to put me up?' he asked of the girl.

'Of course. What did you expect?'

'Well, I've been here nearly two hours, walking round,' he replied. 'I have had some curious experiences. I will talk about them another time. I scarcely knew what to expect.—Mrs Charteris,' turning to the old lady, 'I want you to tell me why my father quarrelled so bitterly with Uncle John.'

'It was over Lucy—your poor, dear mother,' she answered. 'It's a long story, and painful.'

'Oh!' said John Cornelius.

He drank his whisky-and-soda, and presently ate a pile of buttered scones and drank three cups of tea. It was just about this time that a great fact entered his hitherto anger-clouded brain—that the girl so deftly handling the tea-cups was the most beautiful that he had ever set eyes on. Of course she wasn't, but he thought so, and from that moment he felt less of an interloper and more at ease—indeed, inclined to treat his reception by Mr Martin as a rather unpleasant joke, but a joke all the same. As for his encounters with the gardener from Kew and Mr Mole, they never had rankled.

The small car soon returned with his bags, and Smithson showed him to his room, where he discarded his Mexican clothes and his Stetson for a suit made by an English tailor in San Francisco and a cap. Thus attired, and seated on his own lawn, he told the story of his reception to the ladies.

Mrs Charteris was greatly shocked and pained; but the girl, who had a keen sense of humour, burst into peals of laughter at each incident.

'The gardener from Kew!' she cried. 'His name is Clutterbuck. He understands orchids, and hates any sort of interference. I hardly dare look at some of his treasures. I will introduce him to you to-morrow—he will have gone home now—but I must do it my own way. And Martin—he is a surly fellow, but dad says he is a good farmer—it will be fine. And Mole and Mrs Badger and the carriage folks. It's a wonder she didn't say the "quality;" only, Mrs Badger doesn't think we Joneses rightly belong to the "quality." The Corneliuses were the quality *pur sang* in these parts, and she told one of them to go up the road to the wicket—the tradesmen's entrance—the back-door. Can you drive a car, Mr Cornelius?'

'No,' he answered; 'but I can ride every sort of bucking bronco. I had three years of cow-punching in Arizona before I went to Mexico. I have also won prizes in roping contests at San Antonio, Texas. That accounts for my being here.'

'How?'

'Oh, Davison was in real danger. He couldn't swim, and it wouldn't have been of much use if he'd been able to. When I made his acquaintance he was hanging on for dear life to a rock in a bad flood. I yanked him out with a lasso, which I couldn't have done if I hadn't been a bit of an expert. If he'd been drowned, he couldn't have told me that I had been left this place.'

'No, of course not,' said the girl; 'but I wonder why he never told us. We see him often. Rosa must have met him a dozen times since he came home.'

'I put him on his honour,' said John Cornelius. 'But why did you ask if I can drive a car?'

'Oh, I thought you might take Mrs Charteris and me for a spin to-morrow; but I must take you. You have lots of cars, Mr Cornelius, but there isn't a bucking bronco on the estate, or in the county, that I am aware of.'

'Worcestershire is very old-fashioned,' said

Mrs Charteris, suddenly waking up. 'I don't know what a bucking bronco is, unless it is some sort of hacking bronchial cough—some new-fangled name.'

'A bucking bronco, Mrs Charteris, is the greatest quick-stop on coughs that ever was,' said John Cornelius. 'A real bad one doesn't leave you breath enough.'

All of which talk, and much more of the same sort that followed, shows that John Cornelius had really come home.

CHAPTER IV.—HOW JOHN CORNELIUS GOT HIS OWN BACK.

SOMETIME in the early morning John Cornelius, spending his first night at Torringham Hall, had a dream which was quite foreign to any personal experience of his own.

He dreamt that he was in a little *rancho* on the Rio Copalita, which he seemed to remember as the place where the 'Third Degree' police-officers of the State of Chiapas took recalcitrant Mexican horse and cattle thieves to make them confess their crimes. From a cross-pole near the roof a man was dangling head downwards, and the man was Mr Martin of the home farm, who had been slung up by his big toes. Mr Martin was yelling for mercy—not to '*Don Wan*,' as any Mexican criminal of the dreamer's acquaintance might have been expected to do, but to 'Mr Cornelius — Mr Cornelius — Mr Cornelius!'

It was only Smithson, who desired to inform him that his bath and breakfast were ready, and that Miss Arabella had the Daimler at the door.

Within three quarters of an hour John Cornelius was seated in a big car beside that energetic young lady, who assured him that she could manage it quite well.

'We're going to the home farm first,' she said; 'but if Martin doesn't recognise you—and I don't think he will without that big hat and those loose travelling-clothes—I want you to behave as if you had never seen him before. He needs a lesson.'

'I agree,' said John Cornelius—'*muy bueno. Vamos!*'

'What does that mean?'

'Oh, you must ask Davison when you next see him, if you can remember it.'

'You must tell it to my sister Rosa when you see her,' she called, for the car was snorting up a hill. 'Mr Davison is her property.'

'Oh, indeed!' said John Cornelius. 'May I ask whose property you are?'

'My own,' she answered.

'*Muy bueno*,' repeated John Cornelius.

They encountered the farm-bailiff in the yard, with the big gray sheep-dog, Bob, at his heels. As the girl stopped the car, the man lifted his cap rather casually.

'Morning, miss,' he said.

'I've brought this gentleman to see some of your stock,' said the girl. 'You have some wonderful fat pigs, haven't you? You look after them yourself, don't you?'

'Yes, miss, I does my duty by them.'

'And model your behaviour on theirs?'

Mr Martin flushed. 'I don't follow you, miss.' He had not recognised John Cornelius in his San Francisco cut clothes. Evidently the sheep-dog had, however, for the animal suddenly growled. 'What's the matter with you?' demanded his master, aiming a kick, which missed.

'Don't kick your dog, Martin,' remonstrated the girl. 'Bob is much more intelligent than you are.'

'I don't know what you're driving at, Miss Arabella,' cried the man angrily.

'I will tell you. You met Mr John Cornelius yesterday.'

'I met somebody as said he was, miss.'

'And you were very insolent!'

'That's as may be. My orders are to allow no trespassing.'

John Cornelius intervened. 'The owner of a property farmed by himself or for him isn't a trespasser in any country. But you don't recognise me. You were exceedingly abusive yesterday, but Miss Arabella tells me you are a good farmer, and I am disposed to overlook your conduct.'

'But, sir, I never set eyes on you before,' protested Mr Martin.

'Not in the orchard, where I had to draw my revolver?'

'Gosh!' exclaimed the bailiff, enlightened at last.

John Cornelius turned to his companion. 'Do you really wish to see the pigs?'

'No,' she answered; 'we have seen the piggiest of them all.' And she got into the car.

They left the farm-bailiff capless and staring. He had snatched off his cap as the truth struck into his thick skull, but he was not a bit penitent. 'What did he want to come around in them tramp things for?' he muttered, and kicked at his dog again.

'You were pretty rough on him,' remarked John Cornelius as they drove out of the yard. 'You almost called him a pig.'

'Not a bit too rough,' she answered. 'George Martin wouldn't understand gentle methods. I wanted to make him feel. By the way, what is the Mexican for a pig?'

'*Puerco*.'

'Thank you. I'll think of him as a *puerco*, if you wish.'

'But the Mexican *puerco* is the very worst kind of a pig.'

'Well, so is George Martin.'

One thing was certain; whatever fuss Lawyer Jones might make, John Cornelius had found an outspoken champion, and he knew it.

The girl drove him over the greater part of the estate, and introduced him to a score of the tenants and their wives and families. To a man, woman, and child, all were very much astonished, but not one had a word to say in depreciation of Squire Jones.

'He's bin a good landlord. You'll find everything in rippin' order,' he was assured again and again.

It appeared that Arabella had left strict injunctions with Smithson that none of the servants was to talk outside about the astonishing arrival of the real owner of Torringham Hall, and, so far as the gardener from Kew and Mole were concerned, the orders had been obeyed. Mole was sweeping the front lawn when the car returned, and he pulled at his cap as its occupants alighted.

'Good-morning, Mole,' said John Cornelius. 'I haven't met that policeman you spoke about yesterday.'

The under-gardener grinned and scratched his head through the holes in his cap. 'Don't rec'lect no policeman, sir,' he said.

'Not the one who was to take me to Poyke Asylum—the first one I met, I think you remarked?'

Mole dropped his besom and stared at John Cornelius. 'Be you the genelman as got acrost wi' Master Clutterbuck—as said as you was John Cornelius—as wore a big, new-fangled hat?' he asked.

'The same,' said John Cornelius.

'Dang me!' and Mole started to run towards the conservatories.

He was stopped by Arabella. 'Where are you going?' she asked sharply.

'To draw five bob off Clutterbuck, miss,' was the answer. 'I bet him five shillin's as he'd hear agen of what he done, and as I'd hear of what I'd said.'

'Wait a moment,' interposed John Cornelius. 'I don't recollect that he did anything except be very rude. What did he say he had done?'

'Chucked John Cornelius out of the orkard-houses, sir.'

'Well, you have won your bet. He will hear of it again, although I don't remember the incident. But as John Cornelius happens to be my name, and as I am your *padron*—I mean employer—I order you to return to your work. I'll see Mr Clutterbuck, and I promise you that he shall pay you the five shillings.'

'Dang me!' muttered the under-gardener, as he went back to his besom.

Leaving the car in the charge of a chauffeur who came to take it to the sumptuous garage, John Cornelius and Arabella went at once to the conservatories and the 'hot' orchid-house, which they entered, taking care to close the door very carefully behind them.

The gardener from Kew was at work with a syringe, douching his treasures with tepid water from the tanks which ran the whole length of the house. Seeing the girl, and not recognising her companion—for John Cornelius kept in the background—he put away the syringe and stepped forward. Visitors who came with Miss Arabella, the orchid, so to say, of the family, generally left a tip behind them—half-a-sovereign was not unusual. By dispensing information freely, Clutterbuck generally managed to get paid for his trouble.

'Morning, miss.—Morning, sir,' he began. 'Well worth looking at, aren't they? You wouldn't think it, sir, but this here Vanda, pointing to a pencil-stemmed *teres*, travelled a good many thousand miles before it settled down at Torringham. Comes from the Philippines, it do. This here Cattleya comes from the Amazon—biggest river in the world. This Peristeria comes from Central America, or South Mexico.'

'So do I,' interrupted John Cornelius. 'Aren't you keeping all these plants much too stuffy? Down in South Mexico we always grow them in the open air.'

The gardener from Kew looked at the speaker with something like contempt. He was well up in orchids, and quite aware of it. 'Does you, sir?' he rejoined. 'Not Vandas and Cattleyas, you don't, for they don't grow there, as far as I ever heard.'

'Perhaps not,' said John Cornelius; 'but this house really smells very stuffy—far too close and steamy. Hadn't you better open the door, and keep it open?'

'Not me. No, sir. Nor nobody else, not no more than I can help,' replied the gardener from Kew, with dignity.

The girl began to laugh, but John Cornelius persisted.

'Why, what would happen to them?'

'They'd die of the flu,' said Clutterbuck, with a grin.—'You'd better come into the "cool" house, miss, and let me show your friend some Crispums and Cypripediums. They're cold subjects, they are.'

'You are very obliging to-day,' said John Cornelius. And they followed the gardener from Kew into the next house. John Cornelius closed the door very carefully, coming last.

'It don't matter about that so much here,' remarked Mr Clutterbuck.

'Doesn't it? But isn't this place much too cold for orchids?'

'No, sir. Just right for these orchids. Them Crispums—*Odontoglossum*—you'll see on the label—comes from Colombia, from right up in the mountains—six thousand feet; they can stand a bit of cold.'

'Indeed!' said John Cornelius. 'Are you quite sure about that? Not making a mistake,

are you? Colombia's a very hot country, in parts.'

'Not much,' said Clutterbuck snappishly.

It being lunch-time, they went through the 'cool' house quickly. The gardener from Kew opened the door to let them out, and John Cornelius dived into a trousers-pocket. 'Here's half-a-sovereign,' he said, producing the coin, 'but five shillings of it belong to Mole. You owe him five shillings, you know, and I promised him to see that he got it.'

'I don't know what you mean, sir,' said the gardener from Kew.

'Oh yes. He bet you five shillings that you'd hear again of having chucked me out of the other orchid-house yesterday. You're hearing of it again, and he's won his bet. Have you got the change?'

'I chucked'——

'No, you didn't; but I think you said you did. As I told you yesterday, my name is John Cornelius. I asked you then what you cost me a week. Perhaps you will tell me now? I shall have to pay your wages in future, you know.'

But Clutterbuck did not know. At least, he did not appear to know anything. He did not produce the change, and he did not take the half-sovereign. He did nothing and said nothing, being unable.

The girl was too convulsed to speak, but John Cornelius had not finished.

'You understand your job, Clutterbuck,' he said, 'but not the gentle art of leg-pulling. Chaff makes you ratty. I noticed it the last time we met. Well, good-day. I'll give Mole the five shillings you owe him.'

(*Continued on page 551.*)

A PARADISE OF THE HONEY-BEE.

IT is safe to state that, with but very few exceptions, there is no region in either the Old or the New World more comparable to a paradise of the honey-bee than the mountainous area of New South Wales, Australia. Those not familiar with the rough mountain-lands of the mother-state of the island continent can form no conception of the enormous quantities of honey produced by the native forest trees and flowering shrubs every year. Certainly the bee-keepers of this state have realised it, to their infinite advantage. During the great honey-flows, as they are termed, which come every year, and sometimes many times in one year, the supply of nectar is so abundant that, say, one hundred and twenty colonies in the apiary bring in two tons of surplus honey in a little more than a week.

The mountain-forests are white with blossoms in the time of general bloom, and the air is laden with the rich honey-perfume. Enormous flocks of paroquets fly shrieking from tree to tree, revelling in the liberal supply of honey, and millions of excited bees tumble over each other in their eagerness to gather the rich stores, their turmoil making a far-reaching, voluminous, steady roar, which at times overpowers the paroquets' racketing.

When the weather conditions are favourable to honey-secretion the honey-flow becomes a honey-deluge. The bee-keeper, with every nerve aquiver, takes up the pace set by the excited apiary, and tiers up the hives three and four and five storeys high, till four strong men can hardly lift a single hive even a few inches because of its weight of honey. Feverishly he works at the extractor to empty the combs and get them back into the hives for a further supply, till the roar of the bees and the whirl of the extractor get on his nerves, and he longs for the comparative silence of night.

But even at night the apiary is filled with a great low sound like that of a train rushing through a mountain-cutting—the sound of millions of fanning wings driving the air-currents through the hives to evaporate the surplus moisture from the nectar, and turn it into rich, ripe honey.

It might be supposed by the uninitiated that so enormous a supply of nectar is drawn from many different sources. This is not the case. The various trees and shrubs have their set times for blooming, different varieties flowering at intervals right throughout the year. The honey from those which bloom in the winter and spring is mainly consumed by the bees themselves in the rearing of the spring broods before swarming-time. The great bulk of the surplus honey comes from a comparatively small number of varieties. During the big summer and autumn honey-flows the apiarist is on the alert, so that the main yields can be extracted separately at the end of each flow, and kept apart. It has been found that where flows from an inferior and a superior variety of bloom are on at the same time, the bees themselves do not mix the different kinds of honey, but that separate colonies gather from separate sources. The business-like apiarist, then, takes the trouble to extract from the hives working on each variety separately, and keeps the good quality apart, and sells it graded as first-class honey, the other variety being among the second-class. To prevent confusion, too, each class of honey is marketed by the up-to-date bee-keeper under the name of the tree or trees from which it is produced.

Where the sources of the nectar are so numer-

ous as throughout the mountain area of New South Wales, it is out of the question to attempt to describe every honey-producing tree and shrub; but a few of the most widely distributed typical trees and their honey product are given.

Among these honey-producing trees the eucalyptus family easily takes the first place, both in respect to the number of species and to the quality of honey produced. It is a fallacy to believe that honey from the eucalypti is inferior and tastes of eucalyptus. The flavour is in the leaves and the bark, and never in the honey secreted in the little cup in the centre of the flower, nor in the manna or sugary sap exuding from the bark of the tree or dripping from the leaves till the ground is covered, as with a light fall of snow, with granulated manna honey.

Among other trees greatly valued by the New South Wales apiarist are the white box (*Eucalyptus Bosistoana*) and the yellow box (*E. melliodora*). The honey from the white box is water-white in hue, clear, and limpid, with a most delicate flavour, and does not granulate readily. The yellow box has equally fine a flavour, but in hue it is a rich golden, and keeps its liquid form for a long time.

But one of the most valuable of the mountain honey-producing trees, and specially sought after for an apiary-settlement, is the red bloodwood (*E. corymbosa*). It flowers in the autumn, and in February and March, but not every year. Its habit is a general bloom one year, then a year of rest to mature its seed, then a year of light bloom, followed by a year of general flowering again. The large white flowers are carried in thick bunches on the tops of the branches, and the nectar is especially abundant. The honey from the bloodwood is of a clear, rich, golden colour, thick, luscious, and of splendid taste. It granulates almost at once after extraction into a creamy white crystal, and can be eaten by the handful. Much honey from this source is exported from New South Wales to London.

Among other nectar-producing trees of this paradise of the bee are the gray gum (*E. punctata*); Sydney peppermint (*E. piperita*), which grows freely on the most rocky and barren spots, and yields immense quantities of honey; gray iron-bark (*E. paniculata*); white stringy-bark (*E. eugenoides*); and the handsome red apple and its brother the white apple, with their red and dark-crimson honeys.

Additional details of great interest are to be found in the publications of the New South Wales Government, which is fully aware of the enormous advantages offered by Mother Nature to apiarists settling in the mountain area of the parent state of Australia.

BAKED POTATOES.

By M. Berkeley.

CARL HEINZ bowed his head to the blow as he had been taught, and, spitting like a cat, the major passed on.

Carl watched him till his burly form vanished round the angle of the trench; then he once more settled himself comfortably on the overturned biscuit-tin. He did not intend to stand in the mud for any damned German if he could sit with greater comfort on a biscuit-tin.

He rubbed his arm where the little cane had bitten into it. It ached, smarted.

Carl swore lustily under his breath a series of oaths which, had he heard them, would have made the stout major send post-haste for the guard.

Having thus relieved his feelings, he glanced along the trench to see if he had been overheard.

The trench was thinly held. Half-a-dozen men of the Landwehr composed the garrison, and a space of twelve yards or so divided them from Carl and each other.

But presently a stream of men would begin to flow inwards. The tramp of their marching feet was already awaking the echoes in the desolated Flemish villages behind the lines. For the great attack which was to commence at dawn meant a vibration in every part of the huge war machine which lay sprawling like some mighty colossus across middle Europe, with its nails dug deep into the face of France, and the soles of its feet pressing with might and main against the panting breast of holy Russia.

But to Carl the manifestation of all this tremendous energy meant that presently there would be twelve men to three yards instead of one man to twelve yards in his portion of the trench; the sharp blowing of a whistle, and a spring over the parapet, followed by a run across the open in the wake of the rolling gas-fumes; and then perhaps—Death. And that was all. But that was not yet. Several hours must elapse before the reinforcements began to arrive. Meanwhile the man on his right, a gray-headed Berliner, was entirely absorbed in potting at invisible Englishmen, who were returning the compliment at intervals; but the one on his left had caught the fag-end of the oaths, and turned towards him a face, big and round, and covered by a smile which threatened to engulf his entire countenance.

Carl snarled at him over his shoulder.

'What are you laughing at?' he muttered in diabolical German.

'I was thinking that it was a pity that the Herr Major did not hear,' answered the

man. 'It would have reminded him of old times.'

'What d'you mean?' growled Carl.

'Maybrick's.'

Carl started.

'What do you know about Maybrick's?'

'Born in Soho,' said the Landwehr man.

Carl leaned back against the side of the trench and emitted a strange sound between blown-out cheeks. It was not a form of expression which commends itself to the Teutonic soul, but it is familiar enough to the porters about Covent Garden.

'Well, I'm——' He completed the sentence with a little whistle.

'Oh, don't be alarmed,' said the Landwehr man. 'I won't mention it.'

'What did you do at Maybrick's?' asked Carl of the Landwehr, after a pause.

'Head-waiter for three years. Seen the major there many a night; but he doesn't remember me.'

The Landwehr man closed the conversation by settling his broad back against the side of the trench, and composing himself to slumber. So, leaning against a pillar with folded arms and nodding head, might he have awaited the first comers amongst those patrons of Maybrick's in Soho who resorted thither when the more reputable cafés were closed.

The man on the other side of Carl was still wasting ammunition on the people opposite. Carl leaned forward on his biscuit-tin, and leaning his head on his hands, began to think.

Carl had done very little thinking during the thirty odd years of his existence, and the process of giving shape to 'winged thoughts' was attended with much mental anguish. But the Landwehr man's remarks about Maybrick's had stirred up memories lying fallow these many years, and 'winged thoughts' beat about him now in the gathering darkness of the trench, and would not be denied.

For Carl Heinz had not always been Carl Heinz. On the contrary, up to ten years ago he had been known as Charles Smart, Covent Garden porter, to the small circle which claimed him as an acquaintance. In this name he had been married, and in this name his children—he had forgotten how many—had been entered in the parish register at their baptism, his wife being very particular about these things. When he ran away to Germany in the trail of the returning singers at the close of the Wagner season, after a domestic explosion which had ended disastrously for Mrs Smart, he had adopted the name of Carl, because they told him it was the German for Charles. So he said it would do as well as any other, though the choosing of a surname to put on his naturalisation papers had been a more weighty matter. It must be a German one, said the close-cropped, bullet-headed official who watched his every move, as he stood, first on one foot, then on the other, put his head on one side, spat on the ground, sucked the point of the pen, and performed all the other antics from which the illiterate seek to gain courage when confronted by pen and paper.

After much puzzled thought he chose the name of Heinz. He had heard nothing about its connection with sauce, but it was the only German name he knew; for had he not seen it blazing against the sky-line every night as he tramped along the Embankment on his way home to the inner dimness of Camberwell, where he dwelt? It was, therefore, settled that he should henceforth be known as Heinz, and the bullet-headed individual duly made record of the same.

So Heinz he became, and a subject of the Imperial German Empire.

Then, because work was hard to find, he enlisted, and had become quite a fair soldier by the time that he passed into the Landwehr.

On the whole, he had not regretted his change of nationality. In times of peace one great city is very much like another in that gray part of it where the very poor live and work. But in time of war. Ah, that was a very different matter!

At the first hint of hostilities the iron hand seized Carl. It stripped him; scrubbed, reclothed, drilled, entrained, and marched him, with a rifle on his shoulder, a weighty pack upon his back, and the Emperor's blessing, through Luxemburg, Belgium, France, till, with his comrades, he came to a dead-halt before the gates of Paris. Then he turned and came back again, with indecent haste, he thought, being an Englishman. But he got to ground at last, and there, with an occasional excursion east, he had stuck in a trench, wide enough to walk in, narrow enough to be his grave; and separated from him by a short fifty yards lay his countrymen in similar trenches. Daily he heard their voices calling to each other and to him. The language of Bermondsey had been wafted across barbed wire on autumn gales, on light summer breezes, on volumes of poisoned gas, and hearing, his heart had warmed within him.

So it came to pass that the erstwhile Charles Smart, now styled Carl Heinz, soldier of the Imperial German Landwehr, was feeling distinctly homesick as he sat chin in hand on his biscuit-tin. He wished sincerely that Hendrich Seiller had not mentioned Maybrick's; it was a link which he would rather not have forged with the people who lived just the other side of those abominable wire entanglements. For he himself had put in days and nights of work at Maybrick's before fate had made of him a porter at Covent Garden. He had almost forgotten that he had been an Englishman before his comrade mentioned Maybrick's, and now——

He was beginning to think about Mrs Smart. He hoped he had not killed her. He did not think he had, but he had considered it mere wisdom not to take any chances; and so, to

put it in his own words, he had 'done a bunk.'

He had many times regretted the loss of Mrs Smart since he became a German, for the buxom 'frau' who had succeeded her could not compare with her in face or form or culinary accomplishments. Particularly the last-named. Sauerkraut was no exchange for Irish stew, or big potatoes baked in their jackets. Carl had pleaded often, and had even added blows to his pleading, but he had never succeeded in making his fat German spouse produce a really properly baked potato.

Carl thought over all this with deep self-pity as he propped himself against the buttress of the trench, and presently he fell asleep and dreamed about it. He dreamed that it was very early morning in Covent Garden, and he had been carrying without rest since before sunrise. The air was filled with the scent of fruit and flowers —fresh from sweet solitudes far from the throbbing heart of London. They were strewn about in gracious profusion, the morning offering of the countryman to the deity of commerce. Many were trampled under foot, and lay withered, broken, crushed to pulp.

In his dream Carl did not greatly trouble about these things, for during a slack ten minutes after the unloading of one fruit transport of motor-lorries and the arrival of another he had sped away to a quiet corner behind a stack of fruit-baskets, and seating himself on the ground, produced from his pocket a baked potato. It was big, it was fluffy, it was altogether desirable; but it lacked one thing—it was not hot. There was no answering warmth to his fingers, nipped with the chill of early morning; there was not that delicious, penetrating smell with which he was wont to warm the cockles of his heart when he bought the article from the coffee-stall; and yet——

Some one else must be having baked potatoes for breakfast somewhere in the vicinity of his stack of fruit-baskets; for, though his own potato smelt not at all, coming from somewhere there certainly was an odour of the right thing, piping hot. Carl sniffed in his sleep, and firmly stuck his teeth into his dream potato. Then he fell off his biscuit-tin. He woke with a start and looked round. In the darkness he could barely discern the forms of his comrades, asleep on the floor of the trench. The impression of the dream was still very vivid. He could almost taste the potato; he could still smell it. Yes, he could certainly smell it.

Carl rubbed his eyes and sat up. He sniffed like a dog doubtful about a scent, except that in this matter there was no doubt whatever. From somewhere in the gloom, upon a gentle westerly breeze, there was floating to his nostrils the odour, not of one baked potato, but of many, grilling hot, and—butter.

Carl smacked his lips.

From whence was that heavenly smell? Not in the German trenches certainly, for every one but the sentries was asleep, and they had already partaken of the last meal which many of them would need in this world. No, it was not his comrades who were eating baked potatoes.

Carl rose cautiously to his feet and peeped through his loop-hole. A modified form of sing-song was evidently going on in the British trenches—a sing-song with the soft pedal on, but he could make out the low droning of mouth-organs. Yes, they were singing the songs of Bow and Bermondsey, of Islington and Shoreditch, and—they were eating baked potatoes.

As he listened, regret for his forsaken nationality surged over Carl in one great flood of sentiment. What had ever possessed him to deny his native land? His true place was with those raucous-voiced, potato-eating Britishers.

The knots which bound him to Germany were loosely tied, and were not of the conventional pattern.

He became suddenly aware that, whatever the consequences, he must get to those potatoes without a moment's delay. The smell drew him as the magnetic north attracts the compass's needle.

He listened intently. Although it was too dark to see them, he could hear the soft snoring of Hendrick Seiller and his other companions. Noiselessly he put out his hand and gathered his few possessions about him, buckling on a pack here and a tool there. When he had completed the operation to his liking, he paused and listened again. Save in the British trenches, absolute silence everywhere. Then he mounted on to the gallery of the trench, and putting both arms on the parapet, began to draw himself cautiously up.

. . . . . .

Lance-Corporal Ascot, 4th Westhamptons, had just completed giving his friend, Joe Cook, corporal in the same regiment, his own private view of the form likely to be displayed by the N.C.O.'s and men of the 10th Humdrums in the approaching football match in which they were to meet his own battalion; he had also helped himself to a fifth baked potato, when Carl Heinz of the Imperial German Landwehr, together with his pack, rifle, entrenching-tools, and sundry belongings which were his, descended upon the top of him.

From out of the seething mass Corporal Cook was able at last to abstract his friend, and set him chattering with annoyance on his feet.

'Don't shoot,' gasped Carl from between his legs. 'I'm British.'

'Where from?' snapped the corporal.

'Soho and Camberwell,' retorted Carl, as a man might say, 'Eton and Trinity.'

'What cher doin' 'ere, an' 'ow did yer get 'ere?' asked the corporal, keeping a firm hold of Carl's collar.

'Fed up,' he said, throwing an expressive

thumb over his shoulder in an unmistakable Bermondsey manner towards the German lines.

The lance-corporal, who had now recovered himself, entered the conversation, rubbing his neck.

'Deserter, eh?' he said.

'British,' persisted Carl.

''Ow did yer get 'ere?' said the corporal again. 'Yer'd best tell it quick, or'——

'Clippers.'

'But, man, we laid the wire new last night; did it meself. Why, you blinkin' liar, it 's impossible.'

Carl shrugged his shoulders. 'A fool could walk through it,' he said, his eyes fixed on a great cookie from which a savoury steam was rising.

'As you 'ave managed to get 'ere, Bosche, there must be some truth in what yer sayin',' said the lance-corporal, still rubbing his neck. 'Yer landed on me fair an' square, any'ow. And what made yer think abaht returnin' t' yer 'appy 'ome, eh?' he added, sniffing treachery.

Carl made no reply. His eyes were fixed on the cookie, and in them stood two large, bright tears.

The lance-corporal's heart softened.

'S'pose you 've bin a Bosche some time?'

Still no answer.

'You must 'ave bin mortal fed up. Was they cruel to yer? S'pect as 'ow yer thought abaht the 'ome fires an' the missus an' the little uns an' all.'

The lance-corporal felt that the occasion required a certain display of sentiment.

No answer.

The lance-corporal and the corporal exchanged glances, and the lance-corporal swore aloud. 'What 's the idjut starin' at? Answer, can't yer, or I 'll tickle yer up with this.' He waved a large fork used to withdraw the potatoes from the cookie in the face of Carl.

'What made yer tired o' bein' a Hun, Fritz?'

Carl Heinz withdrew his eyes slowly from the cookie and fixed them on the lance-corporal's face.

'The smell,' he said. 'The smell o' them things.' He nodded at the cookie. Then as an afterthought, 'They 're sleeping where I 've come from,' he said. 'They 're going to "gas" you at dawn.'

The lance-corporal's jaw dropped. He turned to Corporal Cook as to one having the greater authority. ''Ear that, Joe?' he said.

But the corporal had already seized his rifle, and was presenting the point of the bayonet at Carl's throat.

'Get up,' he snapped; then, as Carl climbed slowly to his feet, 'Yer 'll repeat that little yarn o' yourn at the right time and place,' he added.—'Lance-corporal Ascot, fall in! Company 'eadquarters! Right-abaht turn! Quick march!'

. . . . . .

Thus it came about that, while the realisation of Carl's dream anent the potatoes was postponed indefinitely, the nice little surprise planned with much skill and cunning by the Imperial German Staff, when it began at six o'clock precisely the following morning, was really no surprise at all.

A GIRL'S SCHOOLING—IS IT 'DOMESTIC' OR 'SCIENTIFIC'?

By Mary Hill, A.C.P.

AN alien working-man published a little book a few years ago giving his impressions of the English working-classes, among whom he had lived and worked. He had no fault to find with the *men;* in fact, he carried away nothing but the friendliest feelings towards them, tinged, too, with no small measure of respect. But when he comes to their women-folk, he can scarcely find words with which to describe them —they are slovenly, thriftless, helpless, utterly incapable of preparing a meal; and he sympathises frankly with the men for having such wives! He describes them as he used to see them, morning after morning, in a mining village, standing before their doors for the hour together just gossiping! He declares that their blouses were always pinned down the front, and their skirts hung in festoons. Their houses were on a par with themselves, as untidy and dirty as their clothes; their extravagance was appalling! Needless to say, he winds up by comparing them, to their great disadvantage, with the women of other lands!

Most people may think the picture overdrawn —in fact, condemn it as a caricature. Perhaps it is, his great appreciation of the merits of the men blinding him to the virtues of their wives. But who dare deny that to some extent he is right? Walk down certain streets in any large town in England, particularly in a manufacturing district, during the morning hours, and what does one see? Would he only find the women he depicts in a mining village?

Take a peep inside the houses, where the women stand with arms folded for an hour or more while the children are at school! Watch those children return at noon for *dinner!* Is one writer correct who declares that such women would as soon think of making a motor-car as of making a milk-pudding or concocting a soup?

Is *their* one idea of a savoury dish a fried steak or chop, and would they look with amazement upon any one who suggested stewing, or mentioned tripe or sheep's head? No one can deny that they spend money without stint *sometimes* —a walk around the shops on Saturday night is sufficient to prove that. But what do they buy, and how do they deal with it when it is bought?

Nothing could be more illuminating than to put an alien's distressing picture of the working-class woman beside the paper read at the last meeting of the British Association in Newcastle by the Head of the Domestic Science Training Department of the Battersea Polytechnic. Apparently she sees eye to eye with him, for she speaks of 'the almost universal thriftlessness of the English household,' 'the appalling wastage of infant and child life,' 'the present physical unfitness of so large a proportion of our adult population,' and declares that 'efficiently trained women' are necessary in order to spread that knowledge which will lead to the substitution of wise economy of time, labour, and money for this 'almost universal thriftlessness;' to the checking of the appalling waste of child-life, and to the creation of a future adult population that is physically fit.

Many details were given of the training such women ought to receive in order that they may be fitted for this all-important work. For example, one reads that 'much importance is attached to the study of hygiene, which is treated as a science based largely upon physiology, chemistry, physics, and bacteriology.' Physics and chemistry are the two sciences that intending teachers of domestic craft need to study most deeply. 'The physics course includes general measurement, specific gravity and heat, accuracy in observation and in measurement being one of the paramount aims. The chemistry course comprises the chemistry of air and water, elementary chemical theory; the common acids, alkalies and salts; coal, gas, fuel; sugars, starch, alcohol; the study of the principal food-stuffs; textile fabrics; soap; the outlines of the bacteriology of the air, water, milk, meat; preservation and purification of food-stuffs; antiseptics and disinfectants.'

Of course, the intention is generally that these efficiently trained women shall deliver their message through the schools—one dare hardly hope for any radical reform among the *women;* the trouble lies too deep for that; but from the girls at school one may reasonably expect some results. For many a long day the *school* had no connection with the *home*—in fact, was vastly superior to it in every way; education had no concern with buckets and saucepans, making frocks and darning stockings. That day has surely passed. The establishment of such departments as the Domestic Science Training Department of the Battersea Polytechnic, and others like it all over the country, is sufficient evidence of some change in public opinion. Special teachers have been lecturing on domestic science for quite a number of years in most of the large towns of England. Most of the working-class women under forty years of age in any manufacturing centre spent at least a couple of hours every week for the last two years of their school-life over it. To what extent has it been effective? They certainly studied 'the principal food-stuffs;' but does it help one whit towards the planning of a nutritive dinner? Many hundreds of them examined and tested the various 'textile fabrics' in the orthodox 'domestic science' method—wrapping thermometers in flannel and in calico to test the rival 'conductivity' of wool and cotton—but has the experiment affected one garment that is worn to-day? The microscope revealed to them the wonders and the horrors of the bacteria of the air, water, milk, and meat; but how far, alas! has that helped 'to check the appalling wastage of child-life or to make it impossible for the present physical unfitness of so large a proportion of our adult population to be repeated in future generations?'

Surely these are questions that demand a reply to-day. Educational reform is in the air, particularly 'scientific' education. Would it not be worth while to consider whether the so-called 'domestic science' training of the girls is either 'domestic' or 'scientific'? A close investigation of the matter would probably convince most people that it is 'neither one nor 't'other;' and *whatever* it is, it fails miserably in its primary object. Surely the school must tackle the domestic side of the question from a new standpoint altogether! The *girl* must be considered as the woman of the future, living in an ordinary, commonplace home—*not* as a scholar sitting in a class-room answering questions on a 'scientific subject' for the benefit of an examiner!

Public opinion demands some change in the boy's scientific education—surely the girl's stands in equal need of reform!

[It will interest our readers to know that instruction on the lines suggested by the writer of this article is already being given in many of our elementary schools. One of the pioneers in this direction is Miss Wilena Hitching, Organiser and Inspector of Home Management to the Derbyshire County Council, whose intensely practical scheme of work is fully set forth in her *Home Management*, a book for teachers, and in her *Home Management Manuals*, intended for the use of scholars. The scheme has met with the hearty approval of the Board of Education, which, in a recent memorandum, quotes in detail her 'admirable course, which extends over three years.' Miss Hitching's books show how the important subject of home management may be taught in a thoroughly practical manner in every school in the kingdom, without the aid of special teachers or apparatus.]

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

MANY are on the wheel again who a year ago would have assured you their cycling days were done, some with a certain loftiness of experience as of those who had put away things so cheap and childish, others with sighs of regret for the powers they fancied gone. They have renewed a splendid sensation, and, as with many another renewal of early and simple experience, have found it better than all the fine and complicated means of procuring new sensations ever adopted in their lives. This August, and in the autumn to come, there will be more wise people cycling along the country roads and lanes of Britain than there have been for some twenty years past. In their enthusiasm they will confess their recent folly. Necessity has brought them to the truth. They know to-day that their old practices were right and the best, and that there is no form of exercise and recreation that is superior to this for persons who conform to any of the more general patterns of mankind, and for most of those who have methods and manners of their own. For the pair of wheels is a most adaptable and sympathetic thing; it contributes to the quickening and enjoyment of life at all times; it affords primarily, instantly, and without ceasing that first requirement of human nature, variety; and at the same moment it cunningly ministers to a subtle instinct that lies beneath the thin surface of our civilised and restricted natures, the instinct of freedom.

* * *

Walking is a respected pastime; one believes in it as in all things that are simple and natural. Yet there are many to whom this business with old Shanks's pony is a weariness and a trial. They consider it a thing of jolts and jerks and of too conscious effort; and they murmur that the scene unfolds too slowly for their patience, that the mystery of what is round the distant bend is withheld too long, and that for a full afternoon's march there is too little of the country covered, too little laid to the stock for winter remembrance. The motor-car, which in the general mass has now joined up for war service and is no longer an item in the scheme of recreation and holidays, had its serious faults, as it seemed to those who loved beauty and liked simple, quiet, leisurely contemplation. It was comfortable, it is true; but, being a thing of anti-exercise, it gave us stiffness after ease. We received the rushing wind, but rarely did our vitality seem to quicken as it does with a dozen turnings of the pedals. One who has had much happiness in the car will utter no ungrateful sentiments upon it; he will merely record that some say the car is too much of the modern mood, that it belongs to pleasures of the haste and whirlwind school, and that with the engines working past their forty the world flies by too fast, and the white riband of road in front is gobbled up too greedily. At the end one may strive to remember something seen and considered. For all the speed of it, it is not life and action; it is not knowledge, it makes little for remembrance, and it gives but peculiar and incomplete freedom. Men who marry wives and men who buy fine motor-cars fasten themselves to places and to systems. Independence has gone. Perhaps it is better so, but anyhow it has gone. The car heaps upon its owner the sense of responsibility, the necessity for continual care. It is another thing, a cause for anxiety; in the subconscious working of our simple existence there is the dim realisation that there is always not yourself only, but yourself and the car.

* * *

The cycle, on the other hand, is as a part of us. Flash with it down a gentle incline in an ecstasy of high speed that has the ineffable quality of being home-made, and then you may toss it over a five-barred gate, and scratch your way along a woodland path, or where there is no path at all, and at the end, if there is no corner of a stable or other good place for this friend, you may carry it up to your room. It is your partner in freedom, and a better companion for summer and autumn days is not to be found in war or peace. And these are days when a little freedom, when release not merely from ordinary conventions and systems of life, but from the harsh environment that closes upon us in these warring times, is better than ever it was before. To be free and upon the open road: it is a thought that may often stir a warm emotion now in many a heart that could not have been touched by it before. With the wheel, and a card of registration, a man may be as free upon the roads of Britain as

 [*All Rights Reserved.*]

ever he was. The law, in its new and comprehensive working for the defence of this harassed realm, has only troubled him to the point of demanding the addition to his equipment of one red lamp for the hinder-part; and in generous compensation the rider in war-time is given an extra hour of precious daylight whereby the red lamp may never be needed. All the rest is freedom and the open roads, the lovely roads of the homeland. A year ago we declared that the cycle was running back to full public favour again, that the roads abounded with delighted people returning to their old love, and that it had been discovered afresh that it is the best of all for summer recreation. Yet some then questioned if this renewal were really such an accomplished fact. Now they know it beyond all question and doubt. The car has nearly gone; the railway train, a poor thing at its best for country enjoyment, and harsh autocrat in its repression of individual freedom, is discountenanced and expensive; but the cycle is here at least as good as ever, and as cheap. Those who return to it after a lapse of many years find it far better than they did before; they wonder they could have deserted it. In the early period, when the cycle was a novel thing, it was a toy and a fashion; it was but dimly understood. They who remained faithful knew, and they were glad, perhaps, that the butterflies of fashion went away to other novelties and left them alone to their delight. The war has brought the prodigals back again. To be awheel in Britain, free and far from one's personal base, is joy as good and legitimate as is to be gained in these perplexing times.

* * *

But an old and well-tried lover of the wheel may sometimes have misgivings that those who thus return to the road may now blunder in their way. They will bring back with them many of the old stupidities and misconceptions. Let us counsel, then, all those who come to it now to do so with an open mind on methods and with forgetfulness of what they did of old. These are days of rebeginnings, of new outlooks and release from old conventions; so let them begin again in their cycling system and in their attitude towards the pastime. The essence of its joy is the freedom that comes with it. That fact cannot be too often stated, and in any consideration, be it of the road, of the nature of the journey, of the place of stopping, of time and circumstance, of clothing, habit, or appurtenances, let this be a point of government. Apply the formula of freedom, which is the spirit of the wheel, to every intention, and see that there is harmony then. That strange contrariness which is set in human nature and leads us so often to stupidities that spoil potential happiness, prompted mankind, as soon as the cycle was discovered and advanced to some practical stage, to shackle itself in new and remarkable ways, to limit and spoil the freedom that was afforded by these responsive wheels. Thus the early cyclists arrayed themselves in wonderful garments. They had tight-fitting suits of smooth, hard cloth, mostly of dark blue, decked with strange braids and cords, or frogged, as is the tailor's term. They wore fancy caps with long peaks. There were touches of silver, perhaps, in this equipment, and there were badges. Those were the Victorian days when soldiers wore scarlet tunics, and when uniforms of every kind seemed to make a peculiar impression upon the emotions of wearers and observers. So the new cyclists delighted to be uniformed, to classify themselves, to give themselves the appearance of a new corps devoted to some exalted mechanical practice, which was indeed far above the comprehension and possibility of the multitude. The uniform was tight; it was hot and extremely uncomfortable; it hindered the cycling movements; but it was a uniform that somehow marked the man and rendered him proudly an object of curiosity. Time brought sanity, and simple rational clothing, loose-fitting and yet good of appearance, took the place of the old uniforms. Cyclists still cultivated a strange gregariousness, by which they assembled in regiments and stormed the countryside in dusty columns, but their garments were of many hues and styles, as sense and taste dictated; and even then the regimental manner was breaking, for, instead of advancing in single or double file, solemnly and somewhat slowly, as did the uniformed riders of the old high bicycles, they became a scattered company. Some went scorching with heads bent over their fore-wheels, and laggards pedalled slowly in the rearguard. This was the dawn of freedom, revolt against the stupid convention whereby so many things that were good were barnacled and spoiled in Victoria's days.

* * *

But conventions in Britain are harder to kill than cats which you drown on Monday, and which mew again for milk on Friday. Even the most appalling wars let the silliest conventions flourish on. So cycling, which was thus born to conventions and absurdities, still has them; and those who begin now, or rebegin in the way of the ex-prodigal, should strive to bring something of the original man and the desert island manner of attitude to bear upon their intention, for that way lie abundant joys that other wheelers know nothing of. Let them think of themselves in a new world—as indeed they are—provided with a new and useful delight for the first time, and consider how best they may employ it. Assuredly they will get no uniform to start with, but they may turn their thoughts towards special cycling-shoes, things made to lace far to the toe, and usually tight, or buckled open affairs that call for the dust. In some such shoes there may

be virtues, but for my part I find that the most comfortable pair of old shoes I have make good things for my pedals. Again, the man cyclist will almost invariably consider that for real cycling, as distinct from the journey of accommodation about the local streets, knickerbockers should be worn—for their comfort and their ease. But again, though it is true such shorts have recommendations, and for brief country trips on cool evenings, or a sprint in the mornings, they have the advantage, for the long day in the saddle, with occasional rests, for the tour through the country, the holiday awheel, one's simple trousers have it. In such ordinary costume when mounted the man may not seem dressed up for the part, but this is only the conventional way of thinking. He is more at comfort, he has greater freedom, he is cooler, the dust does not cake grittily upon his skin, and when he rests, or is free for general practices in the evenings, he is more at his ease and better found. Provided always that the garments indicated are of convenient texture and thickness, as of flannel. For touring in the warm times of summer, stockings and knickers are kill-joys. He, then, who wheels away into the heart of the country in the plain attire of ordinary life has made a becoming bow to freedom, and his future promises well.

* * *

Now there is that regimental tendency; something of it lingers still. At least it is thought there should be two for a trip, that this wheeling is no matter for solitarians. If you would ride in company and find joy that way, there is no more to be said, save that you are right and abundantly justified in your happiness. But if you ride in pairs or trios, or larger formations, and still, being of contemplative ways, sigh for a recreation that will yield full measures of reflection, then let conventions go hang again, for after the fullest experiment we are assured that this is the thing of all for single and contemplative happiness. Add but one to yourself and the freedom you acquire with your cycle is lost completely. Your route must be arranged in consultation, your pace regulated; whims and moods upon the road must be suppressed. If you see a green and flowery bower by the wayside, and thoughts of a rest, a pipe, and some pages of a book pass in the mind, they must be despatched, for such stoppages have to be matters of discussion. Rarely do two souls, however much akin, agree upon the order of such incidents; and even though an understanding be established, all spontaneity has been banished from the affair; it lacks the spice of freedom, and it has been spoiled accordingly. A five-barred gate at a pretty spot has an attraction for me always. But friends may not share my love for gates. Surely cycling is the thing for the meditative person; he has the open road, the changing scene, and the beauty of it all. If the world and yourself are not enough for your thoughts, and you must have some one in company to discuss the petty affairs of families or the concert of the night before, you are no fellow for emancipated cycling. It is best to ride along in reflection, pointed here and there by a definite observation. The scene of itself fills the spiritual being. Now the spirit is bathed in the deep green of the woods and lanes, the green of life, the colour that delights and soothes and rests and is the greatest joy; and in such circumstance the mind of man seems to be cleaned, his thoughts and feelings mount fresh and pure, and happiness comes upon him. He is lost to all but Nature and himself and the gentle humming of his friendly wheel. This is the only time I ever sing. There must be many thousands of these solitarian wheelmen in our country who do not reveal themselves, for in such revelation their practices might be spoiled. I have discovered some of them by a halting process of mutual confession. One friend, who is high controller of fine theatres, a man of clubs, a happy lover of London and its social ways, and unsuspected of such lonely tricks as here described, steals away, as I have discovered from him, in late summer days to the north and to Ireland, and in utter loneliness, upon which he insists most profoundly, goes vagabonding awheel, caring neither where he eats nor where he sleeps, but filling himself with draughts of Nature and a joy of freedom and simplicity that the London he loves cannot yield to him. Another is a distinguished artist, and he too goes alone, and roams on an odd system that somewhat restricts freedom. He starts upon a long route carefully arranged for a week or a fortnight, and at the beginning has only the means for a night or two's lodging with him. In advance he has despatched letters addressed to himself to various hostelries, each containing small financial supplies, and these he takes as he reaches them. The advantage of the system is that a certain progress is assured to those who are otherwise weak of determination and disposed to rest unduly.

* * *

But we who are for solitude yet have a friend on many a run, a patient, good, and happy companion who is in fine sympathy with every event and change. This companion has naught to do with those conventions; he is for freedom too. He is a dog, one of the best of dogs, a strong-built Irish terrier, who loves the wheel as his master, though his part is not to ride, but to sprint ahead in the morning, to be alongside later, and be perhaps a bend of the road behind at the setting of the sun, yet in full equality and high happiness at all meal-times and the special gates. The country round is marked on our imaginary maps for roadside places where there are drinking and canine bathing-places; such is our perfect sympathy and understanding that sometimes we make long detours of some miles to strike upon them. Our original cycling con-

ventions had no place for the companionship of dogs; for me, I would have no other friend on day trips from the home centre, and earnestly now I consider a petition that is often expressed in two big appealing eyes that we twain go a-touring. This good friend loves the chase by wheel as nothing else; he cries his joy to the heavens at every starting and at intervals during the day; he makes his music in the lanes; and he gives the sporting touch by his occasional excursions through the hedges into the woods, and his reappearance perhaps somewhere beyond the next milestone. Or his master may have to wait for him, for these adventures are not always void of difficulty and delay. It was but the other day that from some desperate business he came limping back and one must needs turn surgeon by the roadside. But this is no occupation for parlour or boudoir dogs; be kindly careful of your partner's strength. This Jerry has strong feet and limbs, takes a bounding stride, and is in contentment for many miles, with supper and refreshing sleep to follow. He has something of the Gelert quality about him, for indeed we find him a lamb at home, a lion in the chase. And above all he gives solitude and companionship combined. We together have nothing to do with the conventions, and, if the truth were known, perhaps our instincts bid us go wheeling together because ordinary men and staid house-dogs are not supposed to do such things.

THE DEFINITE OBJECT.

CHAPTER XXXVI.—CONCERNING A CLUE.

'MRS TRAPES,' said Ravenslee, laying aside the book he had been reading and letting his glance wander across smooth lawns and clipped yew-hedges—'Mrs Trapes, what about that stewed shin of beef with carrots and onions you prepared for—our wedding supper?'

'Which,' said Mrs Trapes, glancing up from her everlasting knitting—'which you never stopped to eat.'

'Which omission I will now haste to rectify. Mrs Trapes, pray go and get it ready. I'm ravenous!'

'Good f'r you!' said Mrs Trapes; 'in about 'alf-an-hour you shall 'ave a nice cup o' beef-tea to raven at.'

'Confounded slops!' growled Ravenslee.

'Doctor's orders!' nodded Mrs Trapes, clicking her knitting-needles.

'Can't I have something to chew at?'

'Sure. How 'll a cracker soaked in milk soot?'

'Cracker!' snarled Ravenslee.

'Doctor's orders!'

Ravenslee muttered and took up his book.

'Helen who, did you say?' inquired Mrs Trapes, glancing up. 'Mr Geoffrey—I mean Ravenslee—I 'm surprised at you; swearin' ain't good for a invalid; your temperature 'll be rose if you swear.'

'But, my dear Mrs Trapes, I'm hungry—very hungry—darned hungry!'

'Which is a sign as you're improvin' rapid. Beef-tea 'll be 'ere soon.'

'I won't drink the stuff!'

'Oh, but you will, when Hermy brings it.'

'Hermione!' said Ravenslee, his voice grown gentle, and laying down his book again. 'Mrs Trapes, have you noticed any change in her lately?'

'A bit 'andsomer p'r'aps.'

'Yes; but I don't mean that; it's something that puzzles me. She seems to have grown more—more reserved and shy.'

'Well, she was married to you before she knew it kind of, almost.'

'Do you suppose that's it?'

'Sure. What you got t' do, Mr Geoffrey, is—woo 'er! Woo 'er all you know 'ow. The best woman can't be wooed too 'ard nor too frequent—so you start in an' woo.'

'But sometimes it has almost seemed that she—avoided me.'

'Well, don't let 'er.'

'Do you suppose she 's grieving for Spike?'

'Well, 'e ain't exactly a j'y t' her. There 'e is goin' straight to the devil along o' that Bud M'Ginnis!'

'I must go and fetch him as soon as I can get about again.'

'If 'e 'll come.'

'Oh, he 'll come,' said Ravenslee grimly. 'I 've decided to send him to college.'

'If 'e 'll go.'

'Oh, he 'll go; there 's quite a lot of good in him, Mrs Trapes.'

'Only, it 's mighty 'ard to find, Mr Geoffrey. If that b'y wants t' go t' th' devil, to the devil 'e 'll go. What you got t' do is t' make 'er forget 'im—if you can. Oh, drat 'im, anyway!' and, squaring her elbows, Mrs Trapes knitted so angrily that her knitting-needles clashed like weapons fiercely opposed.

'Yes; but suppose she is grieving for him, Mrs Trapes?'

'Why, then,' said Mrs Trapes—'why, then—— Oh, shucks! I guess I 'll go an' see after that beef-tea.'

When she had gone, Ravenslee sat plunged in gloomy thought until roused by the sound of approaching feet with a creak of shoes, a loud, arrogant creak there was no mistaking, and the Old Un appeared, followed by Joe and the Spider, the latter looking very smart in his new livery.

'Guv,' said the Old Un, 'best respex! 'Ere

we be, come to say 'ow glad we are t' see ye come up smilin' an' ready for more after Fate ketchin' ye a perishin' wallop as we all thought 'ad doubled ye up till the day o' doom. 'Ere ye are, on your pins again, an' 'ere 's us come t' give ye greetin's doo an' j'y o' your marriage.—Shut up, Joe!'

'Why, I wasn't speakin'!' growled Joe.

'No; but you meant to—you 're always meanin' to, you are.—Guv,' continued the Old Un, 'folks is allus a-givin' an' takin' in marriage in this 'ere world, such bein' their natur'—they can't 'elp it! But never in this world nor no other was there ever sich a weddin' as yourn. There was 'er so young an' fair an' full o' life, an' there was you so pale an' nigh to death—one leg in the grave—an' there was me so full o' years an' wisdom an' sorrer for ye both—oh, my pore old bowels was fair yearnin' over ye.'

'Lord, Old Un!' expostulated Joe, 'you keep them bowels o' yours out o' it.'

'Shut up, Joe, in your ignorance; bowels is in the Bible, an' bowels I abide by now an' for ever, amen! Well, there we all were, guv, bendin' o'er your couch o' care very silent an' solemn. "Not a drum was 'eard nor a funereal note," an' there was you s' pale an' nigh t' death.'

'You said all that afore, Old Un!' growled Joe.

'You leave me alone, Joe,' said the Old Un, scowling and flourishing a trembling fist; 'you lemme be, or you 'll be pale an' nigh t' death next.—Well, there was you, guv, an' all s' pale an' still, when, "'Oo giveth this woman?" says the parson-cove very solemn. "That 's me!" says I, quick an' ready. An' so, me 'avin' 'elped t' marry ye, I 've brought Joe an' Spider t' wish ye 'ealth an' 'appiness an' a j'y continual.—Now, Joe, it 's your round—speak up!'

'Sir,' said Joe heavily, 'I—we—I mean—Lord, sir, I am that glad—ah, glad as—as never was.'

'That 'll do for you, Joe!' snapped the Old Un. 'Spider 's round.'

Hereupon the Spider lurched forward, hunched his wide shoulders, took off his smart cap, and stared at it very hard. 'Bo',' said he, chewing vigorously—'I mean boss—er—no, that ain't right either—this is sure a bum start I 'm makin'.'

'"Bo'" will do, Spider,' said Ravenslee; 'let it go at that.'

'Why, then, bo', I ain't one as is ever goin' t' win any gold-mounted testimonials at any talk-fest or heart-throbbin' spiel-act; but what I wanter tell you is this—an' I guess you know I ain't only breathin' out puffs o' hot air—I wancher t' know as I feel about you like—like Joe an' the Old Un does—an' then some more. Ye see, bo', though I ain't never held a straight flush agin four aces, 'n' don't expect to; though I sha'n't ever be a world's champion like Joe here, I guess I know to-day what it feels like, because you ain't goin' t' snuff it after all; and now I guess you 're on.' Saying which, the Spider dexterously shifted his wad to the other cheek and chewed faster than ever.

'I am, Spider; and I want you to know I 'm grateful to you all three. Also, I want to thank you all for keeping this affair out of the papers, though how you managed it beats me.'

'Guv,' cried the Old Un, tremulous and eager, 'oh guv, we 're fair sleuth-hounds, we are—'specially me! There ain't a 'tective nor secret-service cove nor bloomin' bobby fit to black our shoes—'specially mine! Ye see, guv, I know who done it; Joe thinks he knows, an' Spider don't think at all!'

'Oh!' said Ravenslee, and, looking round, caught the Spider watching him wide-eyed, his jaws grimly tense and immobile; but, meeting his glance, the Spider lowered his eyes, shifted his smartly gaitered legs, and chewed viciously.

'So, guv,' piped the Old Un cheerily, 'we 're out for the criminal's gore—'specially me! We 're goin' to track the perisher to 'is 'orrible doom.

Where'er 'e be,
To th' gallers-tree,
Oh guv, we mean t' bring 'im;
An' laugh with j'y
When, nice an' 'igh,
The blinkin' bobbies swing 'im.'

'And you think you know who it was?'

'I do, guv—I do!' nodded the Old Un. 'I knows as 'twas a enemy as done it. Joe thinks it was one o' them gang fellers, an' Spider don't say who 'e thinks done it.'

Once again Ravenslee caught the Spider's eye watching him furtively, and once again he noticed that the Spider's jaws were clamped hard, while he was twisting his natty chauffeur's cap in fingers strangely agitated.

'Sir,' said Joe, 'me an' the Spider searched that wood, an' we found a coat'——

'Shut up, Joe,' snarled the Old Un; 'you 're tellin' it all wrong.—Guv, Joe an' the Spider went a-seekin' an' a-searchin' that wood, an' they found a—cloo.'

'Oh!' said Ravenslee.

'A cloo as is a-goin' t' hang somebody yet—a cloo, guv, as ain't t' be ekalled for blood-guilt an' mystery.—Joe,' said the Old Un, sinking his voice to a hoarse whisper, 'the hour is come—perjooce the cloo!'

Hereupon Joe produced a pocket-book, and took thence a highly ornate coat-button, whereto a shred of cloth was attached. 'I found this, sir,' said he, 'close by where you was a-lyin'.'

So Ravenslee took the button upon his palm, and, as he eyed it, the Spider saw his black brows twitch suddenly together; then he yawned. 'And you found this in the wood, Joe?' he inquired sleepily.

'I did, sir. With that to 'elp 'em the perlice would 'ave the murderin' cove in no time, an' more than once I 've been goin' to 'and it over to 'em. But then I thought I 'd better wait a

bit; if you died was time enough, an' if you didn't I'd keep it for you; so, sir, there it is.'

'You did quite right, Joe. Yes, you did very right indeed!' For a long moment Ravenslee sat languidly twisting the button in thin white fingers, then flicked it far out over the balustrade, down among the dense evergreens in the garden below. The Old Un gasped, Joe gaped, and the Spider sighed audibly.

'Lorgorramighty! Oh guv, guv,' quavered the old man, 'you've throwed away our cloo—our blood-cloo—th' p'lice—you've lost our evidence!'

'Old Un, of course I have! You see, I don't like clues, or blood, or the police. You have all been clever enough, wise enough to keep this confounded business quiet, and so will I.'

'But, oh, guv, arter somebody tryin' t' kill ye like a dog, ain't there goin' t' be no vengeance, no gallers-tree, no 'lectric chair, nor nothin'?'

'Nothing!' answered Ravenslee gently. 'Somebody tried to kill me, but somebody didn't kill me; here I am, getting stronger every day, so we'll let it go at that.'

'Why, then, I'm done!' said the Old Un, rising. 'Guv, you're crool an' stony-'earted! 'Ere's me, a pore old cove as 'as been dreamin' an' dreamin' o' gallers-trees an' 'lectric chairs, an' 'ere's you been an' took 'em off me! Guv, I'm disapp'inted wi' ye. Oh ingratitood, thou art the guv!' So saying, the Old Un clapped on his hat and creaked indignantly away.

'Crumbs!' exclaimed Joe; 'what a blood-thirsty old cove 'e is, with 'is gallers-trees! This means jam, this does.'

'Jam!' repeated Ravenslee, wonderingly.

'Sir, whenever the Old Un's put out 'e flies to jam, same as some chaps do to drink; makes a fair old beast o' hisself, 'e do. If you 'll excuse us, sir, Spider an' me 'll just keep a eye on 'im to see as 'e don't go upsettin' 'is old innards again.'

Ravenslee nodded, and, smiling, watched them hurry after the old man; but gradually his amusement waned, and he became lost in frowning thought. So deeply abstracted was he that he started to find Mrs Trapes regarding him with her sharp, bright eyes.

'Mr Geoffrey, 'ere's a cup o' beef-tea as I've prepared with my own 'and.'

'But where's'——

'She's gone t' bed. 'Ere's a cup o' beef-tea as is stiff with nourishment, so get it into your system good an' quick.'

'Gone to bed!'

'She says it's a 'eadache, o' course—drink it down while it's 'ot—but I reckon it's more 'n a 'eadache—yes, sir. A while back I says t' you, "Woo 'er," I says, Mr Geoffrey. I now says—let 'er alone a while. The pore child's all wore out—it's nerves as is the matter wi' 'er, I reckon. So, Mr Ravenslee, be patient; this ain't no wooin'-time; it's rest she needs, an' change o' air.'

'Why, then, Mrs Trapes, she shall have them!'

A SALMON-RIVER OF FINLAND.

By F. G. Aflalo.

WHEN peace comes to this troubled earth once more, no land will have greater reason to bless it than Russia, and of all the Tsar's dominions, old Finland, which has suffered least, will profit most, for Finland is going to be one of the great tourist centres of the twentieth century. It particularly behoves the angler, eager for new fields to sport in, and for opportunities less costly than those of Norway, to keep his eye on this beautiful northern province, since the new programme of railway construction promises to open up undreamed-of playgrounds for his delight.

Meanwhile there are already rivers of Finland over which enthusiasts have long thrown the reed high over their arm, to recall a poetic tribute of R. L. S. to Andrew Lang, and of these none has been more beloved than the Vuoksen, which, running out from Lake Saima into Lake Ladoga, affords sport to residents of Petrograd, from which capital it can be reached by train in five or six hours. The premier fish of the Vuoksen is the so-called *lokhi*, or 'land-locked salmon.' The English equivalent is given on the authority of resident experts, and without endorsement by the present writer, and the apparent justification lies in the admitted improbability of these handsome fish going either way through the forbidding rapids, miscalled falls, of Imatra. At the same time, and without any desire to prejudice this theory, it should be mentioned that true sea-going salmon have occasionally been taken on the rod above Imatra, and that where these can go others can follow. However, the *lokhi*, land-locked or otherwise, is a very handsome fish, a good fighter, and toothsome on the table. It apparently grows to a weight of fifteen or twenty pounds, and the average would probably be eight or ten. Out of seven fish that I had in my boat in three moonlight evenings of harling, with a total weight of sixty-eight pounds, one weighed fourteen and another eleven.

This was during the glorious moonlight nights early in August, when the river is comparatively low and little can be done by casting. Harling is not sport for an epicure, but the surroundings are enchanting, and each fish fights to a finish. As, moreover, the finish is occasionally staged

within a few yards of the small rapids (which lead to the rest), it offers just the element of danger which lends a spice even to the gentle art. These fish take a Blue Phantom spun in the broken water or a native bait made of pike-skin, called *nirka*, and used without lead or swivel.

There is also abundance of trout, grayling, pike, and a small-mouthed fish called *seeg*, which only a few persistent experts have taken on dry fly. The pike run large. One in the dining-room of a charming island fishing-lodge belonging to Mr James Whishaw, of Petrograd, weighed twenty-nine pounds. This little island, called Warpa Saari, is one of the little earthly paradises that will spring up elsewhere in the land when the new railway has linked up the backwoods. It is the island of the angler's dreams, and the name of M. Sazonoff in the visitors' book suggests its attraction for a tired statesman, while that of Sir George Buchanan hints at a similar boon for an overworked diplomatist.

Warpa Saari has everything that the fisherman can desire on a brief holiday from a troubled world—good boats and gillies, plenty of fish, an inexhaustible store of tackle and baits, a library of books, and, above all, the blessing of peace ensured by those few yards of swift water that separate it from the mainland. 'House Matti,' a rugged old Finn, untroubled by the somewhat disaffected politics of his countrymen, is an ideal boatman, for he is silent, a non-smoker, and a teetotaler; and his keenness to show sport is stimulated by the excellent scale of pay, which, in addition to his six Finnish marks (rather under five shillings at the present rate of exchange, as two marks go to a rouble), prescribes an additional mark for every fish of five pounds or over, and yet another for every completed fifteen pounds weight.

Without having any pretension to grandeur, save at the rapids themselves, this beautiful little river, which gathers immense velocity within five miles of its source, is more attractive than many with a greater reputation, and the effect of summer moonlight following swiftly on a dazzling sunset that reddens the ingathered harvest on the banks is glorious beyond words. Bird life seems scarce. There was neither heron nor kingfisher to advertise the abundance of fish in the pools, and only the last of the swallows flew to and fro under those Northern skies, with an occasional string of wild duck that nested in the reeds.

The troubles of Finland are said to loom on the political horizon, and there is considerable bitterness in Russian military circles over the immunity of its youth from the call to arms; but the agitators of Helsingfors are powerless to disturb these pleasant retreats, and Finland will in the near future owe more of her prosperity to their attraction for the tourist and the sportsman than to all their diatribes in the Diet.

JOHN CORNELIUS COMES HOME.

CHAPTER V.—SQUIRE JONES RETURNS.

AFTER a satisfactory lunch, John Cornelius felt quite rehabilitated. He, or, rather, Arabella, had scored off Martin. He, personally, had got even with Clutterbuck and Mole, and had piled the proverbial coals of fire upon their respective heads; for had he not paid Mole a bet which would have been very difficult to recover, and practically confirmed the gardener from Kew in his position?

Altogether everything looked rosy. He was the owner—the recognised owner—of a splendidly managed estate, and of a great house, replete, as the auctioneers put it, with all the requirements of a man of wealth and standing—motor-cars, he did not know how many; horses for all purposes; park well stocked with deer and cattle; woods and spinneys full of game, for the girl had pointed them out, and had so assured him. Yet were there two flies in his precious ointment—Maravillas, and what he should do with it, and the prospective meeting with Archibald Jones, who for seven years had been squire of Torringham in his stead.

The lawyer was expected to arrive at Biford at 3.30 P.M. Arabella had telegraphed to him, and had received a reply, just the words, 'Will arrive 3.30. Send the Daimler.' No comment. No message from her sister Rosa. Mrs Charteris had declared that she would be at the station to meet the train, but she was easily dissuaded, and John Cornelius and the girl went alone.

Arabella drove, of course; and John Cornelius sat rather stiffly beside her. At the lodge gates—and this was the first time they had had occasion to pass through them—Mrs Badger was standing. She had heard the car's siren, and had opened the gilded barriers. She bobbed a curtsy as they swept by, but did not recognise John Cornelius. He, however, waved his hand and shouted a cheery 'Good-afternoon, Mrs Badger!' which set that lady wondering where the strange gentleman could have seen her before. A Stetson hat and clothes of careless cut are 'some' disguise.

As they drove into the station yard they scattered a little knot of flymen at the gate. John Cornelius jumped down as the car stopped, and nearly collided with the man who had been afraid to drive him to Torringham Hall.

'Hello!' he cried. 'How's the old horse that couldn't do the journey to Torringham and back?'

The flyman recognised the voice.

'So Miss Arabella took yer in?' he said,

wagging a gray beard doubtingly; 'but wait till you see Squire Jones.'

'I am going to do so,' said John Cornelius, adding, 'you old Thomas Didymus.'

''Tain't my name,' the flyman retorted. 'Thomas Collins I be called, an' Squire Jones be my landlord.'

The small crowd sniggered.

'Tommy knows which side his bread be buttered on,' said one.

Nevertheless, it was plain to see that they were all a little uneasy in their minds, for most of their cottages belonged to the owner of the Torringham estate, whosoever he might chance to be.

The train came in and stopped. From a first-class carriage alighted a short, stout, jolly-looking gentleman in country garb, and a tall, handsome girl. The stout gentleman went to the guard's van to look after the luggage. The girl came forward, flushed and hesitant.

'I will introduce you,' said Arabella. 'Mr Cornelius—my sister Rosa.'

John Cornelius lifted his cap and held out his hand. 'Pleased to make your acquaintance, Miss Jones.'

'So you 're not an ogre, and you don't look as if you would turn us out into the fields,' rejoined the girl.

'Goodness, no!' said John Cornelius. 'Whatever made you'——

'Dad 's nervous, that 's all,' she said; 'but it will be a weight off his mind, anyway.'

Just then the lawyer, who looked rather like a farmer, and had been a country squire for seven years, walked up, followed by a railway porter loaded with baggage. Without waiting for an introduction, he placed himself before John Cornelius, standing with legs apart, and looked at him keenly.

'I have had telegrams from Arabella and Mrs Charteris,' he said. 'I knew Andrew Cornelius almost as well as I knew his brother John. Except as a matter of form, I want no evidence. The Court of Chancery will. But I 'll swear the necessary affidavit that you are the only son of Andrew Cornelius. You couldn't be anybody else's son with that face. When do you want us to quit?'

'Is the property in Chancery?' asked John Cornelius.

'Yes—four years. I am trustee. You 'll find everything in order. When do you wish us to quit?'

'I 'll tell you,' said John Cornelius—'after you have shaken hands.'

'Oh, then, you don't resent my not having discovered you?'

'Lord, no! Put it there,' said John Cornelius.

They shook hands heartily. Clearly, as his elder daughter had found time to say, a heavy weight had been lifted from the lawyer-squire's mind.

'I went to America myself,' he said. 'Texas, Arizona, Colorado, California, goodness knows where. I got on the track of a Johnnie Cornelius in Texas, at a town called San Antonio. My informants—everybody seemed to remember him—said he was a cow-puncher, whatever that may be. Nobody seemed to know where Johnnie had gone, but all declared that you were "some looker," and ought to be found easily. I employed Pinkertons. You know with what result.'

John Cornelius laughed. 'I was rather popular in Santone,' he said. 'Painted the town rather red on occasion. Had to skip finally, and wasn't able to leave an address behind me, because I didn't know where I was going. That 's some years ago now. I went to Mexico, where I 've come from.'

'And where you heard that you were wanted?'

'Yes, from a Torringham man—Davison.'

'Jimmy Davison! Why, I 've seen him almost every day since he came back. I thought I saw him on the platform here.'

'So you did, dad,' intervened Rosa. 'He came to meet us, but he disappeared somewhere when he saw Mr Cornelius with Arabella.'

'H'm! He kept things pretty dark. But we 're getting away from the point. When do you want us to leave the Hall, Mr Cornelius?'

'Suppose we talk about that another time,' said John Cornelius, drawing the lawyer aside. 'I might be able to induce you to remain as steward. I've been thinking that I might persuade Arabella to remain also'——

'As'——

'Mistress of the Hall,' said John Cornelius; and taking the lawyer by the arm, he led him from the platform.

Arabella was already in her place at the wheel and ready to start.

'If we sit behind we 'll be able to talk,' said the lawyer.

'If you don't mind,' returned John Cornelius, 'I 'll sit with the driver. I am taking lessons, and it would be a pity to interrupt the course.'

He sprang in beside Arabella, and as it was rather a chilly day, drew a rug carefully over her knees. She thanked him with a smile and a whispered word.

'So that 's how it goes, Bella Bright-Eyes, is it?' reflected a watcher at the waiting-room window looking into the yard.

They drove away, the deposed squire beaming and talking boyishly to Rosa. The flymen touched their hats as the car swung round, and a sunburnt, stoutish gentleman, who had stepped out of the waiting-room, lifted his.

'Mr Davison,' said Arabella, with a motion of her head.

'Hello, Davison!' cried John Cornelius. 'Lucky for you I was down by the Rio Grande that day!'

Davison waved his hat in greeting. 'Lucky!' he said to himself. 'Well, I admit it; but I fancy

that my best bit of luck was Rosa's absence in town when you turned up. She might have been driving that car this minute, and smiling up at you instead of Bella. In which case'——

'I'll get Davison to go to Mexico and sell Maravillas,' reflected John Cornelius. 'It would be a fine honeymoon trip for Rosa.'

THE END.

THE MONTH: SCIENCE AND ARTS.

SIMPLE ELECTRIC PROCESS FOR CLEANING SILVER.

IN these days, when servants are most difficult to get, housewives will welcome any expedient which reduces the time taken to keep the house and its contents in order. One of the irksome periodical tasks about a house is cleaning the silver, and the process we are about to describe greatly lessens the time and the labour involved. The new method is a very simple one, and without explanation many people would never realise that electricity entered into the process at all. The only article needed which will not be found in every household is an aluminium bowl. Into such a bowl pour a quart of boiling water, and add a teaspoonful each of salt and washing-soda. Then dip the tarnished silver articles into this solution, and leave them in for a few seconds; after which the articles can be wiped, and then polished with an ordinary polishing-cloth. With this process it is quite unnecessary to use any powder or paste for polishing. What really happens is that the aluminium bowl, the silver article, and the salt and soda solution form an electric battery, and the tarnish, which is silver sulphide, is taken from the silver article and deposited on the side of the bowl. The action is similar in principle to that which takes place when the process of electroplating is carried on.

A KNEE PENCIL-HOLDER FOR ARMLESS MEN.

An American doctor has perfected a pencil-holder which clips round the leg close to the knee when in a bent position. A writing-pad is held in a suitable frame at the correct height, and the operator, when sitting down and resting the leg upon the ball of the foot, is able to write much more effectively than could be done with the feet or the teeth.

NEW TYPE OF LAND-TORPEDO.

As the inventors of all the belligerent nations are racking their brains to produce new engines of warfare, it is not surprising that many effective devices have been brought forth. Although the invention described below was suggested by an Englishman, Stafford Talbot, of London, it has been worked out by Mr B. A. Villar, of New York. The appliance is essentially a land-torpedo, and has a much greater resemblance to the sea-torpedo than have the bombs commonly designated land-torpedoes which are projected from trench-mortars or aeroplanes. According to the *Scientific American*, in which the new device is illustrated, it consists of a four-wheeled chassis, driven by a small steam-engine at a speed ranging up to sixty miles an hour. The boiler is heated by a petrol or paraffin burner, and all four wheels are driven by chains from the engine. A torpedo in a bullet-proof casing is mounted upon the front of the chassis, and all the vital parts of the mechanism are armoured. Electric cables wound upon suitable drums, which unwind as the chassis goes forward, are used to control the speed and to fire the torpedo. The function of these torpedoes is to run rapidly across 'No Man's Land' up to the enemy's trenches, where they will break through the wire-entanglements and explode among the defenders. The system is said to be much less costly than gun-fire, in view of the results achieved. The new weapon is particularly suitable for surprise attacks, as no noise need be made until a row of torpedoes is launched upon its deadly mission.

NEW TYPE OF BULLET-PROOF ARMOUR.

Although we have not yet adopted the complete armour of the medieval knight, that invented by Dr Guy Otis Brewster, of Dover, New Jersey, is capable of protecting the whole of the front of the body except the legs. The armour consists of a roomy helmet and a breast-plate. Both helmet and breast-plate are V-shaped, with the point of the V to the front, the idea of the inventor being to present to a bullet coming directly from the front an inclined surface from which it would ricochet. In this armour the inventor was subjected to rifle-fire and to attacks with a ten-pound sledge-hammer without receiving any hurt. The armour, which weighs thirty pounds, is well padded inside to absorb shocks from bullets, pieces of shell, or flying débris.

HOME-GROWN SUGAR AND THE WAR.

With the single exception of wheat, our dependence upon foreign countries has been more emphasised by the shortage of sugar than of any other commodity, and one naturally wonders why the growth of the sugar-beet in this country, which has long since been proved to be practicable, has not been more encouraged by the Government. In fact, it is only the war which has aroused our authorities to the importance of this subject, as shown by a belated grant of £125,000 for the erection of a sugar-beet factory and the purchase of land to keep it supplied with the raw material. An area of 5600

acres has been purchased at Kelham, near Newark, this acreage being large enough to provide sugar-beet for a factory on a commercial scale. The site for the factory has every necessary facility in the way of rail and canal transport. As is well known, grants are not made from the Development Fund to assist enterprises undertaken for the making of profits, and the present scheme is to be carried out by the British Sugar-Beet Growers' Society, Limited, which has no such object in view. Once the scheme is well on the way, however, it will probably be extended, and eventually develop into a commercial undertaking, when no doubt the loan from the Development Fund will be repaid. The growing of the sugar-beet in this country is by no means a novel idea, as our readers will be well aware, many references to this subject having appeared in these pages, including a description of the sugar-beet factory at Cantley, and the growing of sugar-beet in that district. These references, however, have described comparatively recent experiments and undertakings, but it is interesting to note that so long ago as 1831 several enterprising young English farmers visited France with a view to qualifying themselves for establishing a sugar-manufactory for the production of beet-sugar. Eventually a company was formed, and a small factory was erected near Maldon, in Essex. This experiment, however, and others of a like nature which have been tried since, were doomed to failure, owing to the small scale on which the operations were carried on, and it was not until the large factory was laid down at Cantley that sugar-beet was successfully grown and manufactured into sugar in this country. A clear proof that the soil and climate in the eastern counties of England are suitable for growing sugar-beet is afforded by the favourable terms offered to certain farmers several years ago by a Continental firm of sugar-manufacturers for beet to be shipped to their factory. One of the principal drawbacks in growing this crop is the amount of labour involved just at the busiest time of the year for farmers. This labour, moreover, is of a semi-skilled type, and could not be undertaken by the class of men and women employed for hop-picking and other similar work. Then, again, the factories can only be worked for four or five months in the year. These difficulties, however, have been overcome on the Continent, and there is little doubt that they can be surmounted in this country.

MOTOR-CAR CONVERTED INTO A FIRE-ENGINE.

The motor fire-engine would be far more used by the smaller towns in this country if it were made at a reasonable price, even at some sacrifice in power. Before the war the motor fire-engine cost nine hundred pounds, whereas a steam fire-engine could be purchased for about one-third that sum. An American concern has recently introduced a fire-engine consisting of a low-priced motor-car to which has been added a water-pumping engine and a chemical apparatus, together with the usual equipment carried on such vehicles. This fire-engine can be produced at a low price, and, unlike the steam fire-engine, is entirely self-propelled.

ENORMOUS STONE-CRUSHER BUILT IN AMERICA.

As is known to most of our readers, stones for roads and other purposes are often broken up by mechanical stone breakers or crushers. A machine of this type, which is claimed to be the largest in the world, has recently been invented in America. This colossal crusher will reduce stones five feet across to eight-inch pieces at a rate of 1250 pounds an hour, while the hopper or bin surmounting it is capable of holding 65 tons. The crushing mechanism is driven by a 300-horse-power electric motor, through the medium of eighteen cotton ropes, which grip into grooved pulleys upon the motor and the crusher respectively. On leaving the machine the broken stone is delivered to revolving screens by belt conveyers, where the smaller material is separated out for further reduction in less powerful crushers.

A MACHINE FOR PREDICTING THE TIDES.

Our American contemporary *Life* contains an interesting description of a complex machine used in the office of the United States Coast and Geodetic Survey. Every captain of a ship, whether it be a coasting-vessel or an ocean-going liner, must know beforehand the height of the tide at any port which he requires to enter. This information is given in the Nautical Almanac for nearly every port in the world, and, as such ships may remain at sea for a year or more, these almanacs must give the times of high-water at the various ports for at least this period ahead of the time when they are issued. As a matter of fact, the Nautical Almanac issued by the British Government gives the times of high-water at the seaports of the world for three years ahead. The calculations involved in compiling these tide-tables represent an enormous amount of work, and even so long ago as 1872 Lord Kelvin, who was then Sir William Thomson, made a rough model to show the practicability of predicting the tides mechanically. Since that time several tide-predicting machines have been constructed. The apparatus needed is necessarily a very complicated one, as a great many factors have to be allowed for, the time element being one of the most important. In this connection it is necessary to allow not only for the differences of time due to longitude, but also for the standards of time used by the various countries. Then we must remember that the tides are affected not only by the attraction of the moon, but also by that of the sun, and that the relative attractions vary according to latitude,

the time of the year, and the positions of the sun and the moon, which vary with the changing phases of the moon. Altogether thirty-seven factors are allowed for by this machine, all of which are needed in certain cases, and it is capable of giving the times of high-water for any number of years ahead. On the face of the machine are dials which give the height of the tide, the day of the month for any particular year, and the hour and the minute of the day at which high-water occurs. Moreover, it will give upon a slip of paper an actual tide curve for any place in the world, from which, so long as the time of high-water is known, the height of the tide can be computed at any moment. This wonderful machine, which has taken fifteen years to perfect, weighs over a ton, and although the adjustments for certain places and years occupy a considerable amount of time, the saving compared with the ordinary method of calculating the tide is enormous.

ELECTRIC TORCH WHICH LIGHTS WHEN TURNED UPSIDE-DOWN.

The novelties in the way of electric torches appear to be almost endless, and several of them have been described in these notes. One of the most recent has been invented by Mr. W. H. Smith, and was lately described in the *British Journal of Photography*. It consists of a bottle with a wide mouth, into which is fitted a rubber cork. Rods of zinc and carbon respectively are inserted through this cork, and they project down the bottle for about a third of its depth. On the top of the cork is mounted a small electric lamp, similar to those used in the ordinary electric torch, and connections are made to the lamp from the zinc and carbon rods. A mixture of water, bichromate of potash, and sulphuric acid is put into the bottle, and stands at a level about one inch below the end of the zinc and carbon rods when the bottle is upright. Upon the bottle being turned upside-down, it really becomes what is known as a bichromate cell, a well-known type of cell for producing small quantities of electricity for electric bells and similar purposes. The electric current produced when the solution surrounds the zinc and carbon rods is strong enough to light up the lamp, and the apparatus becomes an electric torch. The cork of the bottle must, of course, be made perfectly water-tight. Square bottles with large round mouths, such as are used for pickles and similar products, are very suitable for these torches, as they can be laid down on their sides when light is required. A torch of this description can hardly be recommended for the pocket, but for use in bedrooms and about the house it should prove of considerable value.

SUBSTITUTE FOR PAPER SUGGESTED BY MR EDISON.

At a recent interview, according to *Popular Science Siftings*, Mr Thomas Edison, the noted American inventor, stated that he could produce thin sheets of steel, copper, or nickel that would, so far as books are concerned, serve every purpose for which paper is now employed. Mr Edison considers nickel to be the best metal for this purpose, and states that he can produce sheets only one twenty-thousandth of an inch in thickness, and these will be cheaper, tougher, and more flexible than ordinary book-paper. In the Edison Laboratory a sheet of nickel paper with an area of five square feet can be produced within a minute and a half, but for ordinary commercial purposes the material would be made in long rolls, as is now the case with paper. The advantages of the metal sheets include non-inflammability, the capability of being soaked in water without damage, and a vast reduction in bulk when compared with paper, as a single small volume could contain many thousands of leaves.

RAPID DEVELOPMENT OF THE KELP INDUSTRY IN THE UNITED STATES DUE TO THE WAR.

All along the Pacific coast of America vast quantities of the brown ribbon seaweed known as kelp are to be found. This seaweed was collected in small quantities before the war, for the purpose of producing potash fertilisers. In addition to the potash, however, it contains other substances, one of which is acetone, a chemical largely used in the manufacture of cordite. In the early days of the war great quantities of cordite were ordered from America, and the manufacturers soon realised that the acetone needed could more easily be produced from kelp than in any other way. The kelp is harvested by vessels resembling dredgers, except that for the usual 'bucket ladder' is substituted an elevator very similar in construction to that used for stacking the straw when corn is threshed out. The lower end of the elevator is submerged to the correct level, and the weed is cut by vibrating two knives similar to those used for reaping corn. The cut weed is then carried up by the elevator, and discharged into a hopper in the cutting-barge, or over the side into separate barges. The machinery in these cutting-vessels is driven by oil-engines, and they are towed to the grounds by motor-tugs. The chemical process for extracting the desired materials from the kelp is a long one, which need not be gone into here further than to state that the weed is first soaked in vats for a considerable period.

INCREASED SUPPLIES OF BASIC SLAG.

The great demand that exists at the present day for increased quantities of artificial fertilisers has caused both the Royal Society of Arts and the Society of Chemical Industry in London to discuss the possibility of tapping fresh sources of supply. The basic slag formed as a waste product in the manufacture of Bessemer steel

has long been esteemed a valuable fertiliser, but the much larger supply of slag produced by the 'open-hearth' system of steel-making has been almost entirely neglected. It is true that the latter is not so rich as the former in phosphoric acid, nor is it so readily soluble in a solution of citric acid, the test generally employed in the past to determine whether a phosphate was readily available as a plant food. But there is a strong suspicion that German chemists have, for ulterior commercial purposes, unduly exploited the citric acid test, and it is believed that further inquiries and experiments will lead to large quantities of 'open-hearth' slag, which is at present merely a waste product, being ground into powder and used to fertilise the soil.

A NEW FORM OF CHART TABLE FOR THE USE OF NAVIGATORS.

The war has brought home to the navigator the importance of a chart-table by means of which a chart may be examined at night without any light being visible from outside. The ideal form of chart, of course, would be a self-luminous one; but as this is not at present feasible, an excellent substitute has been provided in a new chart-table which is lit from below. The table comprises a substantial outer case for protection of the chart against the effects of the weather, and an inner 'light box' fitted with a plate-glass lid, over which the chart is stretched. Within the box, and below the chart, are a number of small electric lamps so distributed as to illuminate evenly the lower surface of the chart, which thus becomes quite readable. The lamps are so arranged that no ray of light can reach the outside, and the degree of illumination is readily regulated by means of a small hand-wheel. Roomy pockets are provided on each side of the 'light box' for holding the necessary drawing instruments; the chart is securely attached to the surface of the box, so as to avoid any possibility of its being blown about; while the top of the table can be revolved to allow for the direction of the wind. Furnished with such a device, the navigator, even on the darkest night, can plot his course, examine landmarks, channels, &c., on deck without the necessity of resorting to the chart-room. When closed, the table forms a convenient writing-desk; or, if desired, it can readily be unshipped when not in use, and stowed elsewhere. It can be supplied in various forms, either mounted on a substantial pillar, or on four legs which may be bolted to the deck, or in a form suitable for attaching to bridge-rails.

A CEREAL-SAVING INVENTION.

'Necessity is the mother of invention.' The proverb, though trite, is still true. The shortage of cereals in this country caused the Food (War) Committee of the Royal Society to carry out last winter a series of experiments for the purpose of discovering a substitute for them in the production of a certain article of great importance in the prosecution of the war. The experiments have met with complete success, and a suitable substitute has been found in the horse-chestnut, which, hitherto of use only as food for deer and goats, will, for the duration of the war at least, indirectly prove of great service to the community by setting free for human consumption a not inconsiderable weight of cereals. Arrangements for the collection of horse-chestnuts in the autumn are now being made, and the gathering of them will afford an opportunity even to very young boys and girls of 'doing their bit' in the service of their country.

HUNGER AND APPETITE.

An interesting book on *The Control of Hunger in Health and Disease*, written by Professor Carlson, of the University of Chicago, has recently been published both in this country and in America. From a series of experiments made upon a man into whose stomach (as the result of an operation in childhood) there was an opening from the outside, supplemented by experiments upon himself and other human beings, as well as upon various animals, including dogs, Professor Carlson has come to the conclusion that the direct cause of hunger is a series of rhythmic contractions which are invariably set up within the stomach when it is empty. These contractions, beginning at the cardiac or left end of the stomach, and spreading thence in a succession of waves over the entire organ, have their origin in certain receptors in the muscular substance of the stomachic walls. Their presence produces a feeling of restlessness and excitability, and are the physiological explanation of the fact that 'a hungry man is often an angry man.' When the sense of taste is brought into play, or when food, water, gastric-juice, acid, alkali, oil, or other substance is introduced into the stomach, these contractions cease, and are succeeded in a few minutes by a series of digestive movements, which, however, begin at the pyloric or right end of the organ. Hunger in the physiological sense, it should be noted, is not the same thing as appetite, which Professor Carlson regards as due to mental rather than physical causes, being largely an anticipation by the mind of pleasurable sensations which it is hoped are in store. Briefly stated, appetite is the measure of our desire, hunger of our need; and in these days of comparative scarcity of food it is our duty to control the former as much as possible, and not to titillate it by means of *apéritifs* and dishes intended to gratify the sense of taste rather than to provide the body with nourishment.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

OYSTERS FOR TABASCO.

By ÆSCULAPIUS.

I.

JOCULAR mariners nicknamed it Haw-Haw Bay, because they were excited to derisive laughter in passing it. Not that there was no note of trepidation in their boisterousness, for the promontory marking its western extremity was known as the Beachy Head of the Mediterranean. Many ships had been sunk without warning, and many passengers had been shelled in their boats.

'What's the service coming to when a fine ship like that is jammed on rocks charted a hundred years ago?' one merchant skipper asked.

The object of his scorn was a comely liner. She had a yellow funnel and white upper works; and a goodly splash of red below showed her to be well on the reef at Cape Mitylene.

'Think of the cargoes she might be carrying!' the purser said mournfully.

'Bah!' the second officer exclaimed in disgust, making out her name, *Tabasco*, Birkenhead; 'she's too saucy for words.'

Anywhere else the first storm would have made short work of her, but summer weather prevailed in these proverbially fine seas, and she might last for months. No doubt, the presence of submarines in the vicinity militated against getting her off. At all events, no effort of the kind was being made at present. There were no signs of salvage craft about, or indeed of any life on board. Evidently all hands had taken to the boats, giving the inhospitable coast a wide berth. The boat-deck itself was cleared, and the davits turned outwards, with the free ends of their ropes swaying in the gentle breeze.

In the days that followed the *Tabasco* was responsible for many a 'cag' on board his Majesty's ships. Even the *Alcibiades*, on her way to the Pitagora station in August, spotted the unfortunate steamship. The R.N. officers roared at the expense of their R.N.R. messmates, for there was great rivalry between the two branches of the service when it came to navigation. Lieutenant Deans, R.N.R., was always boosting his Yellow Funnel Line, and what made it harder for him to swallow the bitter pill of verbal adversity was that the *Tabasco* was one of their latest ships.

'So that's the sort of seamanship you're always yapping about!' Lieutenant Jewell, R.N., remarked.

'Never mind,' Deans retorted. 'What about H.M.S. *Capulet* and Lundy Island? We know how she went ashore, but we don't know the circumstances under which the *Tabasco* came to grief.'

'Circumstances!' repeated Jewell contemptuously. 'I can't imagine any officer of the watch not clearing that shoal, unless a black bottle was responsible; and I bet there wasn't Tabasco in it either,' he declared, turning on his heel.

II.

There was another kind of 'hot stuff' weaving himself into Cape Mitylene affairs in the person of Herr Kommandant Otto Verbrecher. The *kommandant* also resembled a leech in this respect, that when surfeited with bloody spoil he dropped to the bottom and went into retirement for a while. Perhaps this cautious strain in his nature was responsible for his long immunity from destruction at the hands of the 'Fritzstrafers.' At any rate, his fat bank-account kept on increasing. The Fatherland was not at all niggardly when it came to rewarding services such as the *kommandant* rendered.

The Herr himself was a man of colossal build. In fact, when his boat was diving he had to be careful how he changed his position; otherwise the 'trim' was in danger of being upset. His present career was but an offshoot of his natural bent. Ever since his boyhood days Verbrecher had been potting at something or other. Indeed, if practice counted for anything, he ought to have ranked as one of the crack shots of the world. No animal, small or large, was safe from his depredations. In the days when sniping was in its infancy he used to conceal himself in trees, and snipe everything in sight, his invisible person being execrated by owners of animals falling a victim to his lust. Otto's father often patted him on the back, and said, 'Mein sohn, you'll make a good officer for the Kaiser's army.' Unfortunately, when the time was ripe for him to enter that august service, Otto Verbrecher's father lost a lot of his money. That would not have mattered so much were it not for the fact that when the young aspirant's pedigree came to be investigated, the Wilhelmstrasse people discovered, much to their horror, that Otto's grandfather had started life as a barber. He was, therefore, rejected with contumely. Ever since that lamentable episode the *kommandant*, unlike most of his brethren, had worn his hair long, and had not shaved. All was not lost, however. The German Admiralty had no hair-splitting ideas on the subject of ancestry, and gladly received him into their fold. Verbrecher rose rapidly in the service, and sank the *Falaba* in command of his own submarine, for which he was decorated with the Order of Merit, first class. After returning from that honourable exploit, he married Fräulein Finckelstein, and bought a house in the suburbs of Wilhelmshaven. His bank received more prize remittances than

ever, and his expectations greatly increased when his Admiralty transferred him to the Mediterranean. They gave him a big U-boat, and made his ostensible base at Pola, on the Adriatic, whither his Frau removed her domicile. When the Italian liner *Yolande* was recognised as his fiftieth prize, the *kommandant* returned to Pola for a long refit. On that memorable occasion officers and crew were given six weeks' leave, at which the worthy Herr Kommandant rejoiced, for his fruitful Frau had presented him with triplets, of whom, of course, he was immoderately proud.

III.

Just about the time garrulous traffickers had made Haw-Haw Bay a byword in the Mediterranean, Herr Kommandant Verbrecher was once more on the move. Long leave had so whetted the appetite of officers and crew that they prayed for a victim as earnestly as they sang '*Die Wacht am Rhein.*' Their suave spokesman, an *oberleutnant*, endeavoured to speed up the *kommandant* in this respect. The wily Verbrecher, however, was not taking any chances. He only came to the surface by night, when he made all possible speed on his gas-engine. Once or twice he spotted ships through his periscope, but the circumstances were not favourable, and he preferred to hold his torpedoes in readiness for the big bag he expected to make off Cape Mitylene.

When the *kommandant* finally fetched up somewhat under six thousand yards from his favourite *point d'appui*, he was still submerged twenty feet, so he gave orders to the man standing by the lifting-gear to raise the periscope. Grasping the handles on each side of the lower end, and looking through the eye-piece in much the same way as if it were a telescope, Verbrecher had a good look round. '*Gott im himmel,*' he cried out excitedly, as he finally made out two steamers practically dead ahead of him, 'here's a feast fit for the gods!' He proceeded to take a bearing, but became impatient. 'I must have a better look at them on top.—Diving-stations!' the *kommandant* shrieked. There was a general scramble for these. In rising, the crew operate much the same mechanical devices as for diving, only the opposite way. 'Blow tanks!' Verbrecher hissed. An immensity of bubbles agitated the sea as hundreds of gallons of water were forced out of the external tanks by compressed air. At the same time the square-faced coxswain gave his hydroplanes a 'rise' helm, and the U-boat shot to the surface. The *kommandant* then opened the lid of the conning-tower, and clambered out on to the bridge. The coxswain followed him. One of the ships was stranded, and seemingly abandoned, so the *kommandant* decided she could wait. He then turned his attention to the other one. She was a defenceless tramp. When he first looked at her through his periscope she was apparently standing still, but now she had turned round, and was steaming in a westerly direction. The distance was a bit far for a torpedo. Verbrecher must cut her off on the surface. 'Put clutch in,' and 'Go ahead at full speed on Diesel,' the *kommandant* roared, giving the necessary bearing to his coxswain.

IV.

Next to the tanks, the *Tabasco* was perhaps the most brilliant offspring of the Board of Inventions. Her keel had only been laid down a short time by the Yellow Funnel Line when the Admiralty took her over and made certain constructional changes in her design. In the end she was perhaps the most astonishing ship that has ever sailed the high seas. Things were not what they seemed in the *Tabasco*. She violated all the conventions of shipbuilding. Take the hawse-pipes, for example, those nostril-like holes, hoary with tradition, through which the cable urges its rattling course to and from the bottom. It is true that, for the sake of appearances, these were nicely reproduced in their natural colours. The Yellow Funnel liner, however, made fast fore and aft according to an altogether different system. Her anchors were held in specially devised gaps in the ship's bottom. When cables, working in concealed chutes, released them, the *Tabasco* was able to ride at anchor in the most uncanny fashion.

Behind neat white upper work, rapid-firing, high-velocity four-inch guns were mounted in every available part of the ship. Seamen-gunners, pulling certain levers toward them in the chart-house, caused these blind shields to slide back. Lookouts, hidden in ventilating-cowls, estimated the range, and informed the gunnery-lieutenant accordingly by telephone. That officer was in a position to judge of the correctness of these findings from his station by means of a modified periscope arrangement.

Search-lights had, of course, been installed in certain cowls, but these were not switched on during the Cape Mitylene expedition. The 'sleeping beauty' nature of their plans required them to conserve every ampère of electrical current. The source of this was powerful storage batteries, supplying the ship's mechanism with 'juice,' lighting her, and enabling the cooking to be done in electric ovens, so that her funnel did not emit even the tiniest curl of smoke by day or the faintest spark at night. By the same token, dead-lights prevented the smallest chink of life from showing through the portholes.

V.

As a matter of fact, Commander St John Mivart, R.N.R., of H.M.S. *Tabasco*, knew all there was to be known about Cape Mitylene reef, and the particular cleft in it which would receive the Yellow Funnel liner's nose. Then he let go the anchors which operated in such a

peculiar manner. That was the easiest part of it. The hardest was restraining the natural impulses of his crew. Man is at best a careless creature, and Mivart had great difficulty in making them toe the mark in regard to every detail of their present adventure. Not that there was nothing to be said on their behalf. The world may look bright enough through cowls and gun-sights, but when off duty the men wanted to lounge on deck, or at least to feel that they were free to mingle with the atmosphere without encountering a steel bulkhead at every turn. They came to Mivart, begging him to relax the severity of the discipline under which they suffered.

'What 's your trouble?' the commander asked.

'We can't give it a name, sir,' a stoker called Bridewell said, speaking for the community, 'but it 's a queer sort of feeling, and awfully oppressive, that 's been coming over us lately. We believe it 's the result of staying under cover so much. At any rate, the thing 's getting on our nerves fast, so we thought you 'd let us sleep on deck, or at least come out into the open when darkness falls.'

Mivart was sympathetic, but firm. 'I can quite appreciate your point of view,' he said gently, 'but you knew what you were up against when you signed on for this special service. Giving in to you means creating weak spots in our armour. One cigarette-spark on deck might give the whole show away. As for shadows and silhouettes, you know how this limpid air exaggerates them. The slightest exposure of our persons may advertise the decoy nature of the *Tabasco* from here to Kiel. For goodness' sake, then, exercise more mental control, and try to realise that every ripple on the surface of the sea may have eyes!'

What made matters worse was that a lull occurred in the submarine campaign about the time Mivart elected to play the part of shipwrecked liner. The spirits of the crew continued to droop, and their only object in life seemed to be to afford sea-scoffers an opportunity of exercising their ill-timed wit. At least Mivart thought it was when one tramp steamer had the effrontery to lower a pulling-boat, and come so close that the *Tabasco* people could actually hear the seamen's odious remarks. It was touch-and-go for a while as to whether Mivart could restrain his exasperated men from firing on them, and the commander was wondering what he should do if they attempted to clamber on board, when a signal from the tramp caused the pulling-boat to return in haste. Soon dense clouds of smoke, pouring out of her funnel, showed her men to be stoking hard in their endeavour to get away from the neighbourhood of Haw-Haw Bay. It was only after the tramp steamer got off the *Tabasco's* beam that Mivart saw the cause of their anxiety. By means of a powerful glass, the commander was barely able to make out a submarine breaking water in the far distance. Unfortunately she offered an extremely small target, as yet well beyond the range of his guns.

VI.

So far as the tramp was concerned, the result was a foregone conclusion. She made a gallant attempt to escape, but what use is eight knots compared to a super-submarine's fifteen? As soon as Herr Kommandant Verbrecher got within range, he began shelling the unfortunate vessel. He had decided not to waste a torpedo on such an insignificant ship; and, after all, the *kommandant* preferred gunnery to messing about with torpedo-tubes. The old instincts rose stronger within him than the claims of his later training. Watching the effect of the firing through his binoculars, he encouraged the gun's crews by grunts of approval whenever a good hit was made. When the skipper was blown off the bridge, it so bucked Verbrecher that he helped with the shells himself, and even insisted on firing one of the guns. The tramp commenced to settle, and the survivors took to their boats. Their immunity from fire was short-lived, however, for the *kommandant* had determined to remove all traces of his crime. If he were at the end instead of the beginning of his cruise, it might have been different, but Herr Verbrecher considered he could not run the risk of leaving survivors behind to tell the tale. Such ill-advised humanitarianism would interfere with his plans for the next few days. Besides, the *kommandant* considered he owed it to the Fatherland to extirpate Englishmen whenever opportunity offered. While so engaged in shedding blood a reverent feeling would come over him, and he came to look upon his victims in the light of so many sacrificial offerings to the All-Highest. As to the form which such immolations ought to take, the *kommandant's* practical turn of mind deemed such trifling details unworthy of a moment's thought.

The sinking ship screened the boats to some extent, so Verbrecher manœuvred for a better position. After ten minutes of accurate firing he had accomplished his object. The despised tramp would henceforth form new caverns for deep-sea fish to explore and lurk in. No more would her light-hearted officers and crew irritate countrymen of theirs, on whom was to fall the obligation of avenging them.

When all was over, Herr Verbrecher turned his boat round, and headed her in the direction of the *Tabasco*.

'Swine of Englishmen,' the *kommandant* soliloquised as soon as he had come sufficiently near to study the stranded ship—'how they must fear us! Sheer fright makes them run their steamers on the rocks. *Ach!*' he exulted, with a sneering gesture toward the Yellow Funnel liner, 'they 're fast losing their cunning for the sea. *Deutschland über alles.*'

The *kommandant* regarded with pleasure the first-rate target the *Tabasco* would make for his deck-guns, and he rubbed his hands with satisfaction when he considered how easily they would earn more prize-money that fine afternoon.

'It 's a shame to take the money, as those dogs of Yankees would say,' he muttered gleefully. Still gloating over the prospect, he was about to order his crew to man their guns and open fire, when vicissitudinous war intervened. A high-explosive shell struck him. The *kommandant's* head flew off into a thousand bits, leaving his gory body to spurt blood on everybody and everything near it.

VII.

The pent-up feelings of rage and anguish which were experienced on board H.M.S. *Tabasco* during this period can readily be imagined. When the little tramp was receiving her death-thrust, and her crew were being murdered, gunner after gunner pleaded with Mivart to let them have a shot at the U-boat. Perhaps the commander erred on the safe side. He had not had much experience with the latest four-inch with which the *Tabasco* was equipped. At any rate, Mivart declared he would not fire till he was able to pot the submarine at four thousand yards. 'A submarine like that,' he said, 'isn't sunk so easily as some people think, and unless we plug her with the first salvo, she may submerge in time to give us the slip, and then we 'll have to pack up. I 'm confident she 'll come closer if you 'll only have patience,' Mivart assured them.

'Four thousand seven hundred, four thousand five hundred,' Gunner Potter heard through the voice-pipe. He could stand it no longer, so he let bang at the U-boat on his own.

'*Kommandant's* head gone; still four thousand five hundred,' the range-finder called out mechanically.

'Fire!' thundered Mivart, and salvo after salvo straddled the under-water boat until all that remained was a perturbed indigo-blue sea tinged with oily-looking carmine.

VIII.

Somehow or other, the rocks off Cape Mitylene seemed to be as fatal to U-boats as Scylla and Charybdis were to the ancient mariners. One after another left Pola, promising the tearful Frau Verbrecher (*née* Finckelstein) they would do what they could to find her missing lord and master; but they themselves never returned. One day the Frau was down at the naval pier with her two babies (alas! one of the triplets had died of cholera) in a pram, when a submarine came in with a queer story. They had picked up a wireless message from one of their brethren, telling of a Yellow Funnel liner that lured unsuspecting U-boats to their destruction, and that, in fact, the unfortunate sender of this distressful signal was himself being sunk.

Then it was that Frau Verbrecher, who had become a wealthy woman, owing to the late *kommandant's* successful ventures, offered two thousand pounds to any submarine which would do away with the perfidious liner.

One actually did take on the job, but in the meantime Mivart had weighed his funny anchors and departed from Cape Mitylene in the same way as he had come, like a thief in the night.

Neither is Frau Verbrecher likely to pay this amount in the future.

In the first place, an Austrian colonel, who owns a heavily mortgaged *schloss*, and recently returned from Russia minus his right leg, has already occupied the first-line trenches of her affections, so to speak, and is preparing for a rapid advance on the hymeneal altar. That is, of course, as soon as he has been fitted with an artificial limb.

In the next place, the *Tabasco* is a turbine-driven ship, has a speed of thirty knots with oil-fuel, and is quite capable of defending herself.

Incidentally, the Yellow Funnel liner changes colour as often as a chameleon.

THE WAYSIDE SHRINE.

AN INCIDENT IN FLANDERS, 1917.

ONE sunny day,
Far from the battle's roar, some children strayed
In the deep meadow grass, and laughed and played,
As little children may.

But suddenly
A blue-eyed maiden saw a wayside shrine,
The Cross, the form of Him, and with a sign
She murmured plaintively,

'Our Father,' while
The tiny hands pressed tightly to her breast,
As if to still the heart in its unrest;
Then, with a wistful smile,

'Forgive us—our
Trespasses'—the tears fell fast—'as we'—
The little breast heaved like the summer sea—
'As we'—in vain the power

To speak again.
Just then a noble form knelt at the shrine,
A tender voice spoke low, 'Father divine,
Our loss shall be our gain.

'Forgive them, Lord,
That trespass against us;' and the little child
Knelt by the King, who took her hand and smiled.
God's sunlight on them poured.

HARRIET KENDALL.

UNDECIMUS UNTHANK: HEIR OF ENTAIL.

By Sir GEORGE DOUGLAS, Bart.

CHAPTER I.

IT was late October. Throughout the day rain had fallen at intervals. The ground before the house was thickly strewn with sodden ash-leaves, and, as the afternoon drew on, the air seemed truly to merit the epithet of filthy bestowed on it by one of Shakespeare's witches. In the not uncongenial gloom of his solitary gunroom, old Mr Unthank woke up from a doze. He had been dreaming of his nephew, Undecimus, and was not sorry to be awake. His fire had burned very low indeed, and his movements were characteristic, as, kneeling before it, he picked the fallen fragments of wood and coal out of the ash-pan with a small pair of tongs, and restored them to their proper place. Those movements indicated thrift, methodical habits, and a certain degree of self-dependence. For the old man-servant, Maskelyn, was within call.

The gunroom was on the ground-floor, the blinds were undrawn, and whilst old Unthank knelt at his task, a dark shadow appeared at the window on the outside. Though the gloom was deepening sensibly, the faint flicker of the fire-light sufficed to make the interior dimly visible from without. The shadowy form pressed closer, until a face of almost livid pallor disengaged itself against the window-pane. And on that face there was gradually developed a mischievous and cruel smile. Meantime, wholly unsuspicious that he was being watched, the old gentleman wrought on, finding satisfaction in the thoroughness of work which should leave scarce a pennyweight of good fuel unconsumed. The fire had begun to revive, and he greeted its returning energy with a feeble trill of song:

> 'A wee bird cam' to our ha' door,
> He warbled sweet an' clearly.'

His own warbling was scarcely sweet or clear, yet it bore traces of having been studied in some olden school, and was painstaking rather than spontaneous. A soft, swift tapping on the window-glass checked it. The old man started, and, having looked nervously round, trotted over to the window and looked out. The outer darkness had deepened; face and shadow alike had vanished; he saw nothing.

Frugal in his habits, it was Decimus Unthank's way to make the utmost of the daylight. But he felt glad to-night that the time for lighting up had come. It would help to relieve a certain depression under which he was labouring. For he had been troubled lately by noises for which he was at a loss to account—whispering voices, taps upon the door, even strains of far-away music. He had begun to more than suspect that these sounds had their beginning and end in his own ear. But that was scarcely a reassuring solution of the mystery. For, if it served to dispose of certain shadowy apprehensions, it did so at the cost of a conviction that his own physical organs were ceasing to serve him faithfully. And that was melancholy evidence of the advance of age and the approach of dissolution. Sighing, he struck a light and set it to the unprotected gas-jet.

A crude illumination filled the room, revealing its characteristics. It was an ordinary room enough, in an ordinary house—a man's room, fitted with gun-cupboards and racks for fishing-rods, adorned with a case or two of birds, a somewhat mangy stuffed fox, and a few of Alken's coloured sporting-prints. There was no trace of female occupation; whilst of one thing it would have been safe to take an oath—that nothing in the room had been renewed for at least two generations.

And yet, upon closer consideration, it disclosed a unique feature which sufficed to give it startling singularity. It was this. Ranged on the mantelshelf, upon the tops of presses, wherever they could find foothold, were a number of carvings representing animals, for the most part of the reptile class. Swarming, luxuriating, as they did, they might have served to remind a beholder of the fantastic detail of Late Gothic architectural work, or of a canvas of Filippo Lippi's. Endow them with motion and you would realise the accessories of a Dutch artist's vision of the Temptation of St Anthony. Yet, questionable in their suggestiveness as these carvings were, they were in reality innocent enough, for they represented nothing more than the accumulated result of a hobby or recreation of the landlord's—his only one. In the course

 [*All Rights Reserved.*]

of his daily walks abroad, old Decimus was accustomed to keep a lookout for growing sticks, or knots of fallen wood, which might serve the purposes of his art. It might be that one or the other struck him as suggesting the form of a squatting toad, or the sinuosity of a lizard or a snake. If this were so, the old gentleman had no scruple about possessing himself of the billet, and, having brought it home, he would set to work with his pocket-knife to develop the suggestion inherent in it; to liberate, so to speak, the reptile imprisoned in the block—in which art he took a great delight and had acquired considerable skill. Neighbours who had seen his handiwork would sometimes send him material to work on, though it was by no means certain that he would approve of it; and, as his industry was unremitting, it was scarcely an exaggeration to say that the house fairly swarmed and crawled with his creations: newts, mice, tortoises, natterjacks, and nondescripts.

The sole items on which his expenditure had ever reached extravagance were varnish and glass eyes. There was a cylindrical block of wood beside him now, upon which he had been at work with his clasp-knife until twilight and sleep had overtaken him. After lighting the gas, he picked it up again, set his spectacles astride his nose, and was soon absorbed in the shaping of a coiled snake with lifted head. Imperfect as his work was, it was not wholly lacking in the spirit and suggestiveness which give value to art, and it was easy to see that, whilst he laboured at it—now holding it from him at arm's length, and considering it with head slightly tilted—he enjoyed not a little of that peace, content, and enfranchisement from worldly care which are the artist's compensation and reward. He had reached the most interesting part of his task, having modelled the flat, withdrawn, and lifted head, and hollowed out the eye-sockets, and was now engaged upon the open jaws, with their subtly suggested teeth and flexile tongue, when a slight cough made itself heard close beside him.

'Ahem!'

Faust, on first becoming aware of the presence of Mefisto, was not more taken by surprise than he was, and the painfully violent start with which he let his work fall argued badly for the soundness of his nerves. But, truth to tell, the figure which confronted him was scarcely reassuring. It was, in fact, that which had lately been watching him from the window, and, being seen closer, now resolved itself into that of a young man of seedy and dissipated appearance.

'I appear to have startled you, uncle!' remarked the intruder harshly, laughing over what to him was a joke.

It was no joke to his uncle. 'Of course you startled me,' answered the latter snappishly, his high-pitched voice unsteady with emotion; 'of course you startled me, Undecimus, and it was very wicked of you. I am painfully nervous.'

'I see you are, uncle, and I wonder at it. I had always understood that the righteous man could put his hand unharmed into the adder's nest. And surely you are a righteous man, are you not? Besides, I didn't think I needed to stand on ceremony with you—the only relative I have, as you've often reminded me.'

If this speech was intended to be conciliatory, it failed of its purpose, for the older man remained unmollified. Dislike of an heir because he is the heir is common enough in life; but this initial dislike, in the case of old Decimus, had been fortified by many things.

'That has nothing whatever to do with it,' he retorted sulkily. 'Maskelyn is there, as you know, to answer the door.'

'Ay; but Maskelyn is gone in the legs, worse than you are yourself. It's pitiful to see the old fellow drag his feet. Incipient locomotor ataxy, as I learnt when walking the hospitals; though one would scarcely have thought of him as a gay dog at any time. You will soon be requiring a new factotum, uncle.'

Beneath the dislike looking out from the elder Unthank's eyes, there was present a certain reluctant respect for his nephew's attainments. It might not be pleasant to have symptoms analogous to his own diagnosed in his presence in this way, yet Undecimus's observations had a gruesome fascination for him too. He longed to take Undecimus into his confidence, to describe certain sensations which for some time past had troubled him, and to demand an authoritative (and gratis) opinion on their import. Two considerations, however, withheld him. The first was the fear that he would not be told the only thing he wished to hear: that they meant nothing. The second was the conviction that his revelation would give Undecimus pleasure, all the more so if the symptoms proved serious. For, between these two relations, there was no love lost on either side.

The Unthanks, uncle and nephew, were the sole surviving representatives of a family who had received the charter for their lands from Henry the Eighth, after the Dissolution of the Monasteries. Poor to start with, as its name betokens, the estate had been mortgaged by successive holders until its reduced revenue no longer sufficed to maintain it properly. But, though not scrupling to burden it, the Unthanks clung to their patrimony with a perverse and stupid tenacity which had eventually embodied itself in a deed of entail. It is highly unlikely that Decimus Unthank would have entertained, under any circumstances, the idea of parting with the acres upon which the whole of his life had been spent. And be it said in passing that that life was not yet of exorbitant length, for, though he looked older, he was still in the sixties of his age. But, however much he might have wished

to alienate Unthank, it was not in his power to do so lawfully without the consent of the heir of entail. That heir was his nephew, Undecimus, so christened because representing the eleventh generation of the Unthanks of that Ilk. Now, had he ever pressed his nephew to consent to the breaking of the entail, that consent might no doubt have been obtained *for a consideration*. And that consideration would have to be a handsome one, for the property would be worth more to Undecimus than to his uncle, being freer from restrictions. But, if any pressure of the sort had ever been exerted, it had most likely come from the opposite quarter. For, whilst Decimus, with the economy that came easy to him, had enough to serve his turn, Undecimus stood in chronic need of cash. This, indeed, was the rock upon which the amicable relations of uncle and nephew had split and come to grief. At intervals, for years past, Undecimus had been dunning his relative, striving to raise a loan, or, failing that, to borrow what he could. And, for years past, Decimus had been protesting against being squeezed. For, truth to tell, the old fellow was a better hand at protecting himself than his superficial mildness of manner might have led people to suppose. The circumstances of his life had fostered penuriousness in him. From always having had to be careful, he had become more sparing than was needful. And now no generous shame any longer restrained him, when asked for a loan of a few pounds, from tendering a few shillings. Nor, on the other hand, was there generous pride about Undecimus to hinder his taking anything he could get, no matter how small the sum. Mutual dissatisfaction was the inevitable result, the old man hating to be pestered with requests, the young one to be humiliated by refusals—mutual dissatisfaction, exasperated by taunts, by heated scenes and bitter subsequent reflections. For one form of dissension generated others. So that, instead of being each the solace and support of the other, as might have been, each of these two last survivors of their race was the thorn in the other's flesh.

As a matter of fact, the race of Unthank had had its day; what of physical stamina or moral worth it had possessed was ere this effete. Only, as sometimes happens, reproductive energy had survived. Uncle and nephew, Decimus and Undecimus, represented successive stages in the decadence of a family. But these stages were absolutely distinct, which, of course, accentuated the lack of harmony between them. For Uncle Decimus had led upon the whole a blameless life, or, at least, such a life as the average standard pronounces blameless. That is, his faults were purely negative. He owed no man anything. He had removed no neighbour's landmark, abducted no neighbour's wife. Indeed, he had never felt the slightest temptation to commit any one of these sins. His sole self-indulgence was indolence; just as fear was, *au fond*, the ruling impulse of his life—the fear of giving offence, and of its disagreeable consequences; the fear of illness and of death; but, scarcely less, the fear of life in all that truly constitutes it—to wit, experience, effort, enjoyment, suffering. In a word, Uncle Decimus was null. And the circumstances of his long, sequestered, and unmeaning life had fostered his nullity. His one talent, his one activity, led to nothing, or, at most, to the providing of a grotesque ornament for some humble neighbour's chimneypiece. For many of the cottages round about had specimens of his art—such specimens being the only things with which he was liberal. And, indeed, he would often have to press them upon indifferent recipients, by whom they would be accepted mainly to humour him, and quizzed as soon as his back was turned. By virtue of his consummate nullity, Uncle Decimus was considered harmless. Maybe that, beyond the mere fear of offending, and desire of conciliating, there was in him something of positive amiability. In any case, in the small circle in which he moved, he was popular rather than otherwise. A weakly pathetic figure. Yet even such may retain the power to sting.

Very different and immeasurably more formidable was Undecimus, in whom the negative traits of the uncle were supplanted by a principle of evil. Within the limitations of an impoverished individuality, he represented that redoubtable type, the human beast of prey. To him the habitable world had been first his oyster, then his enemy. The problem being to get from it what he could, its niggardliness and resistance of his efforts had roused fierce animosity in him. It had not taken him at his own valuation, had refused him the means of living as he felt he had a right to live. For, just as there was more of native force in nephew than in uncle, so he made larger demands upon life. Compelled to earn his own livelihood, he had experimented with various professions. And, whereas to Uncle Decimus all systematic labour was mere weariness, the interest of his successive studies had not been lost upon the nephew. Indeed, but for his singular faculty of extracting what was bad from every form of activity, he might possibly have done fairly well in some reputable calling. But, so long as he was studying medicine, it had been the materialistic emancipation from moral codes, and the resultant dare-devil recklessness of the worst of his fellow-students, that he had assimilated. Then a brief apprenticeship to journalism had sufficed him for the negation of truth; so that he had come to flaunt the precept, 'It is not fact, but what is put in print, that really matters.' His last adventure—he was not yet five-and-twenty—had been as one of a company of strolling actors, from whom he had picked up all that there remained for him to learn of dissipated habits

and of low Bohemianism. But, though he was by no means destitute of dramatic ingenuity, his degenerate tendencies had proved too much for his associates, easy-going as they were; so that, after twice appearing drunk upon the stage, he had been summarily cashiered. He was now, therefore, as he put it, 'out of a job,' and hence the object of his visit to his uncle might easily be guessed. By cajolery, misrepresentation, or playing on the old man's fears, he wished to raise a loan of a few pounds, of which, in truth, he stood in cruel need. But the source he hoped to draw from had been too often tapped. Besides, he was in the unhappy case of having told so many lies that he was pretty sure to be disbelieved even when he told the truth. So the task ahead of him was hedged with difficulties. But there is this to be said for Mercury, or whoever is the god of borrowers, that he certainly does inspire his elect with indomitable perseverance.

The dialogue of uncle and nephew did not open very auspiciously. Finding that he was not asked to sit, Undecimus dispensed with invitation, and jauntily seated himself *à cheval* on an unupholstered chair. The vulgarity of the attitude served to accentuate what was unpleasing in his appearance, leading his uncle tacitly to marvel over the total elimination of all gentlemanly refinement from the person of the seedy rake confronting him. Yet any unprejudiced bystander must have acknowledged that, due allowance being made for difference of age and character, the two Unthanks were remarkably alike. Old Decimus was bent, bald-browed, and grizzled; whilst the nephew wore his black hair long, in artist fashion, and was fairly well set up. But the fleeing brow, the high cheek-bones, and the emaciated figure were common to both alike. And, as his roving eye fell for a moment on a mirror which reflected them, this impression came home to Undecimus not for the first time in his life.

'You're very darkly dressed, Undecimus,' remarked the uncle, breaking silence. 'Are you in mourning?'

To which the young man answered grimly, 'No, I'm not in mourning at present, uncle; but I may be before long. And, as a suit of clothes has to last me a long time, it is best to be provided.' And he looked fixedly at the old man, who fidgeted uneasily.

But he pulled himself together to retort, with assumed stoutness of heart, 'I've no present intention of dying, if that's what ye mean!' And, disregarding the other's hypocritically deprecating gesture, he added, slightly flushing as he spoke, 'Nor is the sign that my days are accomplished yet apparent.'

From his straddle seat, Undecimus looked at him with a doubtful air, seeming to ask for explanation.

'You must ha' heard, Undecimus,' he continued, 'that we Unthanks see ourselves before we die. It has been so for generations. My old father saw himself, I know; though there were some who swore he had seen nothing but his own reflection in a glass that had been misplaced. At any rate, from that time he drooped, and it wasn't long before he died.' He paused before resuming meditatively: 'Sometimes I believe that when my own time comes I shall see myself; and at other times I ridicule the notion. But of this at least I feel sure, that, if it does happen to me to see myself, I shall not long survive it.'

So he maundered on, his nephew listening not without interest. From infancy Undecimus had known the old family superstition, and its fantastic character had appealed to him. As materialist, however, and son of the latter half of the nineteenth century, he knew that, except as imaginative pabulum, such things had no significance whatever, and, just now, what he was mainly interested in was the pathological aspect of his uncle's case—the senile mind, in which facts had become so shadowy, and dreams so real, that it was often hard to differentiate between them. In other circumstances he might have found cruel pleasure in playing on the old man's crazy fancies. But, for the purpose now in view, his obvious cue was to ingratiate himself. So he assumed a genial air and slapped his knee and cried, 'Tell you what it is, uncle; you're growing morbid! You've lived too long alone with those ugly beasts of yours—clever, of course, but undeniably ugly. Ugh! As I said last time I visited you, it's enough to make any chap who's been on the burst a bit feel that the blue devils have got hold of him. . . . Look at that toad! It might be the very one Milton had in mind when he made the Old Un take that shape. Let me clap him on the fire—he'll blaze.'

He was suiting the action to the word, when the other shriekingly interposed. 'On no account, Undecimus! Put him back where he was at once. When the house is yours, you can do what you like here; not before. I like to see my wooden beasties about me; it helps to keep me cheery.'

So the nephew saw that, like an impulsive chess-player, he had been betrayed into a false move. He replaced the image on the mantelpiece, whence its life-like eyes continued to regard him; and, starting at a disadvantage for which he had himself alone to blame, he broached the subject nearest to his heart: the borrowing of money.

(Continued on page 585.)

AGRICULTURE AS A FINE ART.

By F. E. GREEN, Author of *The Surrey Hills*, *The Awakening of England*, *The Tyranny of the Countryside*, &c.

THE more one works on the land the more one realises the absence of any kind of unskilled labour connected with agriculture. By labouring one gradually becomes conscious that the much-despised Hodge, whom it has taken a world-wide war to appraise rightly, is instinctively an artist.

It is only those who have laboured much in the fields that can savour the technique of those toil-smitten hands which direct their skill towards some well-foreseen end. As it is only the painter who can thoroughly understand the technical skill of another painter, so it is only those who have by practice in the fields acquired knowledge of rural technique that can fully appreciate the skill of the farm-labourer.

Agriculture is the oldest of the crafts; but since factory chimneys have flourished at its expense, it has been the least honoured and the worst paid. To-day, however, we know it to be the most vital of all our industries; and did not a member of the House of Commons recently startle that assembly with the truth steeped in irony that it was more difficult to replace a skilled carter than to replace a Cabinet Minister?

At all seasons of the year the artistry of the labourer is visible to those who have eyes to see, hands to feel, and brains to know. Hodge may be no more conscious that he is an artist than a country bootmaker of my acquaintance, who, though he cannot draw the simplest design on paper, can, with a knife in his hand, aided by his eye only, cut from a goat's skin a most exquisitely shaped shoe.

There is technique displayed even in the simplest of agricultural work. You can see it in the green-ribbed meadows when harrowed and rolled with unerring uniformity in dark and silver-green bands visible at the season of the year when the blackthorn flings its bridal wreath across the hedge to May. It is discernible even through a cloud of dust to the practised eye when the harrow follows the sower and no oases of exposed seed are left to tempt the birds of the air to descend in flocks and give thanks to some prentice hand that cannot draw a straight line with a team of horses.

Even in the simple act of spraying the plum and apple orchard, technique is necessary, in spite of the many distractions at this glorious blossoming time of the year to seduce the mind of the worker. There is the first haunting call of the cuckoo, revealing to the heart the eternal youth of the world; and the ironic chuckle of the green woodpecker echoing from the woods with its 'catch me if you can' note of allure. Canopied by azure glimpsed between a shower of snowy petals decked with virginal green, it is difficult for the sprayer to note if the liquid shower has fallen upon every bloom. Amid the pink-and-white blossom of the apple, into which the bees are delving for the most delectable honey in the world, one is loath to inject poisonous liquids; yet, despite these allurements, more captivating to one's vagrant fancy than any that a wilderness of bricks and mortar can offer, aphis has to be subdued by means of the chemist working in conjunction with the agricultural craftsman.

The pruner of trees has perhaps been acknowledged as an artist and crowned with the laurels of a 'landscape gardener.' He may not be able to draw anything more complicated on paper than a +, yet he will envisage in a moment the inevitable result of the swift cut to be made with his knife. Before he cuts above this fruit-bud, or below that wood-bud (do you know the difference, learned reader?), he has to think of the advent of next spring, when the buds will begin to break and the leaves unfold like butterflies poised for flight. He will conjure up a picture of how the pink-and-white blossoms will blend with the green leaves, and how clusters of red and gold fruit must hang upon the boughs. His Saynor knife will decide whether the exquisite tracery of branches shall spread into a fan, shape into a cup, or taper into a pyramid.

But any one, it may be said, can pick the fruit from the fruit-spurs created by the technique of the pruner. Yes, any one can; and it may be pleasant to witness the daughters of Eve decked in coloured overalls picking the glistening, rosy-cheeked apple; but the fruit-grower will not bless those who hastily grip the pendent fruit with the finger and thumb instead of with the palm, or bruise them in the basket, or break off the fruit-buds of next year's harvest.

Spreading farmyard manure, digging an allotment, or hoeing turnips for Farmer Giles may appear to the novice to be unskilled labour. But there is skill and artistry displayed even in filling a tumbril and dumping down the manure so that the field looks like a chess-board covered with black pawns, so regularly placed are the little pyramids of manure. The unskilled æsthete would not know this effect was produced by spacing out each little heap of manure six yards apart; nor would he know by the texture of the dung if it be long or short, or how to distribute it so that it does not lie in wasteful lumps. The imaginative field-dresser will know by the amount of manure he distributes exactly how the full-grown grass will ripple with wavelets when caressed by the south-west wind in June, or if the crop will be so

meagre that it will scarcely conceal a hare. He will visualise the billowy depth of the windrows where hay lies in the making; will hear the musical rubbing of the wooden axles of the wagon as it moves like a windjammer over the swell of the hay-field. He will see it shaped fore and aft like an old-fashioned three-decker, loaded with such skill that none of the cargo will have to be jettisoned before it arrives at its fragrant wharf.

But it is in judging the actual time for mowing, by noting the dust of the pollen and seed of the bents on his leggings, and the colour of the bronzing clover, that he will show his greatest knowledge of his craft as a haymaker; and when it comes to building the stack, then it is that he displays his supreme gift as a rural architect.

With conscious pride he will cast his eye over the meadow, mentally envisaging the probable weight of hay before he marks out his foundation or steading without having passed the ordeal of the mathematical tripos. And as the hay is unloaded from the wagon, he, with the cunning of his eye and hand, will build his fragrant edifice so that it stands flawlessly symmetrical. As designer and executant, and as one who works without the aid of pencil or paper, he should as a craftsman satisfy the most fastidious of guilds of craftsmen. Finally, as the thatcher, when he crowns his edifice with a roof of golden straw, he will, if he takes pride in his work and is not hurried by his employer, fashion a cock out of wisps of twisted straw, and place it on the apex of the roof as an outward and visible sign of the joy he took in his work.

But it is not every wielder of a thatching-jack who can thatch a rick, any more than it is every wielder of a fiddle-bow who can play the violin. On his declaring he could thatch a rick, I once engaged a thirsty 'gentleman of the road' to perform that job; and when I complained that his thatching was thin and rough, he assured me that if he flung a bucket of water on to the roof, it would run off the eaves with the precipitancy of a mountain cascade. He threw the water on to the thatch, but the rough, loose straw absorbed it like a sponge, and not a trickle was visible! He had much to say then about the heat of the sun and the extraordinary absorbent qualities of straw.

Perhaps it will be granted that the rick-builder and thatcher is a master-craftsman, that he must possess a sense of proportion and symmetry, and be deft with the adze in splitting thatching-rods; but surely *any one* can turn hay in the meadow? Yes, any one can turn hay, but I have noticed that few townsmen can turn it correctly. Skill is particularly required in turning hay which still lies green in the wake of the machine. Instead of turning the 'hacks' completely with a slight jerk, gripping the bloom with the teeth of the rake, and making the rows fall on fresh, sun-warmed ground, new-mown hay is often spoilt by being only half-turned, with the result that strata are left to ferment into must in the stack.

The swinger of the scythe nowadays is indubitably a rare workman. But he is more than that; he is an artist. In the peculiar bend of the sneath or handle, and in the curve of the reaping blade, one can see that it is the user-artist, whose brain and muscle have been working together in perfect harmony, that has shaped this implement to draw as easily through the luscious dew-sprent grass as the fiddle-bow has been fashioned to draw music from the strings of the violin. Think, too, of the delicate touch of this craftsman of the fields as he sharpens the blade and lightly rubs it with that finishing silky touch on the ringing curve of steel!

Many have thought it easy enough to dig an allotment until they tried to do it themselves, and then they have learned that it requires a knowledge of technique to dig it in such a manner that the turned-up earth will gain all the possible benefit from the sun, the wind, and the rain. Some have dug their allotment so that it looks like a churchyard with newly made graves, with deep hollows unwarmed by the sun, and filled with water in wet weather. He who digs with the stroke of an artist will turn over his ground so that it resembles a roughly shaded drawing with the lines all pointing in the same direction. It is he who will get most out of the soil, because he will dig straight and deep; whilst the novice, with his spade aslant, will dig shallowly and unevenly.

Ever since 'the man with the hoe' was immortalised by Millet, he has been the symbol of ill-paid, unskilled labour. But hoeing is not unskilled labour. The man who knows how to use his hoe will never leave plants to wilt in the sun—deprive them of root pasturage by drawing away loose soil from these tender nurslings of Mother Earth. A field of roots can be ruined by unskilled labour, or given a new lease of life at the hand of the craftsman of the fields. The pattern can be easily destroyed by those who are devoid of the artistic touch.

The technique of 'laying' a hedge is not learnt in a day. The curve, the weight, and the balance of the billhook, the 'slasher,' and the faghook have been conceived and fashioned by the artist hands that have used them for generations. Think of the firm yet delicate touch that goes to the splitting of a branch so that it does not break in two and lives to break into leaf and fill a gap in the hedge! To be able to lay a 'hive' hedge which will break into blossom and leaf is to be able to thread a pattern, the artistry of which will delight the eye of any live-stock keeper.

It is to the ploughman, perhaps, above all others, that the nation looks as the supreme creative artist who will redeem it from mis-

fortune. The ploughshare drawn by a team of horses guided by the clear eye of the ploughman, clarified by the illimitable spaces which surround him, is to us more than the ram of a destroyer. Guided by hands gnarled and smitten by years of laborious days, he draws a strong line across the seared stubble. It is the impelling vivid line sought for so eagerly by every artist as he stands before his canvas at the inception of his creation. The ploughman marks out his broad line of perspective with that simple implement which has been the agricultural craftsman's chief tool for so many centuries, and with it he draws line after line until the field of mottled green and pale yellow is transformed into rich, shining, red earth or vandyke brown. When he has graven these fructifying lines of furrows, he holds in the hollow of his hand the destiny of nations. With the seed-lip slung over his shoulder, with a measured tread over the kind, crumbly earth, and with a superb sweep of the arm and easeful swing of the body, he distributes his largesse. His steps are the rhythmic march of our progress towards victory. There is precision and beauty in the sweep of his arm and his measured stride as he casts the seed; his eye and brain work with perfect harmony pregnant with life. He stands before us to-day as the figure of Destiny. In his untiring stride and noble sweep of arm lies the hope of Britain.

THE DEFINITE OBJECT.

By JEFFERY FARNOL.

CHAPTER XXXVII.—THE WOES OF MR BRIMBERLY.

MR BRIMBERLY, having dined well, as was his custom, lay at his ease in a luxurious lounge-chair in the shade of the piazza. The day was hot; wherefore on a table at his elbow were a siphon, a bottle, and a long glass in which ice tinkled alluringly; between his plump fingers was a large cigar; and across his plump knees was an open paper, over which he yawned and puffed and sipped in turn. Nevertheless, Mr Brimberly was bored, and, dropping the paper languidly, he cherished a languorous whisker, staring dull-eyed across stately terraces and wide, neat lawns to where, beyond yew-walks and noble trees, the distant river flowed.

Presently, as he sat, he was aware of a small girl in a white pinafore approaching along one of these walks—a small being who hopped along by means of a little crutch, and sang to herself in a soft, happy voice.

Mr Brimberly blinked.

Heedless of the eyes that watched her, the child turned into the rose-garden, pausing now and then to inhale the scent of some great bloom that filled the air with its sweetness.

Mr Brimberly sat up, for he permitted few to enter the rose-garden.

All at once the child, singing still, reached up and broke off a great scarlet bloom.

Mr Brimberly arose. 'Little girl!' he called, in voice round and sonorous—'little girl, come you 'ere, an' come immediate!'

The child started, turned, and after a moment's hesitation hobbled forward, her little face as white as her pinafore. At the foot of the broad steps leading up to the piazza she paused, looking up at him with great, pleading eyes.

Mr Brimberly beckoned with portentous finger. 'Little girl, come 'ere!' he repeated. 'Come up 'ere, an' come immediate!'

The small crutch tapped laboriously up the steps, and she stood before Mr Brimberly's imposing figure—mute, breathless, and trembling a little.

'Little girl,' he demanded, threatening of whisker, ''oo are you, an'—what?'

'Please, I'm Hazel.'

'Oh, indeed!' nodded Mr Brimberly, pulling at his waistcoat. ''Azel 'oo, 'Azel what? An' say "sir" next time, if *you* please.'

'Hazel Bowker, sir;' and she dropped him a little curtsy, spoiled somewhat by agitation and her crutch.

'Bowker—Bowker!' mused Mr Brimberly. 'I've 'eard the name—I don't like the name, but I've 'eard it.'

'My daddy works here, sir,' said Hazel timidly.

'Bowker—Bowker!' repeated Mr Brimberly. 'Ah, to be sure—one of the hunder-gardeners as I put on three or four weeks ago.'

'Yes, please, sir.'

'Little girl, what are you a-doin' in that garden? Why are you wanderin' in the vicinity of this mansion?'

'Please, I'm looking for Hermy.'

''Ermy?' repeated Mr Brimberly. ''Ermy? Wot kind of creater may that be? Is it a dog? Is it a cat? Wot is it?'

'It's only my Princess Nobody, sir!'

'Oh, a friend of yours—ha! Persons of that class do not pervade these regions! And wot do I be'old grasped in your 'and?'

Hazel looked down at the rose she held, and trembled anew.

'Little girl—wot is it?' demanded the inexorable voice.

'A rose, sir.'

'Was it—your rose?'

'N-no, sir.'

'Don't you know as it's a wicked hact to take what ain't yours? Don't you know as it's

thievin' an' robbery, an' that thievin' an' robbery leads to prison-bars an' shackle-chains?'

'Oh, sir, I—I didn't mean'—— The little voice was choked with sobs.

'Well, let this be a warnin' to you to thieve no more, or next time I shall 'ave to become angry. Now—go 'ence!'

Dropping the rose, the child turned and hobbled away as fast as her crutch would allow, and Mr Brimberly, having watched her out of sight, emptied his glass and took up his cigar, but, finding it had gone out, flung it away. Then he sighed, and, sinking back among his cushions, closed his eyes, and was soon snoring blissfully.

But by-and-by Mr Brimberly began to dream, a very evil dream, wherein it seemed that for many desperate deeds and crimes abominable he was chained and shackled in a dock, and the judge, donning the black cap, sentenced him to be shorn of those adornments, his whiskers. In his dream it seemed that there and then the executioner advanced to his fell work; a bony hand grasped his right whisker, the deadly razor flashed, and Mr Brimberly awoke gurgling—awoke to catch a glimpse of a hand so hastily withdrawn that it seemed to vanish into thin air.

''Eavens an' earth!' he gasped, and clapping hand to cheek, was relieved to find his whisker yet intact; but for a long moment he sat clutching that handful of soft and fleecy hair, staring before him in puzzled wonder, for the hand had seemed so very real that he could almost feel it there yet. Presently, bethinking him to glance over his shoulder, Mr Brimberly gasped and goggled, for leaning over the back of his chair was a little old man, very slender, very upright, and very smart as to attire, who fanned himself with a jaunty straw hat banded in vivid crimson; an old man whose bright, youthful eyes looked out from a face wizened with age, while up from his bald crown rose a few wisps of white and straggling hair.

''Oly 'eavens!' murmured Mr Brimberly faintly.

The visitor, settling his bony elbows more comfortably, fanned himself until his sparse locks waved gently to and fro, and, nodding, spoke these words:

'Oh wake thee, oh wake thee, my bonny bird!
Oh wake and sleep no more!
Thy pretty pipe I 'aven't 'eard,
But, lumme, how you snore!'

Mr Brimberly stared; Mr Brimberly's mouth opened; and eventually Mr Brimberly rose and surveyed the intruder slowly up from glittering shoes to the dome of his head and down again; and Mr Brimberly's ample bosom surged, his eyes kindled, and his whiskers!——

'Cheer-o!' nodded the Old Un.

Mr Brimberly blinked and pulled down his waistcoat. 'Me good man,' said he, 'you 'll find the tradesmen's entrance round the corner. Go away, if you please; an' go immediate—I 'm prehoccupied.'

'No you ain't; you 're the butler; you are, I lay my oath—

Spoons an' forks
An' drawin' corks.

That 's your job, ain't it, chum?'

'Chum!' said Mr Brimberly in tones of horror. 'Chum!' he repeated, grasping a handful of indignant whisker. 'Oh, outrageous! Oh, very hobscene! 'Ow dare you, sir? 'Oo are you, sir—eh, sir? Answer me, an' answer—prompt!'

'Leave them cobwebs alone, an' I 'll tell you, matey.'

'Matey!' groaned Mr Brimberly, turning up his eyes.

'I 'm the guv's familiar friend and personal pal, I am. I 'm 'is adviser—confeedential, matreemonial, circumstantial, an' architect'ral. I 'm 'is trainer, advance-agent, manager, an' sparrin'-partner—that 's who I am. An' now, mate, 'avin' 'elped to marry 'im, I 've jest took a run down 'ere to see as all things is fit an' proper for 'is 'oneymoon!'

'My word, this is a mad feller, this is!' murmured Mr Brimberly; 'or else 'e 's drunk!'

'Drunk!' exclaimed the Old Un, clapping on his hat very much over one eye and glaring. 'Wot—me?'

'I repeat,' said Mr Brimberly, addressing the universe in general—'I repeat as 'e is a narsty, drunken little person!'

'Person!' cried the Old Un, scowling. 'Why, you perishin'——

''Old!' said Mr Brimberly—''old, I beg! Enough 'as been said—go 'ence! 'Oo you are I do not know, wot you are I do not care, but in these regions you do not remain—your langwidge forbids an''——

'Langwidge!' snorted the Old Un. 'Why, I ain't begun yet, you blinkin', fat-faced, owl-eyed piece o' sooet'——

'Your speech, sir,' continued Mr Brimberly with calm austerity, and making the most of whiskers and waistcoat—'your speech is re-dolent of slums and back-halleys. I don't know you. I don't want to know you! You are a feller! Go away, feller!'

'Feller!' snarled the Old Un. 'Why, you'——

'I repeat,' said Mr Brimberly, with dignified deliberation—'I repeat as you are a very low, vulgar little feller!'

The Old Un clenched his fists. 'Right-o!' he nodded cheerily; 'that 's done it! F'r that I 'm a-goin' t' punch ye in the perishin' eye-'ole!' and he advanced upon the points of his toes, shoulders hunched, and head viciously out-thrust.

'My word!' exclaimed Mr Brimberly, retreating rather precipitately, 'this is very discomposing, this is! I shall have to call the perlice.'

'Perlice!' snarled the Old Un, fiercer than ever. 'You won't 'ave nothin' t' call with when

I've done wi' ye. I'm goin' t' jab ye on th' beak t' begin with; then I'll 'ook my left t' your kidneys an' swing my right to your p'int, an' crumple ye up with a jolt on your perishin' solar plexus as 'll stiffen you till th' day o' doom!'

'Oly angels!' murmured Mr Brimberly, glancing hastily about.

'Then, while you lay bathed in 'orrible gore, I'm goin' t' twist them whiskers into a 'angman's knot!'

'This is most distressing!' sighed Mr Brimberly.

'Then,' continued the Old Un, grinding his remaining teeth, 'I'm a-goin' t' tread your face in an' dance on yer blighted stummick. Arter that'——

'Oh, dear me!' exclaimed Mr Brimberly, retreating before the oncoming peril and mopping perspiring brow. But suddenly his wandering eye was arrested by velvet and gold braid, and lifting up his voice, he called, 'William! James! Come 'ere—an' come sharp!'

Two vast and splendid shapes loomed upon the scene, supermen whose silken calves quivered with unaccustomed haste. At a sign from Mr Brimberly they seized upon the Old Un, and, despite ghoulish threats, solemnly bore him off.

Down the broad sweep of drive they went, the Old Un pouring forth fluent curses with every step, until they came to where stood a powerful automobile, from beneath which a pair of neatly gaitered legs protruded.

'Joe!' cried the Old Un, apostrophising these legs—'Joe, stop bein' a crawlin' worm—come out an' bash these perishers for me, like a good lad!'

But even while he spoke the footmen hauled him along, so that when Joe eventually wriggled from under the car the three were close beside the great gates. The Old Un was earnestly explaining to his captors exactly what he thought of them, of their fathers and mothers, their kith and kin, and the supermen were heeding him not the least, when a thunderbolt seemed to smite them asunder, and Joe was glancing, mild-eyed, from one splendid supine form to the other.

'Hallo, Old Un!' said he; 'what's the matter now, you old book o' bad language, you?'

Mr Brimberly, somewhat shaken with his late interview, and feeling the need of a stimulant, had just refilled the long glass, when, hearing a rustle behind him, he turned and beheld a tall woman, elderly and angular, especially as to chin and elbows, which last obtruded themselves quite unpleasantly; at least, as he eyed them there was manifest disapprobation in every hair of his whiskers.

'Now I wonder,' he sighed plaintively—'I wonder what under the blue expandment of 'oly 'eaven you might be, because if you 'appen to be the washing'——

'I—am—not!'

'Or the cannybal missions'——

'No—sech—thing!'

'Oh!' said Mr Brimberly, and his gaze wandered to the elbows. 'Why, then, let me hinform you'——

'Ann Angelina Trapes is me name.'

'Why, then, ma'm, you've took the wrong turning. 'Owbeit an' notwithstanding, 'ooever you are an' nevertheless, you will find the tradespeople's entrance'——

'You're the gentleman as is so obligin' as to be Mr Ravenslee's butler, ain't you?'

'Sich is my perfession,' Mr Brimberly admitted. 'I am in sole charge of these pre-mises, an' so being, will ask you to withdraw 'ence immediate. I will ask'——

'An' I'll ask you, very p'inted, what you reckon you're doin' in that chair?'

'Doin'?'

'I'll ask you, very p'inted, why you're loafin' around wastin' your master's time?'

'Loafing!' cried Mr Brimberly, very red in the face. 'Loaf'——

'I also ask you, very p'inted, wherefore an' why you loaf, guzzlin' an' swillin' your master's good liquor?'

'Guzzling!' gasped Mr Brimberly. 'Oh 'eavens, this is a houtrage, this is! I'll'——

'It sure is! An' so are you, wine-bibber!'

'Wine-bib'—— Mr Brimberly choked, his round face grew purple, and he flourished pudgy fists; while Mrs Trapes folded her cotton-gloved hands and watched him.

'Wine-bibber!' she nodded. 'An' the wine you now bib is your master's; consequently it was stole; an' bein' stole, you're a thief; an' bein' a thief'——

'Thief!' gurgled Mr Brimberly. 'Ha, thief's a hepithet, thief is, and a hepithet's hactionable! I'll have you indented for perjoorious expressions.'

'Wine-bibber!' she sighed. 'Snake an' plunderer!'

'Never,' cried Mr Brimberly—'never in all my days did I ever 'earken to such contoomacious contoomacity! 'Oo are you, an' wot'——

'Hand over that bottle an' what you've left o' them cigars!'

'Woman, begone!' he cried hoarsely. 'Woman, if you don't go 'ence this very moment, I'll have you persecuted with the hutmost vigour o' the law for a incorrigible female!'

'Female!' repeated Mrs Trapes; and clasping herself in her long, bony arms, she shuddered and smiled, though her eyes glared more stonily and her elbows suggested rapier-points, daggers, and other deadly weapons of offence.

'Female it were, I think?' she inquired, with another grim and smiling shudder. 'Now, sir, to you, I sez, debased creecher, I sez; vulgar an' dishonest loafer, I sez; sly an' subtle serpent, I sez—return to the back scullery wherefrom you sprang, lest I seize you by the hair o' your

cheeks an' bounce your silly head against the wall—frequent, I sez!' and very slowly Mrs Trapes moved towards him.

Mr Brimberly hesitated, but before those deadly elbows he blenched, his whiskers wilted all at once, and he retreated backwards. Across the spacious drawing-room, along the hall, and down the stairs he went, his pace ever accelerating, until, in full flight, he reached the sanctuary of his pantry, where, having locked himself securely in, he sank, panting, into a chair to mop his beaded brow. 'My word!' said Mr Brimberly.

BUFFALO BILL, CIVILISER.

By R. B. Townshend.

ITALIANS certainly do love a good show, and Buffalo Bill's Wild West performances were extremely popular in Italy when he exhibited there. But one of the great Roman dukes who went to see the show sneered at the way in which Bill's cowboys rode their bucking broncos round the arena. 'Circus horses,' he said; 'that 's all they are. Trained to jump about and look wild! It 's mere child's-play. Now the wild stallions that I keep to run with my herds of mares in the Campagna really are wild. No man on earth could get on their backs; or if he did, he would not stay there a single moment.'

The cowboys were highly indignant when this came to their ears. 'Bring out your wild Eyetalian man-eaters,' was their answer. 'You just put them in the arena for us and turn them loose, and you 'll see the sight of your life.'

The duke confidently accepted the challenge, and his herdsmen, who were good enough hands at dealing with horses in their own way, managed to drive in four of his wild stallions on a day agreed upon, and turned them loose in the middle of Buffalo Bill's show before all the people. Within five short minutes those four wild monarchs of the Campagna were all lassoed and thrown; the American cowboy saddles were cinched on to them; the lassos were taken off; and each horse, as he scrambled to his feet, found a western cowboy on his back, and, greatly to his astonishment, found that no bucks or kicks or plunges could dislodge him. An hour later they went out of that arena very different horses. They had found their masters. Buffalo Bill's men had civilised them.

Now Colonel William Cody, or Buffalo Bill, to give him the name men knew him by in the West, was something more than a professional showman; he had a real feeling for romance deep down in him. To him that scornful modern Roman duke seemed somehow to represent the haughty consuls and senators, ay, even the emperors of old Rome, whom in their lifetime men worshipped as gods. What he would have liked to do would have been to handle those man-eaters on the floor of the old Roman Coliseum itself, and have all modern Rome there to see. He would have liked to give his performance in that very same arena where nineteen hundred years ago the gladiators had raised their hands to Cæsar and cried, 'Hail, Cæsar! men going to their death salute thee.'

But the Italian authorities would have none of it. The floor of the Coliseum was not in proper condition. The cowboys might do some injury to the invaluable antiquities there. More than that, it was consecrated ground; for there, in the middle of the arena, the Roman Church holds every year a service to commemorate the Christian martyrs and saints who in that place testified to the faith with their blood. Therefore Buffalo Bill's performance could never take place there. Never. It was absolutely impossible!

But the Napoleonic side of Bill—and he had one—refused to accept that word 'impossible.' And one day a young American diplomat at the Italian Court got a private hint that if he cared to turn up at the Coliseum at midnight he might perhaps see something of interest. 'But mind you keep mum,' was the caution given him; and mum he kept; and also he kept the appointment. That night there was a glorious moon, and the famous spot was guarded only by a couple of drowsy sentries, whom a certain friend who was in the secret had been duly instructed to supply with the strongest of Italian wines till their slumbers were profound.

A small and select audience of people, to whom the secret word had been passed, had taken their seats where once the Roman patricians sat, and as they waited there they thought of all those cruel, blood-stained shows that had been given there nineteen centuries before. Then, once again, from the gates was heard the trampling of horse-hoofs; but instead of the swiftly flying chariots with their gay racing colours or sword-girt, death-doomed gladiators, there came Buffalo Bill at the head of his Wild West escort of cowboys and Indians and Mexicans, all fully arrayed; and out into the arena, where gladiators and martyrs alike had died, they rode .their mustangs, circling proudly round and round that historic floor. They could not, or they would not, go through their regular performances; neither was it possible for them there to tame (though they would have liked it well) the man-eating stallions of the Campagna; but as they circled they doffed their hats in honour of the brave men who in days gone by had circled round that ring before their life-blood soaked into the

sand where now the mustangs trod, and whence the indignant souls of the slain had fled to appear before their Maker.

The young diplomat had brought with him a fellow-countryman but newly arrived from the Far West. 'Look there!' he cried eagerly at the sight. 'Those redskins cavorting round there, as I happen to know, are some of Sitting Bull's Sioux who only a year or two back were killing and scalping and torturing and mutilating every enemy, red or white, that they could catch. And now Bill has 'em so tame that they 'll feed out of his hand. Guess Bill 's a greater civiliser than Julius Cæsar himself or any noble Roman of them all.'

Perhaps he was.

QUAND MÊME.

By B. Paul Neuman.

I.

'NOW, boys,' said M. Rimbout, the French master, 'let us not be so slow. Come, translate. Whose is ze turn? Yours, Green. Take zis leetle piece of unseen. It ees not hard; oh, no. Begin—"*Quand même*"'——

Green was not a genius. The sun was shining, and he, with the rest of the class, was yearning for the cricket-nets. He looked doubtfully and unlovingly at the page. 'Altogether,' he began.

'No, no,' cried the master impatiently. 'Next boy.'

Watts was diffident, but suggested 'Whenever.' Folgate was confident, and rapped out 'Wherefore,' as if there could be no possible doubt.

M. Rimbout's face darkened. He suspected a conspiracy of feigned ignorance. 'I shall ask every boy,' he said, 'and eef I do not have ze right answer, ze class will stay here till tea.'

This was serious. It meant losing a cricket practice, and on such a heavenly afternoon! As anxiety deepened the guesses grew wilder. When only Squab remained the class settled down to sullen despair.

Squab was one of the school butts—a forlorn-looking little shaver, with a bad limp, a stutter, and no physique; slow in his work, and given to mooning about in odd corners with a book or a paper in his hand. From him no help was to be looked for.

Yet, strange to say, it was forthcoming.

'You, Browne,' said M. Rimbout, taking out his watch and laying it on the table, a clear indication that he too thought the issue was decided.

'Sp-sp-spite of everything,' answered Squab with quite unusual signs of interest.

M. Rimbout lifted his watch, and his face relaxed into a smile. 'Zat ees one of eets meanings,' he said. 'Where did you meet wiz eet?'

'I read in the p-p-p-paper, sir, that some great Frenchwoman had taken it as her motto. She m-m-meant to succeed in sp-sp-spite of everything.'

'Well, Browne,' said the master, 'your place in ze class ees not a ver' deestinguished one, but you have on zis occasion, *quand même*, saved ze class.'

From that time 'Squab' fell into disuse. For a week Browne was everywhere hailed as 'Quand Même.' At the end of that time a process of attrition had reduced the name to more manageable proportions. For the rest of his school life he was known as Conk.

II.

The interest excited by the unexpected rescue of the French class soon flickered out, and Conk dropped back into his old position—half butt, half puzzle; 'an awful ass,' qualified by the addition, 'but a rum fellow.'

On the boy himself, however, the experience left a permanent mark. He had already become so accustomed to thinking himself a hopeless dunce that now it seemed to him as if a revolution had suddenly broken out in his humdrum life. The gleam of success, so insignificant in the eyes of his schoolfellows, was to him something wonderful and entrancing. The success coming, as it had done, in connection with that chance phrase, '*quand même*' held for him thenceforth a kind of mystical import. It was a secret password that made him free of a host of new ambitions, an open sesame before which all kinds of impossible doors might, he felt, fly open.

His first efforts were not crowned with any great success. He showed his gratitude to the French language by taking extra pains over M. Rimbout's lessons, but his wretched stutter spoilt his chances. Even apart from this, he was not quick and alert enough to shine in question and answer, and in the examinations his new ambitions were responsible for a bad attack of nerves. In spite of this handicap, however, he rose from the bottom of the list to near the middle, and was greeted in his dormitory with a spirited rendering of 'See the Conquering Hero Comes.' The same night he wrote home asking them to send him regularly a French newspaper and a French magazine. He had three years more at school; but, though he tried hard all the time, and improved his position immensely, he never

succeeded in winning a class prize. But for the Shakespeare prize he was *proxime* to Eves, the school captain, who had won a Balliol scholarship.

'You only won the prize by the skin of your teeth,' the Head told this gorgeous youth. 'The examiner said he had never met with a boy so soaked in Shakespeare (the expression was his) as Browne, but he made the old mistake and left himself no time to touch the last two questions.'

'It's funny,' said Conk slowly when the Head congratulated him on his *proxime*. 'I've always been m-m-mooning about over Shakespeare, and Lamb's Sp-Sp-Specimens, and that sort of st-st-st-stuff, but I n-never thought it would c-c-come in for an exam. The questions might have been m-m-made for me. I c-could have gone on for hours.'

One prize, however, he did win, and, curiously enough, it was on the athletic side, just where his chances seemed most hopeless. With *quand même* always singing in his ears, he had looked round carefully for some opportunity of earning distinction in the field most attractive to the other boys. From football, cricket, and rackets he was barred by his miserable limp. There was just one possibility, and he snatched at it. The sergeant smiled when he presented himself at the shooting-range; but half-an-hour later the smile had changed from amusement to encouragement.

'You've got a rare good eye,' he said to the novice. 'If you stick to it, you'll be in the team one day.'

Six months later he was almost reverential. 'The best shot we've ever had in the school, bar none,' he said when Conk showed him the silver cup which was the shooting prize. 'You'll be shooting in the King's one day; you mark my words.'

'Oh no, I sha'n't,' answered the boy; 'b-b-but I'm glad I p-p-pulled it off this t-t-t-time.'

III.

When Will—to give him his proper name, which he thenceforth resumed—left school, it was to go into his father's business. Mr Browne carried on a big export trade with Australia, chiefly in hardware. The eldest son was in Melbourne, another was manager of one of the London departments, and Will, who was the youngest boy, had to begin at the bottom of the ladder. He had secretly hoped for a university career, but he recognised the fact that his school record had not been brilliant, and he accepted the parental decision with a very good grace. Not that business attracted him, or even the prospect of making a big income. But he must do something, and he felt no impulse towards any other calling. Moreover, business would leave him free to try to realise the one strong ambition that he had brought with him from school. His poor physique, his limp, his stutter, his shy reserve—these things were the handicaps that had burdened him from the start, and threatened to hinder and mar his full development. That should not be, if he could by any means prevent it. How he would use his manhood freed from the handicaps did not trouble him. The great thing was to set it free.

The limp seemed hopeless, but the stutter he determined to tackle at once. His salary was not large at first, but it was supplemented by a very liberal supply of pocket-money, so that there was no pecuniary difficulty. He consulted a physician—not the family doctor, for he had made up his mind to fight his campaign in secrecy. From him he obtained the address of a specialist, whose exercises and instructions were irksome enough to raise a strong presumption of their efficacy. On these the boy set to work with a quiet, dogged resolution that, after a while, met with its due reward. Gradually it began to dawn on the family, first, that Will's stammer was nothing like so assertive as of old, and next—after an interval—that it had practically gone.

'There!' exclaimed Mr Browne triumphantly. 'What did I tell you? It was only a matter of nerves, and business life is the finest tonic in the world.'

Greatly encouraged by this notable success, Will next took in hand his general physique. From a child he had heard himself spoken of as 'very delicate.' At school his limp had kept him out of all the robuster forms of exercise, and had excused his habit of mooning about. His chest was narrow, and his muscles—or, rather, lack of them—one of the dormitory jokes. Now he consulted his doctor again, and, still without a word at home, spent dreary months over breathing practice, and then heaped Ossa upon Pelion—Müller upon Sandow. Perhaps the ardour and perseverance with which he pursued his self-appointed tasks reacted on his business work, for his father, who was chary of praise, spared some for his latest recruit.

'He won't set the Thames on fire,' he remarked to his wife, 'but he's buckled to his job a lot better than I expected. You'll see, my dear, we'll make a good business man of him before we've done.'

'I hope he'll be able to stand the life,' she answered a little anxiously. 'You know, he's always been so delicate.'

'I believe we made a lot too much of his delicacy,' said her husband. 'He looks strong enough to me, except for his poor leg. Anyway, he shall have a real good holiday, though he never seems to care much for the sea. I'll have a talk to him about it. He generally has ideas of his own.'

This view Will justified when his father spoke to him. Three or four of his old school friends

were going to Heidelberg as a reading party, and he would like to go with them.

'Capital!' said Mr Browne. 'Get up your German. Modern languages are an invaluable asset to a man of business. I only wish I'd had the chance when I was your age, my boy.'

From that time, year after year, Will spent his holidays abroad, generally in France or Germany. On one occasion he accompanied the family to Switzerland, and delighted his father by the fluency of his French and German.

'The boy's improved out of all knowledge,' he declared enthusiastically. 'If he does take his own line, it's a thundering good one. It's a thousand pities about that leg of his. Lucky, though, it doesn't trouble him. You never hear him say a word about it.'

'I'm not sure that that's a good sign,' said Mrs Browne doubtfully.

IV.

Mrs Browne's doubt showed her discernment. Will's reticence about his lameness was due not to indifference, but to an intense, an almost morbid, sensitiveness. In other respects he was not at all touchy. At school the outspoken comments and jokes over his stammering had rarely ruffled him, but the least reference to his halting leg stung him to the quick. At home it had long been understood that in his presence no allusion was to be made to the painful subject. Even to his doctor friend he found it difficult to talk of his infirmity. But with his stutter overcome, his general physique improved out of knowledge, and his shyness and reserve replaced by the easy manners and self-reliance that travel so often imparts, he felt that the time had come to deal with the last and the most formidable of his disabilities. '*Quand même*,' he said to himself with a little smile, as he faced once more the neat brass plate in Wimpole Street.

'It's a surgeon's job, of course,' said the physician; 'but if it means an operation, you're as fit to stand one as any man I know; and I wouldn't have said that before you took yourself in hand.'

It was a fortnight before Will could screw up his courage, but at last he forced himself into the surgeon's consulting-room.

'I won't say for certain,' was the great man's verdict, 'but if I were in your place I'd have a shot at it. You look in good condition, and with plenty of massage, and perhaps a sea-voyage after the operation, I think you'd stand a good chance of being as sound on your legs as any man need be. I can't say it's a certainty, but there's a real good chance.'

So far, so good; but when it came to telling his people at home, he found the task quite beyond him.

'I know what it'll be,' he said to himself. 'The mater'll be half-beside herself, the governor will be sure that I'm a *status lymphaticus* case, and the girls will treat me like a pet-lamb. And yet—oh, dash it all! there must be a way out.'

One day, while he was still debating the matter with himself, his father called him into his private room.

'Will,' he said, 'you've been working very steadily for a long time now. You'll be twenty-one this year, and I'd like you to have an extra-good holiday. What do you say to America and the West Indies?'

Will's face lit up with pleasure. 'It would be splendid,' he answered. 'Thanks, awfully. I've always hankered to cross the Atlantic.'

'Very well. You can take a couple of months from the middle of July, and I'll give you a couple of hundreds to pay the bills.'

V.

'It's a queer thing that Will hasn't had a look at the West Indies. He used to rave about them, and now it seems as if he couldn't get away from Toronto, of all places. I don't believe he's even been to California. I can't make it out at all.'

This was Mr Browne's comment on a letter from Will, written apparently in excellent spirits, but containing curiously little information about his movements, and filled with observations on Canadian trade and general characteristics that might almost have come out of a consular report.

'I don't think it's the right time of year for the West Indies,' said Mrs Browne placidly.

'No, that's true; but I should have thought he'd have been all over the States, at any rate, by this time. He's very careless too, and that's not like him. He doesn't give any address except just "Toronto." What's the good of that?'

'The last time he wrote was from some hotel —I've got the letter upstairs. I suppose he's still there.'

'Hullo!' exclaimed Mr Browne. 'Here's another scrap in the envelope. That's careless again. They should have been fastened together.'

'Does it say anything about his movements?' asked his wife when he laid down the offending scrap of paper.

'No. It's all about the war; the news has just got out there, and he's full of it.'

'Ah, poor boy! He'll feel his lameness more than ever now, especially when he hears that Edgar and Henry are both joining up. It *is* hard on him.'

'Yes, it is,' said Mr Browne feelingly. 'I believe he'd have made a fine officer. I'm sure his heart's in the right place.'

The great catastrophe, so long foreseen and dreaded, had come at last, and, at the last,

suddenly, as a thief in the night. Britain, recovering from the first shock, was already springing to arms. The call for volunteers had begun to sound, and everywhere young, eager hearts were taking counsel with themselves. Three weeks before the breaking of the storm Will had gone for his American holiday, and in another fortnight or so he was due to return. Both Edgar and Henry held commissions in the Territorials. Edgar had cabled from Australia that he was coming back by the first liner he could catch, and Henry had already joined up.

Mr Browne, proud of his soldier son, but already racked with anxiety, relieved his feelings in true English fashion by grumbling.

'Doesn't Harry look fine?' asked his mother proudly, hiding her secret fears more successfully than her husband.

'Don't make me blush, mater,' pleaded Harry, who was back on his first leave.

'It's all very well for the young blood,' said his father. 'I should have been agog to be off when I was his age, I know; but what's to become of the business? Rickman told me today that he's joining up next week, and Barton's got the look in his eyes too. I've got Harry's work now to do as well as my own.'

'You'll have Will back in no time,' said Harry. 'He'll fill my place all right as soon as he's got his bearings. He's got a head on his shoulders, has Will.'

'I rather wonder he hasn't turned up before,' said Mr Browne. 'I cabled to him to come back as soon as he could. I suppose it must have missed him. He's so confoundedly careless about his addresses.'

'I shouldn't have thought'—— Harry had begun. Then he suddenly broke off, looked up sharply, and exclaimed in a staccato aside, 'Hullo! Who the dickens is this?'

Through the open French windows of the drawing-room, and over the grass, came a gallant young figure in khaki and a cadet's cap.

Ethel, the tomboy, sprang to her feet. 'It's Will!' she cried. Then in a moment, 'Oh no, of course not.' But she still stood there smiling, frowning, puzzled, hesitant.

For there was no sign of a limp. He carried himself as jauntily as Harry himself, this young khaki sprig. His face was browned, as if sun and wind had been at work upon it, but, for all that, it was just a little too fine-drawn. A year later in the war you would have guessed him wounded, but ready to go back.

As he came nearer he smiled. Every one jumped up.

'But it is!' gasped Mrs Browne.

'Good lord! I don't understand,' blustered Mr Browne.

'I knew it was, but'—— cried Ethel.

The visitor drew himself up, and saluted smartly.

'I see the elder brother,' he said, looking at Harry, 'but where's the fatted c-calf?'

It was only the faintest ghost of a stutter, but it settled the matter. Ethel rushed forward and threw her arms round his neck.

'That's all right, you old dear!' she cried. 'We had veal cutlets for dinner.'

Mrs Browne inconsequently began to weep.

'Good heavens! Sit down, and tell us all about it,' shouted Mr Browne.

'There isn't much to tell,' answered Will, as he lay down on the grass. 'A chap in Harley Street told me that they could carve my leg into the right shape, but I hated talking about it—you know what a fool I am—and I dreaded all the fuss. So, when you'—he looked at his father—'offered me a long holiday in America, I made up my mind that if they said the same out there, I'd have it done, and give you a little surprise. They did say the same, I went into hospital, and you see the result.'

'And what on earth made you join up before you were half-fit?' demanded his father, trying hard to keep the pride out of his voice.

'I suppose I was so bucked at being able to hop about, and I wanted so badly to see whether they'd take me.'

'They'd no business to do it, when you were only just out of the hospital. Of course you didn't tell them.'

'Yes, I did. I knew they'd find out, anyway. There are a few little souvenirs still in evidence on the goodly limb, but they said it'd hold me up quite long enough to stop a bullet.'

'Oh, don't, Will!' And Mrs Browne's tears flowed faster.

'Sorry, mater. It was only a joke. I believe it was my French and German that were the attractions. And when they found that I'd shot at Bisley, that settled the matter.'

'What's going to happen to the business I don't know,' declared Mr Browne, indulging in a final grumble.

'Yes, father,' said Will with sudden seriousness, and a note of tenderness in his voice that was altogether too much for the grumbler, 'it *is* hard on you; but I knew what you'd have done in my place, and I couldn't do any less.'

'God bless you, my boy!' exclaimed Mr Browne, getting up hastily and walking into the house.

'*Quand même—quand même*,' repeated Will softly to himself just before he turned in that night. 'Stutter, limp, rotten chest, no muscle, school dunce; not a very hopeful outfit, but *quand même*'——

And he patted the sleeve of his khaki jacket.

'THE DISCOVERIES OF GENIUS ALONE REMAIN.'

By F. Nicolls.

THE words at the head of this article are from Buckle's *History of Civilisation in England*, a work which was written at the time of the Crimean war, and which the author did not live to complete. The first volume was published in June 1857. He died on 29th May 1862, at Damascus, aged forty years, of fever. On his tombstone an Arab couplet is engraved:

The written word remains long after the writer;
The writer is resting under the earth, but his works endure.

Buckle was a conscientious student, and worked ten hours daily for seventeen years before publishing. Before he was twenty he was known as one of the first-class chess-players in the world. Though he was mistaken in some of his conclusions, there can be no doubt that he was an earnest lover of truth and liberty, and that his style often rises to eloquence in denouncing wrong and in sympathy with the oppressed. A list of nearly a thousand volumes, to assist those wishing to verify his references, is given in the first volume. The notes quoted are voluminous, occasionally occupying the best part of a page. While most of them are from English sources, some are of foreign origin, and these are given, both in the original edition and in the cheap reprint now on the market, in the language in which they were written. It would certainly be helpful to the ordinary reader if in any future edition the quotations from foreign authors were translated.

Whatever view may be taken of the opinions arrived at by the author, the information given and his admirable literary style make him still worth reading. In no respect was Buckle more mistaken than in thinking the spread of knowledge in Europe would have the effect of abolishing or lessening wars. Since the war in the Crimea nearly every European State has been concerned with them, and the present war shows that war-ravages—the desolation of countries and the slaughter of men—are not confined to the most barbarous and uncivilised countries.

Buckle concludes one of the early chapters of his first volume: 'The gigantic crimes of Alexander or Napoleon become after a time void of effect, and the affairs of the world return to their former level. This is the ebb and flow of history, the perpetual flux to which, by the laws of our nature, we are subject. Above all this there is a far higher movement; and as the tide rolls on, now advancing, now receding, there is, amid its endless fluctuations, one thing, and one alone, which endures for ever. The actions of bad men produce only temporary evil, the actions of good men only temporary good; and eventually the good and the evil altogether subside—are neutralised by subsequent generations, absorbed by the incessant movement of future ages. But the discoveries of great men never leave us; they are immortal; they contain those eternal truths which survive the shock of empires, outlive the struggles of rival creeds, and witness the decay of successive religions. All these have their different measures and their different standards—one set of opinions for one age; another set for another. They pass away like a dream; they are as the fabric of a vision, which leaves not a rack behind. The discoveries of genius alone remain; it is to them we owe all that we now have; they are for all ages and all times—never young and never old; they bear the seeds of their own life; they flow on in a perennial and undying stream; they are essentially cumulative, and, giving birth to the additions which they subsequently receive, they thus influence the most distant posterity, and after the lapse of centuries produce more effect than they were able to do even at the moment of their promulgation.'

It will be news to most of our readers, we think, to learn that breech-loaders date back to the times of Napoleon. He afforded every encouragement to the efforts of genius, and recognised the advantages of diminishing the exposure and time required for loading under the old method in the heat of action. A Paris locksmith, in 1809, prepared a breech-loader, which was submitted to the inspection of a committee of officers nominated by the French Emperor. The invention was condemned by the committee as unsuitable to the purposes desired. The Paris locksmith had a journeyman who had been a pupil of Berthollet, one of the most distinguished chemists of the French school, who, born in Savoy, 1748, settled in Paris in 1772. Berthollet rendered great services to the Revolution in preparing and improving saltpetre on French soil, of which there was a great scarcity. He was one of the *savants* who accompanied General Bonaparte to Egypt in 1798, and was a man of great modesty and unostentatious manners. He died in Paris in 1822.

The journeyman, John Nicolas Dreyse by name, betook himself to Prussia in 1827, and settled there as an engineer and ironfounder. Soon afterwards he offered the Prussian Government a *Zündnadelgewehr*, or needle-gun, which was loaded from the muzzle. The peculiarity of his invention was in the absence of gunpowder in the propulsion of the bullet. The needle, propelled by a hammer, struck a bullet to which a fulminate was affixed. In 1828 Dreyse had improved on his invention; his needle was now propelled by a spiral spring. The needle-gun was not immediately adopted; but the subject attracted the attention of the Crown-Prince of

Prussia, afterwards King Frederick William the Fourth. From 1829 to 1836 a variety of experiments were tried at the public expense. At length a gun was invented which was loaded from the breech, and the bullet was propelled through rifled grooves. The two conditions of rapidity and accuracy of flight were thus secured. Trials determined the value of the weapon, and in 1841 sixty thousand of the breech-loading rifles were served out to the Prussian army. The Prussian Government was delighted with the new invention. A royal decree declared it to be the perfection of military arms, 'and a special dispensation of Providence for the strengthening of the national resources;' and a hope was expressed that 'the system might be kept *secret* until the great part which it was destined to play in history might couple it with the glory of Prussian arms and the extension of empire.' It could not be altogether kept 'secret;' but the dullness and stupid conservatism of other nations served Prussia's cause equally as well, and in 1866 achieved for the nation the very glory to which it aspired twenty-five years previously.

Breech-loaders were used by the Prussian troops successfully in putting down an insurrection in Rhineland in 1849. But it was not until much later that the British came to believe in them. Red-tape, routine, circumlocution, and formality were in the ascendant at the Horse Guards. The old Tory 'Iron Duke' was slow to recognise any inventions or improvements made after his own victories had been won. He became impatient and irascible when new inventions were submitted to him, and the War Office authorities were reluctant to credit what the Duke discouraged.

The soldier suffered from the ligatures which bound the knapsack to his back, but any modification of the method of fastening the pack would not be listened to. 'The knapsack question had been exhausted,' were the official terms in which a clever substitute was rejected. So did it fare with the breech-loader when the 'monstrous innovation' was first brought under notice.

A patent had been taken out as far back as 1807 by a clergyman (the Rev. Mr Forsyth) for percussion-caps. It took the authorities at the War Office just thirty-one years to change the flint-muskets used by British infantry to percussion-rifles. To show the sort of men to whom such important matters were entrusted, it need only be mentioned that General Anson of the Ordnance stated that in *his* opinion the Prussians had rather hastily adopted the breech-loader! They had taken a little over twelve years in doing so. This can hardly be called rapid; but it was a good deal less than the thirty-one years we took over percussion-caps. General Anson said he was satisfied British troops with the arms they had would be found superior to any other soldiers in the world, and that 'it was ridiculous to suppose that two armies could fight at a distance of five hundred or six hundred yards.'

It is well for an army to have confidence in its weapons, no doubt; but there is such a thing as over-confidence. Fortunately we were never called upon to contend with muzzle-loaders against an army with breech-loaders. The result could only have ended in disaster, and even British soldiers would have failed to 'muddle through.'

But of all the ridiculous utterances by British officials, perhaps the most absurd one was by the War Secretary, Mr Fox Maule, afterwards Lord Panmure, who said (26th March 1852) that the weapons in the use of our soldiers were '*better than all the inventions that could be discovered.*'

What would these so-called 'statesmen' of sixty-five years ago say to the aeroplanes, Zeppelins, torpedoes, submarines, and inventions used in modern war? Even in those days one would have thought there were a sufficient number of educated men in Parliament to prevent a War Secretary from making such a ludicrous exhibition of himself as Mr Fox Maule did in deciding on the merits of *all* future discoveries and inventions.

The men of genius are no doubt often troublesome to conservative officials. But Buckle was right in declaring that we owe everything we now possess—all the comforts and luxuries of life—to their efforts. Disease, which a century or two ago was often equivalent to a sentence of death, has now been successfully fought, and human life has been prolonged and pain of every kind alleviated by the discoveries of chemists and doctors. The debt of nature has eventually to be paid by every living creature, but something has been gained if it can be arrived at painlessly; and this in the great majority of cases we undoubtedly owe to the discoveries and labours of the men of genius of comparatively modern times.

THE CAMELS.

THE sun runs not before the moon,
Nor night outstrips the day;
Slow, slow o'er many a golden dune
The land-ships take their way.

High, high with waving masts of gold,
Roped in with costly bands,
Their onward course they stately hold
Through seas of surging sands.

O'er lonely desert tracts outspaced
The hot winds burning blow,
While swift beyond the molten waste
The white-winged camels go.

While silver star and moon slow climb
Blue mountains of the night,
The bells of the *cafila* * chime
Across the amber light.

Like phantom ships all white and dim,
O'er waves of sand they sway,
And o'er the gold horizon's rim
Fade mistily away.

MARY M. CURCHOD (MYRA).

IN THE SALIENT.

By LAUCHLAN MACLEAN WATT, C.F.

I.

WE just the other day got sunshine and warmth. What a joy the advent of spring brought to us in this land, after the dreary winter of cold and mire! I remember a friend of mine being carried into a field-ambulance, in the Ancre district, dripping with mud from head to heel, and doubled up with excruciating rheumatism. A man on an adjacent stretcher asked him what it was like where he came from, and his pithy answer, 'Cold hell!' fully and accurately covered it.

Can you picture what it was like in the dug-outs down there after a forward drive? In one, of the usual kind, a man was sitting dead at the top of the stair, his head reclining against the wall, his eyes closed as though sleeping, and five bayonet-wounds in his breast. At the foot of the stair lay another, who had been flung down headlong. In the bed lay a British sergeant, shot through the abdomen, his pipe fallen aside, after his last smoke, where he had been laid, just before he died. Under the bed lay two German officers, dead, with their boots off.

Not far away, up on the bleak and dismal slope, were two great 'tanks,' which had stuck in the mud; and around them clustered the men, our own and the enemy, who would never fight again.

One of our young officers missed his way in the dark up there, and wandered off, lost. Afraid lest he should stumble into the German lines, the locality of which was meanwhile quite uncertain, he took shelter in a dug-out. But he could not stay there. It was full of German dead, some sprawling on the floor, some sitting up against the wall, or in the corners. He flashed his torch around his fellow-tenants once, and once only. 'Their eyes,' said he, 'were hauntingly blue. They stared at me as if questioning my intrusion.' In the darkness something stirred. 'I felt that they were going to leap at me,' he said, 'and I could quite understand one's reason wavering for a little.' So out he went again to seek his way. Hearing voices near, he hid in a shell-hole, with his revolver ready. The voices approached and passed. And then, tired out, he fell asleep. When he woke, chilled to the bone, he found that his revolver had dropped into the mud and disappeared. He had to get along, and keep moving. And then, suddenly, he heard two English Tommies grumbling loudly, somewhere ahead, about the quality of their bully-beef. 'I could have kissed them!' he exclaimed. 'It was heavenly to hear them cursing.'

The artillery activity down there was practically continuous. It woke you through the dark, like the frantic thunder of some mad tom-tom-player, with the 'Ha-ha-ha!' of the hellish laughter of the machine-guns for chorus.

I have now had two months of the Ypres Salient, where I had formerly been for a little while in 1916 with the Gordons. My new regiment, the Black Watch, I saw landing in France early in 1915. Their broken ranks had been replenished and broken again and again since then, till at last, past patching, the remnants of two battalions were jammed into one. Amongst them there were some Aberdonians, so the link with the Gordons was still unbroken.

It was only now that I got my first acquaintance with Ypres itself. It was on a Saturday afternoon, and at the entrance to the town I overtook a man of the Black Watch, who, recognising the red heckle in the bonnet tucked in at my belt, became very friendly. He said he would lead me to the barracks where my people were. But it soon became quite apparent that he did not know the way, and that he was not of my battalion. First he led me to the square, only to be turned back by the military policeman, for the square is shelled daily, and nobody is allowed to pass through it. Only the policeman, another of the forgotten brave ones, stands there for the protection of others. My guide pointed to the fragments of the famous cathedral, and he said, 'That maun hae been a vera fine Catholic chaipel. I never saw sae monie braw chaipels onywhere. Of coorse, they 're a' chaipel folk hereaboot, but they maun be gey supersteeshous to hae sae monie kirks.' After wandering about for a while, he had to admit that he had led me astray. 'But just you gang doon this close,' said he, pointing along a ruined alley, 'and speir at the first body you meet. They 're bound to ken. Oh ay—the

 [*All Rights Reserved.*]

barracks is a weel-kent place!' pawkily covering his own ignorance by his assurance of the intelligence of others.

In a cellar, protected with sand-bags, I found the Y.M.C.A., and soon was at my destination.

I never saw, and hope never again to see, such another town. Before the war it was a prosperous place of about twenty thousand inhabitants. Its cathedral, as everybody knows, was one of the notable churches of the Low Countries, and the magnificent Hall of its Cloth Guild one of the glories of the Middle Ages. But one day in April 1915, while citizens and soldiers were walking about in the crowded square, and the streets were full, a torrent of shell poured over the place, and in a few minutes the square was a bloody shambles of dying men, women, and children; while crowds ran, in screaming distraction, trying to escape from the horrible death that pursued them everywhere. Hundreds took refuge in cellars, but the houses toppled in upon them and crushed them. There is not now a living creature there except our people. Desolation, like the desolation of a town over which has swept the tornado of volcanic destruction, is everywhere. The Cloth Hall is a heap of broken stone. The cathedral lies like a shipwreck, with its bare ribs open to the weather. As you walk through the forsaken streets you hear the whistle and groan of a shell go overhead, and the crash falls just a house or two away from you in an adjacent lane. You hear the bones of the place break in an agony. It is like a town blighted by a curse—a place of fear in the sunlight, and a haunt of ghosts and devils in the dark. It is a place that you hold your breath in, often. Your heart quickens as you enter it. And you breathe freely when you leave it.

Next day I had to hold a service at a windmill, where a casualty clearing-station was established. And then I was to go back to Ypres for a service in the barracks there. The old mill had been dismantled. The story was that it had belonged to the *maire* of the village near by; but it had been observed that, even when there was no wind blowing, the sails would move. And it was proved conclusively that those great arms, seen far and wide, were being used for signalling to the enemy. That finished for ever the *maire's* interest in the affairs of this world, and the mill was fitted up for nobler uses.

Immediately after the service I went through the street of shattered houses, on to the cross-roads, past the church, where only a fragment of the tower stands, all a-topple, with the shell-broken gravestones around it. And there, before me, lay the white paved road to Ypres.

Trees are still standing on either side of it, though many of them are split and broken. And the fields through which it runs bear countless traces of bombardment—water-filled shell-holes innumerable telling of the attentions of the enemy. Not a soul was to be seen upon it. And everything was silent as the grave. It was like a road leading into another world. Horsemen and wheeled traffic, except for an occasional emergency wagon or a general's car, are forbidden in daylight beyond those cross-roads.

I had not gone far along it, when my attention was arrested by the quick sound of Lewis guns firing, away up overhead. So I stood, and saw two aeroplanes fighting for life against several others which pursued them, darting after them and swooping upon them like hawks whenever they tried to escape. At length one of the two, disabled, dropped from cloudland, swaying to and fro, till it fell like a stone. The other kept up a plucky fight, but it, too, at a great height, was riddled, and fell also. The pilot fell out of it, a little speck like a fly. He seemed to pause for a moment, and then dropped after his machine. Somehow I thought these were enemy planes, as I could not see their markings, and I cheered where I stood. But shortly afterwards I met a man resting by the wayside, and he told me they were two of ours. I never afterwards cheered again till I was sure.

A little farther on, a couple of shells came screaming over, and fell in the field beside the road, disturbing some men who had apparently been in some poor shelter, for they squattered away like ducks to another security, and I never saw them again. It makes you think very quickly for a little, asking yourself which way lies safety—on this side or the other—till you suddenly remember that the way of duty lies straight on, and you are probably as safe in the middle as anywhere else.

My service was held in a cellar in the barracks, a dim, dull chamber, with an arched roof. The place was packed. Just as the service began a big gun next door shook the place, and the flash lit up the room. I saw the gleam in the eyes of the congregation, and everybody irresistibly ducked, for it was as though a shell had landed beside us. It was a sight not easily forgotten.

Later on, in Ypres, as I came in to have a service on a pleasant Sunday morning, we had a very startling opening voluntary. A German shell struck a corner of the barrack square, killing one and severely wounding five of my congregation. It was a tense moment. But we went over to another corner. I told the men the service was for those who wished it, and a little band followed me. We read together the Ninety-first Psalm, joined in prayer, and then I spoke a few words on the lesson, which is very specially the soldier's psalm, concentrating on the verse, 'Thou shalt not be afraid for the terror by night, nor for the arrow that flieth by day.' Fortunately nothing more came over.

I remember, also, a service recently on the

canal-bank at Ypres. The day was full of sweet beauty. I had had a long walk from an early service. But somehow Sunday morning seems the favourite time for shelling. As we passed along, a gun just beside the road sent off a morning greeting to the Germans, and others followed suit. It was very remarkable to hear three or four shells sing their terrible song of death together, in flight through the air, side by side.

On the canal-bank a squad was being drilled in gas-helmet exercise, and they did look most grotesquely fierce creatures, like things that had crept out of some goblin story, through deep waters, into the light of the sun. Away on the right was the end of Ypres, the gray, moulder-ing ruins projecting like a broken bone.

The men sat down on the bank, and we sang the Second Paraphrase, and had a short talk together. Now and again an occasional shell fell near, and in between we could hear the cuckoo's call, and the lark singing as though anything like war were very far away.

I had to go back for another service, and it was most interesting to see how the Germans had been searching for our guns. Everywhere were shell-holes, and the wonder truly was how they had really missed the mark they sought. The day previous the crash of their artillery had been constant. And there was a curious accom-paniment to it. For an English regiment had been bragging a little about its football prowess, they having been invincible in over forty games. Now, in the Black Watch we had some notable footballers, who took up the challenge. I ques-tion if there have been many more hotly con-tested games than this played behind the line. All the while shells were falling at intervals not far off; and it was very funny to hear the onlookers shouting, 'Goal!' or 'Foul!' or 'Play the game!' and then observe them giving a hasty glance over their shoulders to see where the last shell had dropped. The players themselves were too eager to think of anything but the game, and the Black Watch broke the boasted record all to smash. The red heckle led again to victory.

Nothing keeps the men so fit as a tussle on the football field; and it steadies and trains heart and eye for the sterner game that is wait-ing for its turn later on.

II.

Nothing could be more comforting to us than, when the German shells come over, to hear our guns take up the defensive with a loud 'Hands off!' And then a deadly dialogue ensues.

It is wonderful to see how cleverly the sites of our guns are hid from aeroplane observation. You might frequently pass the quiet, lonely, ruined cottage by the wayside, whose shutters seemed to have half-dropped from their hinges; but one day you see a canvas screen pulled slightly apart, and the muzzle of a big gun peers out of the shadows at you. Everything seems forsaken, till suddenly you see, up beside the hatch of a broken granary, an officer busy at a telephone, whispering messages to some far-off station.

I remember a place where we had heavy guns which shook everybody and everything near when they were fired; and one day shell upon shell was spent trying to knock them out. But we had imitation gun-shelters erected out in fields, and through the screen of painted tar-paulin and twigs a beam of wood protruded, for all the world like the muzzle of a gun. The German aircraft men had seen these, and many a pound of powder was burned putting the dummies out of action!

Alongside of such practical joke tactics, how-ever, the bitterly stern reality was always claim-ing its place. One night I noticed a fine, stalwart corporal of the guard walking to and fro. I could not help standing still for a long time and watching him. A finer figure in a kilt I never saw. And I thought what a picture he would make at a camp-fire, with the dark night all around! Two days later, in the trenches, he stood up straight, and a sniper's bullet caught him. It took our men hours to bring his body down the trench to the graveyard at the farm beyond the Lille Gate. I went thither from Ypres to bury him and another of our fellows, out by Shrapnel Corner. It and Hellfire Corner live up to their names. There had been a hot time there the night before. I picked up an orderly at the barracks, at random, and he led me along. We did not linger at Shrapnel Corner, for traces of the recent bombardment were too fresh to recommend delay. Tree-stumps had been split and shattered, and the road torn up into holes. The trolly-track up which we were to have gone on leaving the road had been broken, so we waded through the mud beside it till we reached a sluggish stream that seemed uncertain which way it was going. There we had to creep carefully up on to the trolly-road, and, bolting over, drop instantly to the ground when we had crossed. And now the enemy began to shell the railway, which ran quite near; and the whistle and screech of missiles were a constant reminder of the dangers that are always at hand in the Salient.

I had to wait for some hours at the graveyard till the bodies arrived. And somehow the instinct to get in somewhere under cover of however crazy a shelter prevailed. I have seen us pull our rug over our heads when the early morning anti-aircraft shell-cases were coming down with a 'whoo.' In fact, I believe that if one had an um-brella with him he would be tempted to put it up. The little, broken shed into which I stepped had been only a kind of barn or byre. There was scarcely anything of it left, and it was open to the sky. But in there lay eight or nine dead

men, under their blankets, waiting for the grave. One, I remember, was a beautiful youth, with his eyes closed as if in gentle sleep; and still upon his cheeks was the pink glow, as though death had only a minute since frozen life's warm stream. I drew the blankets up over their faces and left them.

The Ypres Salient is an uncomfortable place. It is considered, with good reason, to be 'unhealthy.' Every wind that blows may be said to blow from the enemy's direction. And the notices seem always to stand at 'dangerous.' The last night I was there we had a gas-alarm. The camp was sleeping, so first of all we roused the men, and then, with our gas-helmets on, stood waiting. The thought of the chance of being smothered by this dreadful invention of modern warfare was most unpleasant. It is the only thing that ever made my knees inclined to shake for a bit. We heard the hooters go, and the gongs rattle, and then the roaring barrage. But the alarm passed, and the horror uplifted, though it is not easily forgotten.

Odd accidents occur in the Salient. One day our canteen corporal was sitting at the counter, when a shell burst near the hut. He had his hand in his pocket, and when he pulled it out as a piece of shrapnel passed through, he left two of his fingers behind. The thing happened in a moment, and he felt first of all astonished, and then very thankful to have got off so cheaply.

Sometimes you find the shelter you seek adding only inconvenience rather than ease to your lot. Near Ypres stands the Asylum. It was a hospice of the Sacred Heart. It is a large place, with beautiful courtyards and the remains of a fine cloistered walk around. The Hun was busy when I went in there one evening. The bombardment had lifted a poor dead soldier out of his grave, and he had to be reinterred. I felt quite relieved when I got away from it.

We were only once during the two months out of the Salient, being sent back for a long-promised rest, which was curtailed to two days; after which we were sent up the line again. When we were coming out we passed through little villages and clachans, some of them just clusters of wooden huts, some mere caravans side by side. From the names above the doors —'New Ypres,' 'Vlamertinge,' and the like— you could see that they were settlements of refugees out of the old terrible days, the broken remnants of a once happy population. One day, as we trudged along, we passed through an English regiment resting by the wayside, and, out of compliment to the Scots, a soldier was upstanding, playing the strathspey called 'Stirling Castle' on a violin. He got a hearty cheer all along the ranks.

It was very delightful to get a real bed for these two days, in an attic above a baker's shop in a little French village, ere we returned to the Belgian mud. The villagers were much interested in the Scotsmen. And it was fine, to them, to be awakened every morning at reveille with, 'Hey, Johnnie Cope, are ye waukin' yet?' to hear the pipes at meal-time playing the old injunction, 'O give my love brose and butter;' and then again at 'Lights out' to hear the piper going through the narrow street with the ancient strains of 'Donald Gorm.'

Our kilts always struck the villagers as being something strange and wild. I remember in one quiet village, on our way down to the Ancre, I was quartered for the night on a very quaint household. Their home was a large house beside the road. It had the appearance of a long-decayed gentility; and it was occupied by two faded old ladies and a shadowy, very ancient man. They seemed to be unable to move from beside the stove, nursing the last remaining dregs of life in its scanty warmth. Two officers, mistaking their billet, came in and tried to set up occupation, but I turned them out, directing them to their own place. The spectres had risen to their feet in fear. And after the intruders had gone, they asked me, tremblingly, whether we were *Franc-tireurs*. They seemed to think we were wild irregulars, with our mountain garb and screaming bagpipes.

Our march back to the Salient was through wind and sleet; but I had found a tin whistle in the camp before we had gone out, and as I tramped with the doctor behind the last company I kept the lagging feet going with 'Bonnie Dundee,' 'Mrs Macleod of Raasay,' and many another old march of our northern people. A chaplain has to forget his clerical collar and his Sam Browne belt, and to be lark and linnet, comforter and chum, if he is to be of any living use to the boys.

One never can forget some of the nights up there. I recall the heavens, full of brilliant stars; the new moon, clear and beautiful, like a shallow skiff of beaten silver, with the shadow of the earth, like a sorrow, enfolded in its clasp. The foreground was dark, except for shining pools in shell-holes, and the gleam of a winding stream that crawled through the camp. Far off, behind a ruined woodland, lingered the dim afterglow. In the distant sky hung an observation balloon, watching for the enemy's gun-flashes. Near us was the solitary grave of a Gordon Highlander, 'Corporal Kindness,' a name that spoke to us of the fishing-villages along the Moray Firth. The constant traffic of the transport on the *pavé* rumbled up through the dark, mingling with the grumble of the guns. And a solitary piper was playing somewhere in the deepening night. Loneliness, sorrow, death, and a touch of home, all combined to make up for us a tone-picture of the war. And as I lay down in my billet in a windowless cellar underneath a stair, in an old farmhouse, I listened unsleepingly to the wind wailing like a weeping woman, out over the

miry fields in Flanders. Is it a wonder that we often thought of home—of the tall gray houses in our northern towns, of the villages by the shores, of the cottages in the glens, and of the waves breaking softly on the crags, in the island that I love; and the hearts, as unsleeping as ourselves, thinking of us there?

The wonderful vitality of Nature in the Land of War gave a most pathetic interest to the shattered environment among which we lived and worked. The blackbirds nested in the ruined orchards, right in the heart of the world of smash. The house-martin made his home under the tiles that still hang together on a broken roof. The church of Le Bizet is crushed into wreckage, but the sparrows twitter in the ruins. And at the great convent, just along the road, where the piety of consecrated womanhood sang hymns and psalms and chanted prayers, the little birds flit in and out as though the voice of praise were not to be altogether silenced by the growl of cannon and the crack of shrapnel. Once, at a nasty corner, when for a moment I hesitated to go forward, I felt as though rebuked by a thrush that sat upon a twig by the wayside, and sang of courage and of hope. I have often thought how the lark must wonder at the burst of shrapnel from the anti-aircraft guns, which occasionally invades his province as he sings at heaven's gate above a war-struck world.

Another form of life which came in contact with us, and was not beloved by us, was the swarming crowd of rats. I remember one night going down a track in the fields, and trying to pick my way with the help of occasional flashes of a pocket torch. At every flash I saw rats scurrying along the ruts. This will be one of the great problems of the future of Belgium after the war.

The cat and the dog were, of course, friends and companions, and were looked upon as being in reality of ourselves.

THE DEFINITE OBJECT.

CHAPTER XXXVIII.—IN WHICH SOAPY TAKES UPON HIMSELF A NEW RÔLE.

SOAPY was alone, which in itself was no new thing, for Soapy was a solitary soul at all times; but just now he sat close beside the rotting fence which skirted that desolation behind O'Rourke's Saloon. Moreover, it was night, and solitude profound was his. He sat on a battered and disused pail that chanced to be handy; a smouldering cigarette dangled from his thin-lipped mouth, his long hands pendulous between his knees, his pallid eyelids sleepily adroop; but his eyes, quick and watchful, scanned the deeper gloom of fence and dismal outbuilding, and he sat there very patient and very still. At last he stirred slightly; the cigarette quivered and was motionless again; for, amid the shadows, he had seen a dim shape that flitted swiftly towards him. On it came, creeping swiftly and silently beside the fence, nearer and nearer until it resolved itself into a slender form. Then Soapy spoke. 'Hello, kid!'

Ensued a moment of tense silence; then Spike answered, his voice unnaturally thin and high-pitched. 'That—that you, Soapy?'

''S right, kid!'

'What you—doin' around—here?'

'Who—me? Y' see, I 'm kind o' yearnin' for that gun you got there.'

'Gun? I—I ain't got—no gun.'

'Well, kid, I know Heine 's all kinds of a liar, but he tells me he 's loaned you one o' his, an' so'—— Soapy's long arm shot out in the gloom, and seizing Spike's right arm, he drew it near. 'Why, kid,' said he, 'it kind o' looks like Heine told the truth for once by accident, don't it?'

'You leggo my wrist!'

'Right-o, kid; right-o! Don't get peeved.'

'Well, leggo, then!'

'Sure! Only this artillery ain't goin' t' be no good t' you t'-night. Ye see, Bud—ain't here. 'S rough on ye, kid—'s rough, but he ain't!'

'W-what—d' ye mean?' stammered the boy.

'I mean, as you 're comin' here t' plug holes in Bud's carcass it 's kind o' rough on ye, as there ain't goin' t' be no carcass here t' plug. Ye see, Bud 's took his carcass up-town with him t'-night.'

'You 're a liar, Soapy—a liar! Bud 's inside; I know he is. Leggo my arm; you can't con me!'

''S right, kid, I ain't tryin'. Only I 'm tellin' ye Bud 's left me an' Lefty t' run things here t'-night. Bud 's up-town, at his old man's place. I know, because—I sent him. See?'

'You sent him—you? Ah, come off! You couldn't!'

''S right, kid. I got him away by a fake telegram.'

The boy vented a long, quivering sigh, his whole frame relaxed, and in that instant Soapy wrenched the weapon from his loosened hold and rose. Choking with passion, Spike sprang at him, but Soapy fended him off with a long arm.

'Gimme that gun!'

'Behave, kid, behave, else I 'll have t' dot ye one! Be good an' chase off home; this ain't no place for you t'-night—nor no other time.'

'Gimme that gun!'

'No!'

Spike ceased the useless struggle, and leaned against the fence, panting, while Soapy reseated himself upon the battered pail.

'What you got t' come buttin' in for?' demanded the boy. 'This ain't your show, an' I guess you ain't so mighty fond o' Bud either.'

''S right too,' nodded Soapy; 'no, I ain't exactly fond o' him, kid—leastways I don't run t' help him if he falls, nor kiss th' place t' make it well—no, kid! But I kind o' feel that Bud's too good t' snuff it this way, or snuff it—yet!'

'Good?' said the lad bitterly. 'Good—hell! He's ruined me, Soapy; he's done me in! He's come between me an'—an' Hermy. He tried t' make me think dirt of her, an' now—now I—I'm all alone; I ain't got nobody left—oh, my God!' and huddling to the fence, Spike broke out into a fierce and anguished sobbing; while Soapy, spinning the revolver dexterously on his finger, watched him under drooping lids.

'She was mighty good t' ye, Hermy was!' said he thoughtfully.

'Don't—ah, don't!' gasped Spike.

'An' when he spoke dirt of her, you—believed him, kid!'

'I didn't.'

'You did, else you'd have been with her now. She was always good t' you, Hermy was, but you—well, you preferred Bud.'

'I didn't, Soapy—God knows I didn't!—only—I thought Bud would make me a champion.'

'By gettin' ye soused, kid.'

'Oh, I know—I know now he's only been stringin' me all along! I know now it's too late—that's why I'm goin' t' kill him.'

'Kill him!' mused Soapy. 'Kid, there's good killin's an' bad killin's, an' I reckon this 'ud be a good killin', maybe. But this ain't your job.'

'Why—why ain't it?'

'Well, you got a sister, f'r one thing; an' besides, you ain't a killer.'

'You gimme that gun an' see!' cried the lad, reaching out a hand, tremulous and eager.

'When the time came, kid, 'stead o' shootin' you'd drop your gun, like that time in th' wood.'

'Th' wood!' Spike's voice dropped to a strangled whisper, and he shrank back against the fence. 'You—my God!—you—saw'——

''S right, kid, I was there! An' I'm kind o' glad ye couldn't do it—glad for your sister's sake. But what I'm thinkin' is that maybe she thinks it was you—eh, kid?'

Spike writhed and groaned.

'Eh, kid?'

'Yes!'

'Why, then, if I was you I'd skin off right now an' put her wise; it may mean a whole lot t' her. Ye know where she is—go an' tell her, kid.'

'I can't! I can't—she don't want me no more; she's done wi' me. I guess I'm—oh, I'm too low-down an' rotten!'

'Sure!' nodded Soapy. 'But she's good, an' she's a woman, an' good women are only made t' forgive, I reckon.'

'But there's Geoff. I couldn't face Geoff again.'

'That's because you think a heap too much about a low-down rotten guy called Spike. I guess it's about time you began t' think about your sister f'r a change. Well, s' long, kid. I guess I'll be movin'; this pail comes a bit sharp after an hour of it.' So saying, Soapy rose, nodded, and strolled away, still twirling the revolver upon that long and dexterous finger. For a moment Spike stood looking after him, then, chin on breast, turned and went his solitary way across the desolate waste. But now it was Soapy who, pausing, turned to watch him safe out of sight. Scarcely had the sound of Spike's departure died away than a door opened and closed hard by, and heavy steps approached, halted suddenly, and a hoarse voice demanded, 'Who's there?'

'Why, this is me, Bud.'

'What are ye hangin' around out here for?' questioned M'Ginnis suspiciously.

'Countin' th' stars, Bud, an' doin' th' Providence act—"midst of life we are in death" gag.'

'Aw, cut out that slush an' hike along t' Rayner's wi' me. I got a job for you an' Heine.'

Side by side they crossed the gloomy, open lot until they were come beneath a lamp at a certain bleak street corner. Here Soapy paused and held out his hand, open to the light. 'This don't happen t' be your ring, Bud?' he inquired lazily.

M'Ginnis glanced at the ring upon that narrow palm, a ring wrought into the semblance of two hands that clasped each other; looked closer, drew in his breath suddenly, then straightened his shoulders and threw back his head. 'No!' he answered, frowning into Soapy's imperturbable face. 'What th' hell made you think it was?'

'Why, ye see, Bud, it happens t' have your name scratched inside it; that's all. But if it ain't yours, it ain't!' And speaking, Soapy tossed the ring back over his shoulder far out into the open lot.

For a long moment M'Ginnis stood motionless, staring back at that desolate plot of ground. When at last he glanced towards his companion, Soapy was lighting a fresh cigarette.

(Continued on page 598.)

THE LIVERY OF THE SUN.

By F. G. Aflalo.

Is thy servant a dog?'

THOSE of us who have gone forth into the wilderness under many skies can look back with feelings of mingled pleasure and disgust on the picturesque company of coloured folk who have served us well or ill in the capacity of porters, guides, gillies, soldiers, cooks, and valets. For myself, such of them as were the comrades of angling excursions to lonely lakes, little-known streams, and far-off seas, learning, with much patience on their side and some lack of it on mine, to handle a gaff or landing-net as required, are most easily recalled, for the proud, though not always coveted, post of gillie was always conferred on the most robust and intelligent of the dusky staff for the time being, and I can honestly say of a very few of them that they acquired a degree of smartness that would not have disgraced even the picked gillies of Tay or Tweed, and that they went about their duties with a better grace and with less thought of reward.

It is only when camping, living the overpraised tent life that has thrilled the imagination of the men of cities ever since the days of the black but comely tents of Kedar, that the traveller gets properly to know these sons of the wild temporarily enlisted in his employ. Personal or domestic service in eastern cities does not reveal either the servant to the master or the master to the servant. They must, if they are to know each other better, go far from civilisation. If they are to learn mutual regard, they must march together under the sun and camp together under the stars.

Previous to the tour in Equatorial Africa from which most of the following memories are drawn, I had camped in three continents with a variety of coloured servants, including Moors in Morocco, Syrians in Asia Minor, and Indians in Canada. The first-named were excellent personal servants, capable cooks, devoted nurses in time of sickness, watchful guards in disaffected country, going about their duties without fuss, and, unlike the negro, neither asking for praise nor caring a great deal for blame. One of my Moors used regularly to brush the scorpions off the crumbling staircase of an old house in southern Morocco where I lived one summer. Just before I went to bed he would go silently about this gruesome work, but never a word of it did I hear till the end of the trip, as he feared that the presence of scorpions might have made me uneasy—a delicacy of feeling that one might look for in vain in servants of more civilised exterior.

The American Indian is not, if I may judge him by my memories of Chippewas, a servant at all, but a paid guest willing to lend a hand with camp work. So long as there is paddling or portage to be done he is as efficient as one would expect of a child of such environment, but in the lazy days in camp he has little use for work and none for conversation. He also minds his own business to an extent that may be embarrassing. I recollect one evening, when camping with a solitary Indian out on the great lakes, treading on a loose stone while wading after black bass, and falling full length on a slippery rock overhanging very deep water. My Indian was seated close by in our canoe, smoking a long cigar that I had given him, and all he did was to acknowledge my disaster with a sympathetic grunt. It was not until, still prone, I addressed him in 'far-flung words and few' that he helped me to recover my rod, moving with as much despatch as his racial dignity allowed. The natives of East and Central Africa are of very different calibre. They are of the

> New-caught, sullen peoples,
> Half-devil and half-child.

Here is no silence, no apathy, no personal devotion at any rate to the tourist, a bird of passage who, if the truth must be told, does not as a rule go very far out of his way to win their affection, holding apparently that, though reproof may suffice for the wise man, the other sort are the better for half-a-dozen with the hippo-hide *kiboko* that is one of his first purchases when going up-country.

This ancient policy of the rod for the fool's back has the authority of Scripture, and at that I would gladly leave it but for the need of stating a clear case for travellers who may, in some remote district, far from magisterial or other assistance, find themselves suddenly confronted by a column of mutinous porters. Few evils are more infectious than sedition; and, all the wise proclamations of Government against the sjambok notwithstanding, it may be a question of life and death, a choice between going on or being deserted, so that to blame the traveller for occasionally choosing the short cut to harmony is to ignore the rights to which his contract with the porters entitles him. Out of the meagre store of untoward adventure that marked my last trip, I may perhaps be allowed to recall an occasion on which, as I do not hesitate to admit, I used the whip. If any one blames me for this, I should be glad to see how he would have behaved in like circumstances, with the immediate prospect of being abandoned with all his baggage in the middle of Africa, not many hours before midnight, and in a district known to be visited by a dangerous rogue

elephant that was not shot until a week or two after I went through. I had ridden for some hours out of Kisumu, with an escarpment for objective, intending to climb the latter before camping for the night, when the line of porters suddenly came to a halt, and there was enough jabbering and gesticulating to suggest some sort of trouble. The Kavirondo porters are well-built fellows, and two of my small column were veritable giants. Needless to say, these were the disturbing element, and had just thrown down their loads on the track. Here was a pretty outlook! It would not take many moments for the rest to follow suit. Even had I known their language, which I did not, there was no time for parleying. So I just ranged my mule alongside the malcontents and pointed to the loads with my whip. This elicited no response beyond a sardonic grin; so next moment the *kiboko* whistled, after a way it has, and came down across the shoulders of one of them. I had just repeated the dose, when the mule, anxious to join in the fun, all but sent me over her head, a pleasantry that I forgave her, as in so doing she kicked the other recalcitrant in the stomach, sending him backwards into the bush. This little diversion occasioned much enjoyment among his charitable comrades, and I took advantage of the situation to order a forward movement, in which, after a moment's hesitation, the two naughty ones acquiesced. It is pleasant to add that before I parted with them, some days later, we became good friends, and the Anak with sore shoulders constituted himself my *sais*. I am inclined to believe, after comparing notes with African travellers of much wider experience, that such *contretemps* are exceptional. In the ordinary way, therefore, the rough-and-ready use of the whip is rightly discouraged, and is to be condoned only when, in emergency, a touch of it—*μηδὲν ἄγαν*—alone marks the difference between employer and employed.

On a tour such as this the traveller employs all manner of servants, including Swahili, Kikuyu, Kavirondo, Baganda, and Sudanese. Essentially, they are all negroes. The Swahili have somewhat hazy Arab traditions, but their language, the *lingua franca* of Equatorial Africa, bears little resemblance to Arabic, and their features are those of Ham. It is an axiom of African travel that the negro is a kind of sable caricature of Peter Pan. He refuses to grow up. Mentally he remains from the cradle to the grave in a stage of arrested development, and this accounts for the paradox of negroes of mature years with the minds of little children. It is only fair to take into account this truth about negro mentality when dealing with native servants, and in Central Africa it is equally reasonable to remember that the natives of these newly acquired territories labour under the additional handicap of unfamiliarity with the ways and refinements of civilisation. Those who have enjoyed hospitality in the Southern States of America realise that the gentleman's gentleman valets his master, whose father owned his father, with considerable deftness; but no such training has been available for the Kikuyu and Swahili servants employed in British East Africa and Uganda. The Sudanese, thanks no doubt to military discipline, are somewhat more efficient; but even they are far from finished servants. Those, however, who go on *safari* in the protectorates must be prepared for the crudest interpretation of such duties. It is useless to rave at a porter who carries a dressing-case upside-down in a downpour of rain, or at a personal servant who wraps a leaking tin of butter in a favourite shirt, for such solecisms are the result of ignorance and not of ill-will.

The Swahili claim superior intelligence. Of course; they have an Arab strain, and the Arab is the Prussian of Africa, contemptuous of every more peaceable caste. Yet the coast Swahili have at any rate some justification, not because of inherited qualities, but by reason of the greater opportunities which residence at Mombasa affords of contact with Europeans, whose ways they soon learn, and whose speech they even acquire in a fragmentary fashion which, though of little use for practical purposes, enables them to ask 50 per cent. higher wages. The linguistic standard of my own 'English-speaking boy' may be judged from the fact that when, on one occasion, I sent him for a red box which was in my kit-bag, he promptly came back with a green book out of the suit-case.

The Kikuyu porters are sturdy little fellows who recalled to memory half-forgotten Arab servants in the Altas Mountains. They have little intelligence, and are as quick as children to smile when praised or to sulk under reproof; but they get through a deal of hard work on very little food, and their gratitude for a packet of cigarettes or any other trifling luxury is embarrassing.

Physically superior are the Kavirondo, who inhabit the country at the eastern end of Victoria Nyanza, and they acquire an added freedom of movement from their complete contempt for any sort of clothing. Most of the men go stark-naked, and the married women alone wear a tail. An experience with contumacious Kavirondo porters has already been related, and I found most of my small company inclined to sulk, with two honourable exceptions—a cheery little *neapara*, or head-man, much smaller than his fellows and a model of good temper, and a powerful youth who acted as my gillie, and whose zeal in catching butterflies for me was so great that only after much practice did he manage to bring me each insect in less than four pieces.

The Baganda are said, by Europeans with experience of both, to be more progressive than the tribes inhabiting East Africa, to make better

subjects and servants, and to learn the ways of civilisation with almost uncanny readiness. My own experience of them was limited to three or four weeks; but I had during that time to do with a considerable number and variety of riksha 'boys,' and found them willing enough, but, from lack of training, very inferior to those of Ceylon and the Far East.

These natives, from Mombasa to Lake Albert, have somehow earned a bad reputation for lying and thieving, and are regarded as the antipodes of him who, according to the poet, couldn't lie if you paid him, and would starve before he stole. Well, all I can say is that in the three months I spent among them, constantly on the move, and thereby affording them endless opportunities, I was not robbed to the value of a shilling; and if this agreeable memory says much for the fear of the law instilled in the savage mind by the powers that be, it also says something for the honesty of the natives themselves. They are not prepossessing. They are, in fact, an ugly-looking crowd, lacking at once the dignity of the Sudanese and the politeness of the Egyptians. Yet sweetest nut, as the saying goes, hath sourest rind, and many of these humble servants, though churlish to the eye, have their hearts in the right place.

UNDECIMUS UNTHANK: HEIR OF ENTAIL.

CHAPTER II.

IS there any scene, in the whole comedy of life, more calculated to make the cynic chuckle than this of borrower and unwilling lender? It is so sordid, pitiful, and trite; so subversive of man's vaunted dignity! How it repeats itself, developing regularly, in accordance with a stereotyped plan! And how each successive phase of the little drama brings to light its own peculiar vileness! First the calculated amiability and fawning advances of the borrower, smoothing his way with an unctuous compliment, and watching its effect. Then complacency in the holder of the purse-strings turning sour, like milk before a thunderstorm, as suspicion wakes within him. He has not the strength of purpose to blurt out a blunt refusal; he trims and sidles rather. There are reasons (purely fictitious) for his being economical at this moment. Reasons? These are as nothing to the urgency with which his friend needs cash. And true it is that eloquence and emotion are on the side of the attack. The defender's part is poorly written, hesitant, short of words, and self-repeating. Yet the defence stands its ground. He knows all along that there is nothing to keep him from forking out, except dogged dislike of doing so. He has a good balance at his banker's, and would never miss the trifling sum which would make his friend (so he is informed) entirely independent and proof against mischance for the rest of his life. The fairy-tale is no doubt familiar to him, just as are the kindred fables of unquestionable security and unfailing prompt repayment. Sick of the whole business, he will take his stand on 'principle.' The would-be borrower is scarcely less sick, but him fallacious hopes sustain. And so the sorry play unrolls at an interminable length.

And thus, through the successive moves of this miserable game, Undecimus and his uncle strove to check and counter one another. They were both of them experienced players. At first their argument had dealt with the deed of entail. It had served its purpose, and Undecimus would gladly have persuaded his uncle to pay something for the right to break it. But Decimus was not to be drawn. He had no wish to alter the succession. Nor, again, would he hear of charging the estate for the benefit of his heir. So the conversation settled down into the old time-worn rut. Was Mr Unthank more exasperating than usual to-night, or was his nephew more easily exasperated? Between a close-fist and a spend-thrift, grudge or grievance can never be far to seek. Undecimus's present outlook was more desperate than it had ever been; and, besides, his nerves were strained after heavy drinking. And so there arrived a moment when his fingers twitched, and he could have flung himself bodily upon the older man, and then and there made an end of this obstacle to the accomplishment of all his wishes—an obstacle so utterly destitute of the power of physical resistance, and, at the same time, so perversely and obstinately impenetrable to reason.

For a moment, then, it may be that Undecimus came near to crime by violence. It was for a moment only. Then an apparently irrelevant thought sufficed to stem the current of his feelings. It was a recollection that had darted through his brain—the recollection of a bravado speech which he had once addressed to certain roistering companions of the student or stroller class. It was the custom of these fellows to affect great license in their discourse, and it so happened that, on the night in question, one of them had been holding a defensive brief for murder—justifying the use of any means to clear one's path of useless rubbish that encumbered it. Such boldness pleased his hearers, who, regarding the thesis as purely academical, had listened with approving smiles. Only Undecimus had seen his way to go one better.

'Justify murder?' he had cried, as if inspired by righteous ire. 'Why, what rank drivel you are talking! Would you lead a fellow into the

blind-alley that ends in chokey, and for finale hand him over to Berry to get his cravat fastened? For the coppers are not such duffers as you are pleased to make them out. Hardly good enough, say I!'

Here the audience showed disappointment over the anti-climax, whilst at the same time languidly wondering to see Unthank in the rôle of opposition to the devil's advocate. For such was certainly not his way.

He continued: 'No; you chaps may take my word for it that murder—what the world knows as murder, I mean—is generally a blunder, and very often a fatal one. Would I play with knives that tell tales afterwards, or dabble in drugs whose purchase can be traced?' With expressive pantomime, he replied to his own question.

His hearers' disappointment deepened, for, ere this, some few of them had in fancy seen themselves coquetting with murder. And now that pleasing prospect was dashed. This, however, was premature.

Undecimus proceeded: 'But, gentlemen, don't let your spirits sink. There are other ways—ways that accomplish their end and yet entail no liability, no discredit to the operator, and, above all things, do not soil his fingers.'

He had gone on to describe one of these. He had known a man, so he said, who, poor himself, had a rich nephew, whose heir he was, a youth of vicious propensities. This young man drank hard. Now his uncle had observed that when a drunkard develops pneumonia, it generally kills him. The nephew was confoundedly in his way. What did he do? Knock him on the head? You bet he knew a trick worth two of that. He invited the young hopeful to a prize-fight in cold weather, and allowed him as a special privilege to act as bottle-holder. The youth got very damp about the breast, and then got chilled waiting for the car that was to take them back to their hotel. Pneumonia supervened. Throughout the illness his uncle waited on him hand and foot, and, when it was too late, wired to town for the best specialist. He got great credit for his devotion. But of course the nephew didn't recover; he was too far gone in drink. The uncle inherited his fortune. And what is he now? A 'lifer'? No; a churchwarden. Isn't that a cut above your rotten old murder?

As Undecimus faced his uncle in that unchanging old-world gunroom, these words of his own came back to him, evoked by an association of ideas which he scarcely paused to trace. In his case, the relative positions of nephew and uncle were reversed, the former being empty-handed, whilst the latter held the purse. Other difference there was none.

Meantime the scene being played between them had reached its climax; for, having begun by asking for a loan of twenty-five pounds—more than he expected to get—Undecimus had successively lowered his figure to twenty, to fifteen, ten, five pounds, until now he was employing all resources of his eloquence and diplomacy to secure a single sovereign. It was pitiful! But yet more pitiful was his uncle's tender of five shillings. For it is a canon of the confirmed borrower that the ignominy of borrowing is in inverse ratio to the sum borrowed. Thus, whilst to borrow a handsome sum is not lowering at all, to be able to raise but a few shillings is the last depth of shame. The sum is everything, you see; the act nothing. Undecimus Unthank felt this, and, mustering some poor last remains of dignity, he rose. 'Very well!' said he, speaking without bitterness, 'if you cannot meet me, uncle, I have no choice but to wish you good-evening.'

This unexpected change in his demeanour, which but a minute before had been positively abject, produced a corresponding change in Decimus.

'But I understood you were spending the night here,' he murmured, half-relentingly.

'Thank you, no,' was the cold reply.

'Well, at least, take this! Sorry I can't make it more; but it will tide you over the next day or two, and after that something may turn up.' And he held out two half-crowns towards his nephew. For the old man's conciliatory spirit, neutralised for a time by the thing he hated most, was now reasserting itself.

Undecimus put the proffered boon aside. 'I will not trouble you, sir! I will not trouble you either now or at any future time. And I need only add that I regret the cruel necessity which has forced an Unthank to beg—even from a kinsman.' The last word was underlined, and gave the cue for an exit which would have won applause from the gods of a theatre.

Entirely taken by surprise, and scarcely knowing if he felt most relief or regret, the uncle sat speechless for a moment. Then he raised his high-pitched voice and cried, 'Undecimus, Undecimus, come back! I want to speak to you.'

There was no reply, excepting that the house door was heard to close.

'Gone!' soliloquised the ancient. 'Well, it's no fault of mine, though maybe I *was* a leetle hard on him. I wonder if he will come back in spite of what he said.' And, so illogical is human nature, he sighed almost wistfully.

As a matter of fact, however, Undecimus had not left the house. He had merely opened the front-door and closed it with some force. Moving noiselessly, he next selected one of several shepherd's-plaids which hung from pegs in the entrance hall or passage. The plaid was Uncle Decimus's characteristic wrap, and he wore it in a manner of his own, of which his nephew was well aware. Carrying his booty with him, the youngster then passed through a baize-covered door into the back parts of the house. He still moved stealthily, and it was evident that he

wished his presence to remain undiscovered. But the chances of detection were not great. Knowing the habits of the household as he did, he was able to calculate that the woman who came in daily to do the cooking and housemaid's work would by this time have betaken herself home; whilst a glimpse through an open door showed him Maskelyn, fast asleep by the pantry fire. The old factotum's habits were not those of rigid temperance, and if, as seemed likely, he had lately swallowed a dram, he would probably sleep on heavily for some little time to come. Trusting to this, Undecimus presumed to dispense with caution, and went about his business as methodically as if in his own house. First he took a sheet of brown paper, some tin tacks, and a light hammer from a drawer; then he secured a candle and matches; and lastly he took a handful of flour from the flour-box in the still-room. This done, he left the house and entered the adjoining harness-room, where, as he remembered from old times, Maskelyn generally performed his toilet. And there the various purposes for which the articles had been collected became by degrees apparent.

Having lighted his candle and carefully shaded it, he turned to the single small window, which was blindless, and proceeded to blind it by lightly and deftly nailing the sheet of brown paper over it. To ensure against interruption, he had previously locked the door, and having now possessed himself of Maskelyn's razor, soap, and shaving-brush, he made preparations for shaving. But there was this of unusual in his procedure, that, instead of applying the lather to his chin, he spread it thickly over brow and temples. In a moment or two the luxuriant dark tresses had begun to lie thick upon his shaving-paper, whence he was careful that not one of them went astray. In a quarter of an hour or less Undecimus was bald on the top of his head. The groom's small mirror, hanging from a harness-rack, reflected his features, and he saw that his likeness to his uncle was materially increased.

During his travels with the players, Undecimus had enjoyed considerable practice in the art of 'making up,' and had gained some credit for skill displayed in it. And though the sole cosmetics now at his command were baking-flour and burnt cork, he showed no little cleverness in making these perform the work he asked of them. Briefly, his back and side locks became grizzled, the dark shaving-marks disappeared from his lantern jaws, and, when swathed in his uncle's plaid, worn as his uncle always wore it, he presented no bad stage copy of the original. For, as has been said already, the superficial likeness of the kinsmen was pronounced.

Studying himself before the glass, he corrected details here and there, whilst cleverly mimicking the senile poise of his uncle's head and body. Remarkable as the result was, it failed to satisfy his critical sense. 'The eyes betray me,' he murmured presently. 'I had not realised before that it is our eyes by which people identify us.'

He lowered the eyelids. That would be better. Then he neatly and carefully removed all trace of his visit to the harness-room, put out the light, and unlocking the door, passed cautiously out into the darkness. But, caution notwithstanding, in turning the corner of an outhouse he ran almost into the arms of Maskelyn, who, lantern in hand, was returning from his evening rounds. Undecimus stood still, and for a moment his heart stood still too. The light of the lantern was directed full upon him. But the factotum's sight was none of the keenest, and all he said was, 'I 'll take mare to the shoein'-smith the morn, will I, sur?'

For all reply Undecimus growled. Here was one at least upon whom his disguise had imposed, and who had taken him for his uncle. Then the two men went their several ways. And in the ears of one of them rang words which he had heard spoken that evening, 'Of this at least I feel sure, that, if it does happen to me to see myself, I shall not long survive it.' Well, if it should by chance turn out so. . . .

Old Decimus Unthank was too bad a sleeper not to be a late sitter at nights. His animal spirits were at no time high, but he would labour away contentedly enough at his quaint handicraft, occasionally crooning to himself, until the clock struck midnight, by which time he would be both physically and mentally exhausted and quite ready for bed. Though the Hall was not in reality very remote from other dwellings, it stood in a quiet and primitive countryside, where few people stayed up late, so that the old gentleman's vigils were seldom disturbed by any sound, saving those made by the wind and by the owls without, or by the fire or the busy teeth of some chance rodent within. There was a certain eeriness in the solitude of the room, and as the hour grew later nervous tremors were by no means unknown to Decimus, who would start at the cracking of a piece of furniture, whilst his heart bounded if a log fell from the fire. Long usage had, however, inured him to these petty sufferings. No real harm had ever befallen him at Unthank, and with the fear and anticipation of the same he could put up, as was the way of his generally passive and unresisting nature.

The eight-day clock in the lobby outside the gunroom whirred preparatory to striking twelve, and Mr Unthank was about to lay aside his finished work, when, as had already happened once that evening, there came a faint tapping on the window-pane. The window-blind was lowered, and, for some reason best known to himself, the old man had now no doubt of the actuality of the sound. It was external to himself, not self-generated within his head. Acting with the determination which timid men will

sometimes show, he rose from his seat and went over to the window to lift the blind and look out. But before doing this he took from its place against the wall an old-fashioned pistol of the blunderbuss type, which for some time past he had kept loaded beside him, by way of precaution, often fingering but never discharging it. With this in his hand, he pulled up the blind and peered out into the darkness. The tapping had ceased, but, standing a few paces back from the window, he beheld a vaguely luminous figure, which confronted him, whilst seeming to surge or sway forward in his direction. Fascinated, rather than frightened, and half-doubtful of the evidence of those senses which had before now been known to play him false, the old man kept his eyes fixed on the phantom, whose features were becoming momentarily clearer. The high, bald, hatless brow first detached itself from the surrounding gloom, and then the stooping figure swathed in the gray plaid, as, with conviction merging into horror, the gazer recognised *himself*. It was the sign for which he had waited, though there had been times when he had inclined to pooh-pooh it; and it was not so much surprise at the actual apparition which now overcame him as distress at its significance.

Close and closer toward the window it kept pressing, as if urgent that there should be no mistake as to its identity and purport. And slowly the old man's gazing eyes began to turn backward in his head, whilst the fingers of his left hand grasped his throat, from which a gurgling sound proceeded. He was on the actual point of an apoplectic seizure, when something unforeseen occurred, which, in a wholly unexpected manner, served to relieve the strain upon his brain.

It was just this. Hitherto the eyelids of the spectral figure had been lowered so as to veil its eyes. But at the first sound of the rattle in old Decimus's throat the heavy lids were automatically lifted. And thus, for a single moment, the confronting figures looked each other full in the eyes. That was enough. The next moment Decimus raised the blunderbuss, levelled it, and fired. He had always said that he would do so if any one molested him. The report rang out; the window-pane was shattered; the ambiguous figure, which had had just time to turn away, fell on its face upon the ground. The charge, consisting of slugs, had entered its back at terribly short range.

Whether old Unthank's impulse in firing had been vindictive, self-protective, or merely automatic was never ascertained. For he was not able to be present at the inquest held on the strangely travestied corpse of his nephew. The one strong and effective act of his life had proved too much for him; and, though he lived on for many years, it was from that time forward as a confirmed invalid, the victim of senile decay.

After being a nine days' wonder in the neighbourhood, the Unthank homicide became an old wives' tale; and it is in that form that, in my character of local antiquary, I have endeavoured to save it from oblivion. Only, whereas local gossip regarded Undecimus's prank as a practical joke, I am myself inclined to assign to it a much more sinister significance; and I have good grounds for doing so.

THE END.

AUSTRALIAN AND OTHER SHARK STORIES.

SYDNEY HARBOUR is notorious for the number and ferocity of its sharks, and yet it is a matter of fact that seldom are more than one or two persons seized during the course of an entire year. On the eastern coast of Australia the names of several of the species of sharks differ from those given to them in Tasmanian, New Zealand, and Victorian waters. Those that the Sydney fisherman knows best, and that prove such a pest to him when pursuing his calling, and destroy human life, are the tiger shark, the blue pointer, the so-called white shark, and the gray nurse. Then come the six-gilled and the seven-gilled shark, the hammerheads, and the saw shark. There is also the well-known wobbygong, a creature of extraordinary and beautiful colouring, haunting rocky bottoms and feeding largely upon crayfish and other crustaceans. I have never heard of the wobbygong attacking man. It is sluggish in its movements, and during the daytime may frequently be seen lying upon the bottom, its body resembling a gaily coloured and motley patterned strip of carpet. It is a nocturnal feeder, but it is often caught in the daytime if the baited hook is lowered directly in front of its mouth, which, unlike that of the mouth of its brethren, is not undershot. The jaws are filled with a mass of ugly-looking pointed teeth, set together in an irregular fashion, but all inclining inward. This shark has the most extraordinary power of assimilating the colourings and markings of its coat to its surroundings, and it requires a keen observer to determine whether the object at which he is gazing under ten feet or so of water is not a patch of blue, red, or orange-coloured seaweed growing upon stones or coral of equally brilliant hues.

The blue pointer is an exceedingly handsome shark, with a graceful, tapering body, a long, projecting snout, and an undershot mouth provided with razor-sharp, non-serrated teeth. It is exceedingly swift in its movements, and can turn with lightning-like rapidity. The skin on

the back and head is blue, growing lighter on the sides, and the belly is pure white. This shark is more dreaded by the Australian line-fisherman than any other, for when two or three of them make their appearance it is almost impossible to draw a hooked fish to the surface. I have frequently seen one of these monsters seize half-a-dozen hooked fish in quick succession upon as many lines, and then, finding himself hooked, twine the lines round and round his body in his rage and efforts to escape.

It is always best, when not more than two or three of these brutes begin to persecute, at once to bait the shark-tackle hook, and then haul them alongside in turn, and sever the spine at the juncture of the tail with a hatchet; then, if the boat is large enough and will stand the severe shaking, club them on the head, cut the lines, and let the carcasses sink. But this can only be done when the boat is manned by at least three men well used to the danger of having an angry blue pointer alongside, lashing the water into foam and snapping his jaws wildly in the hope of getting something between them on which to vent his fury.

But even after having rid themselves of their enemy, the fishermen must up anchor and move to fresh ground, as other pointers, and perhaps a dreaded gray nurse or two, will be sure to find the ground ere long, and, disdaining for the time being the bodies of their brethren, devote themselves to the fishing-lines.

I know of only three instances in which human beings have been taken by blue pointers on the Australian coast. One occurred long years ago. A man-servant of Mr Benjamin Boyd, seeing several blue pointers cruising about the base of some slippery rocks, foolishly baited a heavy shark-line and lowered it down. It was at once seized, and the unfortunate man actually tried to drag a fourteen-foot-long shark, weighing many hundreds of pounds, up on to the rocks. He slipped, fell in, and was torn to pieces in a few seconds.

In another case almost the same thing happened. A fisherman, furious at losing so many fine schnapper by several of these voracious creatures which were hanging around his boat, made a thrust at one with a lance. He over-reached himself, and was at once devoured.

In the third instance, a poor half-caste lad, in endeavouring to sever the tail of a blue pointer which was fast in a bowline alongside the boat, was knocked overboard by a blow of the tail, and was at once carried off by a second shark.

During the summer, when the so-called sea-salmon swarm into the Australian tidal rivers in countless thousands, the blue pointers and a small kind of tiger shark create fearful havoc among their serried masses, and for days the beaches are strewn with salmon bitten in halves.

The gray nurse, like the white shark, is noted for its daring ferocity. It presents some very distinct characteristics from most other varieties of the family, the principal being the shape and formation of its teeth, which alone would render easy its identification. It is erroneously called the shovel-nose shark, on account of the shape of its nose. The true shovel-nose shark is distinct, favours white sandy bottoms and shallow water, is more frequently seen about ocean beaches than in harbour waters, and is not considered dangerous to bathers or people while swimming. The aborigines of the east coast regard it as the best of all the family for food, and have not the slightest fear of it.

An instance of the daring savagery of the gray nurse was witnessed by a number of horrified people in Sydney a few years ago. In one of the most congested parts of the harbour, at a spot near Pyrmont Bridge, where the water is thick and filthy, a number of street-arabs were bathing among a lot of floating logs of cedar, connected with each other by a chain and staples, and forming a sort of dock. The boys were bathing inside this barrier of timber, some of the logs of which were grounded on the muddy bottom and some well afloat. Suddenly a gray nurse sprang out of the water over the stranded logs, seized a boy, and swam off with him under one of the floating logs.

The gray nurse has a wide habitat. It is met with, to my own personal knowledge, pretty well all over the North and South Pacific, and is everywhere dreaded by both natives and whites. The only creature in its own element that it fears is the 'killer,' that savage little minor-toothed whale, Orca Gladiator, the bulldog of the ocean, and the friend of the whaleman.

I may mention that there have been hundreds of instances where, when the whale-boats have been stove in, or smashed by being fluked by a sperm whale, and the crews were swimming for their lives, or clinging to bits of the broken boat, the attendant 'killers' have actually swum up to the men and smelt them, or, as the whalemen say, 'nosed' them, and swum off again in pursuit of the wounded whale.

But of all the sharks the Orca is a deadly enemy, and attacks them fiercely as they attempt to strip off mouthfuls of blubber from a dead whale. And it is also a strange fact that the whalemen, when their boat has been capsized or stove in, have been surrounded by hundreds of blue pointers, and very rarely has one of them lost his life or even been bitten. In the deep ocean the blue pointers (the 'blue shark' of the deep-sea sailor) may be met with in droves, the gray nurse only in twos and threes.

Of the white shark not so many examples are seen or captured along the Australian seaboard. The word 'white,' as I have before indicated, is a misnomer. It is probably, with the exception of the tiger shark of the Indian Ocean and the

'bone shark,' the largest of all the shark family known to whalemen.

The Indian ocean tiger shark I have never seen, but I can quite believe that it attains the length of forty feet, or even fifty feet, for I have seen a so-called white shark that measured twenty-four feet. At the shoulders it had the circumference of a fat bullock, and the largest teeth were two inches long and one and a half inches wide at the base. This monster, which was of a pale-bluish colour on the back, and a dirty yellowish-white on the belly, was killed by a bomb-lance from a whale-boat close to the reef of Pingelap (M'Askills Island), North Pacific. It sank in ten fathoms, and the carcass was not recovered until the next day. In the stomach was a large green turtle, partly digested, weighing one hundred and thirty pounds, together with two small hawkbill turtles.

The Challenger Deep Sea Sounding Expeditions brought up in the dredge in the mid-Pacific teeth of the white shark five to six inches long and four inches wide at the base, and it was reasonably conjectured that the monster to which these fearful teeth belonged must have been from eighty to ninety feet in length! The teeth were of no great age, and it is not unlikely that at the present time there are similar monsters in existence, ranging the ocean, as yet unseen by man.

Of the existence of the mighty 'bone shark' there is no doubt. These creatures have been harpooned by the whalemen on several occasions, but have 'sounded' to such a vast depth that the lines had to be cut to prevent the boats from being dragged under. Whether it is really a 'bone shark,' an enormous toothless shark with baleen plates like the right whale, or an unknown variety of the great 'sulphur bottom' whale, may some day be known.

In Australian waters there are at least three or four varieties of the voracious six and seven gilled shark. The teeth in the upper jaw are double-pointed and fanglike; those of the lower jaw are flat, thick, and serrated with either five or seven points. The mouth is not undershot, being at the end of the head, like the wobby-gong's, and the seven or six gills, as the case may be, are placed vertically. On the back there is but one fin, situated far down on the 'small,' as the whalemen say; and the flukeless tail appears to be of an almost rudimentary character, like that of an eel, with thin 'flanges' of skin extending on the under-side from the tip to the ventral fin.

This ranger of the sea has the most repellent odour of all the shark family that I am familiar with, and on dark nights a continuous stream of phosphorescent fluid exudes from the gill-slits as it swims along.

The experience of my friend Ernest Williamson may be added to my own, giving it in his own words: 'My brother and I were in charge of a project to photograph under water a reproduction of Jules Verne's *Twenty Thousand Leagues under the Sea*. We were called upon to get close-up pictures of sharks. The particular feat required quiet observation, but I think it is safe to say we were given opportunities to study the habits of "man-eating" sharks that have not been enjoyed by any other human beings.

'Let me begin my record with the statement that sharks are not necessarily scavengers of the sea. We were told to use fetid carcasses of animals as bait. We did so, and had little success. Finally we decided to use freshly slaughtered calves as a lure for the big fish, and this bait gave us our pictures and a chance to study sharks at close range.

'About half-an-hour after our bait was placed and we had taken positions behind the glass window the first shark appeared. It was a big specimen, between twenty and thirty feet in length. It swam close to our hiding-place, and gave us every opportunity to study its appearance in its native element. Like all other sharks I have seen under water, its big, cold, gray eyes rolled in their sockets like those of a human being. There was a wicked gleam back of the icy stare with which these sharks studied the bait that gave us an odd sensation.

'The first shark swam around the calf repeatedly, but made no effort to attack it. Instead, it retired after ten or fifteen minutes, and we thought our day's work would be wasted. After a short time, however, the first shark returned with a companion, and both fish swam in a leisurely but very timid manner around and around the bait. Then both sharks disappeared. They came back in less than half-an-hour with six other sharks. These tactics were repeated until a school of more than thirty sharks was inspecting the bait and our submarine tube. It was more than six hours after the first shark appeared on the scene before one of the school, swimming slowly past the calf, suddenly made a snap at it.

'In a moment there was enacted the wildest scene of ferocity I have ever witnessed. Simultaneously, the big fish seemed to go mad.

'There is no reason to doubt that the sharks which have taken lives on the Atlantic coast of North America are West Indian sharks. These big man-eaters travel much faster than the swiftest steamer. On repeated trips to and from the Bahamas I have seen big sharks easily outdistance the vessel on which I was travelling. The big sharks might easily have been swimming in West Indian waters only a day or two before they were sighted off the New Jersey coast.

'I am strongly inclined to believe that all the killings may be attributed to one big school. I am confident that sharks, attacked by the dementia I have described, remain ferocious for several days, and possibly for several weeks.

Under ordinary circumstances the so-called man-eating shark has a pronounced streak of yellow in its make-up, and will fly in deadly fear from man.

'In a steamship it is more difficult to catch a shark with a hook baited with a piece of pork and thrown over the stern than in a sailing-ship, as she moves faster through the water. Sharks will follow a sailing-ship for days, and the sailors always have a superstitious fear that they are waiting for one of their number to die. In cases of epidemics like yellow-fever breaking out on board, sharks have been known to follow in the wake until the last victim has been committed to the deep.

'I think the number of sharks reported off the American coast a few years ago was exaggerated, because it takes the eye of a deep-sea fisherman or a sailor to detect the swift-moving fins above the surface of the water. There was a shark known as Port Royal Jack, twenty-eight feet long and three feet beam, which inhabited the water at the entrance to the harbour of Kingston, Jamaica, where the warships anchor, for twenty-five years. During that period he was reported to have killed over sixty seamen who had fallen overboard at various times.

'His last exploit was to attack, with three other sharks, two boats' crews from the British gunboat *Thrush*, which capsized in a squall off Port Royal. Out of twenty men only six managed to reach the gangway in safety. The crew of the *Thrush* swore to be revenged, and they pursued Port Royal Jack for two weeks until they caught him with a hook and hauled him on board, where he was cut to pieces and his backbone divided among all hands as a trophy in remembrance of the death of their shipmates.

'Another famous shark in the West Indies was Shanghai Bill, who haunted the waters outside the harbour at Bridgetown, Barbados, for fifteen years. He was a few feet shorter than Port Royal Jack, but he was very active in pursuing any living thing he saw in the sea.

'He met his fate in a strange way through biting a big brown sheep-dog which fell overboard from a yacht lying in the harbour. Shanghai Bill got his mouth full of the thick woolly coat of the unfortunate dog, and could not get it loose from his strong teeth. It finally choked him, and the shark was sighted two days later floating dead on the surface of the sea, with the body of his canine victim crunched in his capacious maw.'

EARTH-WINE.

By Bart Kennedy.

WINE of the grape is good, but wine of the earth is better.

That is, it is better if upon you is the real parched choke of thirst. If you have been going along over a desert of sand and under a scorching sun for hour after hour, drink-longings of a certain order will assail you.

Not for you will visions arise of iced champagne or copious draughts of the beer that is strong and brown. You will dream not of claret or of hock. And especially will you not dream of port or whisky or brandy.

What you will dream of will be earth-wine. Pure, cold, delicious earth-wine. How you will think of it! How you will long for it! And your memory will summon up the delightful sound of it as you heard it running between and over stones—that delightful sound that you heard in a time that now seems so long, long ago. Around you is the sand. It stretches on all sides as far as the eye can see. And above is the hard, white, glaring sun. And you dream. You dream of pure, cold, delicious earth-wine.

To those who have travelled not, and who have never known the parched choke of real thirst, it may seem that all earth-wine is much of a muchness. To them it may seem that the taste and the flavour of this clear, wonderful wine is about the same here as it is in a place off in the beyond.

But such is very far indeed from being the case. The earth-wine that you get here is not as the earth-wine you get over there. It is not the same in this country as it is in that country, or in this continent as it is in that continent. Here in these mountains it tastes altogether different from what it tastes down below in the far-off plains. In this dark, cool place, where it rises up out of the earth, it is not as it is in another place, dark and cool, that you know of.

Why, the taste and the flavour of earth-wine is as varied as the taste and the flavour of the wine of the grape. It partakes of the nature of the soil from whence it comes just as surely.

And here let it not be thought that I am one who asserts that there is no such thing as bad earth-wine. I have heard men say that of beer. I have heard them put it in this way: that all beer was good, but that some brews were better than others.

No, I do not claim that all earth-wine is good. For it is not. Sometimes it is luridly and awfully bad. I have been forced to quaff earth-wine that was of so fearsome a character that I

have strongly begrudged it hospitality. The earth-wine that rises up in a cloud and then comes back again is always most woeful stuff. I have had some, and I want it not again. Once, for my sins, I lived in a country where they had tanks on the roofs of their houses to catch the wine as it fell from above. Though it came from heavenwards its taste was distinctly unheavenly. Forgive the joke. It is bad, but not so bad as the wine.

Yes, it was fearsome stuff, with a taste as acrid as the sinister whisky that puts you out of action when you have gone forty rods after unwisely surrounding it.

How I used to long in those days for a draught of the delicious, cold earth-wine that I had quaffed in days when I wandered through certain wild mountains! But to long for it was of little use. The only thing to do was to wander back to those wild mountains. Which I did, naturally.

Speaking of mountains puts me in mind of a certain mountain beloved of the Scots. I speak of Ben Nevis. I remember once climbing that noble Scottish mountain. And hereon I encountered earth-wine of the best.

But the most delicious earth-wine I have ever tasted was in the Alhambra, Granada. I have gone around a fair amount, but never have I met the equal of it.

Finer was it than the finest wine of the grape that I have ever tasted. If I remember aright, it was got from a depth of twenty feet below the surface of the earth. Ah, that was indeed the wine! Cold, clear, pure, sparkling, invigorating. The finest wine of Spain. Nay, I will venture to say the finest wine of the whole wide world. To quaff it was to quaff a drink fit for the gods.

We used to go to the Alhambra to drink it when the day was nearing its close. It was an Italian count who first put me on to it. His English was of the sparse and peculiar brand. But sparse and peculiar though it was, it was nevertheless sufficient to convince me that he was talking of something good.

So I went along and had a quaff, and a deep one, with my friend the count.

There are a few people who scoff at earth-wine; who say that they know not the taste of it; who assert that its only real use is for outer application to man. But these people do not know. Their palates are spoiled by too free an indulgence in wines of the grape and the barley. They know not the wonder and the potency of earth-wine. They know not that if they quaffed two or three pints of it a day they would adorn this charming earth of ours with their presence at least ten years longer. They know not of this.

Or, rather, they know not of it till it is too late. When death comes near, and upon them is the last thirst, they call not for the wine of the grape. Neither do they call for the wine of the barley.

They cry out for the wine of the earth.

Were earth-wine charged for at so much a bottle, people would drink it who scorn it now. Indeed, it would be well for the health of men if this were so. But, usually, one is in a place where earth-wine is millions, perhaps billions, of times more plentiful than any other wine. And therefore it has not the appreciation due to it.

Men care not for the thing that can be got for nothing.

The people who appreciate it at its full value are the people of the deserts. And travellers who have known what real thirst means also appreciate it.

A time will come to pass when the wine of the earth will have gone. And when it has gone, gone will be man and his works. Gone will be the trees and the grasses and the flowers. Gone will be the beings who lived with man. The earth will be but a vast desert rolling through space. Silence, a stupendous silence, will reign over all. It will even be as if nothing had ever lived. Man and his works and his heroes and his gods will be as nothing that has gone nowhere. And the earth will roll, a thing of desolation.

When gone is the earth-wine.

SHIELDHILL.

(IN THE VALE OF QUOTHQUAN.)

Sweet violets blue as yonder summer sky,
And deep as sunset gold,
In fragrant life upon the soft sward lie,
Beside this mansion old.
In blue and gold they gem the winding way,
And greet the dawning of each happy day,
With glories manifold.

A river takes its passage to the sea.
A lark bounds from the shore.
I see it, far above the spreading lea,
Homeward and heavenward soar.
It flies, a sweet inhabitant of grace,
With outspread wings above this hallowed place
That holds me evermore.

Great beech-trees stretch their arms in brooding prayer,
And, with a murmuring low,
There come, when summer winds stir gently there
The branches to and fro,
Calm litanies of joy that speed the hours,
While psalms at eventide from leafy bowers
To yonder heaven-lands go.

A sudden glory gilds the Temple Hill,*
And in the valley broad
There gleams the splendour of a moss-bound rill
Athwart the hillward road.
And o'er the restful fields on which I stand
Soft fall the shields of this love-folded land—
The light, and peace of God.

MACKELLAR LEAVES THE MESS.

By 'ÆSCULAPIUS.'

I.

EVEN though a man is only twenty-six, it is somewhat of a shift from accounting in Glasgow to assistant-paymaster, Royal Naval Reserve.

At least Francis Mackellar thought so. The night he joined H.M.S. *Alcibiades* they had to get under way to avoid a gale piling them up on the rocky shore. In the midst of it all came a sarcastic signal from the admiral of their squadron: 'Since you like steaming about, you will proceed at once to the Cape Pharaoh patrol.'

As a result the commander got no sleep, and he was feeling like nothing on earth next morning when he observed Mackellar violating an Admiralty order. 'What the devil do you mean by smoking on the quarter-deck?' he roared.

'I'm sorry, sir,' answered Mackellar, throwing his cigarette over the ship's side. Unfortunately it was the weather side, and the wind caught the 'gaspar' and whisked some of its hot ashes into the commander's eyes.

'Side-boy,' the commander called, stamping his foot on the deck with pain, 'tell the staff-surgeon to look me up in my cabin immediately.'

'Ay, ay, sir,' said the side-boy, scampering away.

What the commander might have said next to Mackellar is uncertain, because a colossal wave struck the ship, drenching them both in spray and broken green seas.

II.

At the time Mackellar joined the *Alcibiades* spring was drawing nigh, after a winter spent in the most disagreeable waters in the world. Officers and men were in the grip of that mouldiness which shore-going people find it so difficult to understand. 'How can you be mouldy,' they ask, 'and yet breathe the fresh air of the sea?'

There is precious little fresh air between-decks in a cruiser carrying a complement of several hundred men. Most of the air is 'potted.' A fighting-ship vacillates between 'action stations' during the day and 'defence preparedness' at night, when everything is closed down as tight as a drum. Therefore, unless one's watch is kept on the bridge, there is scarcely enough exposure in a modern man-o'-war to blow the cobwebs out of one's brain. In addition to 'fugging it' below while off duty, there is the awful monotony of a routine life spent amidst cramped surroundings. No wonder, then, naval officers acquire the habit of pacing up and down like animals in the Zoo!

Mackellar, coming 'straight from the beach,' did not understand the peculiarly touchy and liverish atmosphere into which war conditions had thrust him. He ought to have been more cautious in speaking his mind in a community swayed by tradition. Saluting the quarter-deck is a case in point. When asked by the officer of the watch why he did not comply with this usage, Mackellar said he 'didn't see any particular reason for saluting a teak deck.'

'All the same, my brave fellow,' the officer of the watch reproved him, 'you ought to respect a custom which the mighty Nelson was pleased to follow.'

III.

There was no question about it from the start. Mackellar jarred the mess. Their ruffled feelings found a ready protagonist in Lieutenant Fitz-Boodle. This officer was the very antithesis of the lean, æsthetic-looking Mackellar. Burly and strong, Fitz-Boodle was so full-blooded that he used up many a handkerchief in stanching his frequent nose-bleeds. Mackellar clashed with him quite early in the game on a subject that was very dear to Fitz-Boodle's heart, or, rather, his stomach. He was excessively fond of swine's flesh, and as mess caterer his word was law when it came to what the ward-room should eat. Mackellar, on the other hand, heartily disliked pig in all its posthumous forms, and strenuously objected to Fitz-Boodle's fancy occupying such a large part of the menu. Some wag suggested an 'anti-swine club,' and a few dietetic rebels joined up. They went delirious with joy when Mackellar condemned a lot of obviously bad pork. This he had a perfect right to do as officer in charge of the victualling department during the paymaster's absence, and it meant that a fresh supply could not be obtained for another couple of weeks. The band played the 'Roast Beef of Old England' before dinner, and Fitz-Boodle was much annoyed at the

 [*All Rights Reserved.*]

vociferous applause of the 'anti-swiners.' To make matters worse, the fish course was particularly high that night, and Mackellar suggested that in future they be permitted to wear their new respirators during this dangerous interval. Fitz-Boodle was incensed, and, in his capacity of president on that occasion, imposed the time-honoured penalty for such a breach of dinner etiquette. He fined Mackellar a glass of No. 1 port all round.

IV.

Not long afterwards the *Alcibiades* fired a practice torpedo. When it made its hissing exit from the submerged tube, however, the sliding-door in the ship's side jammed, and the torpedo flat was flooded. Luckily the bulkheads held tight, the tube was eventually plugged, and soon the sea-water was pumped out, and matters put to rights again.

When the alarm was at its height, and Mackellar felt the stern end of the ship drop several feet beneath him from the weight of the inrushing sea, he dashed down to his cabin for his swimming-waistcoat. Unfortunately, Fitz-Boodle saw him in this excited frame of mind. He said Mackellar was in a funk. In the eyes of men who have been accustomed to the perils of the sea from boyhood there can be no more awful stigma.

'You'd have more "guts" if you played "footer,"' Fitz-Boodle said at tea-time.

'Nevertheless, I don't propose to cultivate courage at such a cost,' declared Mackellar, who hated the tyranny of thought which games created in a mind like Fitz-Boodle's.

'We'll see to that soon enough,' said Fitz-Boodle, firing a salvo of rock-cakes at him.

Immediately after dinner, therefore, Fitz-Boodle got a 'pukka' ward-room scrimmage going, and soon there was a pyramidal mass of struggling naval officers in the centre of the room. Fitz-Boodle's strategy was to get Mackellar entangled in this dangerous, wriggling heap. His onslaught was so sudden and vigorous, however, that Mackellar was whirled against the captain, who was sitting on one of the couches enjoying the sport. That was not all. The impact striking the wretched Mackellar in the pit of the stomach, he developed all the symptoms of *mal de mer*. The captain's dignity suffered accordingly, and he was obliged to make a hasty exit.

'This all comes of the naval mess being no longer the select club it used to be,' remarked Lieutenant-Commander Barnwell. He was a splendid navigator, but mad on the subject of *Who's Who*, much to the amusement of his messmates, who were constantly pulling his leg on the subject.

'Don't talk rot,' said Staff-Surgeon O'Brien, calling for a split whisky-and-soda. 'After all, what are we but glorified policemen, armed with big guns instead of revolvers? And some of us haven't even the manners of an ordinary "bobby,"' the staff-surgeon concluded, looking hard at Fitz-Boodle.

V.

One day, when the *Alcibiades* was in harbour, the picket-boat landed officers on the dreary coast near their mooring. Mackellar found himself the odd man in so far as a walking companion was concerned, so he went off on his own. Rain coming on, a crofter invited him to take refuge in his cottage. A peat-fire crackled cheerfully in the old-fashioned fireplace, lighting up the eyes of a dark-haired lass who was working her spinning-wheel. Somehow or other their liquid depths suggested the Spanish Armada to Mackellar, and he was weaving all sorts of romantic incidents into her imaginary genealogical tree, when, much to his disgust, a couple of engine-room artificers came in and spoiled the scene. Gulping down the tea which the mother had brewed for him, and swallowing an oatcake, he pressed half-a-crown on one of the children, and departed in an abstracted sort of way. When he arrived at the naval pier he fancied a number of officers were looking at him curiously. Fitz-Boodle said he was 'tight.'

The captain of the *Alcibiades* regarded him sternly. 'What on earth do you mean by masquerading in that cap, Mackellar?' he demanded. 'Take it off at once.'

Mackellar uncapped, and, much to his amazement, found he was wearing an engine-room artificer's cap. In the uncertain light of the crofter's cottage he had mistaken it for his own.

VI.

'The captain wishes to see you in his cabin, sir,' the sentry said to Mackellar a short time after he had returned on board.

The captain was in a peevish mood. Bad news had just come from his Southsea home, which he had not seen for many weary months. He stood in front of a long table in his fore-cabin, looking gaunt and worn. The commander was standing on his right.

'Will you explain, Mackellar,' the captain commanded, 'your disgraceful conduct of this afternoon?'

Mackellar briefly narrated what had happened.

'I can't believe such a preposterous yarn,' the captain said incredulously.

'You have no sound reason for doubting my word,' Mackellar retorted passionately. 'What's all the row about, anyway?' he asked. 'My only offence consisted in wearing a cap that had an inferior badge on it.'

'Commander,' the captain ordered, 'stop his leave.'

'Very good, sir,' answered the commander, rubbing his hands together briskly.

'Thank you, sir,' Mackellar said hotly, as he was leaving the cabin.

'Commander,' the captain roared in a voice choking with rage, 'send him to his cabin!'

VII.

The staff-surgeon came below a few minutes later. 'The captain has asked me to inform him, Mackellar,' he said, 'whether or not you were in an intoxicated condition this afternoon.'

'Perhaps it's being exposed to the fumes of rum,' Mackellar answered somewhat hysterically. The historic custom of serving out this potent spirit took place every morning outside the ship's office.

O'Brien laughed heartily. 'Alcoholism has, as a rule, a more material basis than that, Mackellar,' he said. 'However, we shall see in a moment.'

The staff-surgeon thereupon proceeded to examine him. His diagnostic nostrils sniffed Mackellar's breath, and he placed a tiny instrument called an alcoholometer on his tongue. He asked him to say, 'Around the rugged rock the ragged rascal ran.'

Mackellar repeated this peculiar sentence in a clear, unfaltering voice, in which there was not the slightest thickness of speech.

'How about your wine bill?' the staff-surgeon asked.

'I've touched nothing but grape-juice since coming on board,' answered Mackellar.

'Good!' O'Brien exclaimed. 'You'll be pleased to hear I'll give you a certificate of sobriety any time you wish.'

'I'm very much obliged to you, sir,' said Mackellar, heaving a sigh of relief.

'Now, my lad,' the staff-surgeon said kindly, lighting a cigarette, 'you may have your grievances; so have your messmates theirs. You haven't bent sufficiently to the spirit of the navy. You must bear in mind that, with the exception of the medical officer, all your other messmates came into the service as boys. It's the only thing they have ever known, and what you may regard lightly is a serious matter to them,' O'Brien concluded.

'What am I to do, then, in the present instance?' Mackellar asked.

'You'll go to the captain in the morning, and tell him how sorry you are for the whole occurrence. In the meantime I'll smooth the way for you by impressing upon the skipper the fact that you haven't been long in the service,' said O'Brien.

'I suppose I'll have to humble myself,' Mackellar said dolefully.

'It's the only way,' said O'Brien. 'The man with a stiff-neck will have it broken every time in the navy.'

Mackellar accordingly obeyed his mentor. The captain of the *Alcibiades* accepted the proffered olive-branch, and the incident was closed.

VIII.

Somewhat chastened in spirit, Mackellar was beginning to absorb something of the discipline of the service, when he was called upon to decode the wireless messages which are received in cipher. He had had no training in this intricate work. A diploma in accountancy does not carry with it a knowledge of how to unravel the mysterious language of the fleet. Mackellar made a mistake which concerned ritual rather than fact. Unfortunately Fitz-Boodle was on watch on the bridge at the time, and the signal was taken to him. The error was discovered, and made the subject of caustic comment on the part of Fitz-Boodle.

'It's too bad, sir,' the sallow-faced wine-steward said to Mackellar, 'how Lieutenant Fitz-Boodle does talk about you. And what's that "watch" you keep?'

'Decoding?' said Mackellar.

'That's right, sir. It's shocking. I say give a bloke a chance. Now, supposing I were to complain of his discrepancies,' the wine-steward said. 'The ward-room, for instance, ought to close at 11 P.M., and yet he often keeps me and the master-at-arms up till after midnight. It's a bit 'ard, sir,' concluded the little wine-steward, whose job was all the more distasteful to him because he was a Good Templar, 'considering we're turned out of our hammocks between 5 and 6 A.M.'

IX.

While at sea Fitz-Boodle 'ran in' the wine-room steward. In other words, he had him reported to the corporal of the watch. The latter called the master-at-arms, who took the wine-steward before the officer on the bridge, and explained his misdemeanour to him. The officer ordered the master-at-arms to put his name in the commander's report.

Such cases are usually heard by the commander at eleven o'clock in the morning. On that occasion the commander deals out rough justice from behind a small table, which is usually placed near the ward-room door. The master-at-arms calls out the names of delinquents, who appear before the commander cap in hand.

'What's the charge?' the commander inquired in the case of Martin, the wine-room steward, referring to his clean record before him.

Fitz-Boodle fell in before the commander, and saluted.

'Shortly after midnight last night, sir,' said Fitz-Boodle, 'I had occasion to pass near where this man slings his hammock. I called out "Gangway," in order that he might make way. Instead of doing so, he was insolent, and swore at me.'

'What have you got to say in answer to this serious charge, Martin?' the commander asked the wine-room steward.

'It isn't true, sir. I gave way immediately without saying a single word. Indeed, sir, I was too tired for anything. Mr Mackellar will confirm what I say,' the wine-room steward declared.

Mackellar was called.

'I was on my way for'ard to the decoding-office about the time mentioned,' Mackellar began, 'and as I approached the vicinity of Martin's hammock I struck my head against a stanchion. I swore in a rather loud voice. It was not Martin who swore, sir; it was I,' Mackellar said, 'and I had every reason for doing so,' he concluded, rubbing the side of his head ruefully.

'I'm quite sure it was Martin,' Fitz-Boodle persisted.

'Inasmuch as there is some doubt about the matter, I'll let you off with a caution this time, Martin,' said the commander, marking his decision opposite the wine-steward's name in the 'doomsday book.' 'As for you, Mr Mackellar,' he concluded, 'you 'll please practise self-restraint in future.'

(*Continued on page 616.*)

THE EFFECT OF WAR ON THE NATION'S GOLD.

By W. V. Roberts.

EVERYBODY knows that when the war broke out one of the first acts of the British Government was to call in as far as possible, through the banks, the gold then in circulation, and to issue in lieu thereof the now familiar one-pound and ten-shilling Treasury notes. The change was tremendous, because it meant that the greatest gold-standard nation in the world suddenly made paper instead of gold its principal medium of domestic commercial exchange; and it was obvious not only that social, commercial, and international relations would be affected, but that the influence of the new order of things would extend also to arts, industries, and manufactures. Yet how many, in the light of experience, can say exactly what the real effect has been or is?

In the first place, it should be noted that although there is less gold in circulation, the world's output of the metal has increased. The value of that output rose in 1915 to no less than ninety-seven million seven hundred and nine thousand pounds, a sum which exceeded all previous annual records. There was a slight falling off in 1916, but none the less the value of the aggregate production in these two war years was in excess of that for any two preceding years. But, curiously enough, with an increase of output there was a decrease of profit. That at least was the experience in the Transvaal, the principal goldfield of the world, as shown in the annual return of the Transvaal Chamber of Mines, the fact being attributed to a rise in other commodities and in cost of working, while the price of gold is, of course, a fixed quantity. As the demand for gold is so great, it is of interest to note that with the output from the Transvaal, West Africa, Australia, Canada, and India, the gold mined in the British Empire amounts to something over sixty millions sterling a year, or more than three-fifths of the entire production of the whole world.

But it does not, of course, follow that the whole of that production, or even the greater part of it, is retained within the Empire. Every country needs gold, and when the war broke out there was a rush on the part of all the great Powers to secure more of it. The United Kingdom did not lag behind. When hostilities began coin and bullion in the Bank of England stood at about forty millions; at the end of May this year that had been increased to something over fifty-five millions. During the same period the reserve was raised from twenty-nine millions to nearly thirty-five millions. At the same time the Bank of France increased its stock of gold, though not quite in the same proportion. Germany also has made most strenuous efforts to gather together a larger supply of gold as some reserve against the huge issue of paper it has now to face. But, in spite of its gigantic efforts, the proportion of its gold to note liability was recently, according to so high an authority as Sir Edward Holden, only 15·7 per cent., as compared with a British ratio of about 22 per cent.

Such facts as these serve to show in some degree how great has been the efforts of the banks to secure more gold, and were it the only influence at work the results would doubtless have been greater. But there has been a contrary movement compelling belligerents, especially Britain, to part with gold. Enormous supplies of munitions, for instance, have been bought from the United States. These, of course, have not been paid for directly by hard gold—a huge loan has been raised chiefly for that purpose—but, all the same, gold has come very largely into play, and has very considerably affected Great Britain. Thus in 1913, the last complete year of peace, we imported about thirteen and a half millions more gold than we exported; while in 1915, the first complete year of war, we exported nearly twenty-eight millions more than we imported, so that there was a complete reversal of the position.

As most readers will suspect at once, the United States of America, on balance, gained most of the gold we had to send abroad. The official figures, which we may take first, are indeed almost startling. In 1913 our direct

export of the metal to the United States did not in value much exceed seven hundred thousand pounds sterling; and in the following year, before the monetary effect of the war had begun to be seriously felt, it dropped to a mere three thousand pounds; but in 1915 our export of gold to America rose at a bound to over twenty millions, perhaps the largest amount we ever sent directly to that country in a single year. To find anything like that figure we must go back to the year 1907, when America was passing through its greatest financial crisis since the Civil War. To ease the strain we then sent her eighteen millions in gold, and the crisis passed. Next we may consider the fact that gold has probably been sent to the United States from other parts of the British Empire, and that it has certainly been sent from other countries of Europe. The amount sent by all the Allies during the war, down to the beginning of this year, is computed at something like two hundred and fifty millions. Recently it was announced that a hundred millions of gold had been accumulated in the New York Sub-Treasury alone, and that the banks held six hundred millions. President Wilson probably had all these circumstances in mind when he declared that the resources of the United States banks exceeded by a huge sum 'the aggregate resources of the Bank of England, the Bank of France, the Bank of Russia, the Reichsbank in Berlin, the Bank of the Netherlands, the Bank of Switzerland, and the Bank of Japan.' No wonder America has been able to talk confidently in thousands of millions, and to raise so easily a first loan to the Allies of six hundred millions. Seldom can there have been so tremendous a turnover in a country's financial position within a decade, and the movement of gold during the war has had much to do with the transition. Of course, some of the smaller neutral states have likewise profited. In 1913 we sent to Spain the ridiculously small sum of thirty-four pounds in gold; in 1915 we sent over seven and a half millions' worth. To Holland we sent about one hundred and sixty thousand pounds' worth of gold in 1913, and an amount valued at over two and three-quarter millions in 1915.

If we leave the international and turn to the domestic aspect of the question, other interesting facts emerge. Some readers, for instance, might suppose that with the withdrawal of gold from circulation there would be almost a stoppage in the mintage of the metal. But that has not been precisely the case. In 1913 the value of gold coined at the British Mint was over twenty-seven millions; in 1914, a year partly of peace and partly of war, the amount dropped to fifteen millions; but in 1915, a full year of war, it rose again to twenty-one millions. The figures for 1916 are not yet available. At the same time, the Government have taken drastic steps to prevent the improper use of coin during the war —that is, use other than currency—and have prosecuted a number of persons for attempting to obtain coin for alloy or other purposes. On other grounds, however, there is reason to think that the commercial use of gold has diminished from quite curious causes. Just before the war the arts and industries of the world consumed nearly forty million pounds' worth of gold per annum. That use has been largely stopped in belligerent countries, and how closely the application of gold is scrutinised may be inferred from the fact that last January the Board of Trade authorised the use of a certain quantity of gold for the decoration of pottery intended for export, but forbade its use for pottery for Great Britain.

But apart altogether from official action, the war has caused increases or decreases in the use of gold in ways probably not generally suspected. Take dentists' gold. Before the war it was said that a dentist in good practice used a hundred pounds' worth of gold a year for stopping teeth, and as there are several thousand dentists, it was humorously suggested that our graveyards might become the British goldfields of the future. But many dentists have entered upon war service in the army or the navy, and the chairman of the London Appeal Tribunal found that out of a thousand dentists in the army only five hundred and sixty were employed as dental surgeons, so that the use of gold by dental surgeons has probably diminished greatly.

Then again, to take an illustration of the increased use of gold, everybody has remarked upon the larger number of marriages that have taken place as one result of the war. The Registrar-General now confirms popular impression by officially announcing that in 1915 there were three hundred and sixty thousand eight hundred and eighty-five marriages in England and Wales. In the census year of 1911 the number was two hundred and seventy-four thousand five hundred and seventy-seven, so that there was an increase over that year of eighty-six thousand three hundred and eight. That means a corresponding increase in the demand for wedding-rings, and probably in other gifts of gold usually associated with weddings. In confirmation, the circumstance may be recalled that at the West Ham Tribunal this year a wedding-ring maker pleaded for exemption from service on the ground that his work was of national importance, and that wedding-rings were so much in demand that his firm was doing an enormous trade. Incidentally it may also be mentioned that at the City of London Tribunal a gold-leaf manufacturer stated that gold-leaf manufacturing had before the war been almost entirely a German industry, but was now becoming a British one. The far-reaching effect of the war upon gold is therefore apparent.

Possibly it was the withdrawal of gold from circulation that strengthened the disposition among the poor but thrifty class to hoard gold.

That much gold is hoarded was shown by the way in which payments were made for amounts in the recent War Loan. At Enfield, a busy munitions centre, seven thousand pounds was paid in gold for war stock. At Newcastle one man produced no less than three thousand pounds in gold to pay for his investment; and at New Malden another paid two thousand pounds in gold. A Wigan miner and his wife carried into the local post-office a carpet-bag containing six hundred and ninety-three pounds ten shillings in gold, their life-savings, and put it all in the loan; while a Kingston man, who had bought a cottage for three hundred pounds, paid for it with golden sovereigns, which he proceeded to dig up in his back-garden. The back-garden seems, indeed, to be a favourite place for hiding gold in France as well as in England, for it is semi-officially reported that on a party of countrymen being allowed to return to a recaptured village on the Somme, gold was dug up from ground that had been turned by shells into a mass of shapeless clay; and that at another village a farmer's wife pointed to a spot among the débris where a safe containing thirty thousand francs was uncovered. It is estimated that gold is now hoarded by private individuals in France to the value of a hundred and sixty millions sterling.

In striking contrast to the way in which some have hoarded coin is the readiness with which others have desired to contribute gold valuables to aid the common cause. When speaking of the result of the War Loan in February last, Mr Bonar Law, as Chancellor of the Exchequer, told the House of Commons that he had received such gifts, but, feeling that he ought not to take them, he had sent them all back except two that had reached him anonymously, and that he had not, therefore, been able to return. But the spirit which prompted the gifts was touching. One donor had written: 'It is heart-rending to read every day requests for money for the War Loan when we have not any to give. As I have no money, I am hoping you can turn this bracelet into money.' That, indeed, is a true indication of the sacrifice which so many in this country are willing to make. The same may be said of the people of France, for the Bank of France, in response to suggestions that it should collect gold in jewellery and art wares, has issued a statement expressing its thanks, but declaring that it would be regrettable to ruin private collections in that way, especially as France's credit has no need for such a sacrifice. Is it not significant of the difference in the national position that the semi-official *Norddeutsche Allegemeine Zeitung* has printed prominently on its front page in heavy type an appeal by the president of the German Imperial Bank urging all German men and women to sell their gold valuables to the bank, and declaring that all gold ornaments are required, except those of special historical, artistic, or ethnical interest? The German Empress appears to have led the way by stripping the imperial households of gold plate, dishes, and ornaments, in order to add to the gold-supply of the empire.

Much might be added as to the great fall in the purchasing power of gold since the outbreak of war, but that would take us far into the region of political economy. Everybody knows that the sovereign goes only about half as far as it did before the war. Is it too much to hope that after the war it will recover something at least of its old value in the market?

THE DEFINITE OBJECT.

CHAPTER XXXIX.—THE OLD UN ADVISES, AND RAVENSLEE ACTS.

IN the rose-garden was an arbour smothered in riotous bloom, and in the arbour was a divan, wide and low and voluptuously soft, meet for the repose of an invalid on a languorous afternoon, or indeed any other time. But just now the invalid reposed not at all, but sat, elbow on knee and square chin on fist, very lonely, and therefore very grim.

All about him roses bloomed, filling the air with their sweetness, but he had no eyes for their beauty; upon the table within reach of his hand were books and magazines, but he was in no mood for reading; clasped between strong white teeth he held his favourite pipe, unlighted and cold, for tobacco had for him no savour. So he sat and scowled at the universe in general, and in particular at a robin that had boldly ventured near and was regarding him with a very round, bright eye.

'She's avoiding me!' said Ravenslee bitterly, teeth clenched upon his pipe-stem; 'there's no doubt about it—damn it, she s avoiding me! And she's not happy here either!'

The robin turned his head to regard the speaker with his other eye, then fluttered his wings and flew away as the lazy quiet of the afternoon was broken by the squeak of shoe-leather, and glancing up, Ravenslee beheld the Old Un.

'What cheer, guv?' said he. 'Greetin's doo; and how's the invalid?'

'Invalid!' repeated Ravenslee, scowling again. 'I'm no invalid.'

'Spoke like a true-bred game-cock, s' help me!'

'I'm as right as rain, physically, Old Un; but'——

'Talkin' o' physic, guv,' said the old man, seating himself and nodding brightly—'talkin' o' physic, the physic as set you on your pins again was love, guv—love!'

'But it so happens'——

'Wait a bit; I ain't done, guv! 'Ere 's me, a old cove as 'as lived 'ears an' 'ears an' 'ears an' 'ears longer 'n you; so nacherally I 'm a powerful lot fuller o' th' wisdom o' life than you, specially in matters o' th' 'eart, guv. Now me, 'avin' 'elped you into th' matrimonial ring, as you might say, 'ave took your 'appiness under my wing, an', guv, I don't like the way you 're shapin' '——

'But, you see'——

''Old 'ard, guv; let a pore old cove get a word in for a change. Now there 's you an' 'er, your fair young spouse, both up to each other's weight, sound in wind an' limb an' meant for j'y—what I want is t' see you come to a clinch! This ain't no time for sparrin' an' out-fightin'—yet 'ere you are a-feintin' at each other from opposite corners'——

'But'——

''Arf a mo', guv; 'arf a mo'—gimme a chance for a occasional word! An' don't frown, guv; don't frown at a pore old cove. Ye see, there 's jest three blokes in this 'ard world as my old 'eart warms to, an' one on 'em 's Joe, an' t' other un 's you, an' t' other un 's 'er—which ain't a bloke. Lord, guv, what a soft armful o' beauty! 'Ow warm an' cuddlesome! Oh, guv, what a waist! What lips! What'——

'Old Un, for Heaven's sake shut up! D' you think I 'm blind? D' you think'——

'Guv, I dunno wot t' think! 'Ere 's you with your 'ead in your 'ands, an' there 's 'er sighin' an' sighin' '——

'Sighing? Where? When? Why'——

'Sighin' an' sighin', guv, so soft an' pretty—I 'eard 'er! Also she wep'—I seen 'er'——

'Where?'

'An' 'er tears, guv, them pearly tears, went t' my 'eart; an' nobody t' put an arm round that waist, nor kiss them sweet lips, nor soothe them tears away:

Oh, alone she sat sighin' by a green willer-tree,
With 'er 'and on 'er bosom, 'er 'ead on 'er knee,
Weepin' willer, willer, willer, my garlan' shall be.

So, guv, I ax you, man to man, why, oh, why, are ye neglectin' your fair young spouse? An', guv, I only ax because your 'appiness an' 'ers is mine—s' help me!'

'How if it 's the other way about, Old Un? Suppose she avoids me?'

'Why, lumme, guv! 'tis a sure sign she needs persoot. Remember this:

'Im as would lovely woman woo,
'E lovely woman must persoo;
For if 'e don't, 'tis plain as plain
That feller 'e will woo in vain.

An', guv, I've only took th' liberty o' sayin' this because my pore old bowels yearns to ye—both on ye. Persoot 's the word, guv—per-soot!'

The Old Un nodded, rose, and creaked away; and Ravenslee, looking after him, scowled no longer, but rising, sauntered across the trim garden to where there was a lily-pool, and leaning over the marble rim, stared down into the placid water.

Now, as the Old Un went his way, there met him a little girl, very neat and tidy, who sang to herself in a small, happy voice, and tapped along on a crutch; but, beholding the Old Un, his dazzling shoes, his rakish hat, she stood silent all at once, glancing up wistfully into that fierce, battered old face.

'Lumme—crutches!' he exclaimed.

'No, please—only one, sir!' she answered, dropping him a little, old-fashioned curtsy.

'Crikey!' said he, staring; 'so young, so tender, an'—a game-leg! A little angel wi' a broke wing—lumme!'

So Age and Youth stared at each other, and she, being a child, was quick to heed that the eyes so bright beneath their hoary brows were kindly eyes, and the smile upon the grim old mouth was very reassuring; wherefore she smiled also.

'Only one crutch, sir,' she repeated. 'An' the doctor says as I won't want it much longer, sir.' Here, dropping another curtsy, she held up for his acceptance a bunch of wild flowers.

'What!—f'r me, little maid?' he inquired.

'Yes, please, sir.'

'Why, bless—bless your lovin' little 'eart!' quavered the old man, and stooped to touch her rosy cheek with a hand gnarled and scarred with much hard punching, yet a very gentle hand indeed. 'God bless that little game-leg; but pretty flowers 'ud be wasted on a old bloke like me. You take 'em to th' guv, see—over there—that tall chap leanin' over th' pool. But first gimme a—a kiss instead, will ye, little lass?'

'I 'd like to, sir?'

And when the Old Un had kissed and been kissed right heartily, he pointed to Ravenslee's distant, lounging figure, winked, nodded, and squeaked away.

Thus it was that Ravenslee, absorbed in thought, was presently roused by the quick, light tapping of the little crutch, and glanced up.

'Oh!' she cried softly. The flowers fell and lay neglected as, clasping her hands, she stared up at him in radiant-eyed wonder.

'Welcome, Highness!' said he, and bowed.

'Oh, it 's the Prince—my dear Prince! Oh, goody!' and she hastened towards him, then stopped all at once, puzzled and abashed because of his elegant attire. Perceiving which, he reached out and drew her down by him on the marble seat beside the pool.

'Why this sudden change of demeanour, Princess?' he inquired. 'What 's the matter?'

'You 're—you 're so different, sir—so different an' grand in all them cute clo'es, sir.'

'Am I, dear? But I 'm just the same inside, you know. And, for Heaven's sake, Princess, do not call me "sir"!'

'But the big gentleman that belongs here, an' has all these lovely flowers an' everything—he says as I must always say "sir."'

'Big gentleman?'

'Yes, the big, soft gentleman with the cute little curls on his cheeks.'

'Oh—him!' said Ravenslee, laughing suddenly. 'Indeed a very just description, Princess. But you don't have to worry about him any more; he's gone.'

'Gone? For good?'

'For very good indeed!'

'Doesn't all this beautiful, beautiful place belong t' him any more?'

'Never any more.'

'Have you come here 'stead of him? Come t' stay?'

'Yes.'

'An' can I pick a rose t' kiss sometimes?'

'As many as you like.'

'Oh,' sighed the child rapturously, nestling within his arm, 'isn't that just—fine? I guess this sure is the Beautiful City of Perhaps, after all!'

'I wonder!'

'Oh, but I'm sure it is—now th' gentleman's gone I just know it is!'

'What makes you so sure?'

'Everything! 'Cause, you see, Prince, my daddy don't have t' be away all day any more. An' mumsey don't have t' sew late, nights, any more. An' when we came into the cute little house where we live—there was the doll that says "Mamma" just waitin' f' me. An' there was a big box o' candies, an' a doll-carriage with real rubber on th' wheels—just like we used to talk about. So, you see, this must be Perhaps at last, an' I'm so—so happy—only '—— Hazel sighed.

'Only what?'

'I do wish Hermy could find her way here too; she used t' be so tired sometimes.'

'You mean that you would like to find Princess Nobody, I guess.'

'Oh, but I can't! I used to look an' look for her every day till th' gentleman said she wasn't here, an' told me never t' come near th' big house any more.'

'But he's gone, and you never had me to help you.'

'Oh, will you—will you help me right now?' she pleaded.

'Surest thing you know!' he nodded. 'Your hand, Princess.'

So, hand-in-hand, he led her, suiting his long legs to hers, along shady walks, up terrace-steps, across smooth lawns, and so to the great house. Here Hazel paused to question him further concerning 'the gentleman,' but Ravenslee laughed, and seating her upon his shoulder, bore her into the house.

And here, in her housekeeper's room, surrounded by many dusty bill-files and stacks of account-books, they presently found Mrs Trapes, whose hawk-eye viewed bills and tradesmen's books while she frowned and muttered such comments as 'Rogues!' 'Thieves!' 'Scand'lous!' 'Wicked!' until, glancing up, her sharp features softened, and she smiled up into the child's happy face.

'So Hazel's found ye, has she, Mr Geoffrey? An' talkin' o' her, you've sure made the Bowkers a happy fam'ly. But, my land, Mr Ravenslee, the scand'lous prices as th' tradespeople has been allowed t' charge you these last six months! Here's th' butcher—listen t' this'——

'Heaven forbid, Mrs Trapes! Rather let that butcher listen to you—miserable wretch!'

'An' there's the milkman—that milkman's cows ought t' blush at th' sound o' your name! Here's his accounts for the last six months, an' I've found'——

'Have you, Mrs Trapes? We're trying to find Hermione. Where is she?'

'Oh, she's in her room—layin' down, I guess.'

'Not,' inquired Ravenslee—'not—er—in bed, is she?'

'Mr Geoffrey, I don't know; I'm busy. Go an' see for yourself. She's your wife, ain't she?'

'Why, since you ask, I—er—hardly know,' he answered a little ruefully. 'Anyway, found she shall be.'

With the child perched upon his shoulder, he strode upstairs and along wide corridors, whose deep carpets gave forth no sound, and so reached a certain door. Here he hesitated a moment, then knocked with imperious hand.

'Come in!' called that voice whose soft inflection had always thrilled him, but never as it did now, as, turning the handle, he entered his wife's chamber.

Hermione was standing before a long mirror, and she neither turned nor looked from the radiant vision it reflected; her eyes, her attention, all the feminine soul of her being just then fixed and centred upon the tea-gown she was trying on. Such a garment as she had gloated over in the store windows, yearned for, but never thought to possess.

'Ann,' she sighed—'oh Ann, isn't it exquisite? Isn't it a perfect dream? Of course, it needs a wee bit of alteration here and there, but I can do that. Isn't it good of him to have bought it without saying a word? And there are heaps of dresses and robes and—and everything! A complete trousseau, Ann dear—think of it! I wonder how he knew my size'——

'Oh, I just guessed it, my dear,' answered Ravenslee in the voice of a much-experienced husband.

Hermione gasped, and turning, stared at him wide-eyed, seeing only him, conscious only of him; and he, lifting Hazel to the floor, seated himself upon her bed, and, crossing his legs, eyed her flushed loveliness with a matter-of-fact air. 'Really,' he continued, 'I don't see that it

needs any alteration; perhaps the sleeves might be a trifle shorter—show a little more arm. But those flounces and things are perfect! I hope all the other things fit as well?'

Hermione flushed deeper still and caught her breath.

'Oh Hermy,' said a soft, pleading little voice, 'won't you see me, please?'

Hermione started, her long lashes drooped suddenly, and then—then, forgetful of costly lace, of dainty ruffles and ribbons, she was on her knees and had the child close in her arms. And beholding the clasp of those round, white arms, the lovely, down-bent head, and all the tender, craving, inborn motherhood of her, Ravenslee held his breath, and into his eyes came a light of reverent adoration.

Presently he rose and left them together, but as he went the light was in his eyes still.

(Continued on page 612.)

IN THE SALIENT.

III.

THE work among the wounded is frequently trying almost beyond human endurance. Many a time I have felt how thankful I should have been for the relief of tears. I remember especially a day when an orderly said to me, 'Oh padre! this is a sad day in this tent.' That meant far more than the mere words conveyed; there were so many young brave lives there, in anguish, maimed, and stricken, swept in, as though upon a tide of sorrow, from the valley of the shadow. And so little could be done. Words were futile. 'Hold my hand, padre,' begged one fine fellow, 'and I'll try to bear it till the doctor comes round.' And it was a hand like flame that he put into mine.

Their patience is perhaps more heart-breaking to look upon than their pain. One, with his leg torn off, said, 'I must not complain. You see, there are so many really worse off than myself.' Once, in a hospital train, where a crowd of helpless men were being loaded up at a siding, I saw one man, groaning in agony from rheumatism, carried in. 'Where are you wounded, old chap?' asked the orderly. 'Hoots!' he replied, 'I'm no wounded at a'. Fling me onywhere. Look after the rest.'

Sorrow and suffering are verily big angels of God. We are learning, in a mystery. And we shall yet have worse—great sorrow for the nation, and empty firesides for thousands, in this crucifixion hour of the Empire. And for us, trying to help and uphold, the greater need for the grace of God.

Every day you saw the tragedy of it. I recall a tent in which I was sitting beside a dying-bed. And there was a screen up around the next one. The man there had a very severe head wound, and was incessantly talking as though giving quick orders to fellows near him. Now and again he would lift his clasped hands to his parched lips, and drink feverishly from an invisible water-bottle, resuming thereafter the exhausting trench drama in his dying delirium.

In another tent were two chums from the same town and the same regiment, both dying. Jack's subconsciousness was busy, going again through the fight which had cost him his life; and as he would fall back, worn out, he would cry for his chum. 'Bill! Come on, Bill. Help! They're in!' But poor Bill was passing away at the other end of the tent, utterly unconscious, the tide of life ebbing far out, in silence, towards the main ocean, with no returning flood for these shores.

I remember also, at this time, another, who suddenly slipped hold on life, and went over the watershed. And he insisted on sitting up in bed, talking to invisibilities, whom he was showing out somewhere. 'Good-bye—thank you!' he kept saying, with a wan smile. He looked at you with eyes that seemed to see you, while yet looking through you at the unseen. And his 'Good-bye—thank you!' almost broke your heart.

The wounded were always keen on souvenirs, and these were of great variety. The New Testament, that had stopped a bullet just above the heart, was a frequent one, and perfectly genuine. A South African had been carrying in his Testament a photograph of his sweetheart, and the bullet stopped just in front of her face. It had made a bruise there, as though she had stepped in between him and death. He had been severely wounded as it was already; and the New Testament was wrapped up in a bloody rag. He will not let that souvenir lightly go. It is, of course, true that any book would prove as efficient as a life-protector; but it is this book that the soldier prefers to carry there, and, more frequently than people think, he reads it, and carries much of it in his heart also.

The passion for souvenirs sometimes seemed to mean more than the mere craze for collecting. I remember one grim fellow who insisted on having beside him a blood-encrusted German bayonet. I imagine it had a story of its own, with some import to himself. Others would sit, dreamily caressing German helmets, which they had brought with them from the field.

Sometimes this passion led to curious adventure. A Gordon Highlander had crept back to No Man's Land for souvenirs, and was coming back with a German helmet slung on his shoulder-strap. But he lost his bearings, and

encountered two men of the Devons who had been out on some scouting duty. He very naturally crouched down as they approached; and they, crouching also, saw, in the dark, outlined against the sky, the German helmet. At that moment he asked, in his own dialect, tentatively, 'D'ye ken faur the Gordons is?' Immediately they jumped to the conclusion that he was a Hun. One of them hit out at him with a rifle, and then both fled, but not before the Scot got in on them with his fists, thereafter he also making speedy tracks for his very life, as it seemed to him. In the morning he reported to the doctor, at the Ambulance, that he thought his arm must have been broken in the night by 'twa German deevils.' And the Devons also had an interview with the same functionary, with a tale of a fierce onslaught made upon them by a terrible enemy, who had cursed them very volubly in a strange tongue. None of the three discovered the truth, though to an outsider it was perfectly clear; another proof that it is the bystander and not the actor himself who sees history in its true light.

There are countless streaks of humour and gleams of laughter even amid the sorrow-clouds of war. The mysterious diseases from which the soldier thinks he suffers sometimes puzzle you. He will proudly, and with a majestic solemnity, tell you that his illness has developed into 'gasteria'—perhaps a more accurately descriptive name than science recognises. More than one is sorry for his wife, who is distracted and harrowed by the 'insinuendoes' of her neighbours, a word almost worthy of a place in the dictionary. And many will tell you of chums who have broken down, and who were not really fit to serve, having been always of a 'historical' tendency. One almost feels a plea for heredity there.

How grateful we were when we found occasions like these! For, though we were not down-hearted, we were often war-weary. And frequently the good cheer of those whom we were there to comfort and strengthen really strengthened and comforted us.

I remember an Irishman, quite of the type of Micky Free in Lever's novel, a rollicking, jolly child of the Emerald Isle, pretty badly battered, but with a sparkle in his eye at which you could have lit a candle. He was from Dublin. I thought I should speak cheerfully to him, so I said, 'Well, now, aren't you lucky to be here, instead of home yonder, getting your head broken in a riot?' 'Troth, I am, sir,' said he. 'Lucky to be here, anyway. And lucky is anny man if he'll only get a grave to lie in, let alone a comfortable bed like this. Glory be! it's myself that's been the lucky one all the time.' Near him lay another. 'Don't spake to him, your honour,' said the first man with a laugh. 'Sure, he's a Sinn Feiner.' But both of them were of opinion that the loyalty of the rebels might be awakened by contact with German shells. 'Bring them out here, sir,' said they, 'and they won't be Irishmen if they don't get their dander riz with a whiz-bang flung at them. That would settle their German philandering. Sure, isn't it too bad what we've been enduring to enable the spalpeens to stay at home, upsetting the State, flinging Home Rule back maybe a generation, with their foolishness, and we as good Irishmen as themselves can be?'

The infinite variety of classes that make up our present army is astonishing. I told once of a Gordon Highlander landing in Havre with a copy of the Hebrew Psalms in the pocket of his khaki apron to read in the trenches. I saw, among our own Gordons, an Aberdeen divinity student, as a private, reading in the mud the Greek Testament and the Sixth Book of Homer's *Iliad*. Anything, from that to the *Daily Mail*, represents the reading of our men. This variety is also very noticeable among our officers. We had the lumber-man from the vast forests of the West beside the accountant from San Francisco; the tea-planter from Bengal; the lawyer from the quiet Fife town beside the Forth; the artist; the architect; and the journalist. And it was this mixture that made possible episodes of irresistible comicality.

For instance, to prevent waste of petrol in 'joy-riding,' a French barrier at one place near us had guards set upon it under a British officer. One day a young northern subaltern, entirely fresh to military work, was in charge; and the tale goes that he stopped Sir Douglas Haig's car, asking him to show his permit and declare his business. When the general did tell who he was, the boy was so taken aback that he is said to have stammered, 'So pleased to meet you!'

Again, a young officer told me that he was leading a well-known general around some trenches in the dark. They came to a traverse. 'We'll go round here,' said the general, and the young fellow led the way. But a watchful Gordon leapt up suddenly with fixed bayonet, and, 'Who goes there?' The youth replied, 'General Blank.' 'Ay, lad,' whimsically replied the Scot, 'ye'd better try again. That cock'll no fecht wi' the Cock o' the North.'

Another, a verdantly green soldier of the King, almost freshly off the ploughed haughs of home, met an officer of high rank. He was carrying his rifle, but he huddled it under his arm, and awkwardly saluted with the open hand as though he had it not. The officer said, very kindly, 'Here, my man, is the way to salute your superior with your rifle;' and he went through the proper regulation field-officer's salute. But Jock, after coolly watching him, as coolly replied, 'Ay, ay; maybe that's your way o't; but I hae my ain way, and I'm no jist sure yet whilk's the richt gait o't.'

It would be worth while seeing this man after a few months' training has brought him into the

'richt gait o't.' In fact, the way in which the men have fallen into the habit of discipline is as wonderful as the way they leapt into the line of service for their country's sake when they were not forced to go. I recall one, who was only a type of many. Up in the mouth of a West Highland glen is a little cottage on a croft. And the man there was the last of his race. When others passed out to the world-wide conflict, his mother, who was very old, opposed his going. But she died. And then he drew his door to, locked it, and went to share the battle for liberty which to-day is shaking the earth. There are far more men of peace than men of quarrel fighting for the soul-compelling things that are of value beyond this dying world, and these are made of the true victory-stuff.

None are less given to talk of what they have done than the very men whose deeds thrill others. They just saw the thing that was needed; they seized the flying moment, and did the deed that makes men's hearts stand still. They came out of it with something akin to the elation of the sportsman who has scored a goal. They saved their side in the game. That was what they aimed at, and they were satisfied.

In my last battalion were two men who, working together, did breathless things without themselves being breathless. They enjoyed them. After one 'stunt' our people in the trench observed a man hanging on the enemy's wire. His hand was slowly moving to and fro. They watched carefully, and saw clearly that he was signalling to them. A little group of officers gathered and considered the matter. But it was entirely impossible, they thought, to dream of attempting a rescue before darkness. So they resolved to get together a rescue-party in the night and save him. Meanwhile, however, these two worthies slipped away, crawled over No Man's Land, and brought the poor fellow in. Rebuked for their temerity, their reply was, 'We couldna thole the sicht o' a chum oot yonder like that.' Another time, after a bitter struggle in a patch of woodland between our line and the enemy's, they came and reported that a man in khaki was to be seen moving from tree-stump to tree-stump, evidently in distress. 'I think he's daft,' said one. And in the gloaming over they went, found him, and brought him in to safety. He had been wounded in the head and side, and left behind. The first day he had kept himself alive by drinking from the water-bottles of the dead; but he had lost his reason and his bearings, and was in despair when our brave fellows got him. And these men were killed later on by a slight accident down behind the lines.

It was difficult to get away from the touch of one's environment. One morning we had a weird reminder. When we opened the door of our hut, there, on the threshold, lay an unexploded 'dud' shell which had fallen in the night. Had it done what had been intended, we should have been very suddenly off somewhere among the stars. It made one think a little of solemn and strange things, and feel more than a little thankful to behold again the light of the sun.

IV.

People speak a good deal about the lust for blood and the fever-passion of battle. But our boys are not blood-thirsty.

A friend of mine, after a 'scrap,' saw a proof of this which almost cost him his life, as he had to resist the tendency to laugh, for he had been shot through the lungs. A big Scotsman, in a muddy kilt, and with fixed bayonet, had in his charge a German prisoner, who was very unwilling to get a move on. And Sandy shouted out to a companion on ahead, 'Hey, Jock, he winna steer. What'll I dae wi' him?' But Jock, busy driving his own man forward, just answered over his shoulder, 'Bring him wi' ye.' Both of these men had the sweat of conflict not dry upon them. But they never for a moment thought of driving the bayonet into that reluctant foe, as the German would have done most readily. Of course, one does occasionally find the old grim warrior still, quite contented under hard circumstances, finding indeed the conditions a kind of real relief after the rust of peaceful days. This same friend, going one night along the trenches, almost thigh-deep in mud, came upon a grizzled Irishman, O'Hara, cowering in the rain. 'Isn't this a damnable war, O'Hara?' said he. 'Thrue for you, sir,' was the unexpected reply. 'But, sure, isn't it better than having no war at all?'

A campaign like this brings one into touch with strange bedfellows. A man I know told me, 'In one place, during the early terrible days, we crept into a cellar, and I lay down to try to sleep. But I soon found this to be impossible, for I became aware of somebody that kept running to and fro in the dark, driving all rest away. I went out, and spoke to the doctor, whom I met. "Oh," he replied, "that's only our lunatic." It was, indeed, a poor fellow who had gone mad in the retreat; and they could meanwhile do nothing but carry him along with them.' Perhaps the weirdest of all the strange mixtures whom I met out at the front was a young fellow at a mechanical transport camp. His father was a Russian Jew, his mother was English, his grandfather Dutch, and he himself was born in London and brought up in Glasgow. In a world of such widely international disturbance you almost expected him to go off into effervescence, like a seidlitz powder.

Amid the sorrows and the weariness of the times out there it was remarkable how closely laughter followed at the heels of tears. We had great fun over a colonel—not in our division—who was very unpopular. He did not know the depths of his unpopularity, but, deeming

himself the best-beloved among his contemporaries, he was perfectly happy. One day, while he was sitting in front of his dug-out reading an old newspaper, a sniper's bullet passed quite close, and went 'pip' into the parados. He paid no attention, of course, for that was only a bit of the day's work. But when another came, he thought it was an attention which carried civility a little too far. So he called a Scotsman to him, and said, 'Go out, Jock, and nail that beggar.' Jock crawled out, glad of the diversion, stalked the enemy, 'winged' him, and was running up to 'feenish' him, when the German held up his hands and cried, 'Mercy, Englishman!' But Jock replied, 'Mercy? Ye dinna deserve nae mercy. Ye've missed oor colonel twice!' I often wonder if Jock told the colonel how he had put it! Or is he still as happy as ever?

It is told of Jock that, on another occasion, when a German held up his hands, after a good deal of dirty work with them, and said, 'Mercy, Englishman. I'll go to England with you!' Jock replied, grimly and coolly, 'Ay, maybe. But, ye see, that's no exactly whaur I was gaun to send ye.'

I was always much impressed by the Wesleyans, whom I often met in painful circumstances. I had never had anything to do with them till I came in contact with them wounded and suffering, but always most brave, patient, and truly religious. They bore their distresses without a murmur, and they died without fear. For they knew what they believed in. They had the gift of religion and the secret of a faith stronger than death. They were true mystics. I remember one day standing beside one of them who had been very dangerously stricken. His eyes were closed, and he was whispering continuously. I stooped down and listened. He was saying, over and over again, 'Oh God, remember me, and help me to get well, for the sake of those I love at home.'

I was turning to slip away quietly, when he opened his eyes and said, 'Whoever you are, don't go, sir. I was only speaking to God.' His religion was so intimate a possession that he did not need to apologise for knocking at the door of love with his prayer.

Nothing could be more touching, and often at the same time funnier, than meeting men past military age who, sometimes for the sake of their boys serving, had slipped into the ranks, mentally folding down a corner of their birth-certificate over the date, and salving their consciences, as did one, who said to me, 'I told them I was thirty-four—but I did not say on what birthday!' I remember one old Scot, who could scarcely move, telling me, 'I doot I'll hae to get oot o' this, an' awa' hame. Thae rheumatics is no good in the trenches; and they're girnin' at me again.' Of course, he had 'a laddie lyin' up yonder,' and a nephew, and 'a guid-sister's brither,' and so on, like the rest. And, of course, if it were not for these pains he would be as good as ever he was! Some time later I met him in the rain, and asked how he felt now. 'Oh,' said he, 'I'm just fine the day. I seen my youngest laddie gaun up, and I'd a word or twa wi' him. I'll be writin' his mither the nicht aboot it. He was lookin' grand. It was fine to get a roar frae him in the by-gaun.'

I called on one old woman at home, and she told me that her husband had only the previous day, which was his birthday, gone off to France. 'Eh,' said she with unction, 'he's a good man, my man. I often think I was a lucky woman to have sic a man. D'ye ken—he never told a lie!' 'And yesterday was his birthday?' I inquired. 'And how old was he?' 'He was fifty-eight,' was her answer. But when I asked how this modern rival of George Washington had got into the army with such an age, she innocently replied, 'Ye see, he said he was thirty-twa.'

How these elderly men endured for any length of time all the discomforts at the front was beyond understanding. They were, of course, frequently caught, when youth was more able to skip nimbly out of the way of death. The little, shell-swept graveyards at the front got many of them very soon.

I spoke elsewhere, some time since, of some of the forgotten and overlooked departments of our army. There are plenty such, of course. But one cannot help recalling amongst them the battalion runners, who carry messages over No Man's Land, or anywhere, from post to post, when air and earth are filled with hissing death, and who also act as guides up to the trenches. They are absolutely fearless. This type varies from the gaunt, silent figure, that stalks before you like an Indian through the dark, to the garrulous youth who talks all the time over his shoulder as he goes. One of the latter was leading up our men, and the colonel said to him, 'I hear that these dug-outs are wretched waterlogged holes.' ''Deed, they are that,' replied the guide. And then, gently, as if on a tender afterthought, 'D'ye ken, sir, I'm often vexed for you; for I'm perfectly sure that you're accustomed to something better than yon at home!'

Another is the military policeman, who controls and guides the traffic at the cross-roads, and where there is danger of shells falling, in such places as the square at Ypres. There, amongst evidences of steady peril, stands this quiet man with the red band on his arm; and he steps forward to warn you that it is not safe to be there! I cannot forget one road, when we were moving up to the front. The stream of life flowing on towards the fighting area was like the Strand in London at its busiest. The policeman with uplifted hand was as powerful there as at home. In a moment, at the signal, limbers, guns, motor-lorries, ambulances, mounted men,

and marching infantry stood motionless till permitted to go on again.

The directions we got one day from an Irish policeman were unforgettable. He said, 'It's quite easy, your honour. You see, when you go into Albert, you don't go into it at all. But you turn to the right, keeping well to the left all the way.' We thanked him, and trusted to Providence, as we are apt to do where there is nothing else that can be done; and, following our directions in a general way, we reached our place in safety!

Again, you will find, right up behind the front, the roadman busy, coolly filling up holes that shells have made, and behaving just as though he were working on a stretch of the Trossachs, or patching up the rut-worn tracks that the rain has damaged along by Loch Hourn.

It is in the air branch of the service that chivalry remains most markedly. Of course, in our navy you still get it, when you find our men risking their lives and their ships to save drowning enemies. But in the air service there is a mysterious spirit of generosity between foes that is almost as striking as the superlative courage of the combatants.

I saw, the other day, a very keen battle far up in the blue. Two German aeroplanes were being pursued by ours. I never hoped to see such skill in flying. They looped the loop; they dived; they rallied—they seemed to outdo the swallows in their art. Then one, winged, fell a great height, recovering quite near the earth, and crawling off, limpingly, managed to escape. Somehow, we felt relieved, although he was a foe. The other, however, was driven down, like a blind thing. Every avenue of escape which he tried was closed, as if by the wings of eagles, by our airmen. But we were quite sorry on hearing that when he reached the earth he was dead, shot through the heart in the last stage of his flight.

These men are among the most wonderful we have. I saw two who had been six miles beyond the German lines. At about ten thousand feet in the air they had been attacked by enemy planes and their machine set on fire. Yet they came back, burned but undaunted, landing within our lines as though they had been at a picnic! And a young friend of mine, shot through the foot, probably lamed for life, told me how, at a great height, he had been attacked. He swooned from his hurt and fell, but recovered consciousness in time to get his machine again in hand, and landed safely two hundred yards across our lines.

There can be no braver hearts than those. Many a time we looked up at them, sailing overhead, and wondered; and the roughest Tommy sends something like a prayer with them as they go.

GERMAN DOINGS ON THE WEST COAST OF SOUTH AMERICA.

By W. Scott Lorrie.

WHEN the commander of the German cruiser *Dresden*, at anchor in Cumberland Bay, Juan Fernandez Islands, descried British warships bearing down on him, he thought that the last hour had struck for himself and his crew. The Kaiser's men at sea have been cynically indifferent to the loss of life. This has been seen time and again, and in no more convincing way than in the fight that took place off Santa Maria Island, as a result of which more than one thousand five hundred British officers and men were left to perish miserably, while Admiral von Spee's men are said to have looked on in seeming indifference.

When the British warships surprised the *Dresden*, her crew expected to have their own measure meted out to them, which might easily have been the case had the British so desired. Nevertheless, when the Germans took to their boats, they were allowed to make for the shore; ay! but with the sting of guilt in their souls. They landed safely, and then witnessed the destruction of their ship, while their killed and wounded were being taken care of by an ambulance-party sent from a British transport, which took them to Valparaiso. This is the sort of deed the little imaginative Germans will never give the British credit for. Immediately the news of the sinking of the *Dresden* was received, the Chilian Government ordered a warship to proceed to Juan Fernandez to pick up the crew of the sunken vessel, who were interned at Quiriquina Island.

A short time ago the commander of the *Dresden* requested leave to abandon for a few days his place of internment. While he was walking about the streets of Santiago his friend the German Minister handed to the Chilian Government a document containing the German Chancellor's reply to certain claims formulated some time before by the Chilian Minister of Foreign Affairs, on account of the violation of the principles of neutrality by the armed transport *Prinz Eitel Friedrich*, the cruiser *Dresden*, and several other German vessels. It is unnecessary to enter into details as to the words in which the German reply was couched; suffice it to say that it was indited in a similar manner to that which characterises most documents of the same character. It was a hollow refutation of the charges that justified the Chilian claims, apparently devoid of fundamental justice, and seemingly based on the policy that 'might is right.' However, it was the prelude of the sequence; for, while the German Chancellor

professed to disavow the Chilian statements, he expressed a desire to hear further from the commander of the *Dresden* before making a definite pronouncement on the subject. Was he trying to hoodwink the Chilian Government? His verdict was distinctly forecasted in the document alluded to, and nobody was so foolish as to believe that, whatever further evidence might be given by the German naval officer, it would induce Herr Bethmann-Hollweg to alter his mind about the policy he had already adopted. It was this desire of his that in all likelihood accounted for the trip of his subordinate to Santiago. At his request he was called by the German resident Minister to furnish evidence with which to strengthen the refutation of the claim that the neutrality of Chile had on more than one occasion been violated by the Teuton profligates.

But the Chilian Government would not allow themselves to be browbeaten by Teuton obduracy and audacity. Therefore, the German note gave rise to a very unpleasant time for the German Minister, who faced the situation with the fierce strength of Ajax defying the lightning. Referring to the stay of the transport *Prinz Eitel Friedrich* in Papudo Bay, where the commander refused to recognise the authority of the Government representative, Herr Bethmann-Hollweg stated that from investigations it appeared that the call at Papudo was made in order to land the wife and family of the captain of the British steamer *Charcas*, and that the German commander was not aware that there was a Chilian official at the place. Still, there was a wide gap between the wheedling allegations arising from German diplomacy and public opinion in Chile. While the latter was incensed by the conviction that the reports of German encroachments were true, and the thought of their injustice acted upon public opinion with exasperating effect, the former, with priggish sang-froid, contended that there had been no violation of neutrality, and, with remarkable churlishness, accused the Chilian authorities almost directly of being blockheads and duffers at a game which, it was doubtless meant, 'they knew nothing about.' What logic could convince such law-breakers? What has been said about German piracy in those waters is only one-tenth of the truth. They played their game, and partially won. Thanks to their secret wireless installations, they got coal and victuals when and where they pleased, and their steamers entered and departed from Chilian ports without their papers and despatches. In one instance, when a Chilian authority personally ordered the detention of a German steamer, the commander grossly insulted him, and said, 'The only man I am under duty to in these days is the Kaiser.'

The recent disappearance of the Chilian barque *Tinto* is another proof of German conspiracy. She left port several months ago, and has not been seen or heard of since. Only a short time before she had tried to deceive the local authorities in a similar way. A rumour went round that the barque had been chartered by German agents, and that she carried wireless installations, coal, and provisions destined probably for some submarine station in the Atlantic. A Government inspector was at once despatched to the spot, and the vessel was not cleared. After the usual comment to which such matters are wont to give rise, the affair drifted into oblivion, until the news suddenly came that she had got away. It is said that she was manned by some of the *Dresden's* crew who were interned on Quiriquina. The Chilian Government took severe measures against the owner of the vessel—a German by birth—and sent out several vessels to search the Strait of Magellan. But what was done in this respect proved of no avail, for the whereabouts of the vessel could not be discovered. What has become of this mysterious vessel? Has she fallen into the hands of some British cruiser? Time will some day, perhaps, throw light on this dark deed.

But the most recent and daring act of any German agent in South America was the stupendous enterprise undertaken not long ago by O. Krause. This man, formerly a captain in the merchant marine, had been acting for many years as agent at Callao, Peru, of the German Kosmos Steamship Line. At about the time when the United States severed diplomatic relations with Germany, this man Krause was engaged in laying the strings with which later he would set his plans in motion. He managed to sow the seed of discord in the Peruvian navy, which resulted in the resignation of several well-known naval officers, including the commanders of the two Peruvian submarines. He put up several secret wireless installations along the coast of Peru, and got a gang of German agents and spies to work the scheme he had devised when the signal to do so should come.

The commanders of the Peruvian submarines out of the way, Krause's next step was to get the two vessels to a certain island, where a German crew would be ready to take them over. But before putting such knavish machinations into practice he must quit the country and go to Mexico. Feeling assured that the arrangements he had made in Peru would be carried out without a hitch, he left Callao in the Panamá-bound steamer *Maipo*. But if Krause and his lot had been smart, the British agents had, indeed, not been lagging behind; for, when the *Maipo* was well out at sea, she was stopped by an auxiliary cruiser flying the Union-Jack abaft, and half-way up her foremast some such signal as this: 'We request that you hand over to us German prisoner of war.' The order was complied with without the least ado, and Krause was transferred to the war-vessel, which must have given him into safe keeping long ago. It

was a fortunate capture, for, had he been allowed to reach Mexico, his plans might have been carried out in such a way as would have meant a serious set-back to British shipping interests on the west coast of South America. With the two submarines mentioned, and an abundantly supplied station somewhere in Mexico, for instance, Mr Krause could have challenged British shipping during all the time it might take to capture or sink the stolen submarines.

For one who has lived in the very place where all these things have happened, and has heard the bitter words to which such acts have given rise, the German reply to the claims, especially of the Chilian Government, has no justification. We are convinced that the Germans will never realise that justice may sometimes be on the side other than their own. Their belief is that the one way of thinking that must needs predominate is the German way. The only truth is that which bears the seal of German sanction; and, what is more, no people in the world are competent to judge things in a light equal to that professed by the Germans to be the true light—their own. So what is the use of arguing the point with such hard-heads? A German fleet, comprising the *Scharnhorst*, the *Gneisenau*, the *Dresden*, the *Leipzig*, the *Nurnberg*, and several transports, lay at anchor at Easter Island for twelve days, and transhipped four thousand tons of coal. The German liner *Sedlitz*, after taking in five thousand tons of coal at Valparaiso, obtained her despatches for Bremen; the steamer *Santa Isabel* shipped a large quantity of coal at Valparaiso, and transhipped it in the Atlantic to German warships, and returned to Valparaiso for more, when she was interned.

Here is another example of German crookedness. When Von Spee's fleet was marauding in Chilian waters it was met by a large Hamburg-American cargo steamer, whose original name had been exchanged for the less compromising one of *Sacramento*. This steamer was despatched from San Francisco by a group of German agents, who had the nerve to constitute themselves into a company for the purpose of this one voyage. The plan was worked in this way. The steamer was loaded with coal and provisions. As the company to which she belonged was domiciled in the United States, she naturally flew the American flag. From San Francisco she was despatched to Valparaiso, where she was consigned to the Electric Traction Company, a German concern. At Easter Island or Juan Fernandez the precious cargo was transhipped to the German warships. Having successfully fulfilled her mission, the *Sacramento* put into Valparaiso to coal and victual. The Chilian naval authorities became suspicious of the good faith of the commander, who furnished somewhat contradictory information as to his voyage. Recognising the steamer to be the one they had received and despatched on previous occasions under another name, they decided that she should be interned, despite the German claim that the vessel was American, since she belonged to a company legally organised according to the constitution of the United States.

There are many other incidents connected with the German movements in the Pacific, some of which have acquired a similarity to legendary tales. An official narrates the story that while on duty at three o'clock one morning he witnessed a small vessel enter the bay of Valparaiso, and then disappear almost immediately. A steam-launch was sent to make a reconnaissance, but the mysterious vessel managed to get out of the way. What could such a vessel be doing at such an hour? The truth will never leak out; but it is probable that she was met by German agents, who delivered messages from the German Government for the commander of the German fleet in the Pacific.

For the Germans, every determination of the German Government is without appeal and infallible. A case in point. When the *Dresden* put into Cumberland Bay, her commander requested the Chilian authority there to allow him to stay eight days, which was the time he estimated would be required to do some repairs to the engines. The Chilian authority visited the vessel, and finding that no such repairs were necessary, requested that, in accordance with international law, the *Dresden* leave within the twenty-four hours prescribed. This the commander outrageously refused to do. Was he aware that British warships were close on his heels? Did he realise that to escape just then was as impossible as a journey to Mars, and that his only salvation lay in the Chilian authority, whom he thought he could browbeat?

Cumberland Bay, where the population barely exceeds two hundred natives, is an unusual place for a warship to call at for repairs. It would have been better and easier to go to Valparaiso. If it was the German commander's intention to act in good faith he would undoubtedly have done so. What was there to prevent him? But here is good proof of German cunning and artfulness. The *Dresden* went to Cumberland Bay with the excuse that the engines were disabled. Whether or not the necessary time to repair them was granted, it would make no difference. The commander was shrewd enough to know that the Chilian authority would in any event be obliged to communicate with the Government, and that to do this it would require from six to seven days, time enough to elude the British vigilance and pursuit. On the other hand, the German Chancellor's point of view, as emphasised in his note to the Chilian Government, was that the commander of the *Dresden* could stay at Cumberland Bay the time required for the repairs, which time could not be determined beforehand. To strengthen his argument in this respect, he re-

ferred to Article 14 of the thirteenth Convention of The Hague, 18th October 1907, in reference to the rights and duties of the neutral Powers in the event of maritime war. According to his inference, the Chilian authority's notification of internment within twenty-four hours was, therefore, not justified; on the contrary, he stated that the very question of knowing whether the vessel should be interned according to Article 24 of The Hague Convention was not sufficiently clear, even to the mind of the Chilian authority, who was obliged to consult his Government. This is but a natural result of Germany's late accession to power, the conceit that arises from the consciousness of great prosperity, and the claim to be the chosen people of God.

A MILLION A YEAR DOWN LONDON DRAINS.

By C. F. Townsend, F.C.S.

EVEN before the war there was a rapidly growing shortage of fats and oils. This may have been due to the people in civilised countries using more fats for edible purposes, although this seems hardly likely; or to a decrease in the supply, although this seems difficult to believe, with the opening up to trade of the hitherto unexplored regions of the world; or to the great increase in the demand for soap caused by the growth of personal cleanliness. The last seems the most probable explanation. Even in Pepys's days soap was almost more than a luxury; it was a rarity, and there is a record in his diary of a present he made to a lady of title of a small keg of soap, which was only just coming into use amongst 'the rich and the great.' Nowadays even the poorest use soap—more or less. As you cannot 'eat your cake and have it,' so likewise you cannot eat your fat and make it into soap, and it seems probable that in the future we shall have to choose between going without our nut-margarine for breakfast or without the soap required for our personal ablutions, not to mention the soap required for cleansing our undergarments in the laundry, or to find some new way of making soap which does not necessitate the employment for the purpose of the fat we want for breakfast. Fortunately for the enjoyment of our future breakfasts, the progress of science has led to the discovery of an entirely new way of making soap without having recourse to our precious fats at all—namely, from cereals, such as maize; and Dr Shorter of Leeds University, who has been carrying out a number of experiments on the action of soap, has found that this new soap made from cereals is much better than the old soap made from fats. Consequently we can still look forward to the enjoyment of our bread and nut-margarine, whilst yet being able to wash ourselves.

This, however, is only one aspect of the question, for, on account of the hardness of the water-supply in the greater part of the British Isles, we use only a very small part of our present fat soaps, the remainder being absolutely wasted. Where a hard water is employed, the whole of the lime in the water must be neutralised by the soap before any cleansing of linen or of the person can take place. Every one is familiar with the nasty curds produced by the combination of the lime in hard water with the fatty matter in the soap, and until this process is complete it is impossible to obtain any lather from the soap. Worse still, the lime-soap combination forms a yellow coating on linen that is washed in hard water, so that it is not only a waste of soap, but a serious nuisance into the bargain. With an average hard water somewhere about thirty pounds of soap are destroyed by the lime, and ultimately go down the drains as lime-soap curds, for every thousand gallons of water used. About 60 per cent. of this soap consists of fat; so that every thousand gallons of London water wastes about eighteen pounds of fat that we might have had for breakfast. Something like seven million gallons of water are used daily in London for personal washing purposes, without taking into account the large quantity used by the laundries for washing our clothes. Fat or oil used in making soap is now worth fivepence farthing per pound. Therefore, over one million pounds' worth of valuable fats go down the drains in London every year without having been of the least service to any one. The soap made from cereals, mentioned above, possesses the additional advantage that, besides saving fats, it is unaffected by the lime in hard water, and for that reason is already being used in the navy, for it can be employed perfectly well for washing in sea-water.

AT THE MOUNTAIN'S BASE.

As if at the world's edge, one sees no more
Time's landscapes heave; so here, in rest, and awe—
An awe most vast—the terraced peaks withdraw
Eyes from all level vision. Waters roar,
And cream, adown a crevice; while the hoar,
Gray rocks stand sentinel. The rook's deep caw
Through rough, serrated passes, like a saw
Most sage, breaks 'mid the silence. Mortal man, adore,
And bare the head! For downward dip, and drift,
All lesser souls; but thou the clear, cold beam
Scannest upon the golden, towering gleam
Of the swirled summit! 'Tis a kingly gift—
A foretaste of the heaven that waits the bold:
Rest on the height, amid the sun's spilt gold!

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

HERE in Britain diplomatic messages, great national appeals, proclamations, fine in their idea, mighty in their import, sentences which, lighted with a reader's imagination, blaze in the being, are often stodgy, complicated stuff of words. They smell of clerks and silken gowns, of old chambers and ancient precedents. They are hardly complete in themselves; the beauty of their intention is only revealed when imagination is applied. In such cases there seems a certain insincerity when indeed there is none. However, one comes to the understanding that this is a necessary governmental way; that in the highest places it is unusual and, maybe, impolitic to speak one's mind in simple terms; and that somehow constitutions and history demand a certain dullness and obscurity. If we reproach our enemies, praise the good Allies, encourage the little peoples who lean upon us, exhort our citizens to effort still higher, there are complications of terms, reservations, restraint, some coldness. The Americans come nearly new to such a business; it has been a rare affair with them, and they have no regard for precedents and forms. Truly, Lincoln was an influence, but the national messages of Lincoln had simplicity and frankness for their chief feature. They were not the European kind of thing. President Wilson's are the same in circumstances of even greater difficulty and greater moment. In their simplicity, their honesty, their idealism, and, above all, in the human sympathy they exhibit for the Old World in its agony, for poor suffering humanity, the appreciation of the sorrow and the pathos of it all, the pity of man for his poor brother, the wish to help, such messages are like draughts of cold water from a mountain spring to parched lips. By them we feel a new force; we feel the youth and earnestness behind them. Even more than by the multiplied millions of dollars, the making of American arms, the coming of American ships, do we sometimes feel in these new and simple thoughts, so plainly expressed, setting forth the nobler principles of national and international life, the grand, the startling, effect of American idealism. Mr Wilson has been well inspired in the simplicity of his messages. The full spirit of Lincoln's frankness has come upon him, and his appeals to Congress, to his countrymen, to the peoples of other lands, make a series which is matchless in plain impressiveness. We see the new hope, the new idealism, shining in them; we hear the call to man to be brave and strong that the end may be good for all. They are the words of man to man in the supreme crisis of the world. No conventions here! The proclamations of the President of the United States to his fellow-citizens and their foreign friends are not drafted by lawyers, considered by committees, altered and amended and given a Tudoresque finish. Instead of such a process, one likes to think of the President pacing in his garden, writing down, as is his habit, a note or two in shorthand, and then in the watches of the night, with the inspiration aflame in him, seating himself—as he does—before his little typewriter and with his own fingers keying the thoughts and words to their existence on paper almost as rapidly as they are shaped in his mind. That new tone in his messages, that simple frankness, that magnetic touch of hope and comfort and idealism, impress each reader at the first glance. Here is something that is not of the old way, not of Europe. It is of the new land, the golden West stretching from the 'Liberty' borne by New York like a charm upon her bosom to the Pacific on the farther shore.

* * *

There was a good example in those few timely, kindly words spoken to faltering Russia, so much harassed, so much tempted by an illusory prospect of peace that had been suggested to her. In the first moments of America's entry into the war her thoughts were of Russia. That was very noticeable. Britain was pleased with the Russian Revolution, but that tremendous event seemed to strike the American imagination more forcibly than ours. At the first moment America flew to Russian assistance with kind, encouraging words and offers of vast supplies. She strove earnestly to make Russia feel that all the body and all the free spirit of the United States were with her. When Russia hesitated, when the way before her began to seem too hard, the President sent a special message to the Provisional Government. It was to give the Russians hope, to stimulate them, and to direct aright their philosophy on the subject of an-

 [*All Rights Reserved.*]

nexations and territorial adjustments, which seemed, amid revulsions of feeling, to be falling into some state of confusion. There was a glow in the words that is not to be found in proclamations from Old-World cabinets. A new conception of America's President suddenly rose in the minds of Europeans when they read, and read a second time, the close of the mighty address to Congress in which he first declared for war. In time so distant that even the history of this ghastly and fateful world convulsion will be condensed by the historians to a page or two, the peroration of Woodrow Wilson's address to Congress will be given in full. 'Civilisation itself,' those men of a new age will read, 'seems to be in the balance; but right is more precious than peace, and we shall fight for the things which we have always carried nearest our hearts—for democracy, for the right of those who submit to authority to have a voice in their own government, for the rights and liberties of small nations, for the universal dominion of right by such a concert of free peoples as will bring peace and safety to all nations, and make the world itself at last free. To such a task we can dedicate our lives, our fortunes, everything we are, everything we have, with the pride of those who know the day has come when America is privileged to spend her blood and might for the principles that gave her birth, and the happiness and peace which she has treasured. God helping her, she can do no other.' Unforgettable words. But in many minds the strongest impression will remain of the address, so wonderful in its intimacy, in its earnestness and simplicity, that the President made in the form of a personal appeal to his fellow-citizens, soon after the American entry, to join together to unite the nation for the preservation of its ideals and for the triumph of democracy in the world war. In no other country since the war began has an appeal so direct and intimate been made to the people; perhaps in no other country would it have been possible. And yet it seems a simple, an obvious, measure. 'Fellow-countrymen,' said he in this printed address, 'I hope you will permit me to address to you a few words of earnest counsel and appeal.' And then, one by one, he spoke to all classes in that great and diverse community. Thus: 'To the men who run the railways of the country, whether they be managers or operative employees, let me say that railways are the arteries of the nation's life, and upon them rests the immense responsibility of seeing to it that these arteries suffer no obstruction of any kind, no inefficiency or slackened power. To the merchant let me suggest the motto, "Small profits and quick service;" and to the shipbuilder the thought that life and the war depend upon him. Food and war supplies must be carried across the seas no matter how many ships are sent to the bottom. The places of those that go down must be supplied, and supplied at once. To the miner let me say that he stands where the farmer does. The work of a world waits on him, and if he slackens or fails armies and statesmen are helpless. He also is enlisted in the great service of the army. . . . Let me suggest that every one who creates and cultivates a garden helps greatly to solve the problem of feeding the nations, and every housewife who practises strict economy puts herself in the ranks of those who serve the nation. This is the time for America to correct her unpardonable fault of wastefulness and extravagance. Let every man and every woman assume a duty of careful and provident use of expenditure, as a public duty and as the dictate of patriotism, which none can now expect ever to be excused or forgiven for ignoring. . . . The supreme test of the nation has come, and we must all speak, act, and serve together.' With time the impressiveness of such appeals increases. Lincoln's words ring through America and the world now as ever they did—nay, more than ever; words of freedom and liberty and great sincerity. Mr Wilson's have even a greater task to perform, and they have a loftiness fitted to the endeavour. We now see the President as the practical man and the idealist at once, a marvellous statesman who achieved the masterpiece of bringing round his hundred millions of fellow-countrymen to the one way of thinking at the right moment. He did it not by hard instruction and stern exhortation from the beginning—thus he would have failed—but by gentleness and extreme sympathy always. At the supreme moment of the crisis he had his hundred millions of Americans ready.

* * *

It happened that I was in different parts of the United States, east and west, when Mr Wilson was in the full flood of his first campaign for the presidency in 1912, and circumstances inevitably led a wanderer to take a new and acute interest in this once university professor, who at first glance and thought seemed to be of even drier stuff than one of his opponents, Taft, and to lack all the colour and impulsiveness that made the other, Roosevelt, such an attractive figure. But the first examination of the man and his career forced a revelation. Here was a new creation in statesmanship, something not regarded before, in the Old World at all events, as being among the possibilities or practicabilities. This man with a straight American mouth, and one of the deepest, strongest chins to be seen on any man of consequence, was a soaring idealist who sternly bent his ideas to the practical cases of the time, but in doing so discarded old conventions and broke old moulds, making new ones for his purpose. Hitherto in his career he had been springing surprises continually, causing commotions in his communities, a disturbing element frequently; but invariably, by common acceptance in the end, working with a mighty

energy and determination for the public good, loving democracy and struggling always for the good of the people against those who would oppress them, reforming without ceasing. Here, it seemed, was a paladin for a new liberty. I followed his progress for a time, and one Sunday in a great New York political club sat from morning to night among the books he had written, in which some of his principles were expounded. They showed a new way of thinking; they gave a hint about a new possibility for the future. One could not doubt that this man was meant to lead America, and, with the Old World showing signs of a new emancipation, of leading perhaps something more than America. Only a few others had noticed in the past what a remarkable personality and mind was here, and what its prospects might be. First to do so was Colonel George Harvey, editor of the *North American Review*, who nominated him for a future presidency in 1906, and five years later described him as 'Woodrow Wilson, the highly Americanised Scotch-Irishman, descended from Ohio, born in Virginia, developed in Maryland, married in Georgia, and now delivering from bondage that faithful old democratic commonwealth, the state of New Jersey.' This bright summary by the American editor indicates an origin and early career of peculiar interest; but there was none of that special romance that it is the delight of a certain class of sentimentalists to associate with the youth of those who were afterwards great. Young Wilson was not a dreamer; no past President gave him a dollar and told him that one day he would be President too; the boy himself did not devote all his leisure hours to the study of the lives of such as Washington, and he made no dramatic declarations to his parents. And yet in the consideration of the origin of Woodrow Wilson, the President of the United States, there is romance enough. What an odd mixture he is!—Scots, Irish, American, and so forth, as Colonel Harvey said. His grandfather on the paternal side lived in County Down, Ireland, and a hundred and ten years ago went to Philadelphia to better things for himself. His other grandfather was the Rev. Thomas Woodrow, a Scottish Presbyterian minister, who held an appointment for a long time at Carlisle, and then moved first to Canada, and afterwards to Ohio, where he held a pastorate. The youngest of the seven sons of the Irishman turned towards the ministry for a career, and was licensed to a post at Steubenville Male Academy. There he, Joseph Ruggles Wilson, came to acquaintance with Parson Thomas Woodrow's daughter Janet, who was a pupil at the companion academy for girls. They became friends, lovers, and married. The President was their third child, two daughters having come before, and he was born at Staunton, Virginia, in the last week of 1856. The little family had moved to Georgia at the time the Civil War broke out, Mr Wilson having accepted a pastorate at Augusta. The boy Woodrow was only four years old at that stirring time, and retains but few impressions of it; but the earliest recollection of his whole life is that of some men shouting in the street outside his father's house that Lincoln had been elected and there would be war. One day, as he remembers, he saw a number of Confederates riding through the town on their way to join the army, and he recalls Jefferson Davis passing through in 1865 on his way to imprisonment. His father was a staunch Southerner, but the family came little into contact with the great struggle. It made no impression at the time on this boy; but yet the Civil War inevitably had a tremendous effect on his mind, his temperament, his thoughts and ideals. It wound up every spring in him, and set him alive and burning for zealous action when the time came for him to go out into the world a man. That was because by the time he was grown up America was passing through that magnificent inspiring period of building and reconstruction under the new unity. The great fabric of mighty and industrious America was being prepared with amazing vigour. Young Wilson saw it at work, and any man with a germ of the statesman in him was bound to be enormously impressed and stimulated. He was. And at the same time he began to feel that destiny might have something for him; he thought of the presidency, and he determined to direct himself towards law and politics. His education was slow in starting. His father did not believe in forcing in these matters, and he was past nine years of age before he could read; but the pastor, in his careful companionship with his boy, had been affording him training of no small value. They had long walks together; they visited workshops and factories where great object lessons were presented, and at other times in the evenings the father read aloud to the members of his family chapters from Scott and Dickens. Then, after four years at an academy at Atlanta, South Carolina, he was sent to Davidson College, North Carolina, but left after a year through ill-health. In 1875 he proceeded to Princeton University, and there a passion for the study of history and politics took hold of him. He read deeply into Chatham and Burke, and in his fourth year he was regarded as the best speaker and debater at the College. This led to a strange and, as some might say, a significant incident. There was an annual debate at Princeton between two rival debating societies, and that there should be no preparation and that the full capacity of the participants might be tested, both the subject and the debating part in it to be taken by each side were chosen by lot. The rival societies each put forth a champion, and then the subject and the side were determined by hazard. Wilson was selected by his society, and when the slips of paper were drawn it was ordained that the

question should be that of Protection against Free Trade, and, further, that Wilson should urge the case of Protection against the other. He would not do so much violence to his convictions, even though it were but an academic exercise; he tore up his commission and abandoned the debate.

* * *

When his university career was completed he tried to settle to the practice of the law, with a partner, but this arrangement was soon abandoned. He determined to teach law instead, took a post-graduate course, and was then appointed lecturer in history and political economy at a women's college near Philadelphia. Some time later he was appointed to the chair of jurisprudence and politics at Princeton, and in 1902 he became president of the university, a position of the utmost control and authority. Now he entered upon his career as a reformer. He set about changing the system of instruction, overthrowing traditions, and abolishing abuses. Princeton at that time was a university greatly controlled by the rich, where their sons, living at the clubs they established, devoted themselves far less to educational matters than was desirable. The new president set a higher standard of efficiency, he made rules by which the students found it necessary to study more than they had done, and he established a system of groups, whereby numbers of students were brought into close personal contact for purposes of discussion and tuition with professors, and not left to their own devices after merely attending lectures, as had been the custom. His was a period of great reforming changes such as had never been known before; but he found strong interests set against him, especially when he attacked the system of the residential clubs and essayed to substitute another that would have made for more efficiency and less luxury. He had defeats to bear; but in 1910 he ascended to a greater reforming task, for then he was nominated, and elected with a plurality of fifty thousand votes, to the governorship of New Jersey. 'Absolute good faith in dealing with the people and unhesitating fidelity to every principle avowed is the highest law of political morality in a constitutional government,' he said at that time. He purified and strengthened municipal government in his state; he amazed the people by his boldness, his independence, and his daring. The rest of the world was a little surprised when it heard that one Woodrow Wilson was to be a candidate for the presidency, but those knowing him and about him were not surprised. At the great Democratic convention he was selected as the candidate for the party after a sharp contest with others, and, according to the custom at these remarkable gatherings, he was cheered for an hour and a quarter. At the later trial, when the Republican vote was split between Mr Roosevelt and Mr Taft, with consequences fatal to them, he was an easy winner. He had 435 electoral votes, the plumping votes, from each state in the electoral college, against the 88 that were given to Roosevelt and the 8 to Taft. The election is not counted this way, but it was reckoned that he had 6,286,987 popular votes against Roosevelt's 4,125,804, and Taft's 3,475,813. The electoral figures take no account of minorities, but the others do. The rest is familiar to most of us. Without doubt Mr Wilson's re-election last year, near thing as it was, meant much for the great cause of the best of the world.

* * *

He is not a man to be judged by physiognomy. He looks cold, hard, unemotional, far from humour, but he is not so. No man is more devoted to home life; he has fine warmth of feeling and rare powers of humour. He can tell a little story as well as any American, and they say he commonly opens his meetings of the Cabinet with an anecdote. He has none of the primary 'bad habits,' as we call them. There was a flutter in Washington when he first went to the White House, and the rumour spread that only grape-juice would be set upon the table. But all were happy afterwards. He lives a clean life. He is fond of sports and games; he is devoted to cycling, rowing, and golf. At times of great stress of mind during the war he has consistently sought relaxation on the golf-course. But when grappling with a problem he paces his study or the gardens of the White House in solitude for hours. The war has aged the President somewhat, but yet his vitality is enormous. It needs to be. On him, perhaps as much as on any one now alive, does the fate of the world depend. He is handling and controlling the most marvellous, most efficient, and most gigantic force that mankind has ever known.

THE DEFINITE OBJECT.

CHAPTER XL.—CONCERNING A HANDFUL OF PEBBLES.

'AND so,' said Hermione as she waved good-bye to Hazel, who stood in the cottage doorway with Mrs Bowker—a Mrs Bowker no longer faded—'you didn't forget even the doll that says "Mamma"?'

'It was such a little thing!' he answered.

'What a—man you are!' she said softly.

'Just that, Hermione,' he answered, 'and—frightfully human!' She was silent. 'Do you

know what I mean?' he demanded, glancing at her averted face.

'Yes!' she answered without looking round. So they walked for a while in silence.

Suddenly he seized her hand and drew it through his arm. 'Hermione,' he said gently, 'I want my wife.'

She still kept her head averted, but he could feel how she was trembling.

'And you think'—— she began softly.

'That I have been patient long enough. I have waited and hoped because'——

'Because you are so generous, so kind—such a man!' she said softly and with head still averted.

'And yet since I have been well again you have kept me at arm's length. Dear, you—love me still, don't you?'

'Love you?' she repeated. 'Love you?' For a moment she turned and looked up at him, then drew her arm from his and walked on with head averted once more.

So they entered the rose-garden, and coming to the lily-pool, leaned there side by side.

'Hermione,' said he, staring down into the water, 'if you really love me, why do you hate to kiss me? Why do you hardly suffer me to touch you? And you've never even called me by my name that I remember!'

'Geoffrey!' she breathed, 'and I—love you to touch me! And I don't hate to kiss you, Geoffrey dear.'

'Then why do you keep me at arm's length?'

'Do I?' she questioned softly, gazing down at the lily-pads.

'You know you do. Why?'

'Well—because.'

'Because what?'

'Oh, well, just—because.'

'Hermione—tell me.'

'Well, everything is so strange—so unreal! This great house, the servants, all the beautiful clothes you bought me! To have so much of everything after having to do with so very little—it's all so wonderful and—dreadful!'

'Dreadful?'

'You are so—dreadfully rich!'

'Is that the reason you keep me at such a distance? Is that why you avoid me'——

'Avoid you?'

'Yes, dear. You've done it very sweetly and delicately, but you have avoided me lately. Why?'

Hermione didn't answer.

'And you haven't touched any of the monthly allowance I make you,' he went on, frowning a little; 'not one cent. Why, Hermione?'

Hermione was silent.

'Tell me!'

Still she was silent; only, she bent lower above the pool, and drew farther from him; whereat his pale cheek flushed and his frown grew blacker.

And presently, as he scowled down into the water, she stole a look at him, and when she spoke, though the words were light, the quiver in her voice belied them. 'Invalid, dear, if you want to be angry with me, wait—till you're a little stronger.'

Ravenslee stooped and picked up a handful of small pebbles that chanced to lie loose. 'Wife dear,' said he, 'I'm as well and strong as ever I was. But I've asked you several questions which I mean you to answer, so I am going to give you until I have pitched all these pebbles into the water, and then'——

Hermione glanced up swiftly. 'Then?' she questioned.

'Why, then, if you haven't answered, I shall—take matters into my own hands. One!' and a pebble splashed into the pool.

'What do you want to know?'

'Two! Why haven't you condescended to take your allowance?'

'Dear, I—I didn't need it; and even if I had, I—oh, I couldn't take it—yet!'

'Three! Why not?'

'Because you have given me so much already, and I—have given you—nothing.'

'Four! Why—haven't you?'

'Oh—well—because!'

'Five! What does "because" mean this time?'

'It means—just—because!'

'Six! Seven! Eight! Why have you avoided me lately?'

Hermione was silent, watching him with troubled eyes while he slowly pitched the pebbles into the pool, counting as they fell.

'Nine! Ten! Eleven! Twelve! Why do you keep me at arm's length?'

'I don't—I—I—you won't let me'—— she said, a little breathlessly; while one by one he let the pebbles fall into the pool, counting inexorably as they fell.

'Thirteen! Fourteen! Fifteen—and that's the last!' As he spoke he turned towards her, and she, reading something of his purpose in his eyes, turned to flee, felt his long arms about her, felt herself swung up and up, and so lay crushed and submissive in his fierce embrace as he turned and began to bear her across the garden.

Then, being helpless, she began to plead with him. 'Ah, don't, don't—dear! Geoffrey! Put me down! Where are you taking me? If any one sees us'——

'Let them!' he muttered grimly; 'you're my wife!'

So he bore her across the garden into the arbour, and laying her upon the divan, sank beside it on his knees, panting a little.

'A little weak—still,' said he, 'but not so bad—you're no scraggy sylph, thank Heaven! Hermione—look at me!' But she turned and hid her face against him, for his clasp was close about her still. So he stooped and kissed her

hair, her glowing cheek, her soft white neck, and, in that instant—wonder of wonders—her arms were round him, strong, passionate arms that clung and drew him close—then strove wildly to hold him away.

'Loose me!' she cried; 'let me go! Geoffrey—husband, be generous and let me go!'

But he lifted her head—back and back across his arm, until beneath her long lashes her eyes looked into his.

'Hermione, when will you—be my wife?'

Against him he could feel the sweet hurry of her breathing, and stooping, he spoke again, lip to lip. 'Hermione, when will you be my wife?'

But, even while he kissed her, between those quivering, parted lips came a murmur of passionate prayer and pleading, 'Oh my love, wait—wait! Let me tell you—ah, loose me and let me tell you.' Slowly his hold relaxed, and, twisting in his arms, she slipped upon her knees beside him, and, crouching close, hid her face against him.

'Beloved,' she whispered quickly, breathlessly, 'oh, dear man that I love so—there is something between us, a shadow of shame and horror that is with me day and night, and always must be. While you lay sick it was there, torturing me with every moan and sigh you uttered. It is with me wherever I go—it is between us now—yes, now, even while I strain you in my arms like this. I have watched you grow strong and well again; I've seen the love in your eyes, and I've yearned to be to you—all you would have me, but because of this shadow I—dare not. Ah, God, how can I be wife to you when —— Let this answer for me.' And she placed in Ravenslee's hand a coat-button whereto a piece of cloth had adhered. 'Dear love, I saw you throw it away,' she explained, 'and I searched and searched until I found it.'

'Why?'

'Because I knew you would soon ask me—this question, and I have kept it for my answer. Ah, God! how can I be wife to you when my brother would have killed you—murdered you?'

Ravenslee hurled the button far away, then lifting Hermione's bowed head, spoke very tenderly. 'How does all this affect our love, Hermione, except to show me you are even sweeter and nobler than I had thought? And as for the shadow, it is—only a shadow, after all.'

'But it is my shame!' she answered. 'You might have had for wife the sister of a thief, but not—oh God!—not the sister of a would-be murderer. If—if I came to you now I should come in shame. Ah, Geoffrey, don't—shame me!'

'God forbid!' he muttered.

Close, close she clasped him, hiding her face against him, kissing and kissing the rough cloth of his coat.

'Oh Geoffrey,' she murmured, 'how we do love each other!'

'So much, Hermione, that I will never—claim you until you are ready to come to me of your own will. But, dear, I am only a man—how long must I wait?'

'Give me time,' she pleaded. 'With time the horror may grow less. Let me go away for a while—a little while. Let me find Arthur'——

'No,' he answered, frowning, 'you sha'n't do that; there will be no need—to-morrow I go to fetch him.'

'To bring him—here?'

'Why, of course. You see, I intend him to go to college'——

Hermione rose, and, coming to the entrance of the arbour, leaned there.

'Why, Hermione—dear love—you're crying! What is it?'

'Nothing,' she answered, bowing her face upon her arm; 'only—I think—if you ask me again—I can't—keep you—waiting—very long!'

(*Continued on page 630.*)

TWO DARTMOOR BOOKS.

By 'TAFFRAIL,' Author of *Pincher Martin, O.D.; Carry On! Stand By!* &c.

LAST night I spent the period between dark and dawn on the bridge of a destroyer, and I have spent a good many hours on that bridge since 1914. The night was cold and cheerless, with no moon, and we patrolled up and down, up and down, on our beat, following the dull, blurred shape of our next ahead. There was no vestige of light in the sky, no welcome gleam on the water; nothing but an occasional ruby shimmer flickering in and out on the undersides of the low, dark clouds to the eastward, the dull glow of our carefully inverted pipe-bowls, and the feeble glimmer of the light in the compass-bowl shining dimly on the face of the quartermaster at the wheel.

The night was still, but from far away, from the eastward, came the deep, thudding rumble of heavy guns, the guns which caused those ruby flashes. Nearer at hand were the liquid hiss, gurgle, and plop of our bow-wave as we drove through the water; the spasmodic humming of a high-powered turbine, and the whirring clatter of a stokehold fan; the clang of the revolution-telegraph reply gong as we adjusted the speed to maintain our correct distance, and an occasional order to the quartermaster.

We were waiting; waiting with the men standing by the guns and torpedo-tubes—waiting for something which never came. I spent the time in my usual manner. I tried to probe

the impalpable darkness with my glasses, until little specks and blurs of light danced in and out of my eyes. I smoked more tobacco than was good for me. I drank bovril from a vacuum-flask and munched ship's biscuit. Even then it was apt to be monotonous, for it was not the first time we had been on this job, nor yet the twenty-first.

The night wore on, and long before the rising of the sun the lightening of the eastern sky told us of the dawn. The deep sapphire of the upper sky paled gradually to faintest turquoise. Lower down came a broad, undefined band of smoky amethyst. It melted into topaz, then to the faintest ruby on the horizon itself. The colouring was veiled in the wreathing eddies of a sea-mist overhanging the calm sea. Close on our starboard-hand a little, black-and-white, parrot-beaked puffin and his wife, alarmed at our approach, paddled hastily through the glassy water. We could see their heads moving as they considered us agitatedly. Evidently they did not like the look of us, for down went their heads, up their little pointed sterns, and they disappeared beneath the surface. The rumble of the guns had ceased. War seemed very far away.

And then, quite suddenly, a gigantic ray of golden light sprang perpendicularly into space from the still invisible sun. It hung there for a moment, faint and nebulous; but, as I watched, it assumed more definite proportions, until its narrow beam looked for all the world like the ray of a huge celestial search-light shining from the heavens, or a golden sword-blade directed at the sky.

The day had come, and, unutterably weary, I left the ship in other hands, retired to the chart-house beneath the bridge, and flung myself on the cushioned settee. It was in my mind to sleep, for I was sick of watching, and my eyes and my body were tired. But then I saw the book I had been reading overnight. It was just a book on Dartmoor, a book by a lady who knows and loves her moor, and used to veil her identity under the pseudonym of 'Beatrice Chase.' The name of the book was *The Heart of the Moor*, and it was published by Mr Herbert Jenkins in 1914. But it was new to me, and the calm, peaceful atmosphere of the first few chapters had attracted me vastly. So it occurred to me to read a little more before composing myself to slumber.

Alas for my good resolutions! I read till half-past seven. I read it right through to the end. My poor words can never do that book full justice, but to my sea-weary mind its fascinating and lovable account of life on Dartmoor came as a blessed relief. It breathes freshness and atmosphere. It made me long to bury my face in the dew-soaked heather, to climb to the top of its highest tor, and to be alone with the sunrise, to drink in its vastness, and to have the sweet smell of it in my nostrils. And even then I could not fathom wherein lies the subtlety and fascination of the author's work. I was trying hard to analyse my impressions, indeed, when a tousled head appeared round the corner of the door to inquire tenderly what time I wanted breakfast, and whether or not I would care for 'a nice lil' bit of 'addick' with my 'biled hegg.'

Haddock and Dartmoor! Ye gods and little fishes! My train of thought fled.

We arrived in harbour late that morning, and my first care was to present our bluejacket steward, who was going ashore to do our marketing, with the sum of four-and-sixpence and a slip of paper whereon was written, '*Through a Dartmoor Window*, by Beatrice Chase (Longmans, Green, & Co.).' And the sailor, trusty fellow that he is, returned towards lunch-time with a volume bound in grass-green cloth.

I spent the afternoon with it, and I liked it even more than *The Heart of the Moor*. It is a beautiful book. Its atmosphere of peace and eternal rest, its reality, its homeliness, and the author's delightful sense of humour all appealed to my jaded mind and tickled my wearied fancy. It acted as a tonic and made me happy.

The author has such a wonderful power of forcing one to take an interest in her and her surroundings. I want to meet 'The Rainbow-maker' and the 'Tweed Dog,' 'Mr Blue-jacket' and his kitten—or cat, as he should be now—'Tiger-r.' I should like to see the author herself, the house in which she wrote the book, and the table where mere words were fashioned into one of the most charming books I have read. I am an unemotional person, according to the best authorities.

Moreover, I am a very heterogeneous reader, and both *The Heart of the Moor* and *Through a Dartmoor Window* are treasures to keep. They now repose on my bookshelf with some of my other favourites—Joseph Conrad's *Mirror of the Sea*, E. V. Lucas's *The Open Road*, Hilaire Belloc's *Hills and the Sea*, F. T. Bullen's *Idylls of the Sea*, and, by way of contrast, Marryat's *Peter Simple* and *Mr Midshipman Easy*, W. H. Fitchett's *Deeds that Won the Empire* and *Fights for the Flag;* all of which, among others, I read and re-read.

And if 'Miss Chase' has had this effect upon me, there must be many thousands of my war-weary fellow-creatures whom she would also influence, many soldiers and sailors who would revel in her work.

I take off my hat to her. She is a true and sympathetic artist, not a mere writer.

MACKELLAR LEAVES THE MESS.

X.

AFTER lunch that day Fitz-Boodle called Mackellar a liar. Mackellar asked him to recant. Fitz-Boodle refused. Mackellar 'saw red,' and knocked him down. He then went on deck.

Now, Fitz-Boodle's messmates were secretly pleased with this *débâcle*. Every leader has his day, and they had been growing restive of late under Fitz-Boodle's domineering ways. In fact, the first-lieutenant said, 'The mess would be a jolly sight pleasanter without that fellow,' alluding to Fitz-Boodle.

Unhappily, the navigator, Lieutenant-Commander Barnwell, coming into the ward-room at that moment, took the matter up the wrong way. The tortuous working of his mind was always leading him to false conclusions when it came to social matters. He regarded Mackellar as an interloper. Moreover, he had never forgiven him for stepping on his dog in the dark, and breaking its forepaw. On this occasion, therefore, he considered he held a brief for expressing the feelings of the mess on the subject of Mackellar. He followed that overwrought young gentleman on deck. 'Your presence in the mess is far from agreeable to us, Mackellar,' he said harshly. 'It is immaterial how you arrange to leave the ship, but do something within a week. That 's all,' the navigator said, walking off.

Then the buglers sounded the call to quarters. It was the afternoon of 31st May 1916.

XI.

The hour for the Jutland battle had struck. The warning came about three o'clock. Deadlights were noisily dropped over port-holes, watertight doors were shut, and officers and men went to their stations.

Staff-Surgeon O'Brien and his stretcher-bearers were already down in the modern cockpit, when Mackellar appeared, looking pale and haggard. Mackellar had been trained in St John's ambulance work, and O'Brien had secured his services as a first-aid number during action.

'What 's wrong, Mackellar?' the staff-surgeon asked, seeing him pace up and down the armoured compartment in an agitated manner.

'They 've told me to leave the mess,' Mackellar moaned, wringing his hands.

'We may all have that opportunity, my lad,' the staff-surgeon said gloomily, as a messenger came up and handed him a signal.

'"From the commander,"' O'Brien read aloud; '"non-combatants are to seek shelter on the port-side."'

XII.

Steaming twenty-two knots, zigzagging, and firing her guns and torpedoes, the *Alcibiades* went into action.

Below the water-line, and wedged in between the working-chamber of a turret and the ship's side, the medical party waited in strained expectancy. The *Alcibiades* being in the advance line of ships, it was not long before detonating shocks indicated to those below that salvos were hitting the ship. The telephone began to buzz furiously.

'Medical assistance is urgently needed in "Q" turret,' said the officer in charge of the conning-tower.

'Come along with me, Mackellar,' the staff-surgeon said. 'As for you, Endewick,' he instructed the sick-berth steward, 'I 'll let you know when it 's possible for your party to move the wounded.'

'Very good, sir,' Endewick replied, handing them their dressing-bags.

XIII.

The staff-surgeon and Mackellar ascended the narrow gangway to the mess-deck, where all tables, benches, and other fixtures were unshipped. Thence their route was a roundabout one by way of the stokehold. The 'potted' air, laden as it was with fumes from the guns and bursting shells, made breathing almost intolerable, and most of the men they encountered were wearing respirators. After unclipping many watertight doors, they finally came to a heavily armoured one in the main-battery. This was opened by means of a ponderous wheel-trainer, and access gained to the open deck in that part of the ship called the waist. While traversing the short space of deck which intervened between the battery and 'Q' turret, the staff-surgeon and Mackellar had a fleeting glimpse of the battle.

The sea was smooth, and the sun bright enough, but there was a heavy pall hanging over the region of the starboard horizon. Whether this was a smoke-screen of the enemy's creation, or whether it was the usual North Sea mist, it was impossible to determine. Frequent flashes of fire visualised the low-lying hulls of many enemy battleships. The *Alcibiades* was steaming in the eastern extremity of the arc of British ships which was endeavouring to close in on the enemy without crossing his mine-field.

XIV.

The staff-surgeon and Mackellar entered the turret from below. The officer in charge, Lieutentant Fitz-Boodle, stood in the spotting-hood, while the gun's crew worked like demons at their stations. Above the din caused by the rattle of the chain-rammers as they drove the projectiles home, the closing of the breech, and the noise of the machinery, they heard 'Left gun ready!' 'Right gun ready!' and the clang of the 'stand-by'

gong. The order to fire was followed by a low rumbling sound, and the guns recoiled with a crash.

One of the gun's crew spoke to the staff-surgeon. 'It's not a case of enemy fire this time, sir; the young officer got jammed in the rammer,' he said, pointing to a fair-haired midshipman, named Carey, who lay on the platform with a crushed leg.

'To think I may not be able to play "rugger" again!' he moaned as O'Brien applied a tourniquet.

'Never mind, my lad; you'll be as good as ever in a very short time,' the staff-surgeon said sympathetically, searching his bag for the proper dressings, while Mackellar prepared a splint.

'Still!' the gunlayer shouted; 'miss-fire! carry on!' The guns had been loaded again, and one of them missed fire owing to a defective cartridge. At the moment Lieutenant Fitz-Boodle had the range of an enemy cruiser; his only thought was that he must sink it, and that as soon as possible. In the excitement of battle he did not allow a sufficiently long interval to elapse in case there was a delayed 'fire.' He gave the order to insert a fresh cartridge. This meant opening the breech, and the inrushing air fanned the smouldering cordite charge already in the gun into an instantaneous explosion. This, of course, took the line of least resistance, and the breech was blown to pieces, killing Lieutenant Fitz-Boodle, who had come down out of his hood, and Carey No. 2; while the rest of the gun's crew were put out of action. O'Brien was hurled toward the fore-end of the turret, and the consequent concussion rendered him unconscious. Mackellar received a mortal wound in the abdomen, which bled profusely.

XV.

Like all persons suffering from acute hæmorrhage, Mackellar's mind was vividly conscious. He viewed with consternation the breaking out of fires, and the possibility of further explosions in a turret which was situated in such a vital part of the ship. They must be warned to send a fire-party and take all necessary precautions. With the blood welling up on every exertion, Mackellar pulled himself over the impediments which lay in his path until he reached the navy-phone. In order to get at it he was forced to lift himself up several steel steps.

Pressing the handle, Mackellar called out, '"Q" turret—fore t.s.,' and it seemed as if, in uttering the words, he was squeezing every drop of blood out of his body. Somehow or other, when the voice of the operator in the fore transmitting station answered, he managed to respond to the supreme effort entailed in telling him of the danger the ship ran from being blown up. He heard the man say, 'Ay, ay, sir,' and report to the conning-tower that fire had broken out in 'Q' turret as the result of a miss-fire.

Mackellar then fell limply on the steel floor of the turret.

XVI.

'Oh, my head!' moaned O'Brien, as he recovered consciousness. 'And what an intolerable heat!' he murmured, raising himself as quickly as he could, with all the naval man's apprehension of fire on board a ship full of explosives.

There were no flames to be seen, however, for the fire-party had extinguished them, and gone to get stretchers.

'I wonder what's happened to Mackellar,' O'Brien muttered, not seeing him about. Still suffering from the effects of his concussion, he staggered over to the other end of the turret, with the intention of attempting to communicate with Endewick. He found Mackellar lying in a pool of blood, and fast losing consciousness.

'My poor lad!' the staff-surgeon exclaimed, bending over him.

Mackellar smiled weakly at O'Brien. 'They 'll have their way, doc.,' he whispered faintly. 'I 'm leaving the mess.'

Sobbing at one moment, the next anathematising the frailties of human nature, the staff-surgeon stanched Mackellar's wounds.

XVII.

Sick-Berth Steward Endewick soon answered the call for stretcher-bearers. Under the direction of the staff-surgeon, the dead and wounded were strapped in flexible stretchers, so that they could be lowered to the deck through the manhole in the floor of the turret. They were then tenderly moved to a suitable part of the port battery.

In the meantime Lieutenant Lingate, R.M.L.I., had been ordered to take charge of 'Q' turret as soon as the evacuation of wounded was complete, and a reserve gun's crew quickly manned its remaining sound gun. During the interval the guns of the other turrets had been 'straddling' the German cruiser in question, which appeared to be the *Frauenlob*. Lingate was just in time to get in a few good hits with his reorganised turret before the *Frauenlob* turned slowly over and sank by the stern, finally disappearing in a cloud of white smoke and a column of spray.

A lull occurring in the action, the *Alcibiades* gave a sudden lurch, as she turned several points to port. She was falling out of line temporarily in order to signal one of the hospital ships to come up and meet her at a safe distance from the firing-line. Staff-Surgeon O'Brien had his patients ready for transference to that blessed ship before the engagement with the enemy was renewed.

XVIII.

When the King visited the fleet after the Jutland battle he went on board the *Alcibiades*. The officers were presented to him, and he saw the men at divisions, and briefly congratulated

them on the gallant part they had played in the recent engagement. Three rousing cheers were then given by the ship's company, and in the silence that followed the footsteps of the King and his staff sounded impressively on the quarter-deck. The King, who was in naval uniform, paused at the starboard gangway.

'And where is Mackellar?' the King asked. 'I have heard how he saved the ship.'

'I regret to inform you, sir,' the captain said, addressing the King as his admiral, 'Mackellar died of his wounds on board the hospital ship.'

The King looked reflectively across the Sound. Heavy seas were rolling in from the north-east, and the lowering skies gave a sinister look to the hundreds of gulls circling around the ship.

'Mackellar was a brave man,' the King said, returning the captain's salute, 'and my navy ought to feel proud of him.

The officers and men of H.M.S. *Alcibiades* stood rigidly to attention, as the boatswain and his mates piped their royal admiral over the ship's side.

THE END.

THE MONTH: SCIENCE AND ARTS.

WONDERFUL WORKING MODEL OF THE SUN, THE EARTH, AND THE MOON.

AN illustrated description of an exceedingly interesting astronomical model was given in *The Engineer* of 1st June. This model, known as an orrery or a tellurion, was designed and made by Dr W. Wilson for instructing the Chinese in the relative movements of the sun, the earth, and the moon. All the motions of these three bodies are reproduced in the model with sufficient accuracy to show the causes of the changing seasons, eclipses, and other celestial phenomena. The difficulty of representing the motions of the sun, the earth, and the moon will be appreciated when it is remembered that each turns on its axis, that the three axes have different inclinations, and that the plane of the moon's rotation round the earth is not the same as that of the earth's path round the sun. It will be easily understood that so complicated a model can only be imperfectly described without the aid of illustrations, but readers will be able to grasp the main features from the following explanation. The model is mounted upon a pedestal standing on the centre of a cloth with the months of the year marked round it in the form of a ring. In the centre of the pedestal is a spindle with a ball at the top of it representing the sun, and having its axis at the correct inclination of about seven degrees from the vertical. Mounted on the lower part of the central spindle is a swinging arm with an upright spindle carrying the earth and the moon at one end, and a weight at the other to balance them. The earth is mounted upon another vertical spindle in such a way that its axis is inclined, as in the case of the sun, to the correct angle—namely, about twenty-three and a half degrees. On the spindle carrying the earth are another swinging arm, an upright spindle, and a balance-weight for the moon, of which the axis is only slightly inclined (five degrees). The plane in which the earth rotates round the sun, known as the ecliptic, is represented as being horizontal in the model; and the plane of the moon's orbit round the earth, which makes an angle of about five degrees with the ecliptic, has been exaggerated, for reasons which cannot be explained here. The earth is caused to rotate round the sun by moving the main arm, while ingenious arrangements of pulleys and cords cause the moon to rotate round the earth and the three bodies to turn on their axes at the correct relative speeds. Another interesting device is a cap extending over the half of the moon turned away from the sun, which is maintained in its correct position during the above movements. The model shows evidence of good design and workmanship, no doubt accounted for by the fact that Dr Wilson was trained as an engineer before taking up the study of medicine. Models such as this would be invaluable in schools for teaching astronomical geography, but the cost of making them must necessarily be heavy.

HOW KITES HELP TO PREDICT THE WEATHER.

Box kites are much used for studying the atmospheric conditions at considerable heights above the earth, these devices being less costly in operation than captive balloons or aeroplanes. Some interesting particulars were given recently in the *Scientific American* of a kite meteorological station established by the U.S. Weather Bureau. The kites used are of the box type, and measure seven to nine feet square by nearly three feet in depth. They consist of a framework of light wooden struts braced with piano-wire, and carrying the usual 'box' at each end. One of these boxes is white and the other black, so that at least one of them is easily distinguishable whatever may be the shade of the background of clouds. The kites are flown by piano-wire, and as numbers ranging up to a dozen are attached to one wire, the pull in high winds is very strong. This feature, together with the length of wire let out, which may extend to several miles, necessitates a large reel or drum with an electric motor to drive it. The reel with its driving motor is mounted in a circular house, which can be slewed round so as to allow

the wire to lead in any direction to suit the wind. An instrument known as a meteorograph is mounted on the framework of the uppermost kite, and by means of fountain pens acting upon revolving drums of paper, records the temperature, the wind velocity, the humidity, and the air-pressure. The vertical height of the kite is found by measuring with a theodolite the angle which the line makes with the vertical; if this angle is known, together with the length of the wire let out, only a simple calculation is necessary to ascertain the vertical height. Other kites are attached to the wire at intervals to help to carry the weight, which is considerable, for a length of several miles. As is well known, the upper air is charged with electricity, the pressure of which is measured by a voltmeter when the reel is insulated. Pressures up to and sometimes exceeding 50,000 volts have been recorded. The results of each day's observations are wired to Washington and Chicago every evening.

NOVEL METHOD OF DEMOLISHING A LARGE STEEL STANDPIPE.

The quickest and cheapest method of demolishing tall factory chimneys and similar structures, whether of brick or of steel, is to weaken one side of the base and topple them over. This plan, however, is not always practicable, owing to the nearness of other buildings, and more laborious means often have to be employed. An ingenious scheme was recently carried out for demolishing a tall standpipe in connection with the water-supply system in Chicago. This pipe measured about twenty feet in diameter, and rose to a height of over one hundred feet. Adjacent buildings rendered the felling of it in the ordinary way quite out of the question, while the building of a scaffolding upon which to do the work of demolition would have been very costly. The difficulty was overcome by constructing a circular platform slightly smaller than the inside of the pipe, and floating it upon the surface of the water contained in the pipe. The pipe was pumped full to begin with, the surface being lowered as the work proceeded by running off the water through a discharge-pipe at the base. Empty barrels were fixed under the platform to enable it to support the weight of a gang of men, and of the oxyacetylene apparatus used for cutting the steel plates. These were pushed outwards and allowed to fall as they were cut through.

WASTE PRODUCTS UTILISED FOR MAKING DYES.

Even America was largely dependent upon Germany for dyes when war broke out, and the cutting off of this source of supply necessitated the establishment of a home dye industry. One of the most interesting developments arising out of this position is the manufacture of dyes from slag and other refuse which had previously been thought worthless by a coke-making company, and had been dumped into Lake Michigan. This waste product was brought to the notice of a chemist with wide experience in England and Germany, who, after much experimenting, succeeded in producing a dye therefrom. Eventually the new discovery was taken up by the coke-making company, which built a factory early in 1916 for producing the dyes on a large scale. No particulars of the processes employed have been published; in fact, great secrecy is maintained regarding them. With this object in view patents have been avoided, as they would have involved disclosure. The finished dye is in the form of crystals, and it is sold by the barrel of 360 pounds at about five shillings per pound.

STARTLING DEVELOPMENT IN THE MANUFACTURE OF FURNITURE.

Most people are familiar with the standardised bookcase, which can be extended from time to time as required by the addition of extra portions. This principle has been carried a great deal further by a Danish inventor, Mr Söron Ringer of Copenhagen, who has devised a series of wood and metal parts with which any article of furniture can be constructed, the apparatus bearing a close resemblance in principle to 'Meccano.' No glue, nails, or screws are used to fasten the parts together, this function being performed by a special iron clip made in a number of standard sizes, or by means of the specially formed ends of the main members of each piece of furniture. Bookshelves, chests of drawers, office cabinets, and similar articles lend themselves particularly well to the new system. Moreover, they can be added to at any time or altered in form; while for removal the articles of furniture may be taken to pieces in a few minutes, and the separate parts packed flat in very little more space than would be occupied by the wood in flat boards. According to the *Scientific American*, Mr Ringer's method of building furniture from standard parts is the result of over fifteen years of experimenting and the construction of some eight hundred different models. Patents covering the system have been taken out in all countries.

PEAT AS A SUBSTITUTE FOR COAL.

The present high prices of coal, owing to the enormous shipping freights, in countries which do not possess this commodity and have to import it, have given a great impetus to the use of peat. According to a recent article in *La Nature* by M. Renié, the most effective way of dealing with peat is to utilise it where found for producing power, in conjunction with apparatus for recovering the by-products. Peat can be burnt under boilers to generate steam, or distilled in retorts for the production of gas and coke, or it may be burnt in gas-producers from

which the gas is used direct in engines or for industrial purposes. The first plan is inefficient, as it is with coal, because when burnt in this way the valuable by-products, including tar, sulphate of ammonia, and acetate of lime, are lost. Distillation in retorts gives the greatest value in resulting products, although burning in gas-producers, assuming the by-products to be recovered, is a near second. Peat must be dried before it can be utilised in the ways suggested, but the process is not a costly one. When the moisture has been reduced, one pound of peat will produce 4·3 pounds of steam, while a pound of coal will produce about 75 per cent. more. For making power-gas peat is particularly effective, the saving over coal at Portadown in Ireland, where engines are worked with peat-gas, being 50 per cent. Peat when dried makes an excellent slow-combustion fuel for domestic purposes. If distilled in retorts the resulting coke is valuable for both industrial and domestic uses.

MACHINE FOR CUTTING STENCIL PLATES.

When packing-cases of goods are despatched from a factory or a warehouse, certain letters and figures are usually marked upon them with stencil plates for the instruction of the transport companies. Other uses for stencil plates will occur to most of us. Hitherto these plates have been cut by hand at considerable cost. For large type a separate plate for each letter is often used, and the operation is a tedious one, while the results are irregular. Recently a machine known as a 'Diagraph' has been placed on the market, which cuts stencil plates of any length in strips of tough oiled paper. This work is done very quickly, and the paper stencil plates are said to last for one thousand markings. Moreover, the complete marks or names being cut in one piece, much time is saved in stencilling, and the results are uniform. The machines are made in three sizes, to produce half-inch, seven-eighths of an inch, and one-and-three-quarter-inch letters respectively. The letter and figure punches and dies are arranged in a circle, and they can be moved into the correct position for punching the paper strip by a hand-wheel. When the machine is set, each letter or figure is punched by a hand-lever.

A METHOD FOR INCREASING OUR SUPPLIES OF SALMON.

There was a time when salmon were so plentiful in the rivers of this country that a clause in the apprenticeship indentures of the period prohibited the giving of this fish to apprentices more than three times a week. According to the Fisheries Sub-Committee of the Empire Resources Development Committee, something approaching this abundance of salmon might be reproduced by 'stripping' the fish of their eggs and protecting the latter in hatching-troughs. By this means some 95 per cent. of the eggs would be hatched, against 5 per cent. in the wild state. As a female salmon of average weight produces 10,000 to 15,000 eggs, it is easy to understand that the above method, even if only partially carried out, would enormously increase the supply of this fish. The Government hatcheries in Canada hatch out 100,000,000 salmon and trout every year, and a similar procedure is followed by the United States fishery authorities.

WALKING-MACHINE FOR TESTING LEATHER.

According to modern business methods all materials purchased are tested for quality as well as quantity before acceptance. When substances have to be tested for wearing qualities, machines are employed which closely reproduce the conditions of actual use, but the results are much more quickly available, owing to the rapid and continuous operation of these appliances. One of the latest testing-machines of this character has been devised for ascertaining the quality of shoe leather, which it does by imitating the motion of walking upon a cement pavement. The main feature of the machine is a disc with four cams upon its periphery to imitate feet. Samples of leather to be tested are mounted upon these cams, and the disc is rotated by an electric motor. This disc is carried upon the middle of a lever which is fulcrumed at one end and free at the other. The edge of the disc with the leather samples bears upon the face near the edge of a horizontal disc of cement, or whatever type of pavement is to be represented. As the leather samples revolve they turn the cement disc by friction, and a very fair imitation of walking is obtained. Weight is got by hanging weights to the free end of the lever, while the horizontal disc has a brake attached to it, so that the leather samples may be made to push as do the soles of a person's boots when he is walking uphill. Two thousand revolutions of the disc are equivalent to a mile of walking.

WINE AS A NATIONAL BEVERAGE.

One effect of our alliance with France during the present war is the tendency towards the acceptance of French customs in this country, and the corresponding adoption of British usages across the Channel. Shortage of staff has caused many British shopkeepers to follow the Continental plan of closing their places of business during the luncheon-hour; while the movement for the securing of a weekly half-holiday has recently made great strides among French workpeople. It will be interesting to observe whether wine, the French national drink, shows any tendency to displace the alcoholic drinks more commonly in use in this country, thus repeating the effect of the Franco-Scottish alliance of the fourteenth, fifteenth, and sixteenth centuries, which led to claret becoming the

principal beverage of the upper and middle classes north of the Tweed. That the French authorities, supported by many of their leading medical men, have a firm belief in the value of wine as a factor in maintaining the efficiency of their army is shown by the fact that a daily ration of half a litre, or seven-eighths of a pint, is issued to each officer and man. It is claimed for wine, particularly red wine, that it is a valuable food as well as a beverage; that it aids digestion, and thus increases the nutritive value of other food-substances; and that it helps in the building up and the restoration of the body, and in the more efficient performance of the vital functions. That the health and the fighting efficiency of the French troops has been splendidly maintained is known to all the world; and it is a fact worthy of note that drunkenness is much less prevalent in countries where wine is the national beverage than in those countries where other forms of alcohol are more largely used.

VALUABLE FIELDS FOR PAPER-PULP.

It is strange how Burma has been neglected as a field for paper-pulp. In 1905 the Government of India deputed an expert to travel over various parts and investigate on the spot the possibility of utilising its many woods, fibres, and grasses as material for paper-making. He wrote a very interesting and exhaustive report; but twelve years after its publication matters remain very much as they were as regards paper production, though prices are at least treble what they were then. Burma has this great advantage over some other countries: where its paper-making material grows in tropical luxuriousness over thousands of square miles, there are usually navigable streams to be found which could cheaply convey any amount of pulp to the nearest seaport by boats or rafts. It seems strange that what seems likely to prove such a profitable industry should have been so long neglected both by the Government, which has a scientific department in Burma, including many highly trained officers on the spot, and by private capitalists. Another possible material is tambookie or tambootie grass, which grows abundantly over large areas of the Transvaal, especially in the northern parts of the country. According to a recently issued *Bulletin of the Imperial Institute*, tambookie grass has now been proved to yield, when subjected to the same treatment, more pulp than Algerian esparto grass, though rather less than Spanish esparto. Not only is the yield high, but the pulp is of good quality, and is readily bleached. Trials carried out at the Imperial Institute show that a satisfactory paper of fairly good strength can be made from it. In all probability, when tonnage is once more available, the most advantageous method of utilising this new material will be to convert it into 'half-stuff' in South Africa, and export it thence to be turned into the finished product in Europe.

A MACHINE TO INCREASE THE FERTILITY OF WHEAT.

A machine of recent invention may ultimately come to have a most important bearing on the world's supply of wheat. The 'tillerer,' as it is called, is designed to increase the yield of this cereal by inducing the plant to produce both more roots and more stems than it does under ordinary methods of cultivation. Wheat has a natural tendency to 'tiller' or 'stool'—that is, to produce additional stems and roots from the stem-joints at the level of the ground-surface; and by raising the level of the earth round the plant at intervals during the early stages of its growth this natural tendency is greatly increased. It is to effect this result, and also to prevent waste in the use of seed, that the 'tillerer' has been designed. Using in some cases only half-a-bushel of seed per acre, instead of the usual two or two and a half bushels, the 'tillerer' first sows the seeds in the earth at the bottom of the four-inch-deep furrows which it makes. When the seedlings show three small blades, the 'tillerer' is drawn over the ground again, and by means of a set of forks takes about half the soil from the ridges on each side of the furrows, and deposits it in the furrows, nearly burying the plants. When the plants have again put forth three or four blades, the process is repeated, a second set of forks taking the rest of the soil from the ridges and completely filling the furrows. At a later stage the machine converts the original ridges into furrows about two inches deep by taking the soil from them and using it to earth up the rows of young plants. The average increase obtained from wheat in England is about twenty-fold, but the average increase obtained from three kinds of wheat on the Nottingham Corporation's farm at Stoke Bardolph by the use of the new method was over eighty-fold, the variety of seed known as 'Little Joss' being multiplied no less than ninety-seven-fold.

HOME BOTTLING OF FRUIT AND VEGETABLES.

A valuable leaflet showing how to bottle fruit and vegetables at home has just been issued by the Board of Agriculture for Scotland, by arrangement with the Edinburgh and East of Scotland College of Agriculture. Where the special bottles designed for this purpose are not readily obtainable, ordinary bottles or jars may be used instead. They should first be thoroughly cleansed with hot water, and then filled to within half-an-inch of the top with sound fresh fruit from which the stalks, &c., have been removed, the vessels being frequently shaken so as to get in the maximum amount of fruit. When they are full, sufficient water should be poured into them to cover the fruit, and they should then be placed

in a fish-kettle or a large, deep pan, and surrounded with cold water at least up to the level of the fruit. (To prevent breakages during the subsequent heating, the vessels should rest on a false bottom—a piece of wood or a layer of hay answers admirably.) The water should then be brought nearly to boiling-point, but not quite, and allowed to simmer (but not to boil) for about ten minutes, so as to destroy the germs and expel as much air as possible. *Immediately* on their removal from the pan, the jars or bottles should be corked or bunged up, the stopper being pressed down tight and tied securely in its place. The stopper should then be coated with a layer of *hard* paraffin-wax, obtainable from most chemists, and easily applied with a brush after being melted. In its absence a wax candle may be melted and used instead. If, however, the vessels have no stoppers, 'they may be sealed by pouring in, until full to the rim, a thick layer of melted fat, or a mixture of eight and a half parts of vaseline and one and a half parts of paraffin-wax previously melted by warming. This should be done *immediately the jar is taken out of the pan.* The melted fat or wax remains on the surface of the water in the jar, and, on cooling, solidifies and forms a thick seal. After the vessel has cooled, the wax may be found to have contracted slightly in the neck; in this case it is advisable to pour on a further quantity of wax to fill the neck up to the rim. The mouth of the jar should then be covered with parchment, such as is used to cover jam-pots, and tied firmly down. The filled jars should be stored in a cool room,' and examined from time to time, in order that any imperfections in the seal caused by cracking of the wax may be remedied. This method of preserving for winter use is applicable to all kinds of fruit, but the best fruits for this purpose are gooseberries and the various kinds of stone fruits. Strawberries, unfortunately, are apt to be discoloured when subjected to this process. The leaflet referred to (No 38) may be obtained gratis and post free on application to the Board of Agriculture for Scotland, 29 St Andrew Square, Edinburgh.

SAILORS' AND SOLDIERS' WILLS.

In the hope that they will bring it to the notice of their friends in the navy and the army, we desire to draw the special attention of our readers to the announcement regarding Sailors' and Soldiers' Wills which will be found on the last page of the Advertising Sheet. Though nearly every one would agree as to the manifest wisdom of the proceeding, the making of a will is apt to be indefinitely postponed—sometimes with disastrous results. It is a duty specially incumbent upon those serving with His Majesty's forces, and the steps we have taken in this connection will, we trust, be the means of leading many to secure, with a minimum of trouble to themselves, the maximum of benefit to those whose welfare is often dearer to them than life itself.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A DEVON SAILOR-MAN.

By Beatrice Chase, Author of *The Heart of the Moor, Through a Dartmoor Window*, &c.

IN the heart of the winter there came to me a letter which is a priceless literary document, though the writer is only a very humble member of the British Navy. It is lying now, after many months, open on the table before me as I write in the Room of Shadow, while a vaseful of big white lilies are leaning their perfumed heads down carelessly towards the sheets of mingled handwriting and type-script of which the letter is composed. Under the lilies is the naked soul of a common sailor-man. I use the word 'common' in the most reverent and laudatory sense. One of the glories of life is that such men are common—as common as the sunshine, the running water, the fragrant June breeze. If this man were asked to write an article or a book, he would be scared out of his senses, and would probably make a hideous mess of the job. We all know, and none know it better than authors, that the best always goes into personal letters to individual friends. It is a crime that it should be so, for such letters would be things beyond price to thousands. Feeling this, I have obtained leave from this sailor-man to use his words as I choose, and many will bless me for extracting this permission.

'H.M.S. ——,
Jan. 18, 1917.

'"Dear Lady of the Moor,"—After writing that line I was called away, and during the interval have, curiously enough, discovered that you have already been given this title by Mr Oxenham in a book of his. For a long time I have intended to write to you. I read *Chambers's Journal* wherever I am, and in your "Pages of Peace" of Sept. 9th you touch us at sea very nearly, and in this ship perhaps particularly. My heart has always found its peace on Dartmoor, and that field, that buttercup-field, so near your house, which you describe, lives for me also.

'And you say: "Among the earth's unspoiled places of peace, hill and mountain and moor country hold first place. To war-worn nerves, the restlessness of the sea is wearisome." It is

good to read; but I wonder if you know what tugging at the heart-strings it causes to the moorland lover, thousands of miles away from home? We left England at the declaration of war, and since then we have not even seen her borders, and the restlessness of the sea has been ever with us. Here, there, and everywhere have we travelled, always thousands of miles from home, and nearly 80,000 miles in all, till at last we hear rumours of a temporary respite in the future, when one who is now a captive on the wrong side of your hills will once again be seeking the glamour and peace of Dartmoor.

'Again you say: "I cannot forget that my sheltered home lying in the arms of the great moor is safe because of the men who are fighting and dying to protect us—and some of these men are Devonians." Ay, and glad and proud we are to be able to fight for such as you, and to fight also for a greater peace than the world has ever known. The curlews are your favourite birds, you say. They are mine. But should you have left out the owls? What would I give to hear them both again! A crying owl in a clump of trees on a frosty night—that sound will never leave my memory!

'For the last three years I have had a picture of an old Dartmoor well hung up in front of my desk, and it has been a daily feast. The stunted tree beside it, the rough granite, the bunch of twigs ready for burning—they all speak to me with no uncertain voice, and I can hear the wind whistling round them. The smell of the hearth-fires comes down the wind, mixed with the salt sea spray, and my spirit tramps the tors while the boundless ocean claims my body. The picture has woven a spell not to be broken, and your written words have put a golden lock on the woven chain, and the key is in my heart for safe-keeping.

'What a mixture of joy and tragedy is life! Just as I reached this portion of my letter a man came in with a cablegram, "Come at once; wife dying." The ocean lies between, and days must elapse before he can possibly get moving. *C'est la guerre.*

'I have also lately learnt of your activities in another direction. Please add my name to your splendid list of White Knights, and I hope and pray I shall always prove worthy of its place there. You will find that the majority of your names are not those of seafarers, simply because they have not the chance of hearing about it.

'Hawthorne, writing in *Our Old Home*, says: "Their stay there may be cold comfort for the evening of life, yet it may compare rather favourably with the preceding portion of existence, which comprised little save imprisonment on shipboard, in the course of which they have been tossed about all over the world and caught hardly a glimpse of it, forgetting what grass and trees are, and never finding out what woman is, though they may have encountered a painted spectre which they took for her. A country owes much to human beings whose bodies she has worn out and whose immortal part she has left undeveloped or debased."

'The latter part is too strong to be applied to the navy under modern conditions, as it was written in '63, but it illustrates some of my meaning. For instance, at periods, even in this ship, we have not been ashore for nine months at a time.

'If you take me for your knight, I thank you from my heart. It shall be to me as a sacrament with you to guard. King Arthur's days come back. "Pray for my soul. More things are wrought by prayer than this world dreams of."

'May you always enjoy that deep peace passing understanding which comes of oneness with God in His lonely holy places.

'By the help of God and you, and women like you, I dare to sign myself,

'WILLIAM THE CONQUEROR.'

Time passed till the end of May, when my knight came. I have never seen anything more perfect than the circumstances of his coming. He reached Venton late in the evening, and his sweetheart was with him. She, too, is a native of Devon, and is moor mad. The lovers had not met for nearly three years—not, in fact, since their engagement. They reached my door at sunset, in the red and gold glory of a perfect May evening. I brought them first into the Room of Sunshine, spangled with great rainbows from the crystal ball radiant with the vivid tulips in the garden-beds outside the low windows. Then we went to the Dartmoor window itself, and gazed through the blue willow-pattern curtains out on the buttercup-field, that field which he had quoted months before, thousands of miles away from home. There it lay, the field of the cloth of gold, quivering all over to a quick westerly breeze, shimmering under the sloping rays of the sinking sun. Through the open casement came the cries of cuckoos and curlews. They stood entranced, these long-separated lovers. Not one tiny thing had been forgotten. One week earlier or later would have been either too early or too late for that field. Then I led them to my chapel, the place he had dreamt of, time after time, in his craving to see it. The west window is the largest, and through its colours, the sun-glow was rich crimson. Great, scented, white trumpet-lilies were on the altar, and the lamp glowed like a huge ruby. Even the lilies were stained rose-colour. It was as if the little white place had put on a rose-red, love-red robe to welcome these brave young lovers. Looking at it through the man's eyes, I could see that it was indeed a vision to any one who had lived so long on the lower deck of a cruiser.

Even there the cries of the curlews and cuckoos haunted us. We shall none of us ever forget it.

The next day was veiled with the real white fragrant moor mist so dear to the exile from tropical lands. In the afternoon I lighted a log-and-turf fire on the big cobbit, and we lounged beside it like happy children, while the white wings of the mist overshadowed the house and tors. I even went the length of hoicking up a chunk of burning turf with the tongs, and holding it out in the room so that the sailor-man's craving nostrils might once more savour that scent which is sweeter than incense to the moor-mad person. It was here, in the Room of Shadow, beside the fire, that I saw to the very heights of my knight's white soul. His sweetheart had gone to the other room for a tell with the Rainbow-maker, and, when alone with me, he poured out all the white flame of love he felt for his chosen one. All the unspoken ideals of a man's soul flowed out in a mighty torrent of words. The ideals of what a husband's love should be for his wife, of the utter reverence and consideration which should form the essential foundation of married love. Many of my knights, thank God! love their wives and children better than themselves; but listening to this humble sailor, I realised that not one among them is a greater and more gallant gentleman.

On the third day we three stood together in the 'Poet's Corner'—which I always brazenly write in the singular number, as if there were only one poet; but, as far as I know, no one else has written poems in the sheltered rock nook of that particular tor. From there we skimmed to Dream Tor, finding on the way a lark's nest right in the very centre of a thick clump of dale gorse. Little orange-lined bills opened at us, and on the tiny heads were feathers so soft that they looked like mist. From Dream Tor we gazed at Bellever and Laughter Tors, which are an allegory. Bellever, the central tor, is the heart of the moor, and the heart symbolises love; Laughter Tor is his mate, the only one near him; so in the central part of Dartmoor you find eternal love and laughter.

The next night they came to say *au revoir*. I never permit good-bye, since there is no separation to hearts that love. Though May had melted into June, it was a twin-sister of their first evening, and I sat in the Dartmoor window for my first quiet tell with the maiden, looking over the buttercup-field with its shimmering glory. To my intense joy, I found she understood and appreciated to the full the wealth of the love that is given to her. Not all women do. One never knows till one asks them. During that interview I made her the 'guardian angel' of a poor knight whose sour-souled, unworthy crank of a wife has broken his honest heart. These guardian angel ladies are an essential part of my Order, and they, too, receive many of the daily prayers given to the knights. They will also be entitled to wear the beautiful badge which is being designed for us all. I felt by this means I had drawn her yet one degree nearer to her knightly lover, whom we then joined in chapel. As we knelt in the gloaming, I was between them, and I held a hand of each, and prayed, deep in my heart, that no ignoble thing might ever mar their perfect love. Then I watched them go till they were out of sight, past the golden field under the shadow of great benignant Hamildown with his purple grape bloom.

Early next morning Mr Blue-Jacket handed me a post-card. It was one of the interior of my own chapel. In one corner the girl had signed; in the other corner the man had. A long line was put between the two sets of initials, under which line were the words: 'You will know how to fill the vacant space.' It was, of course, the order in which we had knelt to say *au revoir* the previous evening. Above, in the centre, he had written:

'And looking upwards, full of grace,
They prayed, and from the Happy Place,
God's glory smote them in the face.'

The following day I received another card. This time it was of Dartmouth, showing where the moor-born river mingles at last with the sea. On it was written: 'From the source to the mouth the river rolls. From the beginning to the end we send you our love.'

Just a common Devon sailor-man! Please love him—I was going to say, 'as much as I do,' but that would be impossible. Anyway, please do love them both, and wish them the one thing that matters on earth and in heaven—perfect love to the very end.

FROM THE RUSSIAN.

Translated by DOROTHY E. STEVENSON.

I HEAR the church bells ring; wistful and drear
Strikes that faint tinkling on my longing ear
And exiled heart. Dull sorrow dims mine eyes,
And, in the mist, my dear homelands arise—

The soft, gray northern skies that hang so low,
The still, white plain, the bells across the snow.
Dear friendly village bells, where'er I roam
I hear you tinkling messages from home.

K. R.

**** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SEVENTH SERIES

JOHN PARDON'S CHOICE.

A LITTLE ROMANCE OF THE FAR WEST.

By Mrs W. F. IRVINE BELL, Author of *Ole Cam'ron*, &c.

CHAPTER I.

UP the rough, deeply-rutted road that led past Michael O'Keefe's homestead to his own isolated ranch, swung the tall, sinewy figure of John Pardon. Instinctively avoiding pitfalls in the shape of stones and holes, the more obscure because of the unilluminating twinkle of stars deep-set in the remote vault of an early spring sky, he reached a long-poled gate, viciously crested with barbed-wire, and passing through it, gained, a moment later, a small, ill-hanging picket-gate, where tall, unkempt bushes of lilac and rose slapped his broad-brimmed felt hat. A narrow, overgrown path brought him to the back-porch of a large, squarely-built bungalow, alike silent and unlighted. Mechanically feeling on the ledge above the door for a key, and heedless of two or three cats that joyfully sprang from a wood-pile and rubbed enthusiastically against his legs, he ducked his head as though from sheer force of habit, and entered a dark, empty kitchen.

The cats, in instant anticipation of fire and supper, mewed, and jumped from chair to table; but the man, having drawn from the pocket of his overalls a block of matches, broke off one, and lighting an ill-kept glass lamp, strode across the room to where a small, six-by-four mirror hung against the whitewashed wall. Holding the lamp above his head, he stood for some moments studying his own reflection — studying it as though it were that of a stranger. A face by no means unattractive looked back at him from the bit of poor glass—a face healthy with sunshine and good clean blood; a pair of well-shaped, steady gray eyes, the pupils of which were just now large and dark from some unwonted emotion; a good mouth, that needed not the cover of the dark, heavy moustache; and crisp, black hair, which, if somewhat thinning on the temples, did not suggest other than a man in the prime of life. As a matter of fact, John Pardon had only just passed the high-water-mark of forty, and he scarcely looked it. Turning slowly away from the mirror and setting down the lamp, he dropped into one of the comfortless wooden chairs, ejaculating in low, musing tone, 'Mary begins to look *old*—she sure does!' then continued to sit staring in front of him with unseeing eyes. The cats, however, encouraged by even a murmur from their master in this unaccustomed mood, did their best to arouse him to the usual evening routine—rounding their backs, erecting quivering 'flag-staffs,' rubbing moist chins against his tall boots, and 'kneading' his trousers with persuasive claws. At length, thus evoked, Pardon sprang to his feet, exclaiming in tones of exasperation, 'Durn ye! Can't ye give a man a moment's peace? I'd drown the whole outfit for two cents!' But there was no anger in the rough speech, and the cats persisted in their attentions, while Pardon, with quick, experienced hand, kindled a fire of split pine and manzañita in the rusty stove, drew forward a smoke-blackened, much-battered coffee-pot, produced from a bare-looking cupboard a tin plate and knife and fork, and from the oven a large brown crock of pork and beans. Next he fetched a loaf of bread—large, white, beautifully baked, with gold-brown crust—and hewed off several thick slices. Having helped himself to the pork and beans, and filled his cup with coffee, black as a boot-lace, he sat down to his solitary supper, closely observed by a row of expectant whiskered faces. Yet John Pardon, for once at least in his healthy, hearty life, seemingly had no appetite for the evening meal. The baked beans slowly solidified to a chilly mass, his cup of coffee steamed itself to flatness, while the man absent-mindedly flicked from the two-tined fork bits of succulent pork to his appreciative guests, or with strong, brown fingers crumbled the fair slices of bread—*Mary's* bread. At last, rousing himself with a jerk, he pushed away his plate, scraped together beans and bread for his feline family, then tipping back his chair so as to rest his feet on the edge of the newly-replenished stove, fished out an old pipe, stuffed in some tobacco, and lighted it with a bit of shaving from the wood-box.

The cats, satisfied that things were finally resuming their normal course, jumped up on the long knees, purring noisily, while Pardon mechanically pulled their ears or scratched an importunate chin. But to-night, even for smok-

 [*All Rights Reserved.*]

ing, the man was in no mood; unnoticed his pipe went out, while his thoughts wandered far from the lonely kitchen, and his eyes grew soft and dreamy before a picture of his own conjuring. Presently a half-smile dawned on the kind mouth beneath the heavy moustache, and musingly fell from his lips these words: 'Just —like—a little *bird*, she—is!' Then raising his arms above his head, he gave a great stretch, and suddenly rose to his feet, ruthlessly sweeping his furry companions from his knee.

'Lordy, lordy!' he exclaimed, glancing round the bare room, where the only sounds were his own voice and the raucous ticking of a clock against the wall; 'Lordy, lordy!—just to fancy *her* a-flittin' round these old rooms! Why, "Sally,"' he went on, addressing an old gray cat who sat watching his every movement—'why, "Sal," old girl, you and me wouldn't *know* ourselves with that little bird singin' and hoppin' in and out—not the kind o' bird, mind you, for the likes o' *you* to stick them durned claws o' yourn into!' he added, chuckling, and boosting 'Sally' ignominiously away on his boot-toe. 'But goshamighty!' he continued, 'this bain't no fit cage for the likes of *her*, "Sally"—nothin' but a crumblin' old shack. Come along; let's take a look round,' he ended in his usual cheery manner, for John Pardon's temperament was not one to remain long behind a cloud; already the look of abstraction had vanished, and his tanned face wore the almost roguish expression of a boy. Lighting a lantern for better ease of carrying, and followed closely by old 'Sally,' he opened a door leading into a long, low room, the very smell of which, and the fixity of the furniture, bespoke disuse—not the proud aloofness of a 'best parlour' reserved for state occasions, but the pathetic forlornness of a room where neither hostess nor guests ever broke the silence or shifted a chair. Into John Pardon the inhospitable atmosphere seemed to strike a chill; he hesitated an instant on the threshold, then with a half-mock, half-real shiver, went in and began a slow tour of the room, the while addressing detached remarks to 'Sally.' '*Dreary*, bain't it, "Sal"? But, bless you, *she'd* soon stir the old place up; and' (the natural pride of a householder asserting itself) 'it's good and sizeable, and the furniture ain't wore. Sure I can just *see* her,' he continued dreamily, 'settin' things to rights; she'd have them south winders open powerful quick, I'll bet, lettin' in the sunshine—and flowers! Why, she'd have a bunch o' *somethin'* everywheres;' he paused before one of the windows, and rattled up to the very top the long-drawn, faded green shade. 'Purty view, too—over the fields beyond to them hills—ain't a purtier view anywheres in the country—there bain't *none* from *Mary's*.' Then, tenderly, 'And here's little Sissy's rockin'-chair. She could sit and sew and sing in that —gee!—but it makes a man's heart jump to think of it. And here's poor old "Tad's" collar, "Sally." You weren't nothin' but a half-baked kitten when poor "Tad" got run over—vowed then and there I'd never have another dawg, "Sally" —it so near bust this old fool heart o' mine. But I reckon *she'd* want a dawg—all the tikes in the country—and no cold-water cure for any o' *your* youngsters, "Sal." Never in all my life saw such a body for havin' *beasts* all over the place! "I just *love* 'em," she said—*love* 'em—yes, "Sally," that's what she said, and she didn't mean you, "Sally," old girl—nor me neither, I reckon.' Thus ruminating, he presently halted again before an old couch. 'Here's poor ma's sofy—never felt the weight of a body since she used to lie there, tryin' to rest the pain in that everlastin', tormentin' back o' hers—gee! *them* were days and nights—makes me right down sick to think o' them even now, "Sally." But that little bird over there—why, *she'd* soon drive away the shadders—it's a comfortable old sofy, ma used to say,' he added, rather inconsequently, 'and—take your durned claws out o' it, you good-for-nuthin' mouser!' he broke off wrathfully, and swooped down so suddenly upon the old cat that, much affronted, she betook herself, with slow dignity, back to the kitchen stove and to the companionship of her own kind.

Thus deserted, Pardon continued his tour of inspection, critically scrutinising each chair, the table, the shelf of books rigid and dusty, the framed lithographs, his mother's work-basket, from all of which his overwrought fancy dispelled the ghosts of long-dead years, and in their stead created the radiant presence of a living, loving woman. Presently, his eye falling upon some burnt matches and bits of crumpled paper, he hastily stooped to pick them up, exclaiming with a whimsical laugh, '*She* wouldn't stand for no litter or messin', that's one thing sartin, John Pardon—as fresh as a mornin' breeze she is, and no cobwebs no more on her ceilin' than there be in her hair—just God's own sunshine she sure is—and everything about her must be bright and shinin' same as silver.' And again the gray eyes grew dreamy, and the whole expression of his weather-beaten face softened into tender lines. From his loosened grasp some of the scraps of paper fell upon an old rag-mat, full of soil and dried mud, that lay before a door, and as he raised himself from gathering them up, the lantern faintly illumined a bare-looking room beyond. It was Pardon's bedroom, in all the comfortless disorder of a bachelor's sleeping-quarters—faded quilt dragging on the floor, blankets in a snarl on the lumpy mattress—cast-off clothing of various kinds tossed about awaiting his fortnightly wash-day. For a moment his eyes carelessly scanned the unkempt room; then suddenly a deep flush surged up in the man's face, mounting from chin to temples, while a great, glad light broke over it as

a thought—wonderful, thrilling, bringing an almost suffocating sense of joy and comfort—flooded the lonely man's whole being. Only for an instant. Then, as suddenly, the colour fled, leaving John Pardon's face ashen white, and all the joy blotted out in fierce anguish. 'My God!' he cried. 'What am I thinking of? Mary—girl—forgive me; but it's more than a man can bear!' The lantern crashed to the floor, flared, and went out, and John Pardon, dropping heavily to a chair, buried his face in his work-roughened hands. There alone, among silent ghosts of the past, the man sat on, wrestling with the foe that had suddenly confronted him, fully armed, to threaten his future—wrestled as only a good, brave man *can* wrestle—until the night stars had faded into the pale dawn of a new day.

CHAPTER II.

A DOZEN years or more previous to that in which this story begins had come and gone since first John Pardon proposed to Mary Patrick. The pair had then already been 'keeping company' for a considerable time, indeed from a certain scorching August day when Pardon, then a lithe young buccaroo, in all the picturesque glory of corduroy breeches, angora 'chaps,' scarlet neckerchief, and wide sombrero, driving a bunch of cattle from a neighbouring state, had lightly sprung from his saddle, and flinging down the long lines of his panting horse before the Patricks' gate, asked Mary for a drink of water, the brown-eyed girl had walked straight into his heart. Like Isaac of old, he found his 'Rebecca' at the *well;* saw her, to his sun-wearied eyes, a cool, refreshing vision, in a pink cotton frock, flecks of sunlight falling on her smooth dark hair, and her rolled-up sleeves showing plump, white arms, which, to John Pardon, looked far too soft to draw up from the deep well the solid bucket, dangling moist and inviting from its rope. Anxious to do her service in winding it up, he hastened forward, but the long-reaching boughs of a giant fig-tree caught his sombrero and whirled it into the depths of the well! Mary had laughed, and gaily chaffed the buccaroo, as lying flat on the ground he fished for the drowning hat, but when he again rose to his feet, and holding the dripping object, began an elaborate apology for being such an 'awkward chap,' the magic thing had happened, and they were no longer strangers. Pardon, coming straight from a cattle country, where, as he had been wont to bemoan, 'Women-folk were as scarce as angels,' fell head over heels in love with the 'round little apple of a girl,' as in his fond mind he used to call her—round cheeks, round waist, round arms, and small round wrists to the fair, plump hands. Short, too, was she—so short that Pardon, looking down upon her up-turned face as she handed him a shining dipper of water, had suddenly found himself feeling strangely overgrown and gawky, yet half-proudly conscious that, did he choose so to do, he could pick her up in one hand.

From that day forward John became her devoted lover, nor was it due to sluggish blood in his veins that he had not speedily asked Mary to marry him. John Pardon, however, like his famous prototype, was 'an honourable man,' and hesitated to ask the woman he devoutly loved to leave her comfortable home and share with him a life of comparative poverty and hardship. He had, to be sure, as with a touch of pride he was wont to claim, the 'finest bunch of cattle in the country, and the prettiest band of horses to boot;' but he had not come alone to his new home. There was an invalid mother, whose pain at least to ease he had eagerly depleted his pocket, so that his isolated ranch was encumbered with debt, and the little time he could spare from his cattle had to be devoted to helping his only sister with the work of the house; small opportunity then had he to improve the place, let alone make it attractive. The Patricks, on the other hand, were well-to-do. The 'old man' had chanced on a 'good thing,' and when he died, left behind him not only a tidy little sum of money, but one of the best ranches in the district, close to the village, and a modern house, eminently ugly and set down in all its angular unloveliness in a hollow under a hill, but thoroughly comfortable and convenient. His wife soon following the 'old man,' Mary reigned supreme, keeping house thriftily and well for two bachelor brothers, who, both being steady, industrious men, were doing well and saw to it that their sister lacked nothing. There was talk, too, of an uncle, living in a distant city, who had made a fortune in some 'patent paint,' and who, being unmarried, would doubtless eventually leave his money to his niece and nephews.

Upon all this John Pardon had long pondered, his independent, albeit easy-going nature recoiling at the thought of his being supposed to seek Mary for what she had or might have, and reluctant to ask her to give up so much for what he felt to be so little that he could offer her. As to Mary Patrick herself, or Polly Patrick as she was commonly called, she, for her part, was quite content to let things stand as they were. Not but what she was secretly proud of her sweetheart, and knew herself to be rather envied of the other girls, John being not only far and away the best-looking young man in the district, but not one other, in that country of good riders, sat his horse with such ease and grace as did Pardon his big buckskin 'Brady,' or handled with such skilful yet gentle control a span of spirited steeds, such as his roan mare 'Kate' and her mate 'Custer.' Very flattering, too, was it to Mary's vanity that

whenever dance or picnic to some distant place was planned, John Pardon's neat, light 'buggy' and fleet horses were sure to be at her disposal, so that while the other girls must either walk in mud or dust, or, at best, squeeze together in some rancher's wagon, drawn by slow, heavy teams, and arrive crumpled and weary from a long, jolting ride, she, with John's rug or dust-sheet carefully tucked about her, and John's skilful hand piloting his overwilling horses, would presently be lifted in his strong arms clear over the wheels, and set down as fresh as paint, unruffled and uncreased.

John, too, though tacitly considered not quite so 'genteel' as some of the young men who on festive occasions came from stores and offices in neighbouring towns, yet held the palm as the nimblest and most tireless of dancers, as well as the most considerate of partners. And though Mary's looking-glass plainly told her that she was not nearly so pretty as Hazel Hubbard, with her auburn hair and peach-like complexion, nor was she so light and graceful a dancer as Annie M'Coon, yet her buccaroo lover was her steady partner, and when *she* 'sat out' he invariably 'sat out' *too*.

All this notwithstanding, Mary in her secret heart cherished a conviction that, among the people of her own native district, John Pardon as a husband would not be accounted a 'catch,' and that did she marry him she would in some indefinable way step out of the exclusiveness of her own small set; for probably nowhere are there more or so jealously-guarded social quibbles as are to be found in just such a narrow community in the Far West as that in which this story is laid. Handsome, merry, kindly as was John Pardon, the fact still remained that he was a buccaroo; that he had come from some 'cattle country up north;' that he lived on a half-reclaimed ranch 'way back' from the village, with its post office, store, and dozen or so small houses; while his sole capital was his cattle and his own rugged health. Mary's greatest friend, Maggie Peterson, had married a grocer, and now wrote glowing letters about their furnished flat and the social gaieties in the small town of W——. Daisy Grant, now the wife of a school superintendent, wrote to Mary quite learnedly on the subject of 'meetings,' 'directors,' and high school 'class-days.' Pretty Hazel Hubbard was 'keeping company' with the Baptist minister in Orangeville, the provincial town a few miles distant, that gave itself great airs over and above the tiny village of Beestop, where Mary and her friends had been born and bred. In short, among all her classmates at the village school, Mary Patrick was one of the few who still lived on at the home ranch. Yet of all the natives Mary was socially the leader. The Patricks were among the oldest inhabitants, and quite the 'best off,' so naturally her friends looked to her to make a good match. Added to all these considerations was the one of religion. The Patricks were strict Roman Catholics, and it was with them that the aged priest, who had married Mary's parents and christened Mary herself, always had his Sunday dinner when he drove from a distant town for a monthly celebration of mass.

John Pardon, on the other hand, came of old New England Puritan stock—never saw the inside of a church, for the very good reason that most of his life had been spent on the wild 'plains,' far away from churches, and his simple, unadorned creed was an absolute faith in the 'Good Man,' as he quite reverently but with the frankest sense of *fellowship*, spoke of the Deity, and in His overruling Providence. Mary, schooled to a profound and reserved awe of the mysteries of the Holy Catholic Church, was at first utterly shocked by the easy familiarity with which Pardon associated the 'Good Man' with the common round of his rough life, and finally withdrew altogether, so far as religion was concerned, behind the reserve fostered by her own special dogma. No, all things considered, Mary Patrick had no desire to take John Pardon 'for better, for worse,' nor, if at times, woman-like, she wondered at and perhaps a little resented his stoutly maintained silence on the vital question, was she at all anxious to bring things to a head, and so probably lose her lover and all his comfortable attentions.

When, however, matters between them had subsisted in such fashion for, as we have said, several summers since their first merry meeting at the well, the inevitable day arrived when John Pardon's devotion, and the real depths of Mary's regard for him, were to be put to the test. Things had, in the meantime, a good deal changed with Pardon. The poor, pain-racked mother had at last been laid to rest in the least dreary spot that John could find in the rather forlorn, unkempt cemetery, towards which most of the inhabitants of Beestop were travelling; and Sissy, clinging to her big brother and weepingly declaring that she was a 'wicked girl' to leave him so utterly alone, had nevertheless received his blessing and a hearty kiss, and waving a wet handkerchief to him as he stood smiling cheerily at the old bungalow gate, had driven away with her 'doctor chap,' to be married and live in a distant State.

(*Continued on page 649.*)

ON LUCK AND CHARACTER.

By G. R. Glasgow.

ONE would like to begin by saying definitely that there is no such thing as luck, and if we could dive far enough back into our own or any one else's past, it is probable that that would be our ultimate conclusion, but so far as one can see, which is but through a glass darkly, it is sufficient to say that most of the things we blindly ascribe to luck are really the outcome of that mysterious compound we speak of as *character*. 'How lucky you are!' 'Just my luck!' 'A lucky accident!' 'I have no luck!' How often we hear these remarks in the course of the day, and how definitely we can picture to ourselves the speakers; the rather flabby, rather muddle-headed, indolent, 'unlucky' ones, who are sticking in the mud, uncertain and irresolute, and, like Mr Micawber, waiting for something to turn up; for in these days of mascots and charms, and touching of wood, the training of character is apt to be rather lost sight of. And yet character is, in itself, the surest armour against fate; the steady resolution that considers a difficulty from every point of view—the will that controls it—the courage that overcomes it, are the most effectual challenge to the gods, and a character possessing these qualities is more likely to bring us luck than all the black cats and four-leafed clovers in the world.

So many great events are due to small beginnings—to neglect of warnings, to a want of instant action, to a policy of drift, partly caused by vague terrors which we are afraid to put into words, partly by the indolent hope that there may be a turn for the better, that nature may relent, that the river may perhaps run back to its source by some unforeseen miracle; and when the inevitable sequel comes, and no miracle has happened, we say helplessly, 'I am so unlucky.'

Take every accident of life, its successes and its failures, and trace them back to their first faint beginnings, and, if you deal honestly with yourself, you will recognise that there was not any luck about it at all—that if you had had prudence and courage and foresight, and so shaped your destiny as to achieve success, you would never have dreamt of ascribing it to luck; it is only the unsuccessful who must have a scapegoat!

The effort to guide and control one's self in all the circumstances of life by a firm will and a considered purpose, very soon develops into a habit, and hardens into what we describe as character.

The creed of luck precludes the possibility of freewill, an impossible position to most people who have had any experience of life. We instinctively know that the inevitable moment comes when a choice has to be made, and that we are free to choose. 'Choose ye *this day*.' The moment passes, and if we let the opportunity slip by, it is no use to say later, 'Luck was against me'—it was not luck but character that played us false.

To even the greatest traitor that the world knows the choice was given. Judas was not predestined to condemnation—it was not by some unlucky accident that he became the betrayer of his Lord. He was one of the chosen twelve, the intimate friend and companion of a Master whom he doubtless began by loving. Every confidence was shown in him; he held and distributed the money. Again and again the appeal of love gave him his chance, even to those last tender words, 'Friend, wherefore art thou come?'

To have been born under an unlucky star, and predestined to such a fate—to have lived with Christ for three transcendent years—and then suddenly to have been thrust out of His presence through no fault of his own, but only because of some primeval curse, would have been impossible. No, the choice had been put before him—life or death—good or evil—and he had chosen; perhaps he himself hardly realised how widely his road had diverged from the one his Master trod, how his soul had deteriorated, how the evil in his character had blotted out the good, until he heard the tragic words that drove him to self-destruction—'What is that to us—see thou to that.' And yet because Leonardo da Vinci represents him as having overturned the salt, we make ourselves miserable over a like accident and consider it 'unlucky.'

A bad character is not so common as a *want of character*, a feeble uncertainty and beating about the bush that prevents our taking the instant swift resolve for right or wrong. We are so apt to linger in the Valley of Decision, but that does not mean that we are therefore doomed to absolute failure; there is never a moment in life when it is impossible to start again; it is only Death that closes a door on which we beat (like Tintagiles) in vain.

There is a moral flabbiness too, which, by always expecting misfortunes, tends to attract them, and so depresses and weakens the mind that it makes no effort to avoid them, and offers no resistance when they come. 'Misfortunes never come singly,' such people say, and they sit gazing out of the window at which they expect the second sorrow to enter or love to fly out!

Many of the natural calamities of life, which are in themselves sufficient for most people, are increased and magnified because of this un-

reasonable outlook on life, this groundless theory that we are born under a lucky or unlucky star, and that therefore it is waste of time trying to avert disasters—disasters which, if we exerted ordinary prudence, a steady habit of mind, and a controlling will, would probably never come near us at all!

It is unreasonable not to look before you leap, to throw yourself blindly into a millstream, and then resent the inevitable consequences and simply curse your luck! It is pitiful to give to yourself and others feeble excuses of heredity or overwhelming temptation for a turbulent temper or a miserly disposition; it is your weak will that is in fault, not your strong passions; it is the feebleness of the nerveless hands that have lost control of the reins, not the fieriness of the steed that has taken the bit in its teeth, that brings disaster. The family temper, to which we refer with a sort of curious pride, and the hereditary vice of which we are hardly even ashamed, are poor excuses for what is not fate at all, but only a tragic acquiescence in a habit of mind we had not the courage or the strength of will to conquer. The choice was there, and we chose. It is at the outset, when we see only the one step before us, that it is most necessary that our feet should be set in the right direction; it is then that we must train the character, and let luck go to the wall; and when you find yourself saying, 'I am so lucky,' you may have the pleasant assurance that you are gathering in the harvest of your own sowing, for, as Bacon says, 'A man's nature runs either to herbs or weeds, so let him seasonably water the one and destroy the other.'

THE DEFINITE OBJECT.

By Jeffery Farnol.

CHAPTER XLI.—OF A PACKET OF LETTERS.

M'GINNIS jerked aside the roll-top desk, and falling on his knees before a small but massive safe built into the wall behind, set the combination and swung open the heavy door, talking to his companion as he did so, and quite unconscious of the pale face that watched him through the dingy window.

'Soapy's gettin' ugly,' he was saying; 'an' it don't do t' get ugly with me, Heine boy! Soapy thinks he's smart Alec all right, but I guess I'm some smarter. Why, I got evidence enough in here t' 'lectrocute a dozen Soapys.'

'So?' said Heine, chewing on his cigar and peering into the safe. 'Say, what's all them tied up in sassy blue ribbon, Bud?'

'These?' said M'Ginnis, and he took out a bundle of letters, turning them over in his big hands.

'Skirt—hey, Bud?'

'Sure thing!' he nodded, and as he stared down at this packet how should he guess how tense and rigid had become the lounging form in the darkness beyond the window, how should he know of the wide glare of watchful eyes or of the sudden quiver of a smouldering cigarette?

'Yes, a girl's letters, Heine! An' a big lot of 'em. I dunno why I keep 'em, but'—— So saying, he tossed the letters back again and turned to his companion. 'Hand over that dope!' he commanded, and Heine passed over a bundle of papers, which M'Ginnis carefully slipped into a certain compartment.

As he did so, Heine spun round upon his heel. 'Gee-whiz!' he exclaimed, 'you shook me that time, Soapy! Where 've you been blown in from?'

'An' what are you nosin' around here for, anyway?' snarled M'Ginnis, shutting the heavy safe with a fierce slam. 'Since you've come in you can get out again—right now!'

Soapy seated himself upon a corner of the desk, and placidly breathed out two spirals of cigarette smoke. 'Heard about Hermy being married, Bud?' he inquired.

'Married? You're a liar! Hermy married!'

''S right!' nodded Soapy; 'she's married th' millionaire-guy as got shot—you know—got shot in that wood. You'll remember, Bud?'

M'Ginnis sank into a chair, and fell to biting his nails, staring blindly before him. 'Is—this—straight goods?' he inquired thickly, without altering his gaze.

'Sure! Ye see she nursed him through his sickness, Bud—kind o' did the piller-smoothin' an' brow-strokin' act. Oh, I guess she comforted him quite some.'

M'Ginnis stared before him, worrying his nails with sharp white teeth.

'Ravenslee's a well man again, I hear, an' they're honeymoonin' at his place on the Hudson—devotion ain't the word, Bud! 'S funny,' said Soapy, 'but the bullet as downed this guy drove Hermy into his arms. 'S funny, ain't it, Bud?'

With a hoarse, inarticulate cry that was scarcely human M'Ginnis sprang from his chair, his quivering fists up-flung. For a moment he stood thus, striving vainly for utterance, then wrenched loose his neckerchief, while Soapy methodically lighted a new cigarette from the butt of its predecessor.

'Easy, Bud, easy!' he remonstrated gently when M'Ginnis's torrent of frenzied threats and

curses had died down somewhat; 'if you go on that way, you'll go off—in a fit or somethin', an' I shouldn't like t' see ye die—that way!'

'Up the river, is he?' panted M'Ginnis.

''S right, Bud, up the river in his big house—with her. I'——

'Is he, by'——

'A dandy place f' honeymoonin', Bud!'

'Loan me your gun, Soapy. I'll get him, by God! if I have t' shoot him in her arms. Loan me y'r gun!'

'I guess not, Bud; no, I guess not. I'd feel kind o' lonesome without th' feel of it. Ask Heine; he'll loan you his; it's gettin' t' be quite a habit with him. Ain't it, Heine?'

M'Ginnis sat awhile glaring down at his clutching right hand; then he rose, and opening his desk took thence a heavy revolver and slipped it inside his coat. 'You're comin' with me, Heine,' said he; 'I'll want you.'

'Sure thing, Bud,' nodded Heine, chewing his cigar, 'but what about lettin' Soapy tag along too.'

'Soapy,' said M'Ginnis, striding to the door—'Soapy can go t' hell right now.'

'Why then, Bud,' drawled Soapy, 'I'll sure meet you—later. S' long.'

Left alone, Soapy's languor gave place to swift action. In two strides, it seemed, he was in the saloon, had beckoned the quick-eyed bar-tender aside, and put the question: 'Where's the kid, Jake?'

The bar-tender lifted an eyebrow and jerked a thumb upwards. 'Shut-eye,' he nodded, and turned back to his multifarious duties.

Up a narrow stair sped Soapy, and opening one of the numerous doors, crossed to a truckle-bed, wherefrom a tousled head upreared itself.

'Who th''——

'Say, kid, are ye drunk, or only asleep?'

'Whatcher want, Soapy? You lemme be. Watcher want?' began Spike drowsily.

'Nothin' much, kid; only Bud an' Heine's gone t' shoot y'r sister's husband.'

'Husband!' cried Spike, drowsy no longer. 'Husband—say, d' ye mean Geoff?'

'That's who, kid. You was crackin' on t' me about wantin' t' make good—well, here's y'r chance. Bud aims t' get there 'bout midnight—up th' river, you know—so you got two hours. You'll have t' go some t' get in first, but I guess you can do it.'

'I will if it kills me!' cried Spike, springing towards the door.

'Hold on, kid! you'll need some mazuma, maybe. Here's a ten-spot. It'll be more useful t' you than me after t' night, I reckon. So get your hooks onto it; an' now—beat it!'

Without more words Spike snatched the money, crammed it into his pocket, and running down the stairs, was gone.

Then, after having lighted another cigarette, Soapy descended to M'Ginnis's dingy office, where, having dragged away the desk, he brought a chair and sat with his ear against the safe, turning the combination lock with long, delicate fingers. To and fro he turned it, very patiently hearkening to the soft clicks the mechanism gave forth, while the cigarette smouldered between his pallid lips. Soapy, among other accomplishments, was a yegg-man renowned in the profession, and very soon the heavy door swung softly back, and Soapy became lost in study. Money there was and valuables of many kinds; these he didn't trouble with, but to the papers he gave a scrupulous attention. Sometimes as he read, his white eyelids fluttered somewhat, and sometimes the dangling cigarette quivered. Presently he arose, and bore these many papers to the sheet-iron upon which stood the rusty stove. Here he piled them and set them alight, and stood watching until they were reduced to a heap of charred ash. Then, returning to the safe, he took out a bundle of letters tied up in a faded blue ribbon, and seating himself at M'Ginnis's desk he slipped off the ribbon, and, very methodically, began to read these letters one after the other.

But as he read the humble entreaties, the passionate pleading of those written words, blotted and smeared with the bitter tears of a woman's poignant shame and anguish, Soapy's pendent cigarette fell to the floor, and lay there smouldering and forgotten, and his lips were drawn back from sharp, white teeth—pallid lips contorted in a grin the more awful because of the two great drops that welled from the fierce, half-closed eyes. Every letter he read and every word; then, very methodically, set them back within the faded blue ribbon, and sat staring down at them with eyes wider open than usual—eyes that saw back into the past. And as he sat thus, staring at what had been, he repeated a sentence to himself over and over again at regular intervals, speaking with a soft inflection none had ever heard from him before: 'Poor little Maggie—poor little kid!'

CHAPTER XLII.—TELLS HOW RAVENSLEE BROKE HIS WORD, AND WHY.

'PAST eleven o'clock, dear!' said Hermione.

'Still so early?' sighed Ravenslee.

They were sitting alone in the fire-glow, so near that by moving his hand he could touch her where she sat curled up in the great arm-chair; but he did not reach out his hand, because they were alone and in the fire-glow, and Hermione had never seemed quite so alluring.

'How cosy a fire is—and how unnecessary!' she sighed contentedly.

'I'm English enough to love a fire, especially when it is unnecessary,' he answered.

'English, dear?'

'My mother was English; that's why I was educated in England.'

'Your mother! How she must have loved you.'

'I suppose she did; but, you see, she died when I was a baby.'

'Poor lonely mite!' Here her hand came out impulsively to caress his coat-sleeve, and to be prisoned there by two other hands, to be lifted and pressed to burning lips; whereat she grew all rosy in the fire-glow.

'I suppose,' said he, the words coming a little unevenly, 'it would be too much to ask my wife to—come a little—nearer?'

'Nearer? Why, Geoffrey dear, our chairs are touching now.'

'Our chairs? Why, yes—so they are! I suppose,' sighed he—'I suppose it would be breaking my word to my wife if I happened to kiss my wife?'

'Why, Geoffrey—of course it would!'

'Yes, I feared so!' he nodded, and kissed her hand instead; and there fell a silence.

'How heavenly it is!' she whispered softly, leaning a little nearer to him.

'Heavenly!' he answered, leaning a little nearer to her and watching the droop of her lashes.

'So—so quiet and—peaceful!' she added, drawing away again, conscious of his look.

'Horribly!' he sighed.

'Geoffrey!'

'Quiet and peace,' he explained, 'may hold such an infinitude of possibilities impossible of realisation to a husband who is bound by promises, that it is apt to be a little—trying.'

Hermione did not speak, but drew his hand to be caressed by the soft oval of a cheek and touched by the velvet of shy lips.

'And yet,' he went on, staring resolutely at the fire, 'I wouldn't change this for anything else the world could offer me!'

'Bear with me—a little longer, dear!' she murmured.

'As long as you will, Hermione, providing'——

'Well, my Geoffrey dear?'

'That it is only—a little longer.'

'You don't think I'm very silly, do you, dear?' she inquired, staring into the fire.

'No, not very!'

'Oh!' she said softly, glancing at him reproachfully. 'You don't think me cruel?'

'Not very,' he answered, kissing her hand again.

'Dear Geoffrey, you don't think I'm very selfish, do you?' she questioned wistfully.

'No—never that!' he answered, keeping his gaze averted.

'Because if'——

'If?' said he.

'If it is hard for you'—— The soft voice faltered.

'Yes, Hermione?'

'If you really think I'm—cruel and—silly, you—needn't wait—any longer—if you wish'——

His arms were about her, drawing her near, clasping her ever closer, and she held him away no more; but beholding her wistful eyes, the plaintive droop of her vivid mouth, and all the voiceless pleading of her, he loosed her and turned away. 'I love you so much, Hermione—so much, that your will shall be my will.'

She rose, and leaning against the carved mantel stared down into the fire. When at last she spoke there was a note in her voice he had never heard before. 'Geoffrey dear, this world is a very bad world for a lonely girl, and sometimes a very hateful world, and I have been lonely nearly all my life—and I didn't think there were such men as you; I didn't think any man could love so unselfishly. All my life I shall treasure the recollection of this hour—yes, always! always!'

Then she turned, and, ere he knew, was on her knees before him, had twined soft arms about his neck, and was looking up at him through shining tears.

'Yes, I'm crying a little! I don't do it often, dear—tears don't easily come with me. But now I'm crying because—oh, because I'm so proud—so proud to have won such a wonderful love. Good-night—good-night! Oh, break your word for once—kiss me, my husband!'

So while she knelt to him thus, he kissed her until she sighed and stirred in his embrace. Then she rose, and hand in hand they crossed the room, and he opened the door. For a blissful moment they stood there, silent in the shadows; but when he would have kissed her again, she laughed at him through her tears and fled from him up the wide stairway.

CHAPTER XLIII.—HOW SPIKE GOT EVEN.

A CLOCK in the hall without struck midnight; but Ravenslee sat on long after the silvery chime had died away, his chin sunk on broad chest, his eyes staring blindly at the fading embers, lost in profound but joyful meditation. Once he turned to look where she had stood beside the mantel, and once he reached out to touch the thrice-blessed chair that had held her.

The curtains stirred and rustled at the open window behind him; but he sat looking into the flickering fire, seeing there pictures of the future, and the future was full of a happiness beyond words, for in every picture Hermione moved.

All at once he started, and glanced swiftly round, his lounging attitude changing to one of watchful alertness, for he had heard a sound that drew rapidly nearer—the hiss and pant of breath drawn in quick gasps. Silently he arose, and turned to see the curtains swing apart, and a shapeless something stagger forward and fall

heavily. Then he reached out to the switch beside the hearth, and the room was flooded with brilliant light; the figure kneeling just inside the swaying curtains uttered a strangled cry, and threw up a hand before his face, a hand dark with spattering blood.

'Oh Geoff—oh Geoff!' panted Spike, 'I ain't come thievin' this time—honest t' God, I ain't!'

'Why, you're hurt! What's the matter?'

'They see me down th' road as I came, an' shot me; but this ain't nothin'. Out th' lights, Geoff! Out 'em—quick!'

But Ravenslee had crossed the room, had seized the lad's arm, and was examining the ugly graze that bled so freely.

'That ain't nothin'. Douse th' lights, Geoff! Out 'em quick; Bud's coming here close behind—Bud and Heine; they mean t' plug you. Oh, put out th' lights!'

Instinctively Ravenslee turned, but even as he did so Spike uttered a hoarse cry. 'No ye don't, Bud—not this time!' and sprang upon the form that towered between the curtains. Came the sound of fierce scuffling, a deafening report, and running forward Ravenslee caught Spike as he staggered back; heard a rush and trample of feet along the terrace, the sound of blows and fierce curses behind the swaying curtains; heard the Spider's fierce shout and Joe's deep roar; two more shots in rapid succession, and the swift patter of feet in flight and pursuit.

'How is it, Spike? Are you hurt, old chap?'

But Spike just then was beyond words, so Ravenslee bore the swooning boy to a settee, and laying him there, began to search hastily for the wound.

But now the door was flung wide, and Hermione was beside him. 'Geoffrey—oh, my love! Have they hurt you?'

'No, dear—thanks to Spike here!'

'Arthur! Oh, thank God! Did he'——

'Took the bullet meant for me, Hermione. I owe your brother my life!'

She was down on her knees, and very soon her skilful fingers had laid bare the ugly wound in the lad's white arm. But now came Mrs Trapes, looking taller and bonier than ever in a long, very woolly garment; and while she aided Hermione to bandage the wound, Ravenslee brought water and brandy, and very soon Spike sighed and opened his eyes.

'Hello, Hermy!' he said faintly. 'Don't worry; I'm all O.K. Bud shot me, an' I'm glad, because now I can ask you t' forgive me. Y' see, he'd have got old Geoff sure if it hadn't been for me; so you—you will forgive me, won't you?'

For answer, Hermione bent and kissed his pallid cheek.

'I'll go and phone for the doctor,' said Ravenslee.

'Which,' said Mrs Trapes, 'I done ten minutes ago, Mr Geoffrey. Doctor 'll be right along.'

Ravenslee turned to Spike. 'How are you now, old fellow?'

'Only a bit sick-like. But say, Geoff—I know I played it low down on you, but—will you—shake an' try t' forget it?'

Ravenslee took and held the boy's outstretched hand. 'I think we're going to be better friends than ever, Spike!'

'Good!' said Spike, smiling wearily. 'But say, Geoff—dear old Geoff—if I got t' die, I don't mind—because I guess this makes us quits at last—don't it, Geoff?'

(*Continued on page 648.*)

THE ROMANCE OF SHEFFIELD STEEL.

By E. T. Good.

WHEN we and our Allies have at last beaten German militarism the victory will be in a large measure due to the capacity of Sheffield steel-works, the skill and sweat of Sheffield steel-workers, and the superior qualities of Sheffield steel products. We owe a debt of gratitude to the people who prior to the war maintained in this country, and particularly in Sheffield, plants capable of turning out the highest class of armaments in great volume, in spite of much discouragement from successive governments and bitter criticism from public speakers and writers. In works designed for the production of munitions of war not less than £40,000,000 of private capital was invested in Britain before Germany made her mad plunge—half of it in Sheffield alone. To-day Sheffield is providing the allied armies and navies with munitions on a scale that no one could have imagined remotely possible three years ago; and when the war is over Sheffield, with a vastly increased productive capacity, will be able to turn its resources to the manufacture of ordinary peace-time goods on an unprecedented scale, and will export these to foreign markets in variety and quantity, and of a quality and at a cheapness that will defy German competition.

Prior to the war the history of Sheffield's heavy trades was an industrial romance. Developments in both the light and heavy trades of this city during the war have been dramatic. Sheffield has revolutionised itself. It has spent millions on new plants and machinery. Scores of acres of land have been covered with new workshops. Skilled workmen have speeded themselves up. Unskilled have become skilled. Tens

of thousands of women have attained a wonderful degree of efficiency, and when the bulk of the 30,000 young Sheffield workmen who are in the army return home this city will turn out probably three or four times the quantity of steel goods that ever it did before the war. German steel and steel products have been swept pretty nearly off all British, allied, and neutral markets, and Sheffield intends to keep them off.

Before the adoption of the Bessemer process in 1856—a process which converted iron worth £7 a ton into steel worth £70 a ton in fifteen minutes, and almost immediately rendered steel available for rail-making, shipbuilding, &c.—Britain's output of steel was only about 40,000 tons a year, of which Sheffield contributed 35,000 tons. Steel-making was then confined to the costly and tedious crucible process, and it was a case of Sheffield first and the rest out of the running. At that time Sheffield made as much steel as France, Austria, and the United States put together. Since then this city has witnessed the rise of many ambitious imitators and formidable competitors—rivals whose rise has been mainly due to Sheffield inventions—but Sheffield is still Sheffield, and its staple industry, alike in the variety and excellence of its products and the skill of its craftsmanship, has no peer.

The purchaser of steel goods, whether he requires a pocket-knife or a huge casting, a fine tool or a 100-ton armour-plate, can be accommodated in Sheffield. Such a variety of steel and steel goods as Sheffield produces is not to be found elsewhere. In quality also Sheffield is at the top. The resistive strength of its armour, the piercing power of its projectiles, the durable quality of its rails and plates, and the cutting power of its tools and knives are unequalled. And Sheffield is in no danger of losing its supremacy. Just as it took the lead in armour-plates two generations ago, so is it leading now in bullet-proof and high-speed tool steels, and it has recently marketed a rustless steel—a unique product from which knives are made which will not rust or stain, but will maintain their original brightness no matter how used.

Until Bessemer discovered the pneumatic method of turning iron into steel the trade was limited to the light industries—cutlery, tools, implements, small-arms, &c. But Bessemer altered that. Strangely enough, his invention, which revolutionised the world's iron, steel, engineering, shipbuilding, and general manufacturing trades, was the result of experimenting in the manufacture of munitions. Bessemer first invented a method of firing elongated projectiles. The British Government rejected this without a trial, but Napoleon III. accepted it and assisted and encouraged the inventor. The invention was satisfactory so far as the projectile was concerned, but there was no gun exactly suitable. Bessemer then started experimenting with the object of producing a metal from which a gun to suit the new projectile could be made. The result was the discovery that molten iron could have its heat intensified, its impurities eliminated, and could be converted into strong, malleable, uniform, and homogeneous steel by the simple process of forcing minute streams of cold air through it. In the words of Stephen Jeans, this was, and still stands, 'the greatest metallurgical discovery of the age.' That was the genesis of Sheffield's heavy steel-trade. Within a dozen years Sheffield was producing huge armour-plates, big guns, giant steel castings, and enormous quantities of steel rails and ship-plates. Steel which cost between £60 and £70 a ton to produce, and was much too costly for heavy work, was brought down by the Bessemer invention to less than £10 a ton, and before the end of the century to £5 a ton, to the infinite benefit of mankind.

In the early sixties (Bessemer took out his patent in 1855, and demonstrated his process the following year) Sheffield made great progress in the manufacture of armour-plates. In 1863 plates twenty feet long and twelve inches thick were rolled in the John Brown Works. In 1868 Charles Cammell produced compound armour-plates which withstood severe tests at Tegel, the Prussian armament testing-station. In 1876 the Italian Government conducted a series of tests between iron and steel plates. The result was not conclusive, and it set Bessemer, Cammell, Brown, and other Sheffielders experimenting again with renewed vigour. Wilson, Ellis, Tresidder, and others soon joined in the work of this city, and as a result the first 'cemented' armour-plate was produced in the Atlas Works (John Brown), and the first 'all steel' plate in the River Don Works (Vickers, Limited), in 1888. The Cyclops Works (Cammell-Lairds) then produced the part-iron, part-steel plate; and in 1891 Tresidder improved his famous chilling process (patented in 1887), which greatly strengthened armour-plates. To-day Sheffield produces steel ingots weighing up to as much as 130 tons, and makes them into armour-plates and guns by hydraulic presses exerting pressures of as much as 10,000 tons.

In remarkable contrast to the progressive development of the Sheffield heavy trades since the middle of the nineteenth century, the light trades of this city have remained in a condition of comparative stagnation. Sheffield was noted for its cutlery, tools, implements, and small-arms centuries ago, and in the nature of its steel and the competence of its workmanship this city has never fallen below the topmost mark; but these light trades have for two or three generations been afflicted with an almost chronic conservatism. The Sheffield cutlers have been too proud and self-reliant to allow modern machinery to

displace their handicraft. The capacity of Sheffield light trades was little or no greater in 1914 than in 1854.

Meantime, the Germans had as far as possible copied Sheffield methods, and gone one better by adopting machinery. By virtue of producing on a large scale by machinery, and by subsidising their export trade, whilst Sheffield stuck to its handwork and failed to increase its productive capacity as the world's population and its demand for cutlery grew, the Germans succeeded in first overtaking and then outdistancing this country in the world's markets. In the last year before the war Solingen, the German cutlery town, exported twice as much as Sheffield. But that will never happen again. This German-made war is proving the salvation of the Sheffield trades, as it is of several other British industries.

In a comparison between the Sheffield heavy and light trades before the war we have a striking object-lesson in industrial economics. In the effects of the war upon both heavy and light trades we have magnificent revelations. Under patriotic impulses Sheffield employers and workmen have effected more mechanical improvements in thirty months of war than they did in sixty years of peace. In spite of the loss of many young workmen by enlistment, Sheffield cutlery works, by adopting machinery and employing women, are to-day turning out articles by the million where previously they produced only in thousands. When our huge army has completed its work and its abnormal demand for cutlery, bayonets, &c., ceases, the Sheffield light trades will be able to rival the heavy industries in the value of their output and the volume of the goods they will export to foreign markets. Before the war Sheffield gave quality, whilst Solingen yielded quantity. In the future Sheffield will produce both quantity and quality.

The strength of German competition before the war, and our future trading possibilities in certain markets, may be gathered from the fact that in the last year before the war Solingen exported to the Argentine four times as much cutlery as Sheffield, five times as much to the United States, seven times as much to China, ten times as much to Mexico, sixty-four times as much to Italy, and seventy times as much to Russia as Sheffield sent there.

Sheffield cutlers and their employers were the most conservative of our industrial classes. Before the war we really had two Sheffields—the old and the new, or the light and the heavy. In the heavy trades, as already noted, where our employers were always prepared to adopt new machinery and methods, and to employ the best men and managers that could be got from anywhere, we saw the constant building of new furnaces and shops and an increasing volume of employment. In the light trades, where old methods, old men, and old managers—or rather, locals—were stuck to with a tenacious affection and religious reverence, we had, until this war broke out, a condition of affairs little better than stagnation.

Had Sheffield been left dependent upon the light trades, with their lack of progressive enterprise, it would only have been a third or fifth rate town to-day, and could have played but a meagre part in this titanic struggle. Thanks to the heavy trades, Sheffield is a city of over half-a-million inhabitants, and it is rapidly growing. It is producing more munitions of war than Krupps, and after the war it will beat both Essen and Solingen, for our cutlery people have shaken off their apathy and lethargy. Workmen have abandoned their old opposition to machinery. Employers are co-operating and organising for the promotion of trade as well as modernising their plants. The Sheffield University, the most up-to-date metallurgical institution in the world, is splendidly assisting industry. In a word, Sheffield—even the ancient cutlery part of Sheffield—is entering into a new era of progress and prosperity.

THE PEACE OF EVEREST.

None but these monstrous children of God know how to join so much beauty with so much horror.

TO the weaklings of the plains who dwell in sight of their snows, obsessed by alternate dread of avalanche and hillmen, the mountains must always be the symbol of frightfulness; but to the traveller they bring a message of infinite peace. Geologists, learned amid the dry bones of their science, vow that mountains are as changeable as any other scenery. They look on the Himalayas as the sport of rivers that grind them to the silt that Brahmaputra carries to the ocean. Yet those who have gazed on Everest see in it the one enduring element in the Indian landscape. The rivers and tanks may run dry, the forests may burn to the ground, the villages may be wiped out by the plague; if the mountains be not immutable, then all our faith in eternity must go.

Yet, for all the atmosphere of peace, there is in these same summits a savour of defiance, as if they would dare us to our destruction. But there is no unfriendliness in this challenge of the Hill Difficult, for its prize, in spite of the risk involved, is blessed change from the dead level of workaday stagnation in the plains.

He who goes to the Hills, even if no higher

than the winding street of Darjeeling, marks first the fall in temperature and then the revolution in perspective. The task of adjusting his vision to the altered focus of the high places is indeed no easy one. He finds that his eyes have much to learn, and even more to unlearn, and his point of view changes with every step nearer to the clouds. His eyes grow keener, yet less discerning. Even the nearer peak of Kinchinjinga is fifty miles from Darjeeling, yet there are moments at which, thanks to the deceptive play of high lights on the snows, it scarcely seems ten. Curiously enough, even the camera records a measure of this illusion, so that it is an actual optical effect and not the result of careless inspection.

If possible, the perspective from the heights is even more startling. Any one moved by the inquisitive spirit which inspired Petrarch to climb his mountain near Vaucluse finds himself master of a wide horizon, but baffled by its details. Only a little way above Darjeeling he may look back on that station and see it only a blur of red and gray, and from the town itself the brighter green of the tea-gardens merges unrecognisable in the purple of the foot-hills and the *duars*. In fact, a bird's-eye view of this sort is like a short index to a crowded book—it embraces wide scope but little detail.

Whether the discriminating eye finds the greater delight in these memorable hill views from the plains or from some point above them is a matter of opinion, even a question of mood. Seen from the Bhutan valleys, those massive peaks hooded with virgin snow seem irradiated with a beauty unsurpassable; yet the mountain prospect can yield even greater delight, given perfect atmospheric conditions, to any one standing on Observatory Hill, for at such comparatively close quarters he seems a part of their glory. Ruskin's definition of appreciation of scenery was the correct one. He who is footsore with climbing will find even the foot-hills hostile; but he who goes forth full of high hope has a welcome even for the difficulties, and struggles manfully to higher view-points from which he may see the wheeling vultures below him no greater than bees droning over a flower-bed.

Thanks to the presence of these soothing neighbours, hill-stations like Darjeeling offer the jaded folk of the plains not only the boon of cold weather, but also a blessed peace after the turmoil of Indian cities. The wearing routine of the plains is soon forgotten in presence of the cold divinity of the snows. The keen mountain-air drives malaria out of the blood and lulls the convalescent in a spell of laziness.

This régime of abiding peace is apparent even in normal years; during the war, when the rest of the world went mad, its healing balm was twice blest. Up in the hills, where Everest rears its head far above the trouble of ants, the war-telegrams daily posted at the club used to read like the stuff nightmares are made of, and came as a salutary reminder to those compelled to stay and work in the lotus-lands of the East of the sacrifices and sufferings entailed on their countrymen at home.

Apart from this willing tribute of remembrance and regret, there was irresistible comfort in the sweet peace of the Himalayas. While shot and shell were ravaging Europe, it was strange to look on those snows undefiled by human foot. Here, in presence of the majesty which invests the Roof of the World, one could see the embodiment of that spirit of enduring calm in which

> The East bowed low before the blast
> In silent, deep disdain;
> She let the Legions thunder past,
> Then plunged in thought again.

There is something unearthly about this peace of the Abode of Snows. It cannot be safeguarded by scraps of paper. It cannot be broken by the sons of man. It is the Peace of God.

THE MINIATURE.

By E. H. LIDDERDALE.

'ROSE—Rose Macfarlane.'

In the one name was the sweetness of June and of herself; in the other the stern, undeviating spirit of economy so desirable in a young matron in time of war. Most expressive, most perfect combination!

Henry Sanders repeated it with rapture as he felt his way along the main street of Southmere-on-Sea, in the super-darkness produced by winter and the Zeppelin danger together. He had just won a striking triumph over the scruples which had made him hesitate to propose to the portionless daughter of a doctor whose income had felt the competition of younger, smarter men. Had he been a millionaire, Henry would still have been temperamentally nervous in money matters, and he was but a young architect who had lost valuable commissions through the war. It is true that he had not to fear the total extinction of professional income which attends the transformation of architects into subalterns. His right arm, badly broken in early youth, and abominably set, was a permanent obstacle excluding him from active service. But people were building nothing but huts and canteens, and everything from boots to butter was 'up' and rising still. These were critical days for middle-class folk

to marry in, now that even the rich had taken to margarine.

And yet he was going to do it. His engagement was an hour old, and the jewels in the shaded shop windows were sparkling for him and her; the sou'-west wind was rising that it might carry his secret far inland. He was intoxicated with his own daring. For a while he bent a keen prospective eye upon the diamond rings, and not the biggest of them all seemed big enough for his happiness. But presently he turned up one of those little side-streets, dignified even in decay, which carry one back abruptly to the quiet elegance, all curricles and malacca canes, of watering-places a hundred years ago. And there, as he stood before the window of a dealer in bric-à-brac, he suddenly saw a miniature from which gazed a pair of vivid dark eyes that seemed familiar to him. But he did not know —how should he?—the owner of those eyes. To judge by the portentous neckcloth and iron-gray coat, the long sparse locks and the black ribbon that tied them, this old gentleman had flourished a considerable time since. Nor was it the beauty of the subject, but the masterliness of its treatment which fascinated him. The clean-shaven face was pale and hatchet-like; the cheek-bones were high; the lips thin, and tightly fastened under a long and rather cheerless nose; gray eyebrows, surprisingly bushy for a countenance otherwise meagre, protruded over the small and vivid eyes.

Henry Sanders had a keen intuitive appreciation of good painting. When the elderly man behind the counter named a sum well within his means, he concealed his surprise that such a fine miniature should be priced so low. It had been but a few days in the shop, said the seller, and was out of his line. And no one wanted such things in these hard times.

Sanders hardly heard him. In his thoughts it was already to-morrow, and he was with Rose, and she was exclaiming with pleasure that he should so soon have brought her a gift. Doubtless a ring is the traditional opening for the ancient lovers' game, the giving and receiving of presents. But Sanders had an idea that he rode superior to convention. And the miniature was a gem—of that there could be no question.

. . . . . .

Rose was more than pleased—she was enchanted! She had no knowledge of miniature-painting, and did not admire the old gentleman here immortalised; it was enough that it was Henry's gift, and that he was ejaculating, 'A Cosway, or I'm a juggins!'

Then, as she turned the little picture over, to admire it every way, it slipped from her fluttering hands and fell sharply on the floor, causing the ebony frame to come in twain. Horrified, they both stooped to pick it up. Henry grasped the front of the frame, discovering the miniature still intact behind its protecting glass; Rose held the little square of wood which enclosed the back.

'Jolly good luck!' he exclaimed, relieved.

But she did not reply. A deeper carmine flushed her cheeks with every moment that she stared at the object in her hand. 'Henry!'

'Yes.'

'Listen! "This miniature, which represents the Rev. Augustus Smillie, D.D., for forty years minister of Gloanside, N.B., at the age of sixty, was painted by Cosway and presented to me by Dr Smillie's widow after his lamented decease in 1820."'

She handed him with a dramatic gesture the wooden square which had so long concealed this information, minutely written in faded ink upon a scrap of paper fastened to its inner side. Wonderful, wonderful Henry! She was silent, and he, suspecting the cause of her emotion, was silent too. But the power of speech quickly returned to her.

'Henry,' she gasped, 'it's a Cosway, and it's more. It's old Dr Smillie himself.'

'Why, yes, I suppose so,' said Henry, feeling the centre of interest shifting a little.

'You don't understand. It is my great-grandfather! How wonderful! How extraordinary!'

'And who is "me?"'

'I can't imagine. But does it matter? This is mother's mother's father. To think of it!'

'I never knew she was a Smillie,' said Henry vaguely. He was so much more interested in the descendant than in the ancestor.

'She wasn't. At least, it depends whom you mean. Oh Henry! it is as though he had returned to wish us joy.'

'Dear old man,' said Henry, *ému*.

'I shall have him set in a wee gold frame with a loop,' cried the descendant, 'and wear him always—you know people do wear miniatures now—for your sake and his. And I shall write to Aunt Meggie to-night; for, to tell the truth, I really know nothing of him but his name. Mother herself was born years after his death. Aunt Meggie is *the* authority on the family traditions, and she shall tell us all about him.' And then, with sweet hesitation, 'Henry *dear*, one knows what sharks dealers are, even when they do not realise the value of what they are selling. You didn't pay an outrageous sum for it, did you—a real Cosway?'

The question was music to him; it showed the gulf that yawned between her and the daughter of the horse-leech. No man of feeling could possibly answer, 'I didn't!' He was clearly called upon to temporise. 'That's all right, little woman,' he said with some princeliness of manner, though without intent to deceive.

'Naughty boy!' she exclaimed. 'You shouldn't—you shouldn't! And in war time, too!'

But her soft brown eyes forgave him. And after that, how could he explain?

. . . . . .

Dr Smillie, in a narrow rim of gold, had been enthroned full three weeks beneath his great-granddaughter's chin, and still Aunt Meggie up in Peebles failed to produce his 'dossier.' They must take the virtues of the fine old fellow on trust until the bronchitis which plagued her should yield to treatment. In the absence of authentic details, Rose, made inventive by happiness, enlarged upon his wit and old-world courtesy. At such times Henry preserved a discreet silence; the ancient's frigid and meagre countenance exercised upon him a depressing influence which not even Cosway's art could dispel. Truth to tell, once he had grown used to the large, tart-shaped ornament riding like a ship at anchor on his fiancée's softly-heaving bosom, he forgot to look at it any more. It was a fine thing to light on a wife and a Cosway in one day; but there was no doubt which was the more permanently interesting find.

He had thought he knew Rose well, but how much he had still to learn! Day by day he found her more delightful; deeper, sweeter, wittier than even he had supposed. She was all that he sought in a wife. He laughed to think that he had ever feared to invite her to become Mrs Sanders. When of an evening they discussed the future, sitting for privacy's sake in Dr Macfarlane's consulting-room, among the horrid properties of his trade, Henry's heart glowed to hear her pungent views on the folly of costly weddings. But when she expressed her eagerness to forgo the bridal white of tradition that organ melted within him.

'No, no!' he cried; 'you are much too pretty to be married in a stuffy travelling-dress. I won't be done out of white satin.'

And, touched by his princely spirit, she forgot that it was her father to whom it would fall to pay the bill.

To do him justice, Henry was in the exalted mood when poor men scatter largesse without a twinge. Rose's prudence deliciously spurred his own to cut capers; he felt so safe in being a little extravagant with such a wife in view. And Rose would have been a super-woman if she could have received those first offerings of his without unmixed delight. But when it came to the third box of *marrons glacés* she made a stand.

'You have given me him,' she said, pointing to the ancestor on the front of her white blouse, 'and this,' indicating a small but lovely diamond sitting on the fourth finger of her left hand, 'not to speak of the rest. And now it is time to stop.'

As she spoke, her brown eyes were so serious that they looked almost black, and for a moment the little dark eyes of the divine glinted as though they too were alive.

'Wonderful chap, old Cosway!' thought Henry, noting both phenomena, and then he laughed and teased Rose about her scruples.

Yes, he was supremely happy in his choice. She was all—all that a wife should be in time of war.

Could it be that she was even a little more The disquieting suspicion dawned, discreetly veiled, after they had been engaged a few weeks. Sweet as it was to know that he was marrying a thrifty woman, he sometimes thought—he wondered—was she just a little—little——

The suspicion did not come into the open till he saw it unmistakably in the breast of another. To be plain, it was Dr Macfarlane who first suggested to him that Rose was just a thought too economical. Not that his future father-in-law said so to him; that which passed was not intended for his ear.

Henry's uncle, a man of means, and not ill-disposed towards his nephew, came to Southmere to leave a cough there; and, anxious to stand well with the Sanders family, the Macfarlanes invited the eminent lawyer to dine. Henry, returning to the drawing-room after he had seen Mr Morton Sanders depart in his cab, found Rose seated by the fire, looking up at her father with defiance in her eye.

'Well, father, people can't expect the meals they had before the sink-at-sight campaign,' he heard her say, gently but dangerously.

'Very likely not,' said the doctor, and then uttered the words that were burning Henry's mouth like a hot potato which it is not manners to eject. 'Very likely not. But parsnips—parsnips and bread-and-butter pudding! And if you must give us Robinson Frères, for heaven's sake, let it be decanted first!'

The doctor was plainly angry; there is something about parsnips that rouses even a mild man to frenzy. Henry did not hear his fiancée's defence; he stole with exaggerated discretion to the back drawing-room, where no one ever sat, and remained there plunged in the evening paper. Was he sorry to find Rose in hot water? Honestly, he could not say he was. The dinner had struck him as shabby to the point of meanness; he tingled when he thought of it. So he sat there feeling very fierce, and yet rather a cad for not taking Rose's part against her father.

And then he heard Rose call, 'Henry!' in a confident voice.

He leaped up, eager to forgive her. 'Here, darling!' he cried, emerging from his lair.

'Henry, what do you think about the dinner to-night? Do *you* still long for our old luxurious ways?'

'How do you mean?' said Henry, temporising, and remembering the frugal Bacchanals, the plain roast and boiled régime of the Macfarlane family in the days of peace.

But Rose saw through him instantly. 'Ah! you men are all alike—*bons vivants* first and

patriots after!' she cried. 'Why won't a simple wholesome meal content you? Think of Belgium—think of Poland!'

'It does content me,' said the craven Henry; then, forcing himself for very shame to be bolder, he added, 'the question is if it contented our guest.'

Her face flushed, then lengthened, hardened, and both eyes and lips seemed to contract under the lover's gaze. Suddenly Henry caught sight of the ancestor on her breast; and then he knew why the little painted face had been vaguely familiar to him when first he saw it in the dealer's window, and the beads started to his brow. He hurried out of the room that he might not see Rose looking so horribly like great-grandfather Smillie. Forgive her, indeed! She was utterly unrepentant!

But there was worse to come. For some time Rose had been busy on a present for him, the nature of which she stoutly refused to disclose. No lover would wish to look a gift-horse in the mouth, but after the affair of the dinner, Henry's interest in that present, the first Rose had ever made him, became too acute for enjoyment. So when next day she called him to the drawing-room, saying triumphantly, '*Now* you may see it!' he obeyed her with painful alacrity, hoping against hope to find a frivolous, even expensive object—something altogether independent of patriotism and cash considerations.

'There!' she said, pointing to the floor. 'Alone I did it!'

At her feet lay a door-mat such as one sometimes sees in dismal lodgings, formed of short tabs of various dark materials, so thickly massed that the foundation to which they were attached by one end was quite invisible. A sickening sensation took him as he beheld it. Of course it was awfully useful and ingenious, and had entailed enormous labour. But how frightful it was! And what was it made of? He stared at it fascinated, paralysed, unable to articulate.

'Now, Sherlock Holmes,' said Rose gaily, as though to unlock the floodgates of his gratitude, 'you know a Cosway at first sight. Tell me what are these?' With her toe she indicated the little tabs.

'*I* don't know,' said the harrowed recipient.

'Then you are less clever than I thought. Why, silly, they are father's trousers—old ones, of course—all cut up and sewn on. I begged them for you because I *knew* you'd like them. They will last for years and years!'

A horrid silence ensued.

And then Rose's pre-eminent virtue flashed out armed for battle. 'It is so much better to use up what one has than to buy anything new,' she said provocatively.

'New!' cried the enraged Henry, the blood rushing to his head. 'As though I supposed you would give me anything new if you could get it second-hand from some one else!'

'*Henry!*'

'Forgive me,' said the wretched man, horrified. 'I'm not myself. I'm not well.' And he poured out apologies and painful thanks in a lame but gallant attempt to restore the *status quo*.

. . . . . .

One is loath to apply the term 'cheese-paring' to one's beloved, but after that day Henry did secretly so apply it. In the watches of the night all her little war economies over 'bus fares, gas, and the like seemed to join hands and dance with horrible grimaces around that sinister door-mat. Why had he not noticed them in time? Why had he let her think him—*him!*—an extravagant dog? He cursed his own weakness until the doctor, in a moment of guilty confidence, let out that he himself could not imagine what had come to Rose. She had never been really close before. Could he bring himself to domesticate such distressing thrift? Affection staggered at the prospect. Six weeks engaged, and already Henry had a furtive eye open for an excuse to break it off!

Light dawned with the arrival ten days later of Aunt Meggie's tardy letter. Rose, after reading it, showed a faint reluctance to pass it on, which so determined Henry not to rest till he had seen it, that he almost snatched it from her. An idea had dawned on him in those sleepless nights for which he needed Aunt Meggie's support. And he found it in the following passage. 'Those who remember him describe your great-grandfather Smillie, I regret to say, as a most disagreeable old man. His parsimony, from boyhood, was pronounced, and became in his later years grotesque. I cannot suppose that he would ever have incurred the expense of a portrait by Cosway; the miniature in your possession, if genuine, was doubtless paid for by some one else. It is authentic that his death was due to a stroke caused by his anger on finding that his daughter, probably for very shame, had secretly bought him a new hat. *De mortuis*, &c., not to speak of the principle of the Fifth Commandment. But such is the truth.'

Eureka! Hope and resolution sprang in Henry once more. When that evening he again dropped in on Rose, she did not guess what deep design led him to propose that they should go down to the beach.

'We shall have it to ourselves,' he said, and she rejoiced to hear the tender suggestion, for of late a faintly perceptible coolness on his part had worried her.

As later they sat crouching on the lee-side of a breakwater, with the windy darkness about them, and the waves slapping the shingle below, she was happier than she had been since Henry had behaved so strangely over her door-mat. They were silent for a time, while Henry prepared for action, and Rose thought how nice it was to feel his arm about her again.

'Rose, do you love me?' he asked suddenly.

'What a question!' she laughed.

'Then give me back the Cosway.'

'Why?' A note of alarm sounded instantly in her voice.

'I don't think those large ornaments suit you.'

'That is not why you want it. Tell me the real reason.'

Now Henry did not choose to reveal his idea to Rose, and while he cast about for an answer she found an idea of her own.

'Oh, I see, I see!' she exclaimed with agitation. 'Oh Henry, you want to pawn it. I might have known!'

'Good heavens, Rose! What do you take me for?'

'For a weak creature—kind, oh yes—but fatally weak and fond of display.'

'My dear, are you mad?'

'Not mad; only observant, only afraid for our future! From the moment you gave me great-grandfather I began to be anxious, and every day your extravagant spirit, your love of costly food and furniture makes me more so. He himself seems to whisper, "You ought not to have let him buy me in war-time." Oh Henry, you need a careful wife indeed!'

'On the contrary,' cried Henry, boiling over at these accusations with a violence which surprised himself, 'what I need is a wife who will spend and spend—even if she ruins me!'

'Then I give you this back!'

She tore off her left glove, and held out to him his ring.

'Nonsense! It's your detestable old forebear I want. It is he who has come between us.'

As he spoke Henry caught at the Cosway which peeped between her loosened furs.

Rose leapt to her feet, clutching her treasure.

'Ye'll no have him,' she cried harshly, suddenly breaking into broad Scots of a distressing variety. 'A winna pairt wi' grandfer! He's ma support—the only one a have. Ay! ye may mock at thrift. Ye'll sing another tune some day!'

At the sound of that accent Henry turned chalky white; he was prepared to marry Miss Macfarlane, but not the Rev. Dr Smillie.

'Rose, give me the miniature. I insist.'

'Ye've no call to insist. We're no mairrit yet,' she retorted.

'If you love me!'

There was no answer.

She leaned panting and defiant against the breakwater, her hands clasped upon the miniature at her throat. In the uncertain moonlight her likeness to the divine was horrible.

'Don't you love me enough to do this one thing for me?' he pleaded.

She wavered visibly at that. 'Oh Henry, and will ye sell him?' she said with a break in her voice.

'Well, and what if I did?' said Henry (who, however, had quite other plans for the ancestor). 'You never knew him, and you can't like what you have heard of him.'

'It's no that exactly,' she hesitated. 'A mean, if ye *must* sell, for the Lord's sake, see ye get a good price!'

At that Henry uttered a word not included in any lover's vocabulary.

'Price be ——!' he thundered, seizing the miniature. 'I'm going to give him away!'

Then Rose closed with him; silently, desperately, the canny Scot and the offended woman within her allied for battle. She was strong and indignant, but Henry was too determined for her. A few seconds of gasping, swaying struggle, and the little chain which held the miniature broke, and delivered great-grandfather Smillie into Henry's impious hand. Before she could recover herself he swung up his arm, and she saw him fling the veteran far out to sea. The little oval disc flashed into the darkness, struck the water, and was gone! Rose shrieked, then wept distractedly; Henry emitted a wild, hyæna-like laugh; the English Channel continued to send its waves hissing along the shingle as though nothing had happened.

How long they stood staring, dumbfounded, at the water, they did not know. But it was Henry who said at last in the tone of one who endorses a desperate measure. 'It had to be!'

He put his arm round Rose, and led her unresisting away from the tomb of her ancestor. She trembled so that she could hardly walk. Anxious to conciliate her, he whispered soothingly, 'We'll take the 'bus home.'

She did not answer for a moment, but when she did she demonstrated the soundness of his idea. The spell was broken. She was convalescent. Her parsimony would soon expand into the comparative extravagance of thrift.

She looked at him with her old sweetness, and said in everyday English, and without apparent embarrassment, 'Thank you, sir; but I should prefer a taxi!'

BLOWN ON THE WIND.

Blow a ship, blow a ship far out to sea,
First one for daddy, and then one for me;
Now one for mummy, a dainty white sail;
Steady, oh steady! oh dear, what a gale!
Which one is leading? Look, look at the pace!
I'm pretty sure daddy is winning the race;
No, he is over: hurrah, now he's right;
Going like this he'll be soon out of sight.

Blow a kiss, blow a kiss far out to sea,
Blow it to daddy wherever he be;
Far from our reach he is tossed on the foam,
So mummy and I blow him kisses from home.
Mummy and I sail our ships on the tide
Because we are certain no sea is so wide,
Nor tempest so stormy but he's sure to find
The kisses and ships that we blow on the wind.

A PLAYGROUND AT WAR.

By IGNOTUS.

THIS war has effected such cyclonic upheavals and disturbances of ordered existence that to find schoolrooms turned into barracks, and churches into hospitals, passes as a matter of course, and evokes little, if any, comment; it is but logical, therefore, to go a step further, and find the playground itself masquerading as a barrack square, and in a larger sense the world's playgrounds serving as battlefields.

Such a one is Egypt, fortunately (or unfortunately) so situated geographically as to be for ever the cockpit of the Near East, as Belgium is of Europe. On the outbreak of war Egypt reverted to type, and, casting forth the tourists and the happy dilettantes who for years had made of her a Tom Tiddler's Ground in which to defy the European winter, welcomed as of old the hordes of men-at-arms who flocked from all parts of the Empire to defend her, and use her as a vast training-ground and a jumping-off place.

A glance at the map will show the desirability of Egypt to any Power purposing to bestraddle the world, and it was therefore to be expected as a matter of course that Germany would make not one but many tries to pluck so luscious a plum from what she held to be a rotting tree.

What upset her calculations here, as elsewhere, was her absolute inability to understand any people's psychology other than her own. True, she had prepared the ground systematically, as only Germany could, with a vast network of intrigue. Sedition, at a given signal, was to flame up into a white-heat of fury and fanaticism, under which the British Raj should scorch and finally wither. But setting aside the fact that religious outbreaks in the Empire were only sporadic, she failed entirely to take into account the British 'Terrier' and the yeoman, the Australian and the New Zealander (forever christened Anzacs), or even such an unconsidered trifle as our native regular army from India, for it is a remarkable fact that, barring a few weeks when the 29th Division was here before and after Gallipoli, Egypt has been mainly defended from first to last by amateurs, some of whom had a cursory acquaintance with soldiering before the war, while the bulk of them had none.

Danger to Egypt, as might be imagined, would come from the East, through Palestine and Syria, and lines of defence were therefore thrown up west of the Suez Canal, which were to prove an insurmountable obstacle to German ambition. While the Territorials and the Anzacs got their first taste of real spadework, varied by strenuous route-marching, musketry, and field-days, the yeomen of England crossed the Canal daily to establish contact with the slowly moving Germano-Turk, and their persevering efforts to find some one to tread on the tail of their coats culminated in the battle of Tussoum towards the end of 1914, when, to use a ringside expression, only the call of 'Time' saved the Turks from being outed in the first round.

If any one be curious enough to look, Tussoum will be found on the Canal, south of Ismailia, and the pontoons with which the Turks intended (*inter alia*) to cross the Canal now form very valued 'soovneers,' as Thomas Atkins calls them, at various spots in Egypt. I know of one in the Canal Company's garden in Ismailia, and of others in the Cairo Zoo, where some sarcastic authority, with a blistering sense of humour, deposited them.

The first round being over, all hands turned to and did a bit more soldiering, while the navy took on the forcing of the Dardanelles by itself. This, however, was found to be impracticable, and the Mediterranean Expeditionary Force was accordingly constituted under Sir Ian Hamilton, and assembling from north and south in Egypt, took ship at Alexandria and fared forth on its Odyssey to the now immortalised beaches. The valour displayed was Homeric, and I think sufficiently disposes of the parrot-cry that we are a decadent race; but it was all in vain, and when, at the end of 1915, evacuation was decided upon, and the most magnificent rearguard action in history (far exceeding that of Ney at the Redinha) was fought, no unprejudiced person could deny that Round 2 had ended all in favour of the Germano-Turks. They had immobilised a large striking force which we might have used elsewhere, and the Crescent had badly hammered the Cross, which to us and to the French, as the rulers of the largest Mohammedan communities in the world, was not the least unpleasant feature of the situation.

 [*All Rights Reserved.*]

Back to Egypt came the undaunted Mediterranean Expeditionary Force, and the end of 1915 saw Round 3 open with an invasion of Egypt from the western desert by the Senussi, egged on by the Germano-Turks.

I have written so fully on this little campaign that I forbear going into the subject again; but suffice it to say that the Senussi, a misguided set of fanatics—Mussulmans, indeed, but bearing about the same relation to the Church of Mohammed as the Seventh Day Adventists do to the Church of England—invaded Egypt on the firm assurance that the British Empire was in the throes of dissolution and had no troops to spare to attend to them. Withal, their invasion was not to be entirely academic, inasmuch as Germany had 'promised' them Alexandria to sack and loot.

To meet the Senussi, a composite bit of British Empire moved out, under General Wallace, who was succeeded later by General Peyton, a lineal descendant of the Peyton so famous in bygone coaching annals, and, to the best of my recollection, a friend of George IV. in the days of the Carlton House circle. The bulk of it was infantry, of course, chiefly Middlesex Territorials with some Lowland Scots. But there were also the New Zealand Rifle Brigade; a South African brigade, fresh from victory in German South-West Africa, and then on their way to France, who took the Senussi campaign as a sort of week-end in Egypt; the 15th Sikhs (with the yellow patch in their turbans), who moved the Territorials to tears of admiration, as one of their majors told me, so gallant and soldierly was their bearing under fire; while for cavalry there were Westminster Dragoons, Bucks, Berks, and Dorset Yeomanry; and in case London was still insufficiently represented in the opinion of any homesick Cockneys, 'B' Battery of the Honourable Artillery Company from Finsbury Square hooked in and joined the dance.

Round 3 completely reversed Round 2, and a sweeping victory was scored, the pity being that whereas the eyes of the world were on the ring for the second round, they had shifted elsewhere before the third was fought. Its uses were, however, enormous and far-reaching in Egypt, disposing finally of the illusion that Britain was done, and suggesting to the natives the eminent desirability of revising their hastily conceived ideas.

Somewhere about this time Lord Kitchener came on from Gallipoli to have a look round, and his programme also embraced an inspection of the Canal defences. 'K,' as he was universally called, was never the sort of individual to wrap up his meaning in diplomatic courtesies where plain language was required, and his quietly uttered criticism revolutionised the defence plans, and Thomas Atkins set himself forthwith to work to entrench the east bank of the Canal with the chivalrous and knightly idea of saving the Turk the trouble of crossing when next he came to call. The labour involved in the transference was incredible, almost beyond words, when it is remembered that, in addition to innumerable bridges and ferries having to be constructed, an entirely new set of works had to be dug, and every pound of bully-beef, handful of oats, and round of ammunition removed and stacked afresh; but it was done.

Johnny Turk called, without any preliminary announcement, in the spring of 1915 at Katia, when a very daring and well-executed raid on the Worcester Yeomanry succeeded in taking some prisoners and adding substantially to our butchers' bill; and this, I suppose, might fairly be called Round 4, and all in his favour.

Round 5 was fought rather more than a year later, when Sir Archibald Murray, who had in the interim succeeded Sir John Maxwell, managed to inveigle a force of some 18,000 Turks, under the German Colonel Kress von Kressenstein, into an impossible position, where he pounced upon them and more than made up for Round 4. Roughly speaking, he deliberately weakened his right flank, and when the Turk advanced, singing at the top of his voice 'Easy mutton,' or whatever corresponds in Turkish to 'Six to four on me,' a surprise and a very heavy defeat awaited him. Von Kressenstein personally escaped, but his force was completely destroyed, though parts of it, like the curate's egg, succeeded in getting away in good order.

Rounds 6 and 7 can be disposed of in half-a-dozen lines. The former was our bloodless victory at El Arish in January 1917, when Sir Archibald Murray was at last able to claim that the Sinai Peninsula had been swept clear of the invader; and Round 7 was the cavalry raid on Rafa, in Syria, which retired directly its object had been accomplished.

Round 8 was the tame and anæmic capture of Khan Yunis and Shellal; and at the moment of writing it seems more than doubtful whether the Turk will stand up for another round here.

The heterogeneous mixture of humanity that has garrisoned Egypt for the past two years has left its mark. The natives were formerly accustomed to the British regular soldier, who, if not a very highly polished individual in the mass, was at any rate imbued with a very distinct idea of his status as a white man, and while quite kind to the natives, did not mix with them but 'kep 'isself to 'isself.' That has all rather changed now. Thousands of men who had never left England before in their sheltered lives found themselves suddenly flung pell-mell amongst the natives, and without in the least meaning to lower the white man's prestige, nevertheless succeeded in doing so by their thoughtless familiarities, and by some inherent

faculty dominant in our race, whereby any man with a coloured face is immediately classified as more or less of a comedian. If this be thought an exaggeration, watch what occurs in any English assemblage directly a nigger shows his face, even before he has time to speak. The Anzacs, too, are not guiltless under this charge. Possibly, however, matters may re-adjust themselves after the war, since it has certainly had the effect of broadening the natives' outlook. Witness, for example, Hussein Mustafa, native tailor to Abbassia Barracks, Cairo, who proudly advertises as amongst his customers such strange wildfowl as 'Duke of Lancesterown, Hests, and Westminister Dragons Yeomanry,' his stock including 'Card breechs and frouses, gabadeans, &c.,' the latter presumably for the benefit of those he so kindly distinguishes as 'Australiors.' This may, of course, be only his little joke, for the Egyptian has a very distinct sense of humour, a faculty in which the Turk, a stolid, bucolic sort of person, is reputed to be conspicuously lacking. I cannot help feeling, however, that this judgment does the Turk but scant justice, for the University of Stamboul actually proposed the Kaiser as a candidate for the Nobel Peace Prize!

It looks now as though such surprises as the war still has in store for suffering humanity will be hid from us here in Egypt, but one significant fact announced last November gave me pause. It was a three-line telegram sandwiched between the scruples of conscientious objectors and other such warlike items, and stated that the Germans had completed their tunnel through the Taurus Range for the Baghdad Railway, and a new recruiting-field in the shape of Persians can thus be tapped by them. True, the Persian is not a warrior by nature, but who would not fight with the Germans waiting behind him to 'encourage' him as only they know how? It may, therefore, well be that we shall yet see ourselves confronted by Persian brigades under German officers before we can finally pipe down in the Near East.

If so, perhaps some novelties in the art of war will be evolved, for, incredible as it may seem, an entirely new method of bridging, or rather damming, the Canal was going to be used by the Turks at their first attempt at crossing in 1914, had they only succeeded in beating back our covering troops. It was simplicity itself, and consisted of tarring the tails and hind-quarters of numerous camels, and then setting the beasts alight, with their faces to the Canal, so that in their agony they would rush in, and with their piled-up bodies dam the Canal sufficiently long for a proper dam to be built. With German thoroughness Sinai camels were selected, as they would know the direction of the Canal; and lest any one think this a fairy-tale, I may say that the nauseating and revolting scheme had previously been successfully experimented with in the neighbourhood of Nablus, in Syria, the fiend responsible for the idea being Muntaz Bey, aide-de-camp to Enver Pasha, a pupil of the German *Kriegsakademie*, and long *persona grata* in German military circles. The only commentary that fits such a proposal is, '*Kultur* will out.'

THE DEFINITE OBJECT.

CHAPTER XLIV.—RETRIBUTION.

HALF-stunned by a blow from Joe's mighty fist, M'Ginnis saw Heine felled by Spider, who, having promptly and scientifically kicked him unconscious, snatched the revolver from his lax fingers and turned to pursue. As he came, M'Ginnis fired rapidly; but dazed by the blow, his aim was wild. So he turned and ran, with the Spider in hot pursuit. The moon was down and it was very dark, and soon M'Ginnis found himself in the denser gloom of trees. On he ran, twisting and doubling, on and on, until spent and breathless, he paused to hearken. Far away, voices shouted to each other—voices that gradually grew more distant; so, in a while, having caught his breath, M'Ginnis went on again. But the wood was full of noises—strange rustlings and sudden, soft night-sounds, and at every sound the fugitive paused to listen, finger on trigger. And ever as he went the wild blood throbbed and pulsed within his brain, sounding now like the pad-pad of pursuing feet that would not be shaken off, and again like a voice that mumbled and muttered querulous words in the air about him, and at such times he glanced round upon the dark, but the words would not be stilled.

'She's married—married—married! You drove her into his arms—you did—you did—you did! And he's alive still and with her, alive—alive—alive!'

And sometimes, as he stumbled along through that place of gloom, he cursed bitterly beneath his breath, and sometimes he ground sweating jaws, since needs must he hearken to that taunting devil-voice.

'Alive and with his wife beside him—alive! And yours the fault—yours—yours! Your shot at Spike so near the house lost you the game—lost—lost! Your shot at Spike was a call for help—saved the life of the man you came to kill! Your shot at Spike lost you the game—lost—lost!'

So, followed by the pad-pad of running feet, haunted by the querulous demon-voice, M'Ginnis stumbled out upon the road—a lonely road at most times, but quite desolate at this hour. The fugitive hastened along, dogged by sounds that none but he might hear. Yet to him these sounds were dreadfully real, so real that once, goaded to a paroxysm of blind fury, he whirled about and fired wildly—a shot that seemed to split asunder the deep night silence, filling it with a thousand echoes. Once more he turned and ran, ran until his breath laboured painfully and the sweat ran from him, but ever the sounds were close about him. At last he beheld lights that moved, and reaching a wayside halt clambered aboard a late trolley, and crouched as far from the light as possible. But even so, his disordered dress, his pallor, and the wild glare of his eyes drew the idle glances of the scanty passengers.

'Looks like you 'd been through th' mill, bo!' said one, a great, rough fellow; but meeting M'Ginnis's answering glare, he quailed and shrank away.

Dawn was at hand when at last he reached O'Rourke's saloon; and letting himself in, strode into the bar. The place was deserted at this hour, but from a room hard by came the sound of voices, hoarse laughter, and the rattle of chips that told a poker-game was still in progress.

Scowling, M'Ginnis stood awhile to listen. Then lifting the flap of the bar, he passed through the narrow door beyond, along the passage and so to that dingy office, from the open door of which a light streamed.

Scowling still, M'Ginnis strode in, then stood suddenly still, lifted his right hand toward his breast, then paused as Soapy, turning about in the swing-chair, took a heavy, ivory-handled revolver from where it had lain on the desk beside a packet of letters tied up in a faded blue ribbon.

'Lock th' door, Bud—lock th' door!' said he softly. 'So!' he nodded, as M'Ginnis obeyed. ''N' say, Bud, take that hand away from y'r gun, an' keep it away. See?' And the lamplight glittered on the long barrel that rested on Soapy's knee.

'So—this is th' game—hey?' demanded M'Ginnis hoarsely, his bloodshot eye fixed on Soapy unwinkingly.

''S right, Bud. Y'see, I been takin' a peek int' that little tin safe o' yours. Say, it looks like you 'd had a bit of a rough house, Bud!'

Soapy's cigarette quivered, and was still again; while M'Ginnis watched him, breathing thickly, but speaking no word. Soapy went on again: 'I been takin' a peek into that little tin safe o' yours, an' I found some papers you 'd been kind o' treasurin' up about me, so I burnt 'em, Bud—not as they mattered very much, there ain't nobody t' worry when I snuff it—but I found as you 'd got other papers about other guys as would matter some t' them, I guess—so I burnt 'em too, Bud.'

'Burnt 'em!' cried M'Ginnis in a strangled voice—'burnt 'em—you'——

'It ain't no use t' get riled, Bud—I burnt 'em. There 's the ashes!'

M'Ginnis glanced at the heap of ash by the stove, and burst into a frenzy of curses and fierce invective; while Soapy, lounging back in the chair, watched him unmoved until he had done. Then he spoke again: 'Also I found—letters, Bud, a packet tied up in blue ribbon—an', Bud, they matter a whole lot. Here they are—look at 'em!'

For a moment Soapy's baleful eye turned aside to the desk as he reached for the letters, and in that moment M'Ginnis's pistol spoke, and Soapy, lurching sideways, sagged to his knees, his back against the desk. Again and again M'Ginnis's weapon clicked, but no report followed, and Soapy slowly dragged himself to his feet. His cigarette fell, and lay smouldering for a moment. He stared at it; then he laughed softly, and glanced at M'Ginnis.

'You fool, Bud—you dog-gone fool! Forgot t' load up y'r gun, eh? But I guess you got me all right, anyway. You 're shootin' better t'-night than you did in the wood that time—eh, Bud? Now I want t' tell you'—— He was choked suddenly with a ghastly coughing, and when he spoke again his voice was fainter, and he held a smartly bordered handkerchief to his mouth.

'They say God made this world, Bud. If He did, I guess he was asleep when you was made, Bud. Anyway, remembering little Maggie, you ain't no right to breathe any longer—so that 's for me; an' that 's for her!'

Lounging still, he fired twice from the hip, and M'Ginnis, twisting upon his heels, fell and lay with his face at his slayer's feet. Then, spying the packet of letters that lay upon the grimy floor, Soapy stooped painfully and fired rapidly four times, and, when the smoke cleared, of those tear-blotted pages with their secret of a woman's anguish there remained nothing but a charred piece of ribbon and a few smouldering fragments of paper. And now Soapy was seized with another fit of coughing, above which he heard hoarse shouts, and hands that thundered at the door. Lazily he stood upon his feet, turned to glance from that scorched ribbon to the still form upon the floor, and lifting a lazy foot, ground his heel into that still face, and crossing unsteadily to the door, opened it. Beyond was a crowd—very silent now—who drew back to give him way; but Soapy paused in the doorway and leaned there.

'What 's doin'?' cried a voice.

'Say, run f'r a doctor somebody—quick—Soapy 's hurt bad, I reckon'——

'Hurt?' said Soapy, in soft, lazy tones. ''S right! But—say fellers, there 's a son of a dog in there—waitin' f'r a spade—t' bury him!'

Then Soapy laughed, choked, and groping before him blindly, staggered forward, and pitching sideways, fell with his head beneath a table, and died there.

CHAPTER XLV.—OF THE OLD UN AND FATE.

SPIKE leaned back among his cushions, and glancing away across close-cropped lawns and shady walks, sighed luxuriously. 'Say, Ann,' he remarked. 'Gee whiz, Trapesy, there sure ain't no flies on this place of old Geoff's!'

'Flies!' said Mrs Trapes, glancing up from her household accounts; 'you go into the kitchen an' look around.'

'I mean it 's aces up.'

'Up where?' queried Mrs Trapes.

'Well, it 's a regular Jim-dandy cracker-jack—some swell clump, eh?'

'Arthur, that low, rough talk don't go with me,' said Mrs Trapes, and resumed her intricate calculations again.

'Say, when 'll Geoff an' Hermy be back?'

'Well, considerin' she 's gone to N' York t' buy more clo'es as she don't need, an' considerin' Mr Ravenslee 's gone with her, I don't know.'

'An' what you do know don't cut no ice. Anyway, I 'm gettin' lonesome.'

'What! ain't I here?' demanded Mrs Trapes sharply.

'Sure. I can't lose you!'

'Oh! Now I 'll tell you what it is, my good boy'——

'Cheese it, Trapes; you make me tired—that 's what.'

'If you sass me I 'll box your young ears—an' that 's what!'

'I don't think!' added Spike. 'Nobody ain't goin' t' box me. I 'm a sure enough invalid, an' don't you forget it.'

'My land!' exclaimed Mrs Trapes, 'a bit of a hole in his arm—that 's all.'

'Well, I wish you got it, 'stead o' me—it smarts like sixty!'

'Shows it 's healin'. Doctor said as it 'll be well in a week.'

'Doctor!' sniffed Spike; 'he don't know what I suffer. I may be dyin' for all he knows.'

'You are!' sighed Mrs Trapes, with a gloomy nod.

'Eh—what?' exclaimed Spike, sitting up.

'So am I—we all are—by the minute. Every night we 're a day's march nearer home! So now jest set right there an' go on dyin', my b'y!'

'Say now, cut it out,' said Spike, wriggling; 'that ain't no kind o' way t' cheer an invalid.'

'It 's th' truth.'

'Well, it don't cheer me more, so let 's have a lie for a change.'

Mrs Trapes snorted, and fell to adding and subtracting busily.

'Say, Ann,' said he after a while, 'if you got any more o' that pumpkin-pie I could do some right now.'

'It ain't eatin'-time yet.'

'But—gee! ain't I a invalid?'

'Sure! Consequently you must be fed slow an' cautious.'

'Oh, fudge! What 's the good of a guy bein' a invalid if a guy can't feed when he wants to!'

'What 's a hundred an' ninety-one from twenty-three?' inquired Mrs Trapes.

'Skidoo!' murmured Spike sulkily. But after Mrs Trapes had subtracted and added busily a while, he spoke again. 'You ain't such a bad old gink—sometimes,' he conceded.

'Gink!' said Mrs Trapes, glaring.

'I mean you can be a real daisy when you want to.'

'Can I?'

'Sure! Sometimes you can be so kind an' nice I like you a whole lot!'

'Is that so?'

'You bet it is—honest Injun.'

'Arthur, if it 's that pie you want'——

'It ain't!'

'Well, what is it?'

'How d' ye know I want anything?'

'Oh, I just guess, maybe.'

'Well, say—if you could cop me one o' Geoff's cigarettes—one o' them with gold letterin' onto 'em.'

'You mean—thieve you one!'

'Why, no—a cigarette ain't thievin'. Say now, dear old Trapesy, I 'm jest dyin' for a gasper!'

'Well, you go on dyin', an' I 'll set right here an' watch how you do it.'

'If I was t' die you 'd be sorry for this, I reckon.'

'Anyway, I 'd plant some flowers on you, my lad, an' keep your lonely grave nice.'

'Huh!' sniffed Spike, 'a lot o' good that 'ud do me when I was busy pushin' up th' daisies. It 's what I want now that matters.'

'An' what you want now, Arthur, is a rod of iron, good an' heavy. Discipline 's your cryin' need, an' you 're sure goin' t' get it.'

'Oh! Where?'

'At college. My land, think of you at Yale or Harvard or C'lumbia!'

'Sure you can think—thinkin' can't cut no ice.'

'Anyway, you 're goin' soon as you 're fit; Mr Geoffrey says so.'

'Oh, Geoff 's batty—he 's talkin' in his sleep. I ain't goin' t' no college—Geoff 's got sappy in th' bean.'

'Well, you tell him so.'

'Sure thing; you watch me!'

'No, I 'll get you somethin' t' eat—some milk an'——

'Say, what about that pumpkin-pie?'

'You sit right there an' wait.'

'Chin-chin!' nodded Spike, and watched her into the house.

No sooner was he alone than he was out of his chair, and, descending the steps into the garden, sped gleefully away across lawns and along winding paths, following a haphazard course. But as he wandered thus, he came to the stables, and so to a large building beyond which were many automobiles of various patterns and make. And here, very busy with brushes, sponge, and water, washing a certain car and making a prodigious splashing, was a figure there was no mistaking, and one which Spike hailed in joyous surprise. 'Well, well, if it ain't th' old Spider! Gee, but I'm glad t' see ye! Say, old sport, I'm a invalid—pipe my bandages, will ye?'

'Huh!' grunted the Spider, without glancing up from the wheel he was washing.

'Say, old lad,' continued Spike, 'I guess they told you how I put it all over Bud, eh?'

'Mph!' said the Spider, slopping the water about.

'Heard how I saved old Geoff from gettin' snuffed out, didn'tcher?'

'Huh-umph!' growled the Spider.

'That's sure some car, eh? Gee, but it's good t' see ye again, anyway. How'd ye come here, Spider?'

'U-huh!' said the Spider.

'Say!' exclaimed Spike, 'quit makin' them noises an' say somethin', can'tcher? If you can't talk to a pall, I'm goin'.'

'Right-o, kid!' said the Spider; 'only see as you don't go sheddin' no more buttons around.'

'B-buttons!' stammered Spike; 'whatcher mean? What buttons?'

The Old Un, who happened to have been dozing in the limousine that stood in a shady corner, sat up suddenly and blinked.

'Why, I mean,' answered the Spider, wringing water from the sponge he held and speaking very deliberately, 'I mean the button as you —left behind you—in th' wood!'

Spike gasped, and sat down weakly upon the running-board of a car, and the Old Un stole a furtive peep at him.

'So you—know?'

'Sure I know—more 'n I want t' know about you; so—chase yourself out o' here—beat it!'

Spike stared in mute amazement, then flushed painfully. 'You mean—you an' me—ain't goin' t' be pals no longer?' he asked wistfully.

'That's what!' nodded the Spider, without lifting his scowling gaze from the sponge. 'Kid, I ain't no gold-medal Sunday-school scholar, nor I ain't never won no prizes at any Purity-League conference, but there's some guys too rotten even for me!'

'But I—I—saved his life, didn't I?'

'That ain't nothin' t' blow about after what you did in that wood. Oh, wake up an' see just how dirty an' rotten you are!'

Spike rose, and stood, his hands tight-clenched, and though he tried to frown, he couldn't hide the pitiful twitching of his lips or the quaver in his voice. 'I guess you mean you're goin' t' give me the throw-down?'

'Well,' answered the Spider, scowling at the sponge in his hand, 'there's jest two or three things as I ain't got no use for, an' one of 'em's —murder!'

Hereupon Spike shrank away, an' the Old Un, reaching out stealthily, opened the door of the limousine; while the Spider fell to work again, splashing more than ever. Thus as Spike crept away with head a-droop, the Old Un, all unnoticed, stole after him, his old eyes very bright and bird-like; and as he followed, keeping in the shade of hedge and tree as much as possible, he whispered a word to himself over and over again. 'Lorgorramighty!'

But Spike went on with dragging feet, ignorant that any followed, lost in a sudden sense of shame such as he had never known before—a shame that was an agony; for though his bodily eyes were blinded with bitter tears, the eyes of his mind were opened wide at last, and he saw himself foul and dirty, even as the Spider had said. So on stumbling feet Spike reached a shady, grassy corner remote from all chance of observation; and throwing himself down there, he lay with his face hidden, wetting the grass with the tears of his abasement.

When at last he raised his head he beheld a little old man leaning patiently against a tree near by and watching him with a pair of baleful eyes. 'Hello!' said Spike wearily; 'who are you?'

'I'm Fate, I am!' nodded the Old Un. 'Persooin' Fate—that's me.'

'Whatcher here for, anyway?' inquired the lad, humble in his abasement.

'I'm here to persoo!'

'Say now, what's your game? Whatcher want?'

'I want you, me lad.'

'Well, say—beat it, please—I want t' be alone.'

'Not much, me lad. I'm Fate, I am; an' when Fate comes up agin' murder, Fate ain't t' be shook off.'

'Murder!' gasped Spike. 'Oh, my God! I —I—ain't'——

The lad sprang to his feet and was running on the instant, but turning to glance back, tripped over some obstacle and fell. Swaying, he rose and stumbled on, but slower now by reason of the pain in his wounded arm. Thus, when at last he came out upon the road, the Old Un was still close behind him.

(Continued on page 661.)

THE MAGIC OF GOLD.

By James Beattie.

IT is curious what strange fancies come to old men, and an idea, whimsical no doubt, has come to me to scribble off some of my vagrant recollections for your journal. I left Scotland in 1861, and came out to southern New Zealand, and here I have been ever since. I spent a month in London waiting until our ship was ready, and it was a wonder-time for me seeing all the famous historical places. The most notable event of that month was the death of the Prince-Consort, which threw London (and I suppose the whole British Empire) into mourning. Now another German—Kaiser Wilhelm, no less—has again thrown Britain and her dominions into mourning; but what a striking contrast between the two! The first mourning was caused by love; the second through hate. In 1861, as showing how friendly and peaceful relations then were, I brought out to New Zealand a small flock of pure-bred merino sheep bought from the stud-flock of the then King of Prussia. (This was before that great and aggressive statesman Bismarck had united the German states into an empire; a work which I sincerely hope this cruel war will undo, or at least render so impotent that small and peaceful nations will be able to dwell in freedom and security in the future.)

It has often been remarked that truth is stranger than fiction, and when I think of some of my early colonial experiences they seem stranger to me than much fiction. The first gold-diggings in Otago had been discovered before I landed; but I was thrown amongst new and greater discoveries when I was quite a 'new chum.' From its foundation by Scottish emigrants in 1848, Otago moved along in a small and homely way until 1861, when Gabriel Read, a wandering prospector in search of rich metals, discovered a payable alluvial goldfield, which completely revolutionised life in Otago. Diggers came pouring in like a flood from Australia, much to the dismay of the old settlers. These new-comers dubbed the former inhabitants 'old identities,' and received in turn the pet name of 'new iniquities.' The old settlers would have stopped the inrush of this wild horde of frenzied goldseekers, but they were powerless, and when prejudice had had time to sink they admitted that the diggers were a great acquisition to a new colony. Prior to this time very little cash was in circulation in Otago, barter having been often resorted to; but now the influx of ready money with the new arrivals greased the wheels of trade, and things boomed. Agriculture, in particular, made great strides after the gold discoveries; and everything else advanced proportionately.

I did not bother the diggings at first, but went inland, and took up the work I was accustomed to—namely, shepherding. I was employed on the Galloway Run, owned by Messrs Shennan Brothers, and, with a mate named Tom Wilson, occupied a hut near the Clutha River. Prospectors were abroad throughout the length and breadth of the land searching for precious minerals, and it was in July 1862 that two of them, named Hartley and Reilly, came to our hut. We ferried them across the river, and they went on a few miles to Dunstan, and made a sensational discovery of gold, which we could have participated in, but we did not know enough in those days to seize the opportunity. Hartley and Reilly in a short time secured eighty-seven pounds weight of gold, and then rushed to Dunedin and applied for and got the Government bonus of two thousand pounds for the discovery of a payable goldfield. The reason of their hurry was that there were other prospectors in the vicinity, hence their haste to be first to claim the reward. It is hard to describe fully the effect of this new discovery; but I witnessed the rush which followed, and it was a wonderful sight. On Saturday we enjoyed our usual sylvan quietness on that remote sheep-run. On the Sabbath morning, a clear frosty morning in August, we could see the diggers coming over the Rough Ridge in one long continuous stream, all heading for the Clutha River, adjoining the Dunstan Range, where Hartley and Reilly had made their great find. The men came in all manner of ways, but as a rule they reminded me of the gipsies in the Old Land. Some came with packhorses, some with bullocks, some even utilised dogs as carriers, while many carried all their belongings on their shoulders in 'swags.' It was a sight to be remembered, and where we abode in solitude on Saturday evening we had the company of thousands of excited goldseekers on Sunday evening. The field discovered by Gabriel Read, and known as Gabriel's Gully, was practically deserted, the few left merely 'shepherding' their claims until authentic reports could be received from their mates on the Dunstan, over one hundred miles away as the crow flies and in a rough and roadless country.

In the meantime conditions were bad on the Dunstan, as several thousand diggers arrived in one week, with nothing to support them except the scanty stores they had carried, which were soon exhausted. The first wagons could not arrive inside a fortnight at the earliest from Dunedin, the only effective source of supply, and the main lot of wagons, drawn by bullocks, which were the principal carriers at that period, would take practically double that

time. On the Galloway Station we quickly secreted our stores for the sustenance of the employees, but we started supplying mutton to the diggers on the field, and the place is known as Muttontown to this day, I believe. Some of the men were driving the sheep in from all around, others were killing them as fast as they could, and others selling them hand over fist. Our first butcher's shop was a bullock-dray with a tarpaulin erected over it, and under this primitive arrangement a roaring trade was carried on. It was the most complete monopoly imaginable, with thousands of eager customers having no other means of supply, and there was no demur to prices fixed at rates which would turn butchers of the present day green with envy. This lasted only a matter of weeks, but it was strange how well it supplied the wants of the diggers in the first days of the rush. I remember the incident of the arrival of the first wagon laden with flour, sugar, &c., and how the provincial government had sent all the available mounted troopers to keep order, and how strenuously they had to labour amongst the madding crowd of starving diggers. They placed themselves round the wagons with firearms ready, and every one who came had to state the number of his party, and the troopers only allowed a few pounds to each. They were surrounded by an anxious, jostling crowd, who emptied the big wagons in a few hours, and many had reluctantly to go empty away until the next wagons arrived. The minimum price for flour was two shillings and sixpence per pound, and everything else was proportionately high; but all were reckoned lucky who got served. On account of the scarcity there was much sickness, especially from drinking Clutha water highly impregnated with mica; but the gold was there and easily got, and that talisman carried the diggers through. Prospectors scoured the country, and found auriferous gullies in various localities, and big rushes took place to the Arrow and Shotover Rivers. The country was almost impassable for wagons, and supplies were got to these new fields from Invercargill *vid* Lake Wakatipu, and then by packhorses in many cases. In these wild, mountainous glens the diggers had many difficulties, and one of the worst of these was lawless men.

The Gold Commissioners lived in distant townships, and diggers had to journey in to get redress for any grievance or injustice, and the law was often tardy. 'Jumping' rich claims was of frequent occurrence where the ground was shallow and easily worked. One gang who were experts at the game plundered many of their weaker neighbours, but met with salutary punishment without the aid of the nearest commissioner. In the course of their successful 'jumping' operations they took forcible possession of a claim held and worked by a party of Maoris. They used them roughly, and the natives retired to their tents and held a brief council of war. They discarded most of their European clothing, and armed themselves with all the weapons at their command, and issued forth to do battle with the invaders of their claim. They then gave a brief *haka*, or war-dance, and, shouting their war-song, charged the claim-jumpers. Such of these as were on the surface fled, but those who were down in the workings could not get clear so readily, and the Maoris chased them off the ground, drubbing them severely. None of them was killed, but some must have had aching frames for days; and the lesson evidently cured them effectually, as there was no more claim-jumping in that district. I left the sheep-run, and followed the gold rushes through Otago and Westland for some years with varying results; but I will leave the story of those rough-and-tumble ups-and-downs to some future occasion.

In conclusion, I think that goldfields exercise great influence in a new country in building up industries; in giving an impetus to agriculture; in bringing good roads and, eventually, railways. The first settlers in Otago expected railways in possibly a hundred years, but through the magic of gold they got them in one quarter of that period. The visible results of the gold discoveries were nowhere more evident than in the growth in size and elegance of the towns, many of which sprang up like mushrooms. In 1862 Dunedin was like a scattered country village with flax hanging over the road-cuttings, where in a few years many fine buildings were erected. It is now one of the beautiful cities of the Dominion and a centre of industrial activity. Although the spur given by the gold-diggings has long since ceased to act, it may be mentioned that amongst the manufactures of Dunedin of special importance in recent years has been the construction of dredges to lift gold from the river-beds where other methods are unavailing. The magic of gold even extended south to Invercargill, which prospered greatly during the boom years, and then had many lean years, but is now a fine and prosperous town by reason of its rich agricultural surroundings.

I said at the beginning of this rambling screed that truth is stranger than fiction, and one of my reasons for thinking so has ever been that I witnessed part of the transformation caused in Otago by the magic of gold.

JOHN PARDON'S CHOICE.

CHAPTER III.

FINDING it impossible thus, single-handed, to keep his house and look after his cattle, Pardon decided to sell all his live-stock except a few yearlings and colts, and so free his time for the better development of the ranch. The parting with his cattle cost him many a pang, albeit for once in his life fortune favoured him, disease in other states having created a scarcity, so that he got top prices and was able to 'salt down,' as the local phrase has it, several hundred dollars—far more ready money than he had ever before possessed. This cattle 'deal'—its cost to him in no slight regrets—its gain in mere gold—John would much have liked to talk over with Mary Patrick, had he not long since divined, though he could not have explained why, that she disliked the subject, and evinced neither interest nor sympathy in his herds and horses. That she was secretly ashamed of his being a cattleman, and winced when her friends or brothers joked about her 'buccaroo,' certainly never crossed his simple mind.

Hiding in his own heart the hurt of his self-imposed sacrifice, and stowing away in an outhouse the angora 'chaps' and picturesque sombrero, poor John reluctantly encased his long legs in the blue overalls of a peaceful rancher, clapped a broad straw hat on his head, and buoying himself up with the reflection that it was 'all for Mary's sake,' set himself to clearing the land and putting it under the plough. Both occupations, accustomed as he was to life in the saddle, with its days and rides of fierce excitement and no little danger—and then the round-up over, of comfortable ease and little to do until the next 'spurt'—Pardon found not only irksome but profoundly dull. All his resolution and his love for Mary were severely tested thus to endure the monotony and toil of dulling an axe, hour after hour, upon stubborn thickets of manzañita and chaparral, or of plodding at foot-pace up and down the furrows of stiff, unbroken ground, guiding the plough and checking his restive horses, as impatient of their uncongenial task as was their master. However, by slow degrees, the rough land began to assume the well-disciplined appearance of a 'farm'—great circles of whitish-gray ashes, through which multitudes of young green things soon eagerly pushed, were all that survived of vast heaps of 'bush,' laboriously dragged together and burnt; several acres of reclaimed land were fostering a grain crop; last but not least, row upon row of tiny bare twigs revealed Pardon's hope of a future orchard. Entirely ignorant of such things himself, yet loth to incur the ridicule of Mary's brothers by asking advice, he furtively noted and chose for his infant orchard the fruit that Mary seemed best to like—figs, apricots, greengages—quite regardless of what kind or variety was best suited to the soil and able to withstand certain treacherous winds that 'drew down' between the hills upon the exposed parts of Pardon's homestead.

Then, between hope and fear that Mary might guess the reason, he set to work to add a new porch to the old house—one so facing as to absorb every ray of sunshine during the short winter months, yet cool and shaded when the torrid heat of summer stifled man and beast. This porch faced the young orchard, Michael O'Keefe's neat ranch, and looked away to the pine-clad hills, which, with their foreground of dense 'bush,' seemed, in John Pardon's fond fancy, safely to cradle that little sector of country from the outside world, but to Mary always gave the impression of dreary isolation. Happily oblivious of this, born and bred as he had been among the vast open spaces of a great cattle country, long inured to the loneliness of camp and cañon, to John Pardon the unlovely old bungalow and the few acres of cultivated land, filched, as it were, from the surrounding wilderness, seemed a goodly heritage enough, meet in time for the making of a home-nest for Mary, 'once the bird is caught,' as he would say to himself with a happy gleam in his eyes. Again and again he pictured Mary seated with her sewing in Sissy's rocking-chair in the new porch—or tending the small garden that he planned should be her special care. No gardener was this buccaroo, so he contented himself with planting honeysuckle (Mary loved honeysuckle) and climbing-roses against the porch, which, however, killed by devoted but misguided attentions, he ruefully beheld grow sickly and brown. 'Never mind,' he would say, when all efforts with pails of water failed to revive them; ''tain't no consequence. *She'll* make the pore little things grow; I sure bain't no hand with *honeysuckles* whatever I may be with *heifers*—best leave 'em to Mary.' As to Mary, if she guessed, she certainly never admitted, even to herself, that all these changes and 'improvements' had for their inspiration her own future place in them. Several local admirers, and one or two from Orangeville (for Mary was not only well liked for herself, but had more sordid attractions as well), had 'proposed' and been dismissed, while the handsome buccaroo still held his peace. Whether or no Mary was piqued by this, who can say? That it helped to steel her own heart against him, and to make her a little careless as to how her easy acceptance of all his devotion might mislead and ultimately wound him, there can be no doubt. Thus

placidly had things pursued their way until, one late afternoon after a prolonged and successful picnic, Pardon and his now famous colts (horses remain 'colts' long and long in that far country of plentiful winter grass and soft roads) were, as usual, fetching Mary and her lightened baskets home. As usual, too, Mary's contributions to the 'spread,' all skilfully prepared and packed by her own plump little hands, had been the most highly praised and completely devoured by the merry party of picnickers—cakes, pies, 'preserves,' dough-nuts. Not one of the girls could rival Polly as a provider of such toothsome things as are beloved of the western soul; and John Pardon's ever-elastic spirits had steadily expanded with the measure of praise bestowed upon his 'girl.' Yet when, having reached the foot of the long wearisome hill, winding steeply up a cañon from the picnic-ground beside a river (now shrunken and vainly clamouring for fresh supplies from the fleckless blue of the 'dry-season' skies), 'Kate' and 'Custer' claimed their prerogative of taking their own time for the long pull before them, Pardon became strangely grave and silent, while Mary, tired by the long day's outing, and her mind absorbed in trying to remember whether Annie M'Coon had told her to beat the whites and yolks of eggs together or separately for 'white mountain cake,' had almost forgotten the existence of the man beside her. Indeed only partially did it rouse her when John, suddenly twisting around the butt of the whip the long lines with which he had been gently slapping the horses, laid his great brown hand, thus freed, over her own small white ones, holding them very close. He did not even look at her, hence the glow in the gray eyes so resolutely fixed in front of him she could not see, or notice how strained were the muscles of his right hand with which he gripped the iron bar of the buggy-seat. 'Mary,' he began, in a voice which the very effort to control made sound flat and unemotional, 'Mary, nobody knows better nor me that it 's askin' a great deal of a girl like you to leave your own comfortable home and your brothers to live in an old shack and run in double-harness with a rough fellow like me. I 'm a poor man, too, Mary; but if you 'll be my wife, I 'll work these big hands o' mine to the bone to help these little soft fingers of yourn, and to make you '—*happy* he had *meant* to say, but, feeling no answering pressure in the hands he held—'as comfortable as I can,' he ended rather lamely. But Mary neither stirred nor made reply, so Pardon went on, while a quick flush spread over his face, as from shame at having unwittingly detected the flaw in his diamond. 'Y' know, I sold them cattle o' mine at a pretty fair price, considerin', and '—trying to infuse a little fun into his voice—'and so I was able to cage a good many o' them purty "gold eagles" (twenty-dollar gold pieces), all for *you*, my girl, if you 'll have 'em. And the old house—y' know, I 've built a nice big porch for you to set in—and the rooms and furniture are all jest as poor ma and little sis left 'em—never used 'em myself—hadn't no heart to somehow.'

Still no response from the woman at his side. Poor Pardon was finding proposing to Polly a far more difficult task than he had reckoned upon. Quietly releasing her hands, and unwinding the lines from the whip-butt, he gave his horses a sharp flick, saying, 'Ged'ap, you good-for-nothin' team o' oxen! Are we to be on the road all night?'

The buckskin horse sprang forward, but 'Kate' merely flattened her ears, swished her long tail across the place that the lash had caught, speedily reducing her mate to his former sleepy gait. No horse more willing than 'Kate'—but not to be imposed upon; right well did she know they had not yet reached the bend of the hill, where, the steepness left behind, they were always put to the trot. There was no impending thunderstorm against which 'twere well to match her speed; doubtless, too, in her own equine fashion, she reflected that the cooler and drier she and 'Custer' took home their sleek hides, the sooner would they be allowed a bountiful supper of crushed barley. No, 'Kate' was not be hurried.

Into the puzzled obscurity of Pardon's brain this display of feminine wilfulness shot a ray of light; it flashed through his mind that all females must be *humoured* a bit! So, dispelling the gloom that had begun to gather on his face, and turning half-gaily towards Mary, he broke out, 'Don't think I want to *hurry* you, girl, if you don't feel just quite ready to hitch up. I 'm willin' to wait, if needs be—I 'll put in next winter tidyin' up the old place a bit more—and then—in the spring—eh, darlin'?' he ended tenderly.

Mary's mind had been working fast, yet she had no answer ready, and Pardon, seeing her still mute and unmoved, and the suspense no longer bearable, exclaimed, 'For God's sake, Mary, say somethin'. You 're breakin' my heart. Don't you know it?'

At that instant a wheel of the buggy, carelessly left to the horses' discretion, jolted violently over a large stone, flinging the two occupants together, and at touch of the girl's soft body, and her hands instinctively catching hold of him, all Pardon's self-control broke down. Crushing her in his arms, and kissing her again and again, he called her all the caressing names that spring to the lips of even the coldest of lovers, pouring out the story of his love and yearning for her since first he saw her at the well beneath the drooping fig-tree.

It was, however, John Pardon's misfortune that he had begun his plea at the wrong end. By prefacing his declaration with a grave review

of all its disadvantages he had unconsciously touched on Mary's weakest point, and conjured up a picture distasteful and repugnant to one who set such store upon creature comforts. The shabby old house, the isolated, poorly-cultivated ranch—to exchange her own easy, pleasant surroundings for a wedded life such as John suggested, was not at all to her mind. And what would her friends say? Fragments of Maggie's letters about the 'furnished flat' in the bustling little town, and of Daisy's superintendent of schools and consequent social prestige, had been racing through her mind during Pardon's slow and halting proposal. Even his allusion to the few hundred dollars he had banked served merely as a reminder of what she most resented —her lover's career as a buccaroo, and of the long years of hard work necessary before, from the rough acres of his dreary ranch, he could win any degree of competence. His passionate appeal, therefore, fell upon an ear already deafened by another voice, and in her self-centred imagination drawbacks which, had she really loved the man, would have appeared mere molehills, were exaggerated into mountains. Disengaging herself from his arms and straightening her hat, she began pettishly smoothing her crumpled dress of dainty flower-strewn muslin, exclaiming, 'Nonsense, John! Don't be foolish. I—I don't *want* to be married.'

Poor Pardon, thus rebuffed, and feeling unaccountably guilty, tried to assist in smoothing her skirt, but detecting a look of annoyance as his hand, moist and blackened by the dusty reins, left a dark smudge on the fair frock, he mumbled contritely, 'I'm no end sorry if I've messed up your purty dress, Mary. Guess I'd best leave it alone.'

Mary, still intent upon her crushed frock, exclaimed, with a touch of impatience in her manner, and avoiding looking at the dejected man beside her, 'Can't you hurry those horses of yours a little, John? It's getting late, and the "boys" (her brothers were still 'the boys' to Mary) will be wanting their supper; *they've* been working all day.'

Mary's speech and ever so slight emphasis on the pronoun '*they*' hurt Pardon to the quick; his face grew set and pale beneath the tan, and jumping lightly over the slow-moving wheel, he went to his horses' heads, saying over his shoulder, 'I reckon I'll just walk up this here steep bit; the colts'll travel fast enough once they hit the level road for home.'

Mary, thus left to her own reflections, began to feel some compunction on behalf of the man who, after all, had devoted his day to her pleasure, and now, after seeing her safe back in her own snug home, must return to his lonely house and solitary meal. So when, the hill-top reached, John gathered up the lines preparatory to jumping into the buggy, as the colts, true to their traditions, broke into a sharp trot, Mary ostentatiously made room for him beside her, turning back the dust-sheet, and under pretext of settling a basket that had jolted forward, said pleasantly, 'There are some of those doughnuts you like so much left over—and some biscuits; you'd better take them home, John; you'll be hungry by the time you get the horses fed and your work done.'

Poor Pardon, feeling that Mary was thus generously forgiving him for having in some unintentional way displeased her, thanked her gratefully, and thereafter, as though no words of love had passed between them, began to chat and joke about the picnic and the 'folks' who had been there. Only 'Kate' and 'Custer,' sensitive to every mood of their owner by his handling of the lines, knew by the unwonted fretting of their bits and frequent flicking of the long whip, that things were not just to Pardon's liking that lovely summer evening. So instead of pulling, as they invariably did, the wrong way at the cross-roads, which diversely led to the Patricks' and Pardon's ranches, to-night they merely cocked their ears and turned their noses towards the narrow, little-used road curving away into the 'bush,' and speeding down the dusty high-road, drew up, unbidden, at the Patricks' gate. Up the neat, flower-bordered path Pardon carried Mary's baskets; then, as their hands met while she gave him the remaining contents in their spotless napkins, he detained her a moment, saying hurriedly, 'Polly, girl, forgive me havin' spoiled your outin', but if you'll give me just a word of hope, and let things go along as they were before, I promise not to bother you—you'll do that much, won't you, Mary?'

Mary, somewhat softened and a little conscience-smitten, and selfishly anxious to retain her lover, readily acquiesced in his wish that the same pleasant footing should abide between them—she nodded, 'Yes,' and Pardon, returning to his impatient horses, drove away, his mind in a turmoil between hope and depression.

For some time thereafter things flowed on in the old way, and John, loyal to his promise not to 'bother' Mary, and still striving to find comfort in his theory as to creatures of the feminine gender needing to be humoured, continued his unselfish devotion to the one woman of his choice. Never a trip to Orangeville but a box of chocolates or fresh dates or some other small offering found their way into the 'jockey-box' for the brown-eyed girl in the village among the hills. Or if Mary herself had 'shopping' to do, John's buggy was unfailingly ready for her use —washed and rubbed till the blue and red paint shone again, the colts as 'slick' as muscles and brush could make them; and John himself, in Sunday clothes and black felt hat, would drive her into 'town,' patiently waiting while Mary lingered over a choice of ribbons or dawdled along the street looking at the shop-windows.

On more than one occasion, however, an outing such as this ending under cover of darkness, Pardon's resolution had broken down, and he had again declared his love, and pled for her acceptance of it. But Mary always contrived to evade the answer for which he longed, sometimes laughing it off, or pleading she was too tired after her shopping to even *think* about 'marriage,' yet careful never so finally to refuse him as to crush his hopes, and set his mind free to seek a wife elsewhere.

Yet the longest lane has a turning, and when another succession of seasons found poor Pardon still a bachelor and the wedding-bells no nearer ringing, he resolved one Sunday evening, when, as was his invariable custom, he was spending it at the Patricks' home, to exact from his sweetheart a decided 'Yes' or 'No.' But the Fates, who apparently delight to thwart by the veriest trifles the best-laid plans of mere man, again intervened to shape his destiny. For Mary's mind, full of a question that had taken possession of it at mass that morning, as to whether, if she made her new dress in the same fashion as that of Annie M'Coon, who was slender, it would make her look 'dumpy,' scarcely listened to what John was striving to bring her to say. Moreover, having squeezed her feet into too small shoes, she was feeling tired, and anxious for John's visit to come to an end. Suddenly he noticed that the girl looked unwontedly pale, and dark shadows were under her eyes. His kind heart and almost quixotic conscience smote him as he thought how completely he had broken his promise to Mary not to 'bother' her, and, turning impulsively, he exclaimed, 'It's God's truth, Mary, that I never meant to make you grieve or fret, and if you don't feel able to say you love me and care to be my wife, it's not for me to keep worritin' the life out o' you. You know now that there isn't in the wide world any woman for me except yourself; that my home, such as it be, is yourn for the takin'. But as I'm a livin' man, I give you my word, girl, I'll not torment you no more with *askin'*. Here's my hand on it'—and he stretched out a hand that in spite of its hard muscles, shook a little—'but only this much let me do. When we say "Good-night" of a Sunday evenin', I'll say to you, "Well, Mary?"—and oh, my little girl, if you can just feel a tiny bit as *I* do, ye don't need to *say* a word—just fly into my arms, and I'll keep you warm and safe so long as the Good Man gives me health and strength.' And Mary Patrick, unequal to the sacrifice of herself, unhesitatingly permitted the sacrifice of John Pardon.

(*Continued on page 666.*)

PREDICTIONS AND PROPHECIES RELATING TO THE KAISER, GERMANY, AND AUSTRIA.

By R. C. WYNDHAM.

THAT visions of future events and the gift of prophecy have been vouchsafed in all times to certain individuals cannot be doubted, for we have the evidence of Holy Writ to confirm this; but very often these predictions are obscure and difficult to unravel until the event foretold actually happens. Then we call to mind the prediction made, perhaps centuries before, and we palliate our unbelief with the example of the Trojans of old and the story of Cassandra.

Daniel's vision of the 'Four Great Empires' happened in the year 606 B.C. Of the Fourth Empire the prophecy says, 'A king of fierce countenance shall arise, understanding dark sentences (lies). His power shall be mighty, and shall prosper and practise, and shall destroy the just people. Through his policy also he shall cause guile to prosper; he shall magnify himself in his heart, and shall destroy many; he shall also stand up against the Prince of Princes, but his power shall be broken.'

The time appointed for the fulfilment of the prophecy was 'Seven Cycles,' and as each cycle represents 360 years, so seven times 360 would equal 2520. As the prophecy was delivered in the year 606 B.C., as before stated, then by subtracting 606 from 2520 we get the number 1914, the year the present war broke out, the greatest war the world has ever seen, as prophesied by the prophet Daniel and St John the Divine, which shall only end with the great 'Armageddon.'

St Peter, in his address on the day of Pentecost, quotes the words of the prophet Joel: 'Your sons and your daughters shall prophesy, and your young men shall see visions, and your old men shall dream dreams.'

Having these examples before us, why should we deny the gift of prophecy in these latter days? We see prophecies and predictions given four and five and even seven hundred years ago being wonderfully fulfilled in our own time.

In a book entitled *Vaticinium Lehninenses*, written by a monk in the thirteenth century, the end of the Hohenzollern dynasty is predicted to happen consequent on the events of the year 1914. Now it is to be noted that the rise of that dynasty began only with Frederick of Hohenzollern, Burgrave of Nuremburg, in the fifteenth century, when the Emperor Sigismund conferred the Mark of Brandenburg upon the said Frederick in 1417. After the death of the

Elector Frederick William in 1688, Prussia became a kingdom, and Prussian militarism began to show itself, but the end of this was foreshown, not a century later, by an old poet, who, in the year 1762, wrote thus: 'The last Emperor of Germany shall be paralysed in the arm, and will mount his horse on the opposite side.' This corresponds exactly with the case of the present Emperor. And the prediction adds, 'His son shall be killed at the gates of Berlin; in that year Poland shall have its own king.'

The celebrated *Prophecies of Strasbourg* and also a Hermit of Aix-la-Chapelle predict the fall of the German Emperor to occur at this same period.

PROPHECIES OF JOHANNES THE MONK, ABOUT 1600 A.D.

1. It will have been thought that the Antichrist has frequently been identified, for all slayers of the Lamb have a resemblance, and all evil-doers are found to be typical of the Great Evil.

2. The veritable Antichrist will be found to be one of the monarchs of his day, a Lutheran. He will invoke the Name of God (the Good Old God), and will claim to be His successor.

3. This Prince of Liars will swear by the Scriptures; he will represent himself as the instrument of the Most High, to chasten the wicked.

4. He will have but one perfect arm, and his innumerable troops will take for their motto, 'God is with us,' and will appear as the legions of hell.

5. For a long time he will agitate by ruse and felony; his spies will overrun the world, and he will be master of great secrets.

6. He will employ philosophers who will attempt to prove that his mission is celestial.

7. A war will cause the mask to be lifted. This war will not be simply against France, but chiefly against another distinguished Power, and in a short time the war will become universal.

8. This war will enlist all the peoples of Christendom; and also Mohammedans, and those from afar. Armies shall arise from the four corners of the earth.

9. The Angels will enlighten the souls of men, and in the third week they will recognise that this is the Antichrist, and that they will all be enslaved if they do not overthrow this despot.

10. The Antichrist will be recognised by many indications; he will go out of his way to massacre priests, monks, women, children, and the aged. He will go forth torch in hand, like the barbarians, and will show no mercy while he blasphemously invokes the Name of God.

11. His pretentious words will resemble those of the Christians, but his actions will be those of Nero and the Roman persecutors. He will have an eagle in his coat of arms, and another eagle will appear in that of his Ally, the other bad monarch.

12. These are Christians, but one of them will die by the malediction of the Pope Benedictus, who will be elected towards the end of the reign of the Antichrist.

13. There will no more be seen any priests, simply to absolve the combatants, for priests and monks will fight as well as other citizens; and further, the Pope Benedictus will have cursed the Antichrist, and it will be proclaimed that those who fight against this despot will find salvation, and dying will straightway be translated to heaven like the martyrs.

14. The Papal Bull which proclaims these things will resound afar, and will give fresh courage to the brave, and carry death to the allies of the Antichrist. The defeat of the Antichrist will demand the death of more men than Rome ever contained.

15. It will need the united efforts of all the Powers, for the Cock, the Leopard, and the White Eagle will not make an end of the Black Eagle if the prayers and wishes of all humane people do not aid them.

16. Humanity has never before known such great peril. The triumph of the Antichrist would be that of the Demon of whom he is the incarnation.

17. It has been said that twenty centuries after the Incarnation of the Word, the Beast will in his turn incarnate, and menace the world with as much of evil as the Divine Incarnation brought of good.

18. In the twentieth century the Antichrist will manifest himself. His army will exceed in numbers anything that has ever been imagined. There will be Christians among his followers, and there will be Mohammedans and savage troops, and there will be Mohammedans and also savage troops among the Defenders of the Lamb.

19. In all Christendom there will not be even a small space that is not red—sky, earth, water—and even the atmosphere will be all red, for blood will flow into all the four elements at the same time.

20. The Black Eagle will hurl himself at the Cock, who will lose many feathers, but will use his spurs heroically. He would speedily be reduced but for the aid rendered him by the Leopard and his claws.

21. The Black Eagle will come from the Lutheran country, and will surprise the Cock, and will invade much of his territory.

22. The White Eagle will come from the northern side, and will surprise the Black Eagle and the other Eagle, and will invade the country of the Antichrist.

23. The Black Eagle will be forced to retreat from the Cock, and the Cock should follow him into the country of the Antichrist, to help the White Eagle.

24. None of the battles which have taken

place hitherto up till now will have been anything equal to those which will take place in the Lutheran country, for the Seven Angels, spoken of by the Divine St John, will now pour out the fires of their vials of wrath on the impious land, which signifies that the Lamb will ordain the complete extermination of the race of the Antichrist.

25. When the Beast sees that it has lost, it will become furious and will work destruction, and for some months the beak of the White Eagle, the talons of the Leopard, and the spurs of the Cock will rend it. Rivers will be forded by means of dead bodies, which will divert the course of the waters. Only the very distinguished, such as Generals and Princes, shall be interred, for the carnage of the war will be heaped together with the victims of plague and hunger.

26. The Antichrist will on several occasions sue for peace, but the Seven Angels will go before the Three Animals and the Defenders of the Lamb, and will proclaim that peace shall only be accorded on condition that the Antichrist be crushed as straw in the thresher.

27. The Three Animals and the Agents of the Lamb cannot stop fighting whilst there remain soldiers of the Antichrist.

28. What makes the decision of the Lamb so implacable is that the Antichrist has pretended to be a Christian, and has blasphemously acted in the Name of God. If then he does not perish, the fruit of the Redemption will be lost, and the gates of hell will have prevailed against the Saviour, and this cannot be.

29. This will be no human war. The Three Animals and the Defenders of the Lamb will exterminate the last army of the Antichrist, but the battlefield will be made a charnel-house as large as a big city. For the dead will have transformed the place, making it a chain of hillocks.

30. The Antichrist will lose his crown, and will die in solitude and in insanity. His empire will be divided into twenty-two states, but none of them shall have either a fort, an army, or a ship.

31. The White Eagle will drive out the Crescent from Europe, where there will remain none but Christians. The White Eagle will then establish himself in Constantinople.

32. Then shall commence an era of peace and prosperity for the world, and there shall be no more war; each nation shall be governed by its own conscience, and will live in justice. Then peace shall reign and happiness shall dawn on the human race.

Such are the extraordinary predictions of Johannes the Monk, uttered over three centuries ago, much of which we see already fulfilled by the present war, but the end has yet to come.

Paragraphs 2 to 8 show clearly the figure of Kaiser William II. as if his name was actually mentioned; especially paragraph 4, where it says, 'He will have but one perfect arm.' It is well known that part of the left arm, as well as the left leg and all the left part of the body of the Kaiser present symptoms of atrophy. In fact, for half an hour after his birth he was thought to have been still-born. Well for the world had it been so.

Again the prediction says, 'His innumerable troops will take for their motto, 'God with us.' What presumptuous arrogance!

Professor Rheinfeld Seehy, lecturer in the university of Berlin, preached on Sunday, December 29, 1915, in the cathedral of that city, before the Kaiser and a crowded audience, exhorting his hearers in the following manner: 'As the Almighty gave His Son to be crucified so that the work of redemption should be completed, so Germany is destined to crucify humanity, to secure its salvation. Humanity must be saved by bloodshed, by fire, and by sword. For Germans this is a holy cause which they must not neglect, unless they commit a crime. Our beloved Emperor for long years laboured to maintain the peace of the world (?), and it is exactly on account of our purity (?) that we have been selected by the Almighty as the instrument to chastise the evil-doers, and to combat with fire and sword the wicked. This is the divine mission of Germany, and it is therefore the duty of every German soldier to burn their houses and destroy them root and branch, by every means in our power, without pity. Pity to the enemy is a crime in the sight of the Almighty. Satan himself has come into the world under the form of a great empire (Britain). *Gott strafe England* ('God punish England') should be the watchword of every German, ay, even in the mouths of babes and sucklings. When this work of destruction is done fire and sword shall not have been in vain. The reign of justice shall be established on earth, and the German Empire shall have created it (?), and will protect it.'

To return to the Prophecies of Johannes the Monk, paragraph 5 says, 'His spies shall overrun the world, and he shall be master of great secrets.' How true this is of the Kaiser and his Government!

Paragraph 10 tells us, 'He will go out of his way to massacre priests, monks, women, children, and the aged. He will go forth torch in hand, and will show no mercy.' Belgium and France can testify to the truth of this.

In paragraph 11 we read, 'His pretentious words will be those of a Christian, but his actions will be those of Nero and the Roman persecutors.' Paragraph 3 bears on this where it says, 'This Prince of Liars will swear by the Scriptures, and he will cause himself to be represented as the instrument of the Most High, to chastise the wicked.' Can words be plainer or point more significantly to the Kaiser?

The example given above of Professor Seehy bears out paragraph 6, but is only one out of thousands. Such a rodomontade of sycophancy, and such expressions of barbarous cruelty make civilisation shudder, and arouse universal anger and contempt.

But the tide has turned, and to-day, instead of their *te deums*, their churches resound with the *de profundis*. Germans would be glad of peace now, many of them on any terms.

Paragraphs 12, 13, and 14 fill us with amazement! Does the present attitude of the Catholics of Canada and the United States of America, headed by Monsignor Bonzano, Delegate Apostolic at Washington, foreshadow the fulfilment of this part of the prediction? Time will tell.

Paragraph 26 says, 'The Antichrist will on several occasions sue for peace.' Has not the Kaiser on several occasions sued for peace both covertly and openly? But peace shall not be accorded until his armies are crushed 'as straw in the thresher.'

How aptly this paragraph fits in with the answer of the Entente to the Peace Note of President Wilson last January!

What shall be said of the vision of the angels at the battle of the Somme, seen by hundreds of hard-headed English soldiers, who cannot be accused of superstition, or of too much credulity in modern miracles? But it has been well said, 'There is more in heaven and earth than we dream of in our philosophy.' What then shall we think of paragraphs 9 and 26?

Another prophet, even earlier than Johannes the Monk, Thomas Joseph Moult, about the year 1500, gives us the following predictions relating not only to Prussia and Austria, but also to Italy and Russia. 'In 1793 there will be the violent death of a Great Queen' (Marie Antoinette, Archduchess of Austria).

'In 1859 there will be a new form of government in a kingdom.' Doubtless this refers to the Independence of Italy, achieved about that time. 'In 1915 a great treachery will be hatched in a European Court.' Would not this refer to the treason hatched in the Russian Court by the false monk Rasputin and others, with the connivance of the German Czarina? 'In 1917 there will be a new form of government in a great empire.' There can be no question of the fulfilment of this, in the events which have just happened in Russia, for mark the difference in the two predictions. That for 1859 speaks of a kingdom, while that of 1917 mentions a great empire.

EXPLANATION OF THE SYMBOLS USED BY THE MONK JOHANNES.

The Black Eagle represents Germany.
The White Eagle represents Russia.
The Other Eagle represents Austria.
The Leopard and his Claws represent England and her Colonial Allies.
The Lamb represents The Spirit of International Justice, Liberty, and Honour, of which Christ, the Lamb, is the Fountain-Head.
The Agents and Defenders of the Lamb represent The Armies of the Entente.
The Antichrist represents The Spirit of Evil animating the Black Eagle and his Allies.

Guile and deceit were to be characteristics of the Antichrist, and it must be admitted that the duplicity and cruelty inherent in the Hohenzollern family, not to speak of Germans in general, are but the ultimate expression of a two-century policy, which, from Frederick II. to the present Kaiser, has constantly exalted force, deceit, and guile, in opposition to justice and honour, denying these principles in international rapport. As far back as 1848 Cavour revealed the cupidity of Prussia for Belgium, and since 1870 the acquisition of that country was for Germans a work to be accomplished. All Germans have looked forward to this, and none but a German could invent the excuse for the invasion—namely, that Britain had intended to make of the country a fortress from which to attack Germany. Conquest has been the aim of every German for long years, more especially since the advent of the present Kaiser to the throne. Many years ago the writer of this article heard a German in London say, 'One-half the trade of London is in the hands of Germans, and I hope to see the other half also.'

Even the two social classes in Germany, which for different reasons should be imbued with the spirit of internationalism—namely, the intellectual section and the populace—are confirmed militants, and the war now raging shows with a fierce light the moral unity of Germany, displaying, in all its hideous nakedness, Teutonic barbarity, surprising even to those who before held what they conceived to be the lowest idea of German humanity. 'Act like Huns,' says the Kaiser to his soldiers, but they had no need of the stimulus. In horror we pass from wonder to wonder, on learning what the German press and the leaders of the German people say and do, and on seeing them, like the foul fiend, gloat over the massacre of feeble women and children, unoffending priests, nuns, and travellers by sea, whether enemies or neutrals, and the wholesale destruction of property, families made desolate, widows and orphans crying to heaven for vengeance. Even when compelled to retire from before the advancing forces of the Allies, the German soldiery, *by order of their commanders*, lay waste the districts they are forced to evacuate, carrying off the inhabitants and their goods and property into worse than slavery. Already in 1870 all the German hordes, the Prussians and Bavarians especially, had inaugurated this system, 'to terrorise the enemy,' as one of their commanders said at the time. In the present war they have gone even beyond this, and have

displayed a vandalism which outvies the vandalism of the ancient barbarians—burning all the houses of the districts from which they have been driven, setting fire to the property they could not carry off, laying waste fields and gardens, uprooting fruitful trees, and rifling churches or levelling them to the ground. But the greatest crime of all is the violation of the tombs and graves of the dead for the sake of the metal and jewellery to be found in them; rifling the dead of their leaden coffins; and robbing the graves of what they could get. Hear the report given by the correspondent of the *Daily Mail*, in the issue of that paper for Thursday, March 29, 1917. 'Looking for the first time at the ruins in the liberated land, the natural comment was that the Germans had left no one unrobbed, except the dead; but these judgments have turned out too favourable to the Boches, who have not only broken open the vaults in the country churchyards to make machine-gun shelters, but pillaged the graves for the zinc and lead linings of the coffins.

'At Champier, near Nesle, the cemetery has been torn up as if by ghouls, coffins broken up, and the remains of the dead scattered about and filth thrown into the graves. The same thing has been done at Margny-aux-Cerises, Laucourt, and Roiglise. It is evident that robbery was the only motive, because only the tombs of the well-to-do were treated in this fashion.'

For generations to come, the very name of German will be odious, and stink in the nostrils of all civilised nations. And let us remember that it is not only in the districts where the war is being carried on that this diabolical work is practised. German spies and German incendiaries are to be found in all lands, fomenting rebellions and wantonly destroying the property of neutrals, and this they call 'legitimate war.' Was it legitimate war to sink the *Lusitania*, and the many ships of neutral nations, as well as those of belligerents; to destroy factories and property in neutral America? Was it legitimate war to murder Miss Cavell, or to shoot Captain Fryatt?

German statesmen hurl invective against the enemy outvying in the coarsest language the lowest of the populace. Generals laud the pillage of conquered cities, and declare openly that the life of a German soldier is worth many cities of the enemy. In this too they are inconsistent, for they hound their soldiers to their death recklessly on the battlefield.

Princes exalt assassination and poets sing of undying hatred and odium. *Gott strafe England* is the burden of the song taught even in the infant schools. The German Chancellery openly professes the secret maxim of lying and deceit, and insults the enemy as a drunken wanton would a rival of her own ignoble calling.

At the very dawn of the nineteenth century, from the execrable Von Clausen to the no less brutal Bismarck, the German leaders of the people have inculcated the principles of the so-called 'absolute war.' 'Leave nothing to the conquered but their eyes to weep,' says Bismarck. And Bethmann-Hollweg says, 'Necessity has no law. What are treaties but scraps of paper?'

Low cunning, lying, and unheard-of cruelty have characterised this war as far as Germany and her Allies are concerned, as history will show. What greater hypocrisy, deceit, and lying could there be than in the excuse given by the Kaiser for the submarine piracy *à outrance*? At best it is a tardy excuse. What of the sinking of so many ships before Kaiser William found his transparent excuse? The obvious fact is the Kaiser, feeling that his powers approach exhaustion, would deceive his own people and make neutrals believe that by a cowardly stab in the back, as it were, or by a shot from behind a hedge, he could force peace on his own terms, and that speedily. Protests against this cowardly warfare—if we can call it warfare—have been sent to him from every nation; but for the minor nations who unfortunately live on the borders of the marauders, and who for the pirates would be a *bonne bouche*, 'discretion is the best part of valour.' Even for these nations this thraldom will cease before long.

O. W. C.

'The rest is silence.'

By Lady Skerrington.

One word, Oh God! Let just one word float backwards,
Across the restless tide,
That stretches to the far, unseen horizon—
A waste of waters wide.

I pace along the shore, and o'er the shingle:
No sound comes back to me
Except the ripples, that are ever breaking,
Of that relentless sea.

With straining eyes I watched his vessel sinking
Far out of sight;
And never have I seen him since, my loved one,
Save in the dreams of night.

Only in fancy can I see him near me,
Smiling in youth serene:
Yet in my dreaming I am ever haunted
By the 'What might have been.'

And in my dreaming I can hear his laughter,
Infectious, blithe, and gay,
Until I find, sometimes, that I am smiling
As in that bygone day.

The little jests, so frivolous and foolish,
Within my heart remain:
Only the voice that gave the jests their value
Sounds to me not again!

Is there no tiniest chink, Oh God, to westward,
In that far, golden gate,
Through which may filter sounds, however faintly,
To those who wait?

RECOLLECTIONS AND REFLECTIONS.

By C. L. G.

EDITORS may be divided into two classes, those who write and those who edit. The purely editing editor, who confines his energies to giving instructions, revising articles, keeping in touch with the people who count, and generally dominating the situation in his office, is becoming rather a rare bird nowadays. But some of the very greatest of the tribe belonged to this class—Delane in particular, who during the whole tenure of his editorship of the *Times* did not write more than two or three articles. As compared with the product of some leader-writers, his contribution was infinitesimal; but volume is no sure criterion of value, though Vauvenargues tells us that *les meilleurs auteurs parlent trop*. There is a story of the Rev. Thomas Mozley, who for many years wrote leaders for the *Times*, submitting a book to a publisher, who asked him if he had ever published anything before. Mozley replied, 'Two volumes of sermons, and about seven thousand leaders in the *Times*.' But Delane was no *roi fainéant*, as may be learned not only from the biography written by his nephew, but from the very interesting paper of reminiscences contributed a few years ago to the *Cornhill* by Dr Wace, the Dean of Canterbury, who was formerly one of Delane's leader-writers. No one kept a firmer hand on his staff or acted more consistently in accordance with his conception of the duties and responsibilities of an editor. Any irregular intervention he strongly resented, and he occasionally turned the tables with deadly effect on the intervener. Thus it is told that a well-known journalist, who in his earlier days was an occasional contributor to the *Times*, was asked by the head of a firm of brewers if he could procure the insertion of a paragraph describing the festivities held at the coming of age of the brewer's eldest son. The journalist promised to do his best, wrote an account of the celebration, and submitted it to a friend on the staff of the paper. It was set up in type and included in the 'make-up,' but unfortunately at the last moment it caught the eye of Delane. As we have seen, he hardly ever wrote for his paper, but he often supplied piquant headings to items of news, and so the unfortunate paragraph duly appeared under the title, 'Ale Kings at their Revels.' Some highly efficient editors, while showing a remarkable *flair* in the choice of writers and in controlling their pens, have abstained from writing because they could not write. There was one who wrote such an extraordinarily bad hand that it was said to be a deliberate device to conceal his inability to spell. Delane wrote in an admirably trenchant style, as his letters abundantly prove; his abstention was simply due to his belief in the Napoleonic maxim, '*Il faut se borner*.' Other great editors in the past were contributors to their own columns, and of these perhaps the most notable were Russel of the *Scotsman*, and Hutton and Townsend of the *Spectator*, who for many years between them wrote the greater part of the paper. Their partnership was a remarkable instance of the loyal and effective collaboration of two men who differed widely in temperament, and yet, unconsciously no doubt, approximated so closely to each other in expression that even constant readers were often mistaken in the ascription of their articles. Nothing could have been more unlike than their handwritings. Hutton wrote a minute and sketchy hand, while Townsend's characters were large and round, like those of a schoolboy. When he went out to India in the 'forties' to join the staff of the *Friend of India*, Townsend's handwriting was so bad that the compositors registered a formal protest. He consulted his chief, Mr Marshman, who advised him to double the size of his script. He took the advice, acted upon it to the end of his life, and never gave any more trouble to the compositors. As a cure for illegibility the device is worth recording, but nowadays dictation to shorthand writers and the use of the typewriter renders its adoption less needful. The evils of dictation, unless the product is regarded as a rough draft to be rigorously revised and condensed, are too obvious to call for comment. People who dictate are rarely self-critical. But the convenience of being able to read contributions in type-script instead of manuscript is very great. An editor can arrive at a decision in half the time taken in mastering an unfamiliar handwriting. At the same time, the typewriter obliterates the personal note in the look of a contribution. It is impossible not to form a sort of general idea of a contributor from the look of his manuscript. Some handwritings

 [*All Rights Reserved.*]

are positively repellent, but calligraphy is not always a proof of mental power. Scholars are nearly always recognisable from the influence of writing much Greek, and, to speak broadly, a well-turned-out manuscript is generally worth reading.

The outside contributor is a strange animal. He will sometimes send a contribution four or five times the maximum length of the articles which appear in the paper he approaches. And the nature of the article submitted often shows a complete disregard or ignorance of its views or tendency. Journalists who study these points and have something to say are bound to succeed. No diplomas are needed in journalism. Any editor worth his salt is always on the lookout for talent, and ready to acknowledge and enlist it. There have been editors, as we have seen, who, without being scholarly themselves, have had an unerring instinct in the choice of men who wrote well and could be trusted to maintain the literary quality of the paper at a high level. Others, less self-protective and more negligent, have never troubled themselves about such niceties. I remember as a boy, when Tyndall delivered his famous presidential address at the meeting of the British Association at Belfast and fluttered the clerical dove-cotes, how a clergyman wrote in protest to the Dublin *Daily Express*, and signed himself, using English characters, *Tou gar kai genos esmen*. Unluckily his handwriting was not very clear, and the signature appeared as *Ton gar kai geros soner*. A couple of days later another letter appeared, the writer of which alluded to 'Your correspondent Mr T. G. K. Soner.' Even in these days of anti-classical reaction and tirades against the futility of schoolboys learning Greek, I doubt whether such a blunder would have appeared in a paper of any standing. But editors are not always infallible. It is not so long since a London daily was imposed on by an ingenious contributor, and printed on the 1st of April an article describing in great detail some new mechanical invention, full of 'bosh' technical terminology of the most delicious absurdity; while another journal within the last fifteen years or so published a letter on the habits of a bird at a zoological gardens in South Africa which was boldly described as a 'semi-Bombay duck.'

Later still the charming fantasy which Sir J. G. Frazer (the author of *The Golden Bough*) prefixed to his selection of Addison's Essays was regarded by one reviewer as a record of experiences which had actually taken place. An editor should not be grossly ignorant or credulous, but personally I should be sorry to see the tribe so perfectly equipped by knowledge and scepticism as to be proof against all the arts of the literary hoaxer. They are sometimes illegitimate and cruel, but there are occasions on which they simply minister to mirth. The most perfectly successful and the most riotously ludicrous of these impostures is that related by Mr Eric Parker in his delightful *Eton in the Eighties*, when he describes how for months a group of clever Eton boys supplied the editor of a London magazine with correspondence describing the special games, customs, &c. at Eton. These letters were triumphs of circumstantial absurdity, and, to crown all, the editor was actually invited down to Eton, where some of these bogus customs were enacted for his edification. The history of this hoax is recorded in a little volume unhappily out of print, but the full story remains to be told, and when the name of the editor is disclosed, amusement will give place to wonder and—in some quarters—to intense delight.

My experiences of editors who really edited their contributors' articles have been diversified, but, with one notable exception, they have inspired me with gratitude. I don't suppose I ever wrote anything which did not gain from condensation; and when, in the exercise of editorial functions, I have had to retrench my own work to meet the demands of the make-up —'Please cut out twenty-four lines,' or half a column, or whatever it was—the process, though sometimes painful, has nearly always resulted in improvement. Writers like myself who are not troubled with exuberance of ideas are irresistibly impelled to pad out their scanty stock with irrelevant upholstery. The blue pencil is to them a boon. The exceptional 'editing' editor to whom I have referred above was one of the most brilliant and stimulating journalists of his time, but his method of dealing with contributions was to rewrite them largely in his own trenchant style, and the consequences were occasionally electrifying to the author. As the editor of a weekly journal published in the provinces he had gathered round him a remarkable band of clever young men, several of whom have since achieved marked distinction in the world of letters. My association with his journal was brief and undistinguished. I only wrote two or three papers, one of which was devoted to a somewhat depreciatory estimate of a popular humorist, whose signal abilities I came in later years to hold in high admiration. But when I ventured to criticise certain blemishes in his work, I never expected to find my mild rebukes turned into ferocious censure by the addition of such a phrase—inserted after a quotation from the author under review—as 'It is vomitable, but it pays.' The editor knew no moderation in praise or blame; he made divinities of his idols and cast his pet aversions on to the dunghill. That was my last contribution to his paper, for shortly afterwards he published a savage article on another editor, one of the first and the most generous of my patrons, holding him up to contempt as a literary Stiggins and his paper as an asylum for maudlin sentimentalists,

adding that every one who wrote for it was obliged to adopt the style of the editor. As a matter of fact, the fault of the editor in question was that he did not revise the work of his contributors half enough—*experto credite*—while his castigator carried the process to lengths which I have already illustrated. My subscription to his paper had several months to run, but I wrote to the publisher to say that, in consequence of this article, I requested that no more copies should be sent to me. Soon afterwards I received a very friendly letter from the editor, saying that he was not going to take back a word of what he had written, but that he sincerely regretted the severance of my connection with his paper. I gathered from those who knew him better than I did that he would have respected me far more if I had taken up the cudgels for my friend with equal ferocity to his own. But I made no sign, and was content to be quit once and for all of any further personal association with the most brilliant of the tribe of Bludyer. I never told the other editor, but he heard of my action from a common friend, and wrote me a characteristic and charming letter, expressing his lively regret that I should have given up my connection with the paper that had attacked him. He had read the article, and the passage describing his own paper as a 'hospital for diseased cats' had given him 'the first hearty laugh he had had for many months' —his life was then clouded by grievous domestic anxiety.

One belongs to one's own generation, and can never perhaps fully appreciate the typical representatives of the next; so I may be pardoned for thinking that the editors of thirty and forty years ago were more interesting and remarkable men than their successors. Amalgamations and associations may earn huge dividends for shareholders and bring colossal incomes to their directors, but they do not throw up Bagehots or Delanes, Townsends or Huttons, Greenwoods or Henleys. The days of the independent and despotic editor are past; the competent organiser reigns precariously in his stead, acting as a sort of buffer state between his proprietor (or proprietors) and his staff, or endeavouring to reconcile the conflicting claims of policy and commercialism. The notion of giving an editor an absolutely free hand is incompatible with the principles which govern modern journalism—except in the rare instances where the editor is also proprietor, or, still rarer, where a periodical is organised on a non-commercial basis. Of this Utopian system there is at the moment one conspicuous and admirable example which aims at enlightening and clarifying rather than inflaming public opinion. But to say more about it would be derogatory, for it dispenses with advertisements of all sorts, and has gained in prestige, influence, and independence by this self-denying ordinance. Some editors are responsible to a board, and their position cannot always be a bed of roses. I knew one not many years ago, and on my meeting him shortly after the paper had changed hands he replied somewhat ruefully to my congratulations on his retention in office, 'I used to have one proprietor; now I have *ten*.' But perhaps the most trying position of all is that of the editor who has not complete control, but is, as it were, *primus inter pares* with colleagues who are each in charge of a department. A daily paper was founded on these lines not a thousand years ago. There was a board of directors, with a managing director; there was a managing editor, a political editor, and a literary editor, to say nothing of other persons who exercised editorial functions. The paper was launched at a most favourable opportunity, with ample resources at its back, and it had the further advantage of meeting an unquestioned need by the representation of views which lacked authoritative expression. But it was a huge financial failure, largely, if not entirely, because of the lack of central and coherent control. A friend of mine was offered a post on the staff by one of the editors, but when he went to receive his instructions he found that the engagement had not been officially confirmed by whoever was really responsible; and he used to describe how, after interviews with five different editors, he came away quite uncertain whether he was appointed or not. The tragi-comedy of this failure—for it was not without some tragic disappointments—has been told in print under a thinly veiled disguise, and forms one of the most instructive episodes in the romance of modern journalism. In spite of the efforts of an expert 'newspaper doctor,' who was called in to pull things together, the proprietors were obliged to discontinue publication. Their losses, judged by pre-war standards, were huge, and though they had spent money like water, they were bitterly and unjustly criticised for not carrying on. The plain fact is that if a high-minded millionaire, with the best of intentions, who knows nothing of the newspaper world or of journalism, decides to found, equip, and run a daily paper, and, instead of choosing one strong editor, entrusts the control to half-a-dozen people of more or less conflicting aims, he can make as certain of losing one hundred thousand pounds a year as if he were to turn the money into sovereigns and play ducks and drakes with them from the deck of a liner in the mid-Atlantic.

One of the innovations of modern journalism —though perhaps it would be more correct to call it a revival on an extended scale—which has much to recommend it, is the recognition of verse as a regular feature, and not an intermittent embellishment. In older days the poets' corner was confined for the most part to obscure provincial journals, and was as a rule an unremunerated refuge for the incompetent

amateur. A century and more ago it was otherwise, when Coleridge and others contributed political and patriotic poems to the London daily press. But the practice died out. Certainly it was a very rare occurrence thirty or forty years ago for a poem to appear in a London daily. Poets who desired immediate publication were restricted to the pages of the weeklies or monthlies. Browning's indignant response to a disparaging comment on his wife's *Aurora Leigh*, which occurred in one of Edward FitzGerald's letters, appeared in the *Athenæum*. The mordant lines of Samuel Butler, 'A Psalm of Montreal,' on the discovery of a plaster cast of the Discobolus in a room full of skins, plants, snakes, insects, &c., in the Montreal Museum of Natural History, describing Butler's interview with the old custodian, who was employed in stuffing an owl, first saw the light in the *Spectator;* and, strange to say, Swinburne's 'Faustine' was first published in the same journal. The credit of making serious 'occasional verse' a regular feature in a daily newspaper, and of setting a high standard, probably belongs to the late Mr Harry Cust during his meteoric tenure of the editorship of the *Pall Mall Gazette*. Mrs Hinkson ('Katharine Tynan') in her recently published Reminiscences tells us that in one year no fewer than fifty of her poems appeared in the *P.M.G.*, and though she was probably the most frequent as well as one of the most gifted of its poetical contributors, one seldom saw verse in its columns that was not either accomplished or sincere. The practice spread first to other evening papers such as the *Westminster Gazette*, which still keeps it up, and then to the morning press. Poems by laureates had always enjoyed a privileged right of entry to the leading daily, but after Tennyson it cannot be said that they conduced to the prestige of the office. I am thinking now of such poems as those of Mr Kipling, whose splendid homage to France appeared in the *Morning Post* before the war, and the brilliant political satires signed 'I. C.' which adorned the same columns also in ante-bellum days. The war has been responsible for a great efflorescence of verse, by far the best of which has come from the trenches or has been inspired by direct first-hand experience of warfare in its various phases on sea or land or in the air. For months together hardly an issue of the *Times* appeared without a poem, and the very large number of volumes of verse published in the last couple of years seems to indicate that the poetry-reading public has grown with the supply. The daily topical poem, however, had already become a feature of the halfpenny press, thus adding to the essentially miscellaneous character of modern daily journalism, which has swallowed up the society paper and seriously encroached on the preserves of the weekly illustrated periodicals by an ever-growing reliance on the resources of photography. When the *Daily Graphic* was started in 1890 the great bulk of the illustrations were reproductions of pen and pencil drawings, but of late years it has abandoned these methods entirely. The camera is beyond doubt a most valuable auxiliary, but, like all auxiliaries, needs to be employed with discretion. How helpful and illustrative in the best sense it can be is well shown in the pages of the *Manchester Guardian*, the photographs in which, both as regards choice and execution, are by far the best to be found in the daily press. But the notion that the camera never lies has long been exploded. In the hands of the unscrupulous snapshotter the thing becomes a weapon, and very often a poisoned weapon. The instantaneous camera sees differently from the human eye, and its pictures are often grotesque libels, more unflattering even than the most repellent portraits of the most uncompromising realists or impressionists. Again, it is far too often employed as a means of invading privacy or of maliciously lending point to a 'campaign' against some notorious or unpopular personage. The camera, in short, adds a new terror to public life.

War tests everything and everybody, and brings out the best and the worst that is in us. And though the result in the main is encouraging by its splendid disproof of the misgivings of those who held that the fibre of our race had been sapped by luxury and self-indulgence, it cannot be maintained, in view of the predominating influence and the popularity exerted and enjoyed by certain outstanding figures in the world of journalism, that we have reason to be proud of our press as a whole. We find more sanity, moderation, and freedom from personal attacks and bitter recriminations—more, in fact, of what is representative of the best traditions of British journalism and of the spirit of unity and steadfastness—in the leading provincial than in the metropolitan papers. And this is due partly to the more feverish atmosphere of London, but still more to the fact that already, years before the war, the control of the most widely circulated organs had been steadily passing into the hands of men who set enterprise before enlightenment, excitement before instruction, publicity before patriotism, and everything before independence. The development of elementary education had enormously increased the newspaper-reading public, the opportunity was great, and so far as the mere mechanism of the supply and the skill with which the materials were presented went, no one can deny the energy and ability displayed by the organisers of the new journalism. They have shown themselves masters of the art of transport and distribution—of 'getting there first.' It is in their aims and methods as instructors that they have failed utterly in courage, in vision, in illumination. The problem they have set themselves to solve is, 'What does the man in the street like?' The

notion of raising his standard, of giving him something better than what he has been accustomed to, is dismissed as quixotic and uncommercial. Just as it is the craze of the fashionable school of 'educationists' to beguile children into the paths of knowledge by turning every lesson into a game, so it is the aim of the newspaper proprietor to enlarge his circulation by 'brightening' all departments of journalism. No doubt there was much in the older journalism that was ponderous and stodgy, but modern methods have swept away its solidity and sanity along with its tiresome conventions and prolixity. In the desire to be 'merry and bright' at all hazards, highly coloured impressions, in which the personal note is always forced, take the place of precise reports. Everything is dramatised—down to the squalors of police-court cases; judges are encouraged to be facetious and magistrates to be jocular. Yet there are journalists—some of them bred in the new school, others who are survivals of the old—who continue to better their instructions, and, though working for proprietors destitute of any sense of letters, to redeem the vulgarity of their surroundings by the saving grace of style. It is one of the curious and welcome instances of 'man's unconquerable mind' that even a Napoleon of the press cannot altogether sterilise the intellect of his scribes. There is good writing in bad papers, as conversely there is bad writing in good papers. But, tested by the needs of the hour, the provincial papers set an example to their London contemporaries by their larger abstinence from 'grousing' and recrimination, and their more consistent endeavour to promote unity, concord, and concentration. This remark does not apply only to the papers published in the larger centres. Having no interest in or official connection with any paper outside London, I feel perfectly free to express my admiration and respect for those provincial organs which, though hard put to it to keep their ends up against the competition of their sensational and all-pervasive London rivals, have never stooped to their methods, but have chosen the better path of steadily and unfalteringly maintaining the best traditions of British journalism. There are few parts of England where there has been better excuse for depression or the adoption of an alarmist tone than East Anglia, yet there is no paper in the country which has more unswervingly lived up to the precept,

Aequam memento rebus in arduis
Servare mentem,

than the *Eastern Daily Press* of Norwich. There is an unwritten law which debars one newspaper from discussing another; some journals even go to the length of refraining to mention a contemporary by name. It is not a bad rule in so far as it promotes a healthy professional solidarity, but it has its drawbacks when a paper has 'deserved well of the republic' and there is no means of recognising its services. Good papers do not blow their own trumpets or tell us that they are winning the war. The testimony of an obscure outsider may be of little value, but as a journalist of nearly thirty-five years' standing I may claim the right, in virtue of what it has meant for me and mine in the last three years, to salute a newspaper which has been sane and steadfast from the first days of the war; which has never indulged in scapegoat-hunting or uttered the cry, '*Nous sommes trahis;*' which does not advise the appointment of Ministers or crab the appointments when its suggestions are disregarded; in fine, which has no desire to promote that most pernicious consummation, newspaper government, but prefers to face the facts honestly, to discard rumour, to combat dissension, and to drive home the need of fortitude, endurance, and self-denial.

THE DEFINITE OBJECT.

CHAPTER XLVI.—IN WHICH GEOFFREY RAVENSLEE ATTAINS HIS OBJECT.

MRS TRAPES glanced sadly round her cosy housekeeper's room, and sighed regretfully. She was alone, and upon the table ready to hand lay her neat bonnet, her umbrella, and a pair of white cotton gloves; beholding which articles, she set her lips more resolutely, folded her bony arms more tightly, and nodded in grim determination.

'The labourer is worthy of his hire,' she sighed, apparently addressing the bonnet; 'but, if so be the labourer ain't worthy—why, then, the sooner he quits'——

A sound of quick, light feet upon the stair, and a voice that laughed gaily, a laugh so full of happiness that even Mrs Trapes's iron features relaxed and her grim mouth curved in her rare smile. At that moment the door opened and Hermione appeared, a radiant Hermione, who clasped Mrs Trapes in her arms and tangled her up in her long motor-veil, and laughed again.

'Oh, Ann, such a day!' she exclaimed, laying aside her long dust-coat. 'New York is a paradise—when you're rich! No more bargain-days and clawing-matches over the remnant-counter, Ann! Oh, it's wonderful to be able to buy anything I want—anything! Think of it, Ann! Isn't it just a dream of joy? And I've shopped and shopped, and he was so dear and patient! I bought Arthur a complete outfit'——

'Arthur!' said Mrs Trapes, and groaned.

'And you, Ann, you dear thing, I bought you—guess what? But you never could! I

bought you a gold watch, the very best I could find; and he bought you a chain for it, a long one to go round your dear neck, set with diamonds and rubies. I mean the chain is—it's the cutest thing, Ann! You remember you used to dream of a gold chain set with real diamonds, some day? Well, "some day's" to-day, Ann.'

'But—oh, Hermy, I—I'——

'He wants to give it to you himself, because he says you're the best friend he ever had, and —oh, here he is!—You did say so, didn't you, Geoffrey?'

'And I surely mean it,' answered Ravenslee, tossing his driving-gauntlets into a chair; 'though you certainly threw cold water upon my pea-nut barrow, didn't you, Mrs Trapes?'

'Oh, Geoffrey dear, do give her that precious package! I'm dying to see her open it!'

So Ravenslee drew the jeweller's neat parcel from his pocket, and put it into Mrs Trapes's toil-worn hand. For a moment her bony fingers clutched it; then she sighed tremulously, and, placing it on the table, rose and stood staring down at it.

When at last she spoke her voice was harsher than usual. 'Hermy dear—I mean Mrs Ravenslee, mam—I can't—take 'em!'

'But, dear—why not?'

'Because they're coals o' fire.'

'But you must take them, dear; we bought them for you.'

'Which jools, mam, I can in nowise accept.'

'Why, Ann dear, whatever'——

'Which jools, mam, havin' been a dream, must for me so remain, me not bein' faithful in my dooties to you an' Mr Geoffrey. Consequently I begs to tender now my resignation, yieldin' up my post in your service to one better worthy, an' returnin' t' th' place wherefrom I come.'

Here Mrs Trapes put on her bonnet, setting it a little askew in her agitation.

'Th' labourer is worthy of his hire, but if he ain't—so be it!'

Here Mrs Trapes tied her bonnet-strings so tightly and with such resolute hands that she choked.

'Why, Ann dear,' cried Hermione, 'whatever do you mean? As if I could bear to part with you!' Here she untied the bonnet-strings. 'As if I could ever let you go back to Mulligan's!' Here she took off the bonnet. 'As if I could ever forget all your tender love and care for me in the days when things were so hard and so very dark!' Here she tossed the bonnet into a corner.

'My land!' sighed Mrs Trapes, 'me best bonnet'——

'I know, Ann. I made it for you over a year ago, and it's time you had another, anyway! Now open that parcel—this minute!'

But, instead of doing so, Mrs Trapes sank down in the chair beside the table, and bowed her head in her hands. 'Hermy,' said she, 'oh, my lamb, he's gone! You left Arthur in my care, an'—he's gone, an' it's my fault. Went away at five o'clock, an' here it is nigh on to ten—an' him sick! God knows, I've searched for him—tramped to th' ferry an' back; an' th' footmen, they've looked for him, an' so have th' maids—but Arthur's gone—an' it's my fault! So, Hermy—my dear—blame me an' let me go.'

The harsh voice broke, and bowing her head, she sat silent, touching the unopened packet of jewellery with one long, bony finger.

'Why, Ann—dear Ann—you're crying!' Hermione was down on her knees, had clasped that long, bony figure in her arms. 'You mustn't, Ann—you mustn't. I'm sure it wasn't your fault, so don't grieve, dear—there!' and she had drawn the disconsolate gray head down upon her shoulder and pillowed it there.

'But—oh, Hermy, he's gone! An' you told me to—look after him.'

'Ann, if Arthur meant to go, I'm sure you couldn't have prevented him; he isn't a child any longer, dear. There, be comforted—we'll hunt for him in the car.—Won't we, Geoffrey?'

'Of course,' nodded Ravenslee. 'I'll phone the garage right away.'

But as he opened the door he came face to face with Joe, who touched an eyebrow and jerked a thumb over his shoulder. ''Scuse me, sir,' said he, 'but it's that Old Un; covered wi' dust 'e is, sir, an' wants a word wi' you. And, sir, 'e's that mysterious as never was. Shall I let him come in, sir?'

'You try an' keep me out, lad, that's all!' panted the Old Un, ducking under Joe's great arm. 'I'm a better man nor ever you'll be!'

So saying, the Old Un hobbled forward, and, sinking into the nearest arm-chair, fanned himself with his hat, which, like the rest of his garments, bore the dust of travel.

'Greetin's, guv!' said he when he had caught his breath. ''Ere I be—a old man as 'as done more for ye than all th' young uns put t'gether. —Mrs Ravenslee, mam, best respex!'

'And what have you been doing now?' inquired Ravenslee, smiling.

'Well, guv, I been an' got th' murderer for ye; that's all!'

Hermione caught her breath suddenly, and gazed at the fierce, dusty old man with eyes full of growing terror; beholding which, Ravenslee frowned, then laughed lightly, and, seating himself on a corner of the table, swung his leg to and fro.

'So you've found him out, have you, Old Un?'

'Ah, that I have!'

'Are you sure?'

'Ah, quite sure, guv!'

'Well, where is he? Trot him out.'

''E's comin' along—th' Spider's bringin' un.

Ye see, he 's a bit wore out, same as I am; we been trampin' all th' arternoon. Look at me shoes. That 's th' worst o' patent-leather; they shows th' dust.—Joe, me lad, jest give 'em a flick over with yer wipe.'

But at this moment steps were heard slowly approaching, and Hermione uttered an inarticulate cry, then spoke in an agonised whisper: 'Arthur!'

Pallid of cheek and drooping of head, Spike stood in the doorway, his shabby, threadbare clothes dusty and travel-stained, his slender shape encircled by the Spider's long arm. At Hermione's cry he lifted his head and looked up yearningly; his sensitive mouth quivered; his long-lashed eyes swam in sudden tears; he strove to speak, but choked instead.

Then Ravenslee's calm, pleasant voice broke the painful silence. 'Old Un,' said he, rising, 'I understand you are fond of jam. Well, from now on you shall bathe in it if you wish.'

'Spoke like a true sport, guv!'

'Why, you see, you have surely done me a very great service'——

'Meanin' because I found ye th' murderer'——

'Murderer?' exclaimed Ravenslee, staring.

'Why, yes—there 'e is!' and the old man pointed a long finger at the shrinking Spike.

'Old Un,' said Ravenslee, shaking his head, 'don't joke with me.'

'I—I ain't jokin', guv,' cried the Old Un, rising. 'Why—oh, lorgorramighty! you don't mean t' say as this ain't 'im! Why, 'e 's confessed, guv; I 'eard 'im!'

Ravenslee smiled gently, and shook his head again. 'But he has been sick, Old Un; he was hurt, you know, when he saved my life.'

'But, lord, guv, if 'e confessed'——

'He has been sick, Old Un, and when we are sick the wisest of us are apt to say silly things. Even I did, so they tell me.'

'What!' quavered the old man; 'ain't I—ain't I found no murderer for ye arter all, guv?'

'You 've done something much, very much, better, Old Un—you 've found me my brother!'

'Brother!' echoed Spike. 'Brother! Oh Geoff'—— He sighed deeply; and as Ravenslee crossed towards him, he smiled wanly and sank swooning into the supporting arms of the Spider, who, at a word from Hermione, bore the boy upstairs. But scarcely was he laid upon his bed than he opened his heavy eyes. 'Say, Spider,' said he wearily, 'old Geoff, sure, does play square—even to a worm like me—well, I guess! No, don't go yet; I wantcher to hear me try to explain the kind o' dirty dog I been—I guess he won't want t' call me "brother" after that. No, siree; he 'll cut me out same as you have, an' serve me right, too.' Then turning towards where Ravenslee and Hermione stood, he continued: 'Geoff—Hermy dear—ah no, don't touch me; I ain't worth it; I'm too dirty—Spider says so, an' I guess he 's right. Listen. I meant t' go away t'-day an' leave you, because I felt so mean; but th' old man followed me, an' I couldn't run because my arm pained some—ye see, I fell on it. So I let him bring me back, because I guess it 's up t' me t' let you know as I ain't fit t' be your brother, Geoff—or Hermy's.' For a moment Spike paused; then, with an effort, he continued, but kept his face averted: 'Geoff, it was me—in the wood that time! Yes, it was me, an' I had a gun. I—I meant—t' do you in, Geoff'——

Spike's voice failed, and he was silent again, plucking nervously at the sheet; while Hermione's proud head drooped, and her hands clasped and wrung each other in an agony of shame. But to these painfully rigid hands came another hand, big and strong, yet very gentle, at whose soothing touch those agonised fingers grew lax and soft, then clung to that strong hand in sudden, eager passion.

'Poor old Spike!' said Ravenslee, and his tone was as gentle as his touch.

'But—but, Geoff,' stammered the boy, 'I—oh, don't you see, I meant to—kill you?'

'Yes, I understand; you thought I deserved it. Why?'

'Oh, I was crazy, I guess! Bud told me lies—an' I believed him—lies about you an' Hermy. He said—you 'd make Hermy go—the same road—little Maggie Finlay went; so I came t' kill you.'

'Spike, if you believed that, if you really believed that, I don't blame you for trying a shot.'

'But I didn't—I couldn't! When I saw you sittin' there, so unsuspectin', I just couldn't do it. I tried to, but I couldn't. An', somehow, I dropped th' gun, an' then I heard a shot; an' when I looked up I saw you throw out your arms an' fall. My God, I 'll never forget that! Then I saw Bud starin' down at you, an' th' pistol smokin' in his hand. I meant t' do it, but I couldn't; so Bud did it himself. I 'm as bad as him, I reckon; but it was Bud shot you. Soapy saw him, an' knows it was Bud. Ask Soapy. An' now I 've told you all, I guess I ain't fit t' stay here any longer.'

Spike's voice choked upon a sob. He buried his face in the pillow; and so there fell a silence—a strange, tense hush, a pause so unexpected that he looked up and saw that Hermione's head was bowed no longer, but she stood, very proud and tall, gazing upon her husband, and in her eyes was a great and wondrous light; and as she looked on him, so he gazed on her. They had no thought, no eyes, for Spike just then; wherefore he hid his face again.

'I guess this about puts the kybosh on th' brother business!' he sighed miserably; 'an' I, sure, ain't fit t' be th' Spider's pal, I reckon!'

But now the Spider spoke, rather quick and jerkily. 'Say, kid—get on to this! I 'm takin' back—everything I says t' you t'-day. See?

Because—oh, well, I guess you've, sure, woke up at last! So, kid—give us your mitt!'

Eagerly Spike grasped the Spider's big fist, and they shook gravely and very deliberately, looking into each other's eyes the while. Then, still quick and jerkily, the Spider turned and hurried out of the room.

Then Spike turned to Ravenslee. 'Geoff,' he sighed, 'I 'm not goin' to ask you to forgive me yet. I can't. I 'm goin' t' wait an' show you'——

But, as he paused, Ravenslee's hand was upon the lad's drooping shoulder. 'Arthur,' said he, 'from now on—from to-night you are going to be my brother more than ever—a brother we shall both be proud of. What do you say?'

But Spike 's eyes were wet, his mouth quivered, and instead of answering he buried his face in the pillow again.

'Say, Hermy,' he mumbled, 'take him away before I do th' tear-gushin' act! Take him downstairs—give him a drink—light him a cigarette—kiss him! Only take him away before I get mushy. But, say—when I 'm in bed you 'll—you 'll come an'—say good-night like—like you used to, Hermy dear?'

Swiftly she stooped and kissed that curly head. 'I 'll come—oh, I 'll come, boy dear!' she murmured, and left him with Mrs Trapes.

Downstairs the fire glowed, filling the room with shadows, and side by side they stood looking down into the heart of the fire, and were silent a while, and though she was so near he didn't touch her.

'So it wasn't Arthur, after all!' he said at last.

'No,' she answered softly, 'it wasn't Arthur—thank God!'

'Amen!' said he, so fervently that she glanced up at him swiftly, then looked into the fire again; and seeing how the colour deepened in her cheek, he came a little nearer; but still he didn't touch her. Instead, he took out tobacco-pouch and pipe and began to fill it with strangely clumsy fingers, and Hermione saw that his hands were trembling.

'Let me!' she said gently. So he surrendered pipe and pouch, and, watching, saw that her hands trembled also. When at last she had filled the pipe, he took it and laid it on the table.

'Aren't you going to smoke, dear?'

'No, not now. You 'll remember that Arthur also suggested you should'——

'Give you something to drink!' she added, a little breathlessly, and crossed to the tantalus in the corner. 'Will you have brandy-and-soda?'

'Thanks—yes—that will do,' he answered absently; and when she dutifully brought the filled glass, he took it and set it down untasted beside the pipe.

'Why, Geoffrey!' she said in murmurous surprise, 'aren't you thirsty?'

'No, not now. You will probably remember that Arthur also suggested you should'——

'I know!' she breathed; 'but, oh, Geoffrey dear—wait—just a little longer.'

'Why?' he demanded hoarsely.

'Because!' she answered, staring down at her clasped hands.

'Why?'

'Because, my Geoffrey, if—if I let myself—kiss you now, I—shall never be able to—tear myself away, and I must say good-night to Arthur and'——

She paused as a knock sounded on the door, and Mrs Trapes appeared. 'Why, dear land o' my fathers!' she exclaimed, 'ain't you had time t' take off your bonnet yet, Hermy?'

'Goodness me,' exclaimed Hermione, 'I forgot it!' So saying, off it came, and there was the curl above her eyebrow more wantonly alluring than ever.

'An' there 's that blessed b'y,' continued Mrs Trapes, 'a-layin' upstairs yearnin' for you, Hermy, an' him s' pale an' gentle—God bless him! An' it now bein' exackly twenty-two an' a half minutes past 'leven by my beautiful new watch as ticks most musical! Time as you was in bed—both o' you! An' that reminds me, Hermy, I sent your maid t' bed like you told me, an' with my own hands I laid out one o' them lovely noo night-dresses—the one with the short sleeves an' lace as you showed me last night, an'—— Land sakes, she 's gone! Think o' that now—my, my! Mrs Ravenslee 's wonderful quick an' light on her feet, Mr Geoffrey!'

Here Mrs Trapes raised the watch to her ear, and hearkened to its tick again, smiling at Ravenslee's broad back as he turned to reach his glass.

'Them night-dresses,' she sighed, 'as is all fluffs an' frills an' open-work, may be all right when you 're young; but for true comfort give me flannel, every time.'

Here Ravenslee, in the act of sipping his brandy-and-soda, choked. When at last he glanced round, Mrs Trapes was gone.

Then he drew a chair to the fire, and sitting down, took up his pipe and tried to light it, but Hermione's nervous white fingers had packed it too tightly for mortal suction; whereat he sighed, and yielding to the impossible, sat with it in his hand, lost in happy thought, and waiting for the swift, light footsteps he yearned to hear.

The clock in the hall without struck midnight; but long after the mellow chime had died away he sat there waiting. But the great house lay there very still about him, and no sound broke the pervading quiet. Wherefore at last he grew restless, frowned at the dying fire, and his strong fingers clenched themselves fiercely about the pipe they held.

All at once he started, rose to his feet, and turned towards the door, eager-eyed, as a hand knocked softly. Before he could speak it opened, and Mrs Trapes reappeared. She was clad in a long flannel dressing-gown, and as she stood in

the shadows by the door he could vaguely define that she still held the precious watch to her ear.

'It do tick that musical,' she said, 'an' I can't sleep this night till I've tried t' thank ye both for—for all your goodness to a lonely woman. Ah, Mr Geoffrey, I guess th' day as you came seekin' lodgin's at my little flat was a good day for Ann Angelina Trapes—— Why, my land, Mr Geoffrey—ain't Hermy here?'

'No,' answered Ravenslee, a little bitterly—'oh no, I'm quite alone—as usual, Mrs Trapes.'

'Why, now, that's queer!'

'How queer?'

'Because I've jest been into her bedroom, an' there's her things—except that night-dress; but she ain't!'

'Not there? She must be! Did you look in—her bed?'

'Lord, Mr Geoffrey, her bed ain't been tetched!'

'Then where in the world is she?'

'Well,' said Mrs Trapes, consulting her watch again, 'it is now exactly fifteen and three-quarter minutes after midnight, so I guess she's in bed somewhere. But this is a big house, an' there's lots o' bedrooms; so, if I was you, I'd go an' look—till I found her.'

Ravenslee was at the door so swiftly that Mrs Trapes started, and she saw that his eyes were very bright, and the hands he laid on her bony shoulders were quivering.

'Mrs Trapes,' said he, 'I will!'

Then he stooped, very suddenly, and kissed the thin, gray hair above her grim eyebrow, and so was gone.

'Find her?' mused Mrs Trapes, glancing after him up the wide stairs. 'Why, yes, I guess he will sure find her—where she should have been weeks ago. Lord, what a silly, beautiful, lovely thing love is!' and she stood a while smiling down into the fire, and her smile was very tender.

Then she sighed, switched off the lights, and went softly away.

THE END.

BRIDGES AND CANALS IN RUSSIA.

THROUGH Volhynia, the fair fields of which are sown with steel and watered with blood, flows the river Styr. It is approximately the same length as the Thames; but a river of two hundred and fifty miles is a mere brook according to Russian standards, and, like its neighbours, the Stokhod and the Strypa, it acquired fame only when its bridge-heads had been more than once the scene of savage fighting in the present war. It runs quietly past Lutsk, mirroring all that is left of that brickwork skeleton with the railway station, which, when the writer last saw it, suggested a charred cage. Yet in and out of that grimy ruin the trains were running daily, bringing up thousands of men and tons of ammunition for the firing-line, and taking back to well-earned rest in Petrograd or Moscow those who had bled for their country. Lutsk has been taken and retaken more than once; and even after the Austrian guns had been driven out of range the German airmen paid it daily visits with a special eye to its many hospitals. When the Russians entered it, they found it full of souvenirs, such as Hindenburg spoons and Kaiser crockery, left by the enemy in his hurried retreat.

A little farther west, out in what is referred to in the war news as 'the Lutsk salient,' the Styr runs past another ruined hamlet, Rozeische, where several bridges, some of temporary character to replace others destroyed in the fighting, span its quiet waters. From one of these bridges there is a sweeping view up and down stream, but the observer could not remain long undisturbed, for there were few hours of the day or night in which the footway did not tremble under the tramp of troops moving up to the lines or of prisoners coming in from the front, or under the heavy wheels of ammunition-carts going full and returning empty. The troops were in fine fettle, and sang as they swung over the bridge. The prisoners would have sung too, had they dared; for they knew when they were well off, and would not, even if unguarded, have faced about and gone the way they came. Now and again, perhaps, a small batch of surly German officers required closer watching, but the Austrian rank and file were glad to be out of the losing game, and these willing captives worked cheerfully in the neighbouring field hospitals without the need of any sentry to guard them.

The old bridge over the Styr was a comfortable spot at times, but not at all times. It was, in fact, a favourite but elusive target with the German airmen, who, having bombed it all through the summer without scoring a single hit, used always to vent their spleen on the easier mark afforded by a Red Cross camp on the left bank. Even here they achieved little beyond killing a few orderlies and transport horses, and scaring the wounded to the verge of hysteria.

Those summer and autumn days in Volhynia were hardly suited to the contemplative angler's normal day-dreams, but in happier times the Styr must be a paradise for those skilled in catching pike and carp. More than once, leaning over the parapet of the bridge, he watched an old pike dash out from the reeds and take toll of the small fry. Once, indeed, he tried a cast of flies by way of catching a live bait for the pike, but first a shower of shrapnel missed him by a matter of feet, and then, as he was doing

the quarter-mile in record time with an eye to the nearest dug-out, a bomb came whistling just behind him, and sent a gray mare twenty feet across a marsh.

The Styr is full of coarse fish. Unfortunately it was just then also full of Austrians, as the enemy, hoping no doubt to poison its waters, flung his dead in hundreds into the river during the last retreat. This humane design failed of its purpose. The Cossack palate is not fastidious. Whenever a body was actually sighted, rope and grapnel were requisitioned until the 'foreign matter' was removed. For the rest, what the eye did not see, the tongue did not taste, and our Russian friends continued to bathe merrily in the Styr all through the hot August days, and even drank of the waters of Marah without complaining of the vintage.

Quite recently the Imperial Russian Agricultural Society succeeded in obtaining permission from the Government to make a canal between Onega Bay, on the White Sea, and Povyenets, on Lake Onega. This will make a route by which British and American goods can be shipped into the Russian interior, and it will also open up a large new supply of fuel in the north. The great coalfields of Russia are much farther south, and the idea is to utilise the huge peat-deposits that lie between Lake Onega and the White Sea. The river Onega is not connected with the lake, and is only useful in summer, as ice closes it between November and May.

From Lake Onega the peat (and other things) could be sent on to Petrograd *viâ* the river Swir and Lake Ladoga, and also by means of the Marie Canal and the Alexander of Württemberg Canal to the great river system of which the Volga is the centre.

Efforts are also to be made to utilise the vast supplies of anthracite in Russia, a great quantity of which remains untouched for want of means of transport. Much of this lies in the Donetz district, and the completion of the Baltic and Black Sea Canal system which will connect the Western Dwina and the Dnieper will do more than anything to release these hidden supplies. One of the biggest coalfields in Russia also lies in the district through which this canal will pass. Much cannot have been done to this canal since the war started, as its way lies directly through the war zone, but when completed it will prove an inestimable boon to a very large district. A canal is also planned that will connect this one with Petrograd, and by this means there will be a curving route between Petrograd and Riga.

In the south there are also far-reaching plans; the Don and the Volga are to be connected by a canal, and the Don is to be made more navigable by the construction of nine sets of sluices. This will be a very expensive business; but the Don traverses a valuable district, and Rostov, at its mouth, is a growing port, and a distributing centre for a very large area. Rostov is 'on the make,' and has recently obtained permission to build for itself a university.

There are also many projects for Siberia, which is, of course, one of the countries of the future.

Finland has ambitions, and wishes to connect some of its lakes by means of canals, and the Government has been asked to investigate the matter and sanction their construction.

JOHN PARDON'S CHOICE.

CHAPTER IV.

YEAR after year slipped by, as even in so slow-moving a place as Beestop they are bound to do, and with the years came the inevitable changes in the scattered little community. One by one the girls married and went away to their new homes elsewhere; the young men, for the most part, migrated to the small valley towns or large cities along the coast; while in the dreary cemetery more than one mound was added to that upon which John Pardon still faithfully strove to keep the coarse grass clipped and a sweet-brier rose growing. Thus, with the old people taking their long sleep, and the young ones wide awake in the throbbing life of distant cities, more than one of the homesteads, until recently astir and prosperous, was now deserted; and the houses, suffering from the quick decay inevitable in that climate of alternating long rains and longer droughts, looked out of half-shuttered windows behind lop-sided verandas, upon leaning fences and hanging gates. The modern world moved too fast for Beestop, and in the swift-rushing stream of that western life was rapidly becoming a mere backwater. Only at John Pardon's isolated ranch, and that of his friends, the Patricks, things remained much the same. Save for several goodly acres of grass and grain where formerly flourished only the wasteful 'bush,' and for the orchard, which, if its irregular outlines and scarcity of fruit bore silent witness to Pardon's lack of genius as a horticulturist, at least presented in the respective seasons lovely vistas of white and pink blossom or thick, cool green, the lonely rancher's surroundings afforded only a negative witness to the passing of time. In the big, dreary bungalow, the green blinds, now streaked with the faded yellow of many summers, still shut out the sun and imprisoned the close atmosphere of silent, unused rooms. Roses, lilacs, trumpet-creeper, years ago kept trim and disciplined by 'Sissy,' had now run up to un-

gainly heights, with much display of dead wood and sparse blossom; the 'new' porch, whose floor was to have creaked cheerily beneath the gentle rock-rock of Polly Patrick's chair, while long sprays of her favourite honeysuckle should breathe sweet caresses about her brown hair, had long since been boarded up as a shelter for farm utensils, sacks of seed, or 'loppings' from the orchard for winter fires.

If, the while John Pardon's strong arms shifted sacks or stacked wood in the soil-stained porch, there ever rose before his eyes the glowing vision of his early dreams, it was as one's eyes may rest for a moment on the accustomed portrait of a dear, dead face; for in Pardon's great heart hope had been slowly slain, and Mary Patrick, as the central figure in his dream-picture, had become a symbol rather than a possible reality in his life and home. As a rancher Pardon had been only moderately successful; the monotonous work and routine had always been irksome to him, and with the dwindling of his hopes of winning Mary, his ambitions also waned. Satisfied so long as he could keep free of debt, lay by enough for old age, and pay a modest life-insurance in the interest of 'Sissy' and her babies, he drifted into becoming the 'handy man' for all his neighbours—doing their ploughing, lending a hand with the harvest, hauling their wood—always cheery, generous, industrious in an easy-going fashion, but never faring far on the high-road to affluence.

As to the Patricks, with them everything had prospered. The 'uncle' about whom gossip had been eloquent, having died, left, if not the vast fortune with which 'patent paint' was supposed to have endowed him, at least more than enough to relieve his heirs of any anxiety for the future. The two men, now confirmed bachelors, were constantly improving the house—the luxury of a bathroom; a new, up-to-date dairy; finally, a small furnace that kept the whole house during the winter in that parched, subtropical temperature beloved of all their kind. So Mary's comfort-loving soul fairly basked in its congenial environment; while Mary herself grew rounder and rounder, her plump hands more plump, and her complexion, whose fair pallor when she was a girl had been one of her chief attractions, had at length, through ease of life, lack of fresh air, and perhaps too abundant diet of her own richly fried 'cakes' and pastries, grown thick and sallow. Thus from Mary Patrick, while still in the 'thirties,' had fled all semblance and spring of youth, and with it any serious thought of ever rewarding the long-tried faithfulness of her girlhood's lover by marrying him. There had, to be sure, been times in the earlier months following John Pardon's self-imposed compact, when some one would chance to remark that he was 'thin and poor-looking,' or when, his face in repose, she could not but notice weary lines about the kind mouth, and a smitten look in the gray eyes that used to be so merry, that Mary's conscience pricked her remorselessly, and, driven to seek excuse for her own selfish conduct, she even tried to persuade herself that if only John would become a 'good Catholic,' instead of being 'nothing at all,' she might make up her mind to marry him. So it was doubtless with a very real, though unacknowledged, sense of relief, as well as of surprise, that when, in a very tentative manner, she approached John Pardon on the subject of religion, she met with a layer of resistance wholly unsuspected. 'Why, Mary,' he had said, in the same slow, grave voice with which he had prefaced his first proposal—'why, Mary, it strikes me that we're both hittin' out for the same place, though maybe we foller a different trail; and I reckon that the Good Man don't much care *which* it be, so long as we *git thar*. But I couldn't lie to *Him*, no more'n I could to *you*, girl, by pretendin' to believe what I sure don't.'

Such an air of finality accompanied this short speech that Mary knew that in this direction lay no prospect of change, and by degrees she fostered a conviction that to marry John Pardon would be to sacrifice her religion. Nevertheless did she excuse her weak selfishness in not giving the man a final answer, thus freeing him to choose elsewhere, by storing up his own voluntary words that he could never care for any other woman, and by shutting her eyes to the clear light in which a man of such simple, straightforward views as his regarded his pledge to her. Yet it happened one evening that Mary, seeing John, at the close of a heavy day's toil in the harvest-fields, starting for home just as her brothers were coming in for a savoury meal ready for them, felt a sudden stab of compunction; the man looked so strangely wistful as, with an effort to make light of it, he called out, 'Well, I guess I'd better mosey along home and git my supper, and then make a batch of bread—ain't had no time lately, and crackers is dry eatin'.'

'See here, John,' she exclaimed impulsively, 'if you like, I'll make your bread twice a week with ours, and you can fetch it when you're passing. Bread-making ain't a man's work, anyway. So you bring some flour, and I'll do the mixing and baking.'

Such a wave of gratitude flooded the tanned face and gray eyes that Mary felt uncomfortably contrite, while John, seizing her hand, exclaimed, 'God bless you, Polly; if you ain't the best little woman in the world, I'll eat my hat!'

And Mary, hurriedly murmuring, as she had done once before on a memorable occasion, 'Nonsense, John; don't be foolish,' hid her self-accusing face by hastening back to the kitchen, calling back to him, 'Good-night. Don't forget to bring the flour.'

John had gone away in a tumult of emotion and renewed hope; but though Mary's crisp

brown loaves in a faultless towel were unfailingly ready when John called, and many a good thing was added to the parcel from time to time, John Pardon continued to sit down to his lonely board, until the vision of Mary sitting opposite him, and of Mary's step making echoes in his silent kitchen, had faded, together with other fair pictures of the past.

CHAPTER V.

THERE dawned a glorious day late in spring. John Pardon, returning from a several weeks' trip into the 'big timber' country, and fetching along a heavy load of 'shakes' (shingles) for repairing the Patricks' big barn, walked slowly up a long mountain road, beside his straining team, 'Kate' and 'Custer,' long ago passed out of the elastic class of 'colts,' but, as results of good care and abundant feed, still able and willing for road and load. Safe in the jockey-box were stowed some trifling gifts for Mary Patrick—a bark basket of cunning Indian workmanship, some cuttings from a dogwood-tree that she was anxious to try to grow, and a box of very indifferent candy from the one small store in the one small town through which he had passed on his way from the forests. Spring-time, the world over, is the choicest theme of poets, the gladdest time to man and maid; yet surely in no clime or country can the season's grace and beauty be surpassed as set forth among the foothills of the Sierra Nevada mountains. There, among the infinite purple depths of cañon and river gorge; on the steep sides of ever-varying hills, where live-oak, pine, and birch cling with desperate roots among the outcrop of quartz and greenstone; through the narrow, sun-misted valleys where bands of cattle, lean from long 'rustling' during the rainy season, eagerly crop the rich growing grass, the Great Artist has surely revelled in the possibilities of His wonderful palette. Through the whole gamut of greens, from the palest sage of the bull-pine's slender needles to the 'invisible green' of twisted and ancient live-oak, the miracle of His paint-brush renews its annual marvels. Here, as far as eye can see, are masses of pinky waxen manzañita-bells, their delicate sweetness making the heavy, rather sickly perfume of the clustering white chaparral vulgar in comparison. There, where the greedy bush has not encroached and the sun dances hotly on steep, grassy slope, a myriad 'poppies' flash the rich gold of their cups like priestly censers, while among the shingle and sand of river 'flats,' lupines of every size and shade, from palest blue to deepest purple, flutter among their silvery leaves. Across a sky of blue so intense that proud Italy herself might feel envious, flash gorgeous blue-jays, or the great crested woodpecker on his annual trek to the mountains, there to waken the vast silences with persistent rat-tat-tat on bough and bole, where rough red bark offers a well-stored larder for his kind, as well as a foothold for the plastic, deftly fashioned feet of bounding gray squirrels.

On such a day of such a spring as this, even John Pardon, somewhat wearily plodding up the long hill, could not but feel and respond to the glad, far-reaching call of all outdoors; he whistled softly, and cheerily chirruped to his horses, as with long whip-lash he idly flicked at the leaves of overhanging boughs. Presently he placed a stone under one of the wagon-wheels to give his team the accustomed 'breather,' and his eye, following the flight of a pair of wood-doves startled from a sunny dust-bath, was arrested by the figure of a woman on the curve of the road winding above him. Dressed in riding-clothes, she seemed to be leisurely gathering flowers and pausing to gaze across the misty cañon; while her horse, a sturdily built dappled gray, browsed on tufts of coarse grass among the crevices of the high rocky bank. Pardon wrinkled up his eyes for a long stare; then, ejaculating in tones of surprise, 'Well, I 'm blest if there bain't a stranger!' kicked away the stone, and uttered such a sharp, 'Ged'ap, you!' to his team, that they rapidly scrambled up the next steep bit, which, bending back and forth like the letter S, brought them to the curve where John had discerned the unknown rider. Screened by a clump of live-oak, and more from curiosity than from necessity to halt again his steaming horses, he once more propped the wheel and stopped to look and listen. Clear and sweet upon the still air came the sound of a woman's voice singing:

'There's sunshine in the heart of me,
My blood sings in the breeze;
The mountains are a part of me,
I 'm fellow to the trees!'

Then the singing stopped, and he heard her say in accents so musical and clear-cut that it sounded to John Pardon like the language of another world, 'Whoa, "Fay"! Whatever do you think you hear? *I* don't hear or see *anything* except a lizard. You are naughty to-day; but wait a few moments more and we 'll go home.' Then again she took up her song, the words of which, wholly unfamiliar as they were to the listener, yet stirred strangely in his heart:

'My golden youth I 'm squandering,
Sun-libertine am I!
A-wandering—a-wandering
Until the day I die.'

As the words died away in a poignantly-sweet, half-melancholy minor key, John Pardon, curiosity and emotion getting the better of courtesy, stepped forward from his shelter, and a picture met his eyes, never to be effaced while memory should last. In the full golden glow of the westering sun—the high rugged bank, gay with flowers, as a background—stood the singer of that strange song. Somewhat above average height, slender as a reed, there was about her

an indescribable something that Pardon, ignorant though he was of the world beyond those western hills and plains, recognised at once as setting her apart from the women of his daily life. Her dress was of the simplest—brown riding-skirt, touched here and there into golden tones by the sunlight; white cotton blouse, with wide collar rolling back from her long, slender neck. Her face was hidden from Pardon's view by the broad brim of a straw hat, tied sharply down on one side by a blue scarf of some thin, shimmering stuff, whose long ends, tied in a loose bow, floated about her shoulder. One hand, covered by a fringed leather gauntlet, held long sprays of lupine; while the other, ungloved, and at that moment grasping the horn of a dainty Mexican saddle, was white and slender, with tiny, multi-coloured flashes as from a jewelled ring. The silver sheen of the horse's long flowing tail and mane added to the vision-like brilliancy of the little group. The girl was about to mount, and with firmly gathered lines strove to hold the horse while her foot sought the stirrup. But the animal, made restive by the scent and sound of the team behind it, and eager to start for home, danced and whirled about the road, which, being too level for a proper take-off, and the bank affording no foothold, baffled the rider's efforts to reach the stirrup. Hastily wrapping the reins round his whip-stock and bidding his horses stand, Pardon hurried to the stranger's assistance.

Lifting his old felt hat with all the grace and ease innate to men of the plains, he said, 'How d'ye do, marm? Your hoss seems kind o' uneasy like. Shall I hold it till you get up?'

'Oh, thank you so much; please do,' came the answer in the same sweet, clear accent that sounded so strangely 'foreign' to Pardon's ears; and as she quickly turned towards him he caught a full view of her face—a face such as he had supposed never existed outside of the Christmas Number of some of the papers sent from the Old Country to his friend and neighbour Michael O'Keefe.

With feelings akin to astonishment, his delighted eyes took in every feature—the pointed, elf-like chin; the sweet red bow of a tiny mouth, above which, like a leaf, curled the short upper lip; then the straight little nose; and a low forehead across which strayed a lock of hair, which to John Pardon's excited fancy looked like spun gold. Forehead and chin were white as milk, while the rich colour of a damask rose flooded her cheeks and set off the clear blue of her large eyes. Pardon, strangely moved by the girl's fair face, but too courteous to stare, instantly took the lines from her hand, covertly noting its white shapeliness and long, slim fingers, on one of which was an old ring with quaint device (incomprehensible to Pardon's uneducated eye) wrought in minute diamonds—not in the least such a ring as he was accustomed to see in jewellers' windows in Orangeville, but in some indefinable way curiously in keeping with the whole subtle personality of the wearer.

'Now, marm, I guess she'll stand,' quoth Pardon; and the girl, gripping anew the flowers and glove in her right hand and the saddle-horn with her left, tried once more to place her foot firmly in the stirrup for the necessary throw of the other across the saddle. But the gray mare continuing to fidget and twist, the girl, with her encumbered hand and long, divided skirt, could not succeed in mounting.

Pardon saw the colour pass in rosy waves over her face with the effort to pull herself up; then, with a short, merry laugh, she turned to him, and, without a shadow of coquetry, but with a pretty appeal in her voice that went straight to the man's heart, said, 'I'm afraid I can't manage it, after all! Would you be so good as to help me up?'

'Sure I will!' exclaimed Pardon heartily. 'You just take the lines, marm—now—there you are!' and tingling with the light pressure of her hand on his shoulder, he settled her foot in the stirrup, giving her skirt a shy but deft little pull into place about the tall, laced boot.

'Thank you so much. You're awfully kind;' then suddenly bending forward, she patted and hugged the smooth neck of her horse, saying to Pardon, half-apologetically, 'I don't know *why* "Fay" is behaving so badly to-day; generally she stands so well that I can mount quite easily if there is even a stone for me to stand on.'

As she spoke she was pulling on her glove and gathering the reins; while Pardon, longing to detain her, made pretence of holding the horse. 'You're some plucky to ride about the country alone, marm. None of *our* women would do it. Bain't you ever scared?'

She looked down at him, surprise and amusement dancing in her eyes, and a happy smile curving her small mouth. 'Dear me, no! There's nothing to be *afraid* of, *is* there? And, you see, I can trust "Fay" anywhere. She used to belong to a buccaroo, and is as sure-footed as a goat. The only thing that really excites her and makes her pull is the jingle of cow-bells.—Can't stand *those*, can you, "Fay"?' she questioned laughingly, and again bent forward to caress the mare, thus rousing in Pardon's breast a perfectly unwarrantable feeling of jealousy.

'Well, she's sure fallen into good hands, marm!' said he, running his eye over the fat sides of the animal, and playfully pinching the soft silver of her nose. 'But, lordy, what a bit! Ain't got even a leather chin-strap! You ought to have a curb for her, marm. I'd be glad to give you mine. It's a real nice one—silver, ye know—a real Mexican bit. Don't use it myself any more—*my* buccarooin' days is over,' he ended, with a smothered sigh and a sudden expression in his face, not unnoticed by the blue eyes regarding him from under the shadowing hat.

'That is very good of you,' she replied warmly;

'but I don't think I could make up my mind to use that sort of bit for "Fay;" and, you know, if she really *wanted* to run away with me, I hardly think I could hold her, no matter how she was bitted;' and half-unconsciously she glanced at her slender arms, showing white between the turned-back cuff of her short sleeve and her gauntlet-cape. 'But now I expect that "Fay" and I had better start for home—and thank you so much for leaving your own horses in order to come to my help. Good-bye!' and in another moment the glancing shoes and silvery tail of the gray mare vanished round the bend of the road, leaving to John Pardon a sudden sense of loss.

Slowly removing his old hat, and meditatively scratching the mass of crisp dark hair, he stood staring in the direction the horse and rider had disappeared. 'Whew-w-w!' at length came a prolonged low whistle from his lips. 'Well, I'll be *durned!*' quoth John Pardon.

RELICS FROM THE SEA.

By W. A. Atkinson.

Full many a gem, of purest ray serene,
The dark unfathomed caves of ocean bear.

IT was, I believe, a distinguished historian and philosopher who, in order to preserve for future generations some memorials of our present civilisation, proposed that a vast chamber should be excavated in some convenient hillside, be filled with examples of all our industrial and artistic products, and then be hermetically sealed up for a century. At the end of that period the chamber should be opened, so that the people of that day might, by viewing the material products of their forefathers, obtain some satisfactory idea of the stage of civilisation which had been reached by their ancestors of a hundred years back. At the same time the newer generations might add examples of their products to the vast subterranean museum, which would then be sealed up again for the benefit of the peoples of succeeding centuries.

Of the feasibility or the profit of such an undertaking it is not necessary to say anything; but it may be remarked that in this matter, as in many others, the seemingly blind forces of nature are accomplishing in a partial and erratic way that which human intellect would like to do in a systematic way, but finds it too vast and difficult to attempt. Since man first went down to the sea in ships, he has had to pay toll for the voyages he has made and for the victories he has won. From the days when the first prehistoric man ventured on the sea in his rude dug-out or coracle, right on to our own days of *Titanics* and *Dreadnoughts*, a varying percentage of the craft, however rude and worthless, however perfect and valuable, has been claimed by the remorseless sea. The ships have gone down with all their contents—perhaps only a few badly made water-jars, or perhaps treasures of art, of science, and of industry which were priceless in their day, but all illustrative of the civilisation then attained—and there they lie at the bottom of the sea, being slowly destroyed or gradually silted up. The absolute destruction must be great; and yet it is almost certain that a proportion will be saved for the edification of future generations. If the flint, bone, and metal weapons of prehistoric man have been preserved for thousands of years, who shall say that the guns, the engines, and the anchors of the *Hawke* or the *Formidable* may not escape destruction, and be revealed to the wondering eyes of a generation to which the titanic struggle in which those ships were struck and sent to the bottom has become a matter of ancient history? If the flesh of the mammoth has been eaten by modern savants; if the lifelike sketches of this animal, made by the men who hunted it, have been preserved for us; if, as geologists demonstrate to us, the footprints of animals long since extinct are recorded on the rocks, and even the ripple-marks of the tide and the rain-marks on the shore are preserved, who dares aver that everything which now sinks to the bottom of the sea is a total loss? It cannot be. The process of preservation is seemingly a blind and haphazard one, and the chances are, apparently, all against it; but in the aggregate it is efficient, like those natural selections which keep in existence species of animals and plants which seem at first sight helpless against the forces opposed to them.

The largest proportion of those things which lie at the bottom of the sea can only be restored to human sight by great geological changes, which will lay bare the ocean depths, and at the same time remodel the continents. But, fortunately for us, it is not necessary to await those changes in every case. In one way and another, chance accidents disclose to us from time to time some of the treasures of the sea, and salvage-work is carried on more boldly and with greater success as new inventions are introduced.

A common occupation of the Kentish 'hovellers,' or boatmen who go to the aid of ships in distress, is to sweep the Downs for lost anchors. It sometimes happens that a ship anchored in the Downs is caught by a storm which rises so quickly that it becomes necessary to leave the anchor in the ground and let the chain-cable run out through the hawse-hole. Both anchor and cable lie at the bottom of the sea, and are lost

for the time. The hovellers, however, when fair weather returns, go out in their boats and sweep the ground. A small weighted rope, about two hundred fathoms long, is dragged along the bottom by boats at each end of the line. If the operation is successful, the rope catches the upturned fluke of the anchor, and the latter is dragged from its holding, and drawn on board with the cable attached to it. The work is often long and tedious, especially when the precise locality of the lost anchor is not known.

These salvage labours frequently result in some curious hauls. Two very old cannon have been obtained in this way at different times. The first of these was discovered in 1775. It was a sort of swivel gun, having a brass barrel and chamber about five feet in length, to the breech of which an iron handle two feet eight inches long was attached for the purpose of turning it on its pivot. An opening was cut into the top of the rear part of the gun, and the chamber, which was a separate piece, was fitted into the gun through this opening. The chamber was loaded, and inserted like a cartridge, when the cannon was to be fired; so that the weapon was an early form of breech-loader. From ornaments and inscriptions upon it, the cannon was thought to be a Portuguese weapon dating from about the year 1370.

The second cannon was drawn up from the Goodwin Sands in 1830, and was very similar in form to the one already described. It was a little smaller, however, and was made entirely of iron. The chamber of the first gun was wanting, but this gun retained its chamber, and also the wedge by which the chamber was secured. The cannon was placed in the museum at Dover. It is believed to be as old as the one previously discovered, if not a little older. How these two guns came to be off the coast of Kent is difficult to explain. The historian of their discovery thinks that they might have belonged to the Spanish Armada, but it is hardly possible that guns so old would have been retained on those vessels.

Guns and shot are very commonly recovered from the sea. In the Tower of London there is a gun and part of another which were obtained from the wreck of the *Mary Rose*, which was sunk off Spithead in 1545. Part of her pump and a couple of bowstaves were also recovered, and are in the same collection. These relics were, I believe, all brought up after the vessel had been about three hundred years under water. No less than twenty-three pieces of cannon were recovered from the wreck of the *Royal George*, which sank in 1782. A gun belonging to H.M.S. *Lutine*, wrecked off the coast of Holland on the 9th of October 1799, is now in the Guildhall Museum in London. *La Lutine* was originally a French vessel, and was captured by Admiral Duncan in 1797. Spasmodic attempts were made to recover her treasure, which consisted mainly of bullion and coins, from the year 1801 onwards, the Dutch Government claiming the wreck. Subsequently one-half of what remained was ceded to the British Lloyd's Association, and in recent years the work of salvage has been vigorously prosecuted. In the operations as far back as 1886 two cannon were obtained, along with three watches, about three thousand coins, and other relics. Stone shot, if not the cannon from which they were fired, have been taken out of the wreck of the *Florida* at Tobermory. This ship belonged to the Spanish Armada, and was blown up by Maclean of Duart in 1588. Explosives have had to be used in the recent salvage operations to break up the hard crust which has formed around the wreck. In or about the year 1840, as recorded in the *Gentleman's Magazine*, some twenty guns and a great number of granite balls were found buried in the sand and clay on the western side of Walney Island, in Furness, at a place only accessible at low water. The cannon were of the old chambered pattern, like those found off the coast of Kent, but the largest is said to have had its 'breech' in the centre, and to have been designed to fire both ways. Various conjectures were made as to the manner in which the guns came to lie in the sands of Walney. There is little doubt that they were relics from some wreck, but to what nationality the ship belonged was not ascertained. The guns were probably transferred to Woolwich.

Some years ago the writer assisted in the identification of a Roman amphora which had been brought up from the Goodwin Sands by a trawler. It measured two feet six inches in height, nearly two feet in diameter, and was calculated to hold sixteen gallons. It had a rounded base and two handles at the neck, each of which was nearly two inches thick. This vessel was brought up in the net of a Hull sailing-trawler, the *Vigilant*, in 1860, and it is now in the Hull Municipal Museum. A relic of this kind is intrinsically of little importance; but when we reflect upon its relatively fragile nature, and take into account the fact that it may have, and indeed almost certainly has, lain three times as long at the bottom of the sea as the oldest of the cannon, its preservation and recovery are matters of unusual interest. I have also the record of one or two Greek amphoræ which are thought to have been dredged from the sea; and Bellarmine jars and other vessels of later date are very commonly brought up in the nets of the trawlers. The museum at Hull possesses one or two of these Bellarmines, one dredged up near the Shetlands, and also a jar, which was probably made in the Levant, but was dredged from the Dogger Bank.

Personal effects of all kinds have been recovered from the sea, often in the oddest associations. Thus the relics from the *Royal George* include a coffee-mill, a silver spoon, a bottle of wine, an old pipe, the butt-end of a musket, and a silk

handkerchief. Many of these things were encrusted with oyster-shells. Some years ago a dredger working in Chesapeake Bay brought up a set of false teeth, to the top of which an oyster was firmly attached. The teeth and the oyster were exhibited, and, so the story goes, no less than three persons put in a claim for the teeth on the plea that they had lost them in Chesapeake Bay. The portrait of Captain Edward E. Williams, the friend of Shelley, who was drowned with the poet in the Gulf of Spezzia in 1822, is one of the frail things recovered from the sea. The portrait was drawn by Williams himself, and it appears to have been little the worse for its immersion in the sea. In sharp contrast with these small and fragile relics is the post-chaise which was brought up from the Goodwins. Its wheels were still attached to their axles, and came up with the vehicle. A stranger haul even than this was that of a cable-repairing steamer, which drew up from the bed of the North Sea a small sailing-vessel along with the damaged cable.

A few years ago some sponge-fishers discovered on the coast of Africa the wreck of an ancient vessel. It lay in nineteen fathoms of water, about three miles north-east of the port of Mahdia. Divers were brought to the spot, and they found that the vessel was a Greek galley laden with treasures of art dating from the earliest years of the Christian era. The treasures consisted chiefly of bronze and marble statues, statuettes, and medallions, a great number of which were subsequently recovered. The works of marble were in many instances injured by the sea-water, though some, which had been deeply buried in the mud, were fairly well preserved. The bronzes, on the other hand, were little the worse for their long immersion. In addition to the actual works of art there were many examples of ordinary furniture and utensils, including beds, chairs, kettles, bowls, and a terra-cotta lamp, which still retained its wick.

The bronze horse on the Pont Neuf at Paris was cast in Tuscany by the order of Marie de Medici, widow of Henry IV., and daughter of the Grand Duke of Tuscany. It was brought to Paris by sea, and the vessel being shipwrecked off the coast of Normandy, the statue fell into the sea, and lay there for a year. It was then recovered, and carried to Paris, where it has since remained. The original statue of Henry IV. was destroyed during the Revolution, but another was erected in its place in 1818.

The east window of the church in Quernmore Park in Lancashire has a curious history. The glass was made in England for a church at Cannes, and was forwarded by sea. The vessel in which it was placed was wrecked near Marseilles, and, as the window was given up as lost, a new one was ordered in England. A Greek merchant bought the wreck and her cargo, and succeeded in recovering the window, which was sold by auction with the remainder of the salvage. The window was purchased by the owner of Quernmore Park, and set up in the church there.

Some of the old railings removed from the front of St Paul's Cathedral about forty years ago were sent to America in the steamship *Delta*. The vessel was wrecked, but the railings were recovered. They were placed round the tomb of John George Howard and his wife in the High Park, Toronto, and the following inscription was recorded on a brass plate:

St Paul's Cathedral for 160 years I did inclose.
O stranger, look with reverence.
Man! man! unstable man!
It was thou who caused the severance.

Captain Washington in his lecture on 'Naval Architecture,' delivered at the time of the Great Exhibition in 1851, gives a list of a series of failures in the attempt to sheathe our ships with lead; and he hints that something might have been learned from a Roman galley of the time of Trajan, which had been recovered from the bottom of the Lake of Riccia, and was found to have been sheathed with lead fastened on with copper nails. How many lessons in naval architecture and gunnery are now being laid down in the ooze at the bottom of the narrow seas for the enlightenment of future generations? Let us hope that those generations may be able to look behind the grim ferocity of it all, and see the underlying arts of peace; for it would be a harsh injustice to us to be judged through all the ages by such memorials only as these.

THE SONG OF MORNING.

I WOKE from sleep at dawning yestermorn,
When waves of glory filled the summer sky,
And birds were singing from the hedge of thorn
Beside a stream of water running by.

Up rose the sun, and upward swelled the song,
It seemed as if all joyous things of earth
With dew-besprinkled flowers, and grasses long,
Gave to the morn the first-fruits of their birth.

The friendly sparrows twittered in the eaves,
And from afar I heard a thrilling note
Uprising from the beech-grove decked with leaves,
And knew the music of that golden throat.

It was the merle, companion of the hours
When winter tore the sweetness from the land,
Who trembling came, fear-driven by the showers,
And took the bounty from an outstretched hand.

Now hope triumphant moves the soul elate,
And love leads forth the song of thankful praise,
Till, wearied singing to his brooding mate,
The songster in the brook his thirst allays.

The daisies ope their petals to the sun,
While Nature breathes her message on the air,
The message of a perfect day begun,
And all the myriad joys awaiting there.

Oh, wearied ones, who stand with death apart,
Here lies the balm of healing in the strife.
Lay down the grief that chills the stricken heart,
And hear the beat of God's abundant life.

SEVENTH SERIES

WITHOUT SANCTION OF ADMIRALTY.

By 'ÆSCULAPIUS.'

I.

'SEVEN o'clock, sir,' said the marine servant, opening up the dead-light. The light, streaming in through the port-hole, converted the particular steel box known as Staff-Surgeon O'Brien's cabin into the semblance of a living-apartment.

'What a glorious morning!' exclaimed O'Brien, thrusting his head out into the brilliant sunshine. 'I shall certainly go fishing to-day,' he said, contemplating with pleasure the calm sparkle of the sea. In between ships at their moorings, he also caught glimpses of the peaty shore suffused with a radiance unusual in that locality. His meditations on the forthcoming joys of angling were rudely interrupted, however, by a gush of blackish water which struck him on the nape of the neck. The *Alcibiades* had coaled on returning to harbour the night before, and her deck-hands, with the prospect of a 'make-and-mend' afternoon before them, were lustily removing all traces of it from the ship's side.

'Confound the swabs!' the staff-surgeon muttered savagely, withdrawing hastily, and jumping off his bunk. 'However, they say coal-dust is good for the scalp,' he consoled himself, as his towel reflected the seamen's efforts. Slipping on a bath-robe, he gathered his shaving-things together, and went up the ladder to the main-deck.

II.

Dense clouds of steam-vapour poured out through the door of the bathroom, which was situated near the wardroom, on the port side.

'Good-morning, sir,' several shadowy figures greeted him on entering. The gorgeousness of their kimonos, picked up anywhere from China to Peru, stood out like rays of the sun trying to penetrate a mist.

'I see the stalls are all taken, as usual,' growled O'Brien, peering into the three bath-cubicles in turn. Lieutenant Fitz-Boodle occupied one, lying in the hot water in an attitude of relaxed beatitude. The navigator, Lieutenant-Commander Barnwell, was crooning away in another.

'Hello, doc.!' said the assistant-paymaster, turning off the spigot in the third. 'I'll be out of it in a minute.'

'I sincerely trust so,' the staff-surgeon replied. 'Fitz-Boodle is hopeless; and as for the pilot, one has to allow him fifteen minutes to practise his songs.'

'At any rate, some organised noise is necessary to drown your infernal moans,' Barnwell retorted.

Rubbing the moisture off the looking-glass, O'Brien began shaving. A couple of officers were utilising the space near him to take an old-fashioned 'tub,' and, of course, they splashed in all directions.

'Bring me my sea-boats, please,' O'Brien asked his servant, who happened to look in with a bath-towel.

This remark apparently had the effect of precipitating open hostilities between the A.P. and Fitz-Boodle. These were led up to in a more or less furtive manner, for the A.P. kept throwing cold water on Fitz-Boodle at intervals across the intervening compartment. Fitz-Boodle's serenity was much disturbed, and the navigator's suffered also when some of the salt water, in its flight, dropped into his mouth while he was in the throes of a treble note. Peace, however, might have been preserved if, at the juncture mentioned, the A.P. had not committed the overt act of directing a moderate-sized spray from the cold douche attachment towards Fitz-Boodle's cubicule. Fitz-Boodle jumped out of his bath in a rage, seized the fire-hose coiled up outside, and, turning on the cock, directed it anywhere. The full force of the stream struck the deck-bathers, who, with a howl, evacuated their shallow metal tubs, and, emptying the soap-suds contents on the deck, used them as shields. Both of these improvised defences, however, were sent flying by the A.P., whose colossal limbs and loose joints were the terror of everybody when he ran amuck. On this occasion he crashed out in order to engage Fitz-Boodle for possession of the hose. The battle was not quite decided, but the cock was turned off, when a signalman came in with the announcement, 'Captain's orders, gentlemen; everybody to note carefully. "Flag to *Alcibiades*. Your daily consumption of fresh water is too high. This must be reduced, even at the risk of your drinking less."'

 [*All Rights Reserved.*]

Everybody roared at the innuendo, for the *Alcibiades* was a 'wet' ship in other directions. In the way of the navy, however, when a point of discipline is involved, the skylarking ceased, and the staff-surgeon was enabled to complete his shaving, half-drenched as he was. By this time there was no hot water left in the pipes, and he was forced to content himself with sea-water, fresh from tanks which had just been filled. The timidity with which he stepped in was only equalled by the suddenness with which he jumped out. 'It's as cold as a loch in Iceland,' he moaned.

'Never mind, doc.,' the naval instructor, who always took a cold bath himself, assured him; 'it'll tone up your enervated Celtic constitution.'

'My only fear is that the use of salt water leads to that shrivelled-up appearance of which your body is such a notable example,' replied O'Brien, drying himself vigorously.

III.

Returning to his cabin, O'Brien found his under-garments arranged on one chair, and his uniform folded on the other. 'These servants seem to think the essence and quintessence of their art is simply to fold; generally their arms, too, so far as any work is concerned,' he muttered when he came to don his uniform and found it necessary to apply the clothes-brush diligently. He was fastening the strap of his wrist-watch, when there was a knock on his jalousie. 'Come in,' he intimated.

The door was pulled aside, and a messenger appeared. 'Signal, sir,' he said.

The staff-surgeon read the preamble: 'Duties of H.M.S. *Alcibiades*—medical guard and duty steamboat.'

'Confound it!' he muttered under his breath, as he initialled the paper, and realised that his hopes of going fishing on this, one of the few fine days in the year so far as that station was concerned, had been defeated.

IV.

'Porridge, haddock, bacon and eggs, sir,' the corporal of the servants said monotonously, after he had presented the staff-surgeon with that typewritten gist—waggish officers call it jest—of the wireless press news known as the Poldhu.

'Scotch fodder I do not eat,' O'Brien rejoined. 'As for your fish, from the leeward point of view, it's too pathetic for words. Yes, I'll have bacon and eggs. Why we don't send trawlers out and get a supply of fresh fish is more than I can tell,' he grumbled, buttering a roll.

'Coming fishing with me to-day, doc.?' the first-lieutenant asked. That jovial officer had already observed the white St George's cross on a blue background, flying from the topsail-yard halyard, and he knew quite well this was the medical guard flag. He was also aware of what was troubling the staff-surgeon. The latter was compelled to stand by till eight o'clock the following morning, in order to respond to calls for medical assistance coming from craft which had no surgeon on board.

'You go to ——!' O'Brien retorted fiercely.

The chief yeoman of signals came up to him, cap in hand. 'The flag-ship has just signalled as follows: "Send medical officer to see a case in the *Roister Doister*." When shall I say you'll leave, sir?'

'When I've seen my own sick, and that'll be about 9.30,' the staff-surgeon said sternly, as he rolled up his napkin.

V.

'You'll take the staff-surgeon to the *Roister Doister*, and wait for his instructions,' the officer of the watch told the coxswain of the picket-boat.

'Where is she lying, sir?' the coxswain inquired.

'How the mischief am I to know?' retorted Lieutenant Fitz-Boodle, who was keeping the forenoon watch. 'Use your brains as well as your telescope, and you'll probably find her at the lower end of the Sound.'

'Ay, ay, sir,' said the coxswain, signalling the tiny engine-room to go ahead. When the propeller began to revolve, he first of all put his helm over to starboard, in order to clear the stern of the *Alcibiades*, and then described a sort of half-circle. The stem of the picket-boat, rising and falling to the motion of the swell, was pointed toward Buzzard Sound.

Wind and tide are continually swinging war-ships at anchor; it may be the stern, or a turret, or foretop is seen from a different angle, but it gives the frequent observer an ever-changing conception of the personality of any one ship. The fleet, too, was remarkably talkative on this particular morning. Signalmen stood on some point of vantage, generally somewhere near the bridge, with a signal-flag in each hand, which they manipulated dexterously, or perhaps instead the stolid-looking arms of the semaphores. The yard-arms, also, of many of the ships were what shore-going people would call gay with bunting, but to the practised eye of the seaman every flag meant something. Curious lookouts, with eye glued to telescope, would detect the call-sign of their ship being made in the distance. They proceeded to translate the signal which immediately followed, calling out aloud the meaning of it to another signalman who waited, pad and pencil in hand. Any one of those signals might mean anything, from one officer asking another, 'Will you dine with me to-night?' to 'Prepare to leave harbour at once.' Of course, such *enclaire* or non-code signals may only be made in an isolated base, free from all possibility of enemy spies.

Standing upright in the stern-sheets, with his back to the picket-boat's cabin, O'Brien surveyed

all these passing sights with the familiarity of a Londoner walking down Piccadilly. The *Alcibiades* was at present on intimate terms with the aristocracy of this great naval base. When she was not running errands for these frowning battleships, she was billeted with them, so to speak, in Belgravia. The staff-surgeon's picket-boat, too, was just one of hundreds of craft which were plying the roads of the sea at the beck and call of the Dreadnoughts; and if one took the trouble to go up in a seaplane, one could spot definite arteries of traffic, radiating in their direction, along which steamed anything from a commissariat-ship down to the little duty steamboat which carries despatches round the fleet.

O'Brien came this way quite frequently, conveying cases to the hospital-ships. These lay in a bay, separated by a peninsular sort of point from the flotsam and jetsam of ships they were now approaching, which may be regarded as the camp-followers of a mighty fleet.

VI.

The picket-boat came alongside H.M.S. *Prometheus*, which was specially designed for making delicate repairs to submarines not involving docking. The O 2 was tied up to one side, while on the other was the *Roister Doister*, a torpedo-destroyer which had come alongside to have something done to her dynamo.

The staff-surgeon was going up the gangway of the *Prometheus*, when the coxswain of the picket-boat called out to him. 'I've got to shove off, sir,' he said apologetically, looking through his telescope in the direction of the *Alcibiades*; 'the Blue Peter has been hoisted.' This meant that the picket-boat must return forthwith to the *Alcibiades*.

'It's the same old story when Fitz-Boodle's on watch,' O'Brien complained under his breath; 'he's always recalling picket-boats. Very well,' he said aloud to the coxswain; 'I'll make a signal when I want you.'

'Very good, sir,' the coxswain said, and in a few minutes he was off.

'Good-morning, sir,' said the warrant-officer of the watch.

'Hello, Mawworm!' O'Brien responded; 'how's the leg?'

Mawworm changed ships frequently, and in each one he made a point of consulting the surgeon regarding his leg. This, he proudly declared on such occasions, was hit by a Mandarin bullet while he took part in the rush for idols and other curios during the allied occupation of Pekin.

'It gives me a twinge now and then,' answered Mawworm.

'Serves you right, too,' said the staff-surgeon, crossing the deck of the *Prometheus;* 'you ought to have left looting to the Germans.'

'Boys will be boys, sir,' the warrant-officer said jauntily, a reminiscent look coming over his weather-beaten face; 'and who'll say our boys at the front to-day have not earned a good looting expedition on enemy territory?'

'Perhaps you are right,' O'Brien admitted thoughtfully, balancing himself on a couple of planks which connected the *Prometheus* with the destroyer.

VII.

The quartermaster of the *Roister Doister* saluted him. 'I'll tell the captain you're here, sir; the sick officer's in the first-lieutenant's cabin.'

The captain came on deck in a few minutes. He was a young commander, of slight build, brown hair, and the inevitable blue eyes of the sea. 'Sorry to bring you all the way down here, O'Brien, but the surgeon of the *Prometheus* is on leave. You'll be pleased to hear, however, the patient's one of your own cloth, so it'll be a case of Greek meeting Greek.'

'Then he'll be amenable to common-sense medical advice, which is more than can be said of the ordinary N.O.,' retorted O'Brien, following the commander to a hatch abaft the funnels. They let themselves down the ladder on to the deck of the captain's flat, and the commander waved O'Brien into the first-lieutenant's cabin. 'Here's your patient, doc.,' he said; 'he's our surgeon-probationer, Joughins by name. I'll leave you with him, O'Brien. Come and have a "spot" before you leave;' and the captain reascended the ladder.

The young officer lay in his bunk, with his face, which was turned toward the door, slightly flushed, and a certain intense look in his eyes.

'You've got a touch of "flue," my lad,' the staff-surgeon said, after he had examined him; 'but you'll be all right in a few days. When are you sailing?'

'Not till next week, sir; but I can't sail in her,' the surgeon-probationer said in a voice trembling with emotion.

'Why not?' inquired O'Brien.

Joughins covered his face with his handkerchief, and sobbed so that his whole body shook as if he had the ague. 'It's no use, sir,' he finally said. 'I'm a coward. I can't stick the dark nights when we steam along in a ghostly sort of way; and if we're in company, our friends look equally as spooky. The other officers are usually on watch, and I am left to brood and listen to the infernal swish of the sea. One feels it all the more being a non-combatant, where one simply waits for something to happen. That's not all, sir,' the surgeon-probationer said in an awed whisper.

'What else is there?' asked O'Brien.

'Some time ago our Lieutenant Oswald was lost at sea. He had a watch which chimed the hours, and late at night I wake up with the sound of it ringing in my ears, and I seem to

see Oswald, who was hard to rouse, standing over me in a menacing attitude.'

'Was this weird ticker lost with him?'

'No, sir. He had left it lying on his bunk before going on deck to meet his death; otherwise the King of Siam would have been displeased.'

'What the blazes has the King of Siam got to do with it?'

'The King of Siam,' Joughins replied solemnly, 'gave the watch to Oswald when that unfortunate officer was on the China station. Strange to say, he stipulated that if Oswald died before him, it was to be returned to His Royal Highness; and the Admiralty complied with his wishes in this respect.'

'Joughins,' said the staff-surgeon, rising abruptly, 'you're suffering from war-neurasthenia. You'll have to go to hospital for a bit; and after a drop of leave, the best thing for you to do will be to complete your medical course. Meanwhile pull yourself together, and I'll go along with you shortly.'

'Thanks very much, sir,' Joughins replied; 'I feel better already.'

O'Brien went up the ladder, and down the wardroom hatch.

VIII.

The captain was sawing a few inches off the hind-legs of an arm-chair, so as to give it a more comfortable sitting angle, and did not notice the staff-surgeon till the latter was alongside him. 'Well!' he asked jerkily, ordering a couple of cocktails, 'what's wrong with the boy? We don't want to lose him, even if he's a bit mouldy at times.'

'I'm afraid he's a hospital case,' O'Brien replied. 'If you don't mind, I'll send a signal for a boat.'

'Certainly not,' said the captain, walking to the foot of the ladder. 'Quartermaster,' he called out.

'Yes, sir.'

'Bring me a signal-pad.'

'Ay, ay, sir,' said the quartermaster, coming down a moment later with the required form.

The staff-surgeon wrote out the necessary signal: 'Duty Medical Officer to Hospital Ship *Bengal*. H.M.S. *Roister Doister* has one officer for hospital. Please send boat.'

'Make this signal, quartermaster. I suppose you can semaphore it?' the captain asked.

'Not direct, sir; I'll make it to the signal station on the point, and they'll pass it on.'

'I don't care how it is done; but get it off at once.'

The quartermaster signified his appreciation of this fact by a hasty salute. He had no sooner withdrawn than another pair of legs began descending the ladder, and Mawworm, displaying great agility for one whose leg was the object of such tender solicitude on his part, appeared, cap in hand, and addressed the captain. 'The engineer-captain of the *Prometheus* sends his compliments, and will you come over and see him, sir?'

'Thank you, Mawworm.—I'll have to leave you now, O'Brien. Sorry I can't ask you to lunch; but we've nothing on board. I'm cadging these days off the *Prometheus*.'

'That's all right,' O'Brien answered; 'I'm off myself to have a yarn with Rushbrook of O 2.'

'I may see you later, then,' said the captain, following O'Brien up the ladder.

The staff-surgeon hailed one of the submarine's crew, who was cleaning the top of the periscope. 'Is Commander Rushbrook on board?'

'No, sir,' the blue-jacket replied; 'you'll find him in the wardroom of the *Prometheus*.'

ISRAELITES OF THE ISTHMUS OF PANAMÁ.

THE SAN BLAS TRIBE ON THE PANAMÁ COAST.

By Paul Tyner.

'IN that old world men call the new,' and in the immediate neighbourhood of the great water-way between the oceans which realises the dream of centuries in the greatest of modern engineering achievements, may be found a people set apart by a record and characteristics that give them rare ethnic and historical interest and importance. As yet these people are virtually unknown to the modern world, occupying no place on our political maps or in our histories. Yet it is more than possible that intelligent study will show them to have a value for our present mankind in the making, and one not less to be regarded in its way than the value to commercial progress of the interoceanic canal. They occupy a territory nearly as large as Belgium, in close proximity to what for more than four hundred years has been one of the world's great trade-routes. During all this time, and probably for more than a thousand years before, they have maintained their tribal and territorial integrity.

These people are the San Blas tribe of Indians. They inhabit a section of the eastern end of the Isthmus of Panamá, which is officially included in the province of Colon on the map of the Republic of Panamá, as before November 1903 it was ostensibly a part of the Republic of Colombia, of the Confederation of New Granada, of the

Spanish Viceroyalty of Panamá, of the Viceroyalty of Peru. But, as a matter of fact, neither in this present year of grace nor at any previous time, so far as can be learned, have any of these 'governments' been acknowledged or submitted to by the San Blasians. Within their borders neither the Conquistadores nor their successors have ever exercised sway; across their frontiers the writs of Spanish monarchy or of Hispano-American republic have never run. Numbering only twenty-five thousand in all, they have about five thousand men of fighting age, all of whom incidentally are 'Pacifists,' who believe in 'preparedness,' and who are well armed and as alert as they are valorous. The San Blasians, therefore, seem likely to continue to preserve the independence which they have so long defended and maintained against apparently overwhelming odds, for during the greater part of these four centuries they have seldom been at peace with the Spanish invaders. It is only within the past generation that, having taught the proud Castilians the folly and uselessness of interfering with them, the San Blasians have enjoyed peace and tranquillity.

This remarkable achievement in itself suggests an inquiry. No one questions the marvellous courage and daring of the early Spanish adventurers, their military skill, and the immense superiority they enjoyed in the use of firearms against peoples still in the spear and bow-and-arrow stage. Thanks to a strange commingling of religious fervour and fanaticism with the most utter ruthlessness and rapacity, the Spaniards swept everything before them, and reduced all the tribes and peoples surrounding these San Blasians to the most degrading servitude. The San Blasians alone held their own in fight after fight, day after day and year after year, through four hundred years. What enabled them to do this?

And the answer, I humbly venture to suggest, must be found in the fact that they have lived in accordance with a primal biological law of man's being which, alas! most of us civilisees have flagrantly, if ignorantly, disobeyed. The San Blasians are the one tribe of Indians left in all the Americas who have preserved their ethnic purity of blood, and who have never been conquered. The two things go together. I am not unmindful of the brave and long resistance made to corruption of blood and subjugation by the Mayas of Yucatan and the Mosquitoes of the Nicaraguan coast, as well as by the Navajos and Yaquis of the south-western territory of the United States and the north-western corner of Mexico. But these tribes have been all but extinguished. Clearly the persistence of the San Blasians goes to a deeper cause than the fighting instinct of self-preservation; to a cause deeper even than the primal regard for sexual purity found in primitive peoples everywhere. In the San Blasians there is evidence that this instinct is well buttressed by centuries of religious training and practice—the religious training and practice, as I shall offer reasons for believing, of the people of ancient Israel.

As has been noted, these Indians inhabit a region bordering on the Gulf of San Blas (named after the tribe), and extending east along the coast for some forty miles from the city of Colon, in the province of the same name occupying the north-eastern end of the Isthmus of Panamá. No European settlement has ever been made in their territory. In 1502, when Columbus, on his last voyage, attempted to found not far from the present city of Colon (named in his honour) what would have been the first European settlement on the American mainland, having made all preparations to return to Spain, leaving his brother Bartholomew in charge, these Indians descended on them with such force and fury that the Spaniards were compelled to flee to the ships, and returned with Columbus.

The San Blas coast is famous for producing the finest coco-nuts that come to European and American markets. There is also a considerable production of cacao (the basis of our cocoa and chocolate), vanilla beans, sarsaparilla, mahogany, and a small amount of wild rubber. In all these products the San Blasians trade freely with those Europeans and Americans visiting the islands in the Gulf and settlements along the shore in sailing-vessels, and bringing to them cottons and cutlery, cheap jewellery, and glassware. The San Blasians also frequently carry their own products and wares, in the shape of Panamá hats, baskets, brightly coloured woven shawls, and pottery, by water in cayucas or dug-outs, or overland by mule-back, into Cartagena, Colon, and other towns on the isthmus, occasionally making their way as far as Panamá, and even to Bogotá. They are not adventurous traders, although canny at bargaining, and keenly alive to opportunities for increasing their hoards of silver.

For natives of the tropics, they are remarkably industrious, sober, and thrifty in their habits. They show great amiability and peacefulness in their relations among themselves and with their neighbours—so long as those neighbours refrain from aggression. But in their jealousy for the preservation of their racial purity they are clannish to the last degree. No white man is allowed to remain in a San Blas settlement after dark, and it is said that no white man has ever seen a San Blas woman except through a marine-glass from his vessel offshore. The women are kept as invisible and as closely guarded, when white men are ashore, as are the denizens of Oriental seraglios. All this with no disrespect for the white men, but with unusual respect for their own women, and for untainted motherhood.

The San Blasians speak a Spanish patois, usually interlarded with words and phrases from

the tongue of the Cholus, the predominating native race on the Isthmus so far as numbers are concerned.

Except for a vague tradition among the old chiefs, it is difficult to ascertain much concerning the language originally used by the San Blasians. It was certainly not Cholu, although that dialect may be a corruption of a more ancient speech, that of the Chibchas of Cundinamarca, or the Chichas of Argentina. And the San Blasians are a nobler type physically, mentally, and morally than the Cholus—cause and consequence of their refusal to intermarry with the Spaniards, or the negroes, or indeed with any other of the tribes of the land, so preserving the purity of their blood with an invincible persistency ever since the Spanish 'conquest.' It is the proud boast of these people that no San Blas man has ever begotten, and no San Blas woman has ever borne, a mongrel.

This trait is all the more remarkable when it is remembered that all the other peoples of Central America and of the West Indies cherish no such sentiment. On the Isthmus of Panamá especially, crossing of the races has been so varied and constant that it is generally affirmed that, outside of San Blas, no native of Panamá is of pure blood. Among other people than the San Blasians the colour-line is not drawn either on the country-side or in the social and political life of the cities.

When I first visited the San Blas coast in 1888, I had the good fortune to have for travelling companion the late Dr Ferdinand C. Valentine, an eminent New York surgeon and physician whose forebears were of an old rabbinical family of Jews in Holland, and who was himself a proficient Hebrew scholar. Years before, he had become deeply interested in such study of the ancient peoples of Central America as his own researches at Copán in Honduras, and some association with the archæological work of M. Desiré Charnay in Mexico, and of M. and Mme. le Plongeon in Yucatan, had been able to afford. We were the guests in Cartagena of a brother of Dr Valentine, who was established in that city in charge of the branch of a large New York house engaged in the Central and South American trade. It was in a small sloop belonging to the Valentines that we made the trip from Cartagena along the coast. While his younger brother was busy trading with the natives in San Blas, the chief town, Dr Valentine, as was his wont, strolled about the place in company with the *padre*, visiting the sick and prescribing their treatment. He became interested in the case of a bright young fellow of eighteen suffering from what proved to be tuberculosis of the bone, seriously affecting the left leg. The grandfather of the lad, a very old man, was particularly distressed by his grandson's condition, and while dozing in the midday siesta would mutter and mumble strangely. Fancying that words used in this half-conscious talk bore a striking resemblance to Hebrew, Dr Valentine ventured to try on him certain passages from the original text of the Thorah that for the Israelites have had vital significance through the ages. To his surprise, the old man seemed to understand perfectly and displayed remarkable warmth of feeling, insisting on embracing my friend and even kissing his hands. Dr Valentine's professional interest had been keenly roused by the case of the lad, and he expressed willingness to undertake his treatment, which, he informed the family, might necessitate taking the boy to New York. Consent to this was given, and the young man, whose name was Juan Battista, returned with us to Cartagena, and shortly after to New York. There his case was made the subject of clinical study by physicians, presenting, as it did, certain rare pathological features. After amputation, he recovered his health and spirits. Taken into his benefactor's family and treated with great kindness, he quickly developed a very beautiful and faithful affection for all the members of the household, and especially for the doctor. Spanish was spoken in the family, but, to enhance his usefulness, this young San Blasian made the most of his opportunities to learn English. This suggested to Dr Valentine an experiment. He interested his protégé in the study of Hebrew, taking him to services at the synagogue. I cannot but consider it significant that the boy became much more proficient in Hebrew than in English, a fact for which his natural brightness and alertness would not sufficiently account, as his opportunities for becoming familiar with our speech were certainly the greater.

In talking with this young tribesman, I was much struck by the native and naïve innocence of his mind. He was as clean and sweet as a little child in thought and habit. The jealous screening of the women of his tribe, he told me, was not observed when there were no white men about. It was not that of the Oriental zenana. With their own men it was quite unnecessary. No San Blas man would think of seducing a woman (any woman), any more than he would cut his own throat. Every woman was treated with scrupulous respect. From an early age, indeed from the time of the approach of puberty, both boys and girls were taught to keep their minds and bodies sacredly pure for their future mates. He was looking forward wistfully to marriage with the girl to whom he was betrothed, and with whom his union had been postponed on account of the disease from which he was now happily freed; although he was not certain that the union would be permitted, as it was the custom of the tribe not to permit the mating of diseased, defective, or deformed persons. It would depend upon the decision of the elders; and whatever that decision, he would accept it cheerfully as *best for the tribe*. It happened

but rarely that any reason for forbidding marriage occurred, the people enjoying most unusual immunity from disease in a land where leprosy and tuberculosis were very common.

As to the origin of the people, all he could tell me was that they had always regarded themselves as different from, and in a way superior to, all other peoples, and that they had long ago come from a distant land beyond the seas. With smiling conciliation, he suggested that in that distant land the Jews, and even the British and the Americans, who seemed to him 'very like the Jews,' were kinsfolk of the San Blas tribe. 'But the Spaniards and the French? Huh!' His gesture and tone were expressive as to his conviction that the Latins were indeed 'heathen tribes without the pale.' Then he grew solemnly contemplative, his customary boyish brightness clouding over as he declared, 'Very bad, very wicked, very cruel people—those old Spaniards!'

Yet to this fervid detestation of the Spaniards, as I learned on another occasion, there were two notable exceptions. The San Blas people held in loving and reverent memory Vasco Nuñez de Balboa and the good Bishop Las Casas, the discoverer of the Pacific, and the apostle and emancipator of the Indians. The story treasured among the San Blas folk, as I gleaned it from Juan Battista, is that a remarkably close and firm friendship was formed between Balboa and the San Blas chief of his time. The Spaniard had loyally helped his native ally in driving back and practically exterminating other tribes that had been at war with them for years, and it was this chief who had guided Balboa and his men through the Isthmian jungle to the spot where he at last stood, 'Silent, upon a peak in Darien,' and gazed with a wild surmise on the expanse of the broad Pacific. Balboa fell in love with the favourite daughter of this chief, and they plighted their troth, the Spaniard, who probably had Jewish blood in him, being adopted into the tribe. Pedro Arias Davila, the Governor at San Sebastian, heard of this contemplated alliance, and was infuriated. He had expected to wed his own daughter to Balboa, and indeed there was probably reason to believe that if he had not met the San Blas maiden, Balboa would have become Davila's son-in-law. Summoning his lieutenant to San Sebastian on the pretext of a conference concerning important orders received from Spain, Davila placed him under arrest on his arrival, convicted him of high treason on the trumped-up evidence of enemies that he had planned rebellion against the Spanish Crown to set himself up as Emperor of the American continent. He was promptly beheaded, and the tradition among the San Blas tribe, which my young friend Juan Battista communicated to me, was to the effect that Balboa's dusky betrothed arrived on the scene just in time to witness his execution, and that the event caused her to lose her reason. Davila, further to satiate his fiendish appetite for revenge, a little later captured the girl and subjected her to gross brutality. From that moment it was *guerra al cuchillo* between the San Blasians and the Spaniards. Over the dead body of the unhappy San Blas princess, the old chieftain and his men vowed the tribe unto the remotest generation never again to permit a Spaniard even to see a San Blas woman, and relentlessly and perpetually to resist any and every Spanish attempt to encroach upon their territory or dominate their people.

In the history of the Isthmus, this bitter hostility against the Spaniards stands out in marked contrast to the friendship shown by the San Blas tribe for the British and the Americans, and by most writers the traditional enmity between English and Spanish is accounted sufficient reason for this friendship. While recognition that the English were at war with their own foes played some part in the matter, I do not think it was the only consideration. During the sixteenth and seventeenth centuries, at least, all white men looked alike to the remaining tribes of Central and South America, and they made no distinction between Spaniard and Briton. There is now published (thanks to the activity of the British-Israel Society) a volume of testimony concerning the identity of the British race with two of the lost ten tribes of Israel that disappeared at the dispersion in 721 B.C.—that is, with Ephraim and Manasseh. It is known that other of the tribes scattered over the earth, several into northern Africa, so that the claim of the kings of Abyssinia to descent from Solomon may not be entirely unfounded. In north-eastern China, only twenty years ago, a people were discovered who, although they had adopted the Chinese costume and language, held rigidly to the distinguishing religious practices of the Israelites. Why may it not be possible that these San Blasians are descended from one or other of the tribes carried in that early day into captivity in Babylon, and thence dispersed to all quarters of the globe?

Nominally their present religion is Roman Catholic, and, as has been noted, they hold the heroic and devoted missionary Las Casas in special veneration. Their Christianity, however, is of much the same Hebraic type as that of the Puritans and Presbyterians of the British Isles, New England, and Canada.

In this connection it is worth while recurring briefly to events in the history of Panamá illustrating this remarkable friendship of the San Blasians for the British, a friendship which has played a larger part than is generally recognised in the history of the modern world.

It was in 1572 that Francis Drake, sailing from England with letters of marque from Queen Elizabeth to fight the Spaniard, entered the harbour of Nombre de Dios, stealing past the fort in three small pinnaces at night. With a

handful of men he attacked the town, and would have carried off the silver from the king's treasure-house had he not fainted from his wounds and a panic fallen on his followers in consequence, so that they beat a retreat. But the fame of this attack brought the English unexpected allies in the persons of these San Blas tribesmen, who welcomed the arrival of a people at war with their own foes and would-be oppressors. Their chief had a pow-wow with Drake, and, furnishing valuable information as well as guides and fighting-men, joined the English in an attack on a treasure-train of mules crossing the Isthmus. 'Several tons of silver and much gold,' part of the king's fifth of the plunder from Peru, intended for shipment to Spain, were captured. Nor had these strange warriors forgotten Drake when, thirteen years later, and now an English admiral, he sailed the seas with twenty-eight ships of the line, ravaged the shores of the Spanish Main, and exacted large ransoms from the neighbouring settlement of Cartagena, among other cities in the West Indies and Central America. Having in the meantime gained undying lustre and established the sea-power of Britain by his victory over the Spanish Armada, Drake made a third descent on these coasts in 1595, burning and pillaging the cities of Santa Marta and Nombre de Dios. From the latter place he attempted, again with the aid of the San Blasians, an expedition across the Isthmus to sack Panamá. He was beaten back, however, more by the deadly miasma and frightful entanglement of the jungle than by any force the Spaniards were able to bring against him. He sailed then to Puerto Bello, and his ships were about to attack that strongly fortified city, when Sir Francis died in his cabin. He was given a sailor's burial in the mouth of the harbour. And there were no more sincere mourners at the death of the man whose name for twenty years had been a terror to the Spaniards afloat and ashore than were his San Blasian allies. To this day the simple monument that marks the resting-place of one of the greatest of British naval heroes is regarded as a sacred shrine by these simple children of the forest and the shore.

They showed their friendliness for the English again in assisting Henry Morgan (afterwards Sir Henry), the daring buccaneer who, in June 1668, with a fleet of ten small ships attacked and captured Puerto Bello. And they were with him when, three years later, with a handful of British dare-devils, and guided and reinforced by a band of the faithful San Blasians, he crossed the Isthmus and challenged the might of the Spanish Viceroyalty in three hours of fierce fighting, which resulted in his reducing that stronghold, overcoming a force outnumbering his own by more than ten to one, and capturing and sacking Panamá city. In the annals of martial daring this exploit has scarce a parallel. It should not be forgotten that without the aid of the San Blasians it would not have been possible.

But the San Blasians evinced an admiration and affection for the Scots beyond that commanded by the English when, in November 1698, several hundred colonists from Scotland, inspired by that daring dreamer and business genius, William Paterson, who had four years before founded the Bank of England, became their neighbours in the ill-fated colony of Darien, or New Caledonia. Early chronicles tell how the San Blas Indians welcomed the Scots as allies in their own constant warfare with the Spaniards. When the San Blasians came aboard the Scots ships, 'they were treated kindly and there was much drinking,' according to the letter home of one of the colonists. In those days the Scots were much in the habit of wetting a compact of friendship with liberal potations. It is recorded also that the San Blasians were of great assistance to the Scots in building the town of New Edinburgh and the Fort of St Andrew. They bore valiant part in several skirmishes with the Spaniards sent from Panamá and Puerto Bello to drive the Scots from the Isthmus.

So far as I can gather, they regarded the French who came to the Isthmus to build the Canal in 1881 with little more favour than they had extended to the Spaniards; but they seemed to regard the Americans as rightful heirs of the Scots, and their completion of the great waterway as fulfilment of the vision presented to them when their ancestors aided William Paterson to make the first survey for a marine highway between the Atlantic and the Pacific.

JOHN PARDON'S CHOICE.

CHAPTER VI.

HAD the question been put to so habitually frank a soul as was John Pardon why, when delivering his small gifts, late that same spring day, to Mary Patrick, he had refrained from any mention of his rencontre with the stranger girl, he would doubtless have been puzzled to find an answer. Even to her brothers, as together they unloaded the 'shakes' and discussed all details of his trip to and from the 'big timber,' he did not once allude to the incident so stamped upon his mind, or seek to discover who the girl might be. That it was impossible for any item of news in that sparse district to remain long undivulged Pardon well knew—and he could wait.

So it was not until several days later, when

his neighbour, Michael O'Keefe, had come in one evening to have a look at John's paper and smoke a pipe with him, that the latter, stretching himself and smothering a yawn, asked with carefully assumed indifference, 'Say, Mike, have you heard tell of any strangers comin' to settle in this here surroundin' desert o' ourn?'

Michael O'Keefe, a droll little man with a weazened, old-young face, an ancient pot-hat always perched on the back of his head, and small shrewd eyes, much wrinkled at the corners, glanced at Pardon, tilted back his chair, adroitly spat through the open window, and with great deliberation stuffing tobacco into an evil-smelling pipe, quietly remarked, 'She ain't *takin' any*, John!'

Pardon, thus unexpectedly trapped, reddened beneath the tan, but realising from long experience that it was useless to try to bluff his Irish-American friend, dropped his chair with a bang on its forward legs, and said with a sly chuckle, 'Who *says* she bain't? Anyway, *you* bain't in the runnin', Mike, my boy!'

Michael, wholly unmoved, and without the least change of expression on his parchment-like countenance, struck a match, and when his pipe was well going, said in even tones, 'No more nor *you*, John; so don't go an' git no foolishness into that cabbage head o' yourn;' and he settled the superfluous tobacco in the bowl of his pipe with a dirty brown thumb.

'Why, durn ye, Mike,' cried Pardon, now thoroughly roused, 'what are ye drivin' at? And who *is* she, anyway?'

'Steady, boy; don't git heated!' replied Michael calmly. 'I'm only tellin' you she bain't for the likes o' you an' me—no disrespec', John;' and he clapped a hand on his friend's long knee. 'They're from the Old Country—she and her brother,' he went on; 'an' back there her own folks is big bugs—own more land an' houses than this whole durned, sun-baked, bush-grown wilderness put together. My old dad's people used to live in one o' their villages—owned the whole bloomin' village, they did—an' nobody passed 'em without touchin' their hats. Not that, for myself, I holds much with that sort o' kow-towin',' he added, Michael being a dyed-in-the-wool democrat, in the most democratic of countries. 'But,' he continued, 'I reckon they bain't so well off nowadays—"land-poor," as they say back home; and there was a whole boilin' o' boys an' girls. At any rate, old Powell—Sir Thomas, they called him—he's bought that God-forsaken ranch o' Sam Bunker's, an' shipped Bob—that's the youngest son—out here to see if he can earn an honest livin' by the sweat o' his brow. Don't envy the poor young beggar comin' in for any o' Sam Bunker's leavin's. Decant young chap he seems, too. I run acrost him the other day when I was huntin' after that red calf o' mine, and he put up for a talk—leastwise *I* did—*he* didn't say much. but give me a hand right enough with the break in the fence where that bally heifer burst through.'

Michael paused for breath and to pull hard at his smouldering pipe, the while regarding Pardon out of the corner of his eye, as though expecting some comment upon his story. But Pardon, busying himself about the stove, said, with small display of interest in his voice, 'Oh, I see. So the young lady is this—what's his name?—this Powell's wife, eh?'

'Wife!' grunted Michael half-wrathfully. 'Wife *nuthin'*—didn't I tell you she's his sister? What's the use o' my talkin' if you bain't goin' to listen? "*Joy*" he called her—or some such moonshine name as that. Not that it concerns you nor me, John, *what* her name be, as I said before.' Then, getting up stiffly from the hard wooden chair, he said, 'Well, John—reckon I'd better make tracks for home. It's gittin' dark, and I'll be breakin' my neck in one o' them cursed holes in your road;' and he started for the door, cramming down the pot-hat still more tightly on his close-cropped head. 'By the way,' he added, pausing for a moment, 'that thar young Powell said he would be wantin' a lot o' haulin' an' horse-work done, one way an' another, so I told him as how I guessed *you* could take on a job or two, now you've got through with them shakes for Joe Patrick.'

'Sure I can,' replied Pardon heartily, while a cheering though inexplicable feeling that the world wasn't such a bad place, after all, suddenly possessed him. 'Thank ye, Mike,' he called after the queer little figure vanishing in the dusk. 'I'll mosey along up to Bunker's—I should say Powell's—ranch, maybe, day after to-morrer.' Then, as he turned back into the house and prepared for bed, he might have been heard speaking aloud, but for the sole benefit of an old gray cat. 'His *sister*, is she? Lucky feller. But, for myself, I'd rather be somethin' else than a brother to her!' he chuckled. 'And don't her name just suit her? "Joy," Mike said it was—*Miss* Joy, I should say—beggin' her pardon for takin' liberties behind her pretty back. And day after to-morrer, with luck, I'll be seein' her—not, of course, that *that's* anythin' to a poor old scrub of a bachelor like me. As good as married, too, though the weddin'-bells be long in ringin'!' and so saying, he rolled himself in the untidy heap of blankets tossed about his bed, in the depths of which he was soon wandering in the mazes of a dream, wherein rainbows and golden hair and Michael O'Keefe's red calf were hopelessly entangled.

The 'day after to-morrer' found John Pardon early astir, and, his breakfast of the inevitable beans and coffee disposed of, busy with a toilet of unwonted care. First there was a tremendous din of washing in the back-porch, where the energy of his ablutions, in a shallow tin pan, scattered cold drops hither and thither, sending

the old cat and her kittens flying in every direction. Then, having rattled the kitchen-window shade up to the top with such gusto that the very cord whirled round and round the roller, Pardon sorted from among the knives in the table-drawer his old razor, stropped it thoroughly on his boot-top, and speedily smothered his chin in a foam of lather. Between crisp-sounding scrapes of the razor-blade, he addressed remarks to the old cat, who at the sound of his voice paused in the very middle of moistening a spotless white paw with a rough red tongue, and looked up at him, with an only semi-diverted expression in her oblique green eyes. '"Sally," old girl, we're goin' to make a *call* to-day—strictly on business, you know. We don't expec' to *see* no one 'ceptin' the young British feller, *do* we, "Sal"?' 'Sally,' finding the conversation wholly devoid of mice and kindred subjects, continued her tongue to the tip of her paw, and then applied the 'sponge' vigorously to an already immaculate ear. 'What are *you* dressin' up for, "Sally"? Maybe she don't *like* cats; so I mustn't pack you along on my saddle. Gee! but it's a fine mornin',' he exclaimed, laying down his razor, and in such gay spirits that he playfully flung some of the hairy lather on to 'Sally's' extended tail. 'Use Pears' soap, "Sally"!' he laughed; then, as the old cat disgustedly licked off the white foam, 'Don't like the taste, eh? Come along, then. You shall have a bit of cheese—fine day this, "Sally"—let's all be happy.' Having hacked off a savoury peace-offering for the offended 'Sally,' he resumed his toilet, stopping a moment before the cupboard to survey his wardrobe. Resisting the temptation to wear a black coat and starched collar, unalterably decreed for Sundays and for the occasions when he drove Mary Patrick to Orangeville, he took out a new dark-blue flannel shirt, a pair of clean dark overalls, and his second-best black felt hat. Also he fingered longingly a large tie of red-and-black satin stripes that Sissy had sent him one Christmas; but a tie savoured too much of a social call *versus* a strictly business one, so Pardon resigned himself to merely buttoning the neck-band of his shirt, generally left flapping for greater comfort. Then, followed closely by 'Sally' in hopes of a mouse-hunt in the hay, he went to the barn, and astonished old 'Brady' by such a grooming as he had not experienced for years. The heavy Mexican saddle, richly carved and inlaid, that had been Pardon's chief pride in the days when he loped many a mile in the wake of a bunch of cattle, was carefully dusted and polished, the bit and stirrups rubbed till they shone, and a few moments later, under a radiant blue sky, man and horse were rapidly moving in the direction of the long-neglected Bunker's ranch, now taken over by young Powell. Less than a half-hour's ride found them emerging from a circle of densely bushed hills, in a hollow of which, like a broad-lipped cup, lay the ranch whose unpruned orchards and vine-terraces, and the dilapidated bungalow, were now mercifully and beautifully veiled by the fresh green of spring, and a perfect smother of fruit-blossom and lilac.

John Pardon screened his eyes with his hand, so intently scanning the sun-bathed hollow that it was only when 'Brady' suddenly pricked his ears and turned his head that he noticed the figure of a woman emerging from a small path within a few yards of him.

It was Joy, and at sight of her John Pardon's heart gave a great bound. Pulling his horse up short, he swept his hat off, as the girl, startled by the sudden rush and bark of two big dogs that accompanied her, stopped to look.

'Good-mornin', marm,' cried Pardon, his eyes the while noting how the sunshine gleamed in the gold of her soft hair, how blue as the sky were the eyes that looked up at him, how the rich colour mantled her sweet face.

Then, recognising him, she stepped forward with a bright, frank smile. 'How do you do?' she said. 'You see we got home quite safely—for it *was* you, was it not, who so kindly came to my rescue on Cañon Hill the other day?'

'Yes, marm,' replied Pardon. 'Pleased to meet you again. My name is John Pardon, and you are Miss Powell, I reckon. I've come to see your brother, if he's anywhere 'round; for my neighbour, Michael O'Keefe, told me as he was wantin' some haulin' done—— But excuse me, marm, for keepin' you standin' in the blazin' sun.'

Joy glanced at the blue sun-bonnet dangling from her arm, the other filled with big boughs of waxen-belled manzañita. 'Oh, thank you. That doesn't matter; I never *can* keep anything on my head!' she added with a little laugh. 'Won't you come down and see my brother? He is propping some of the poor old plum-trees behind the bungalow. What a nice horse!' she broke off abruptly, running her long white fingers caressingly over 'Brady's' nose.

Pardon would have liked to dismount and walk beside her, but some instinct prompted him otherwise; and there was an indescribable something about the carriage of the girl's head, and the way she spoke and moved, which caused a tiny shadow to fall across Pardon's gay spirits. In spite of himself he could not but recall his friend Michael's half-joking words, 'Don't go an' git no foolishness into that cabbage-head o' yourn;' so, settling himself in his stirrups and lightly spurring his horse, he raised his hat as though the interview with Miss Powell were ended, and rode down the hill, leaving the girl to follow, if so minded. Joy, however, taking a short cut, was at the bungalow gate before him.

'You can tie your horse here,' she said, as Pardon swung out of the saddle. 'Oh—I see—

he, like my "Fay," is a thorough Western horse, and doesn't *need* to be tied,' she added brightly when Pardon flung down the lines, leaving the animal to stand.

'Him a good old horsy, bain't you, "Brady"?' he said in a crooning fashion. 'Carried me hundreds of miles, marm, when he wasn't nothin' but a colt—the pair of us, for the matter of that. We 're gettin' old now; ain't that so, "Brady"?' He turned to meet Joy's blue eyes looking straight into his own.

'*You—old!*' she exclaimed mirthfully; then, 'Please come up to the veranda,' she said, 'and I will call my brother.'

Pardon followed her up the rickety old steps, and, seating himself, saw her flit like a bird through the open door, the dogs bounding and tumbling after her. From where he sat he could just catch a glimpse of a long, low room, unlike —quite unlike—any of the houses with which he was familiar. A thought which puzzled and yet pleased him was that the room seemed to be a reflex of Joy herself—flowers everywhere—books everywhere—sunshine—open doors and open windows—a few pieces of quite plain furniture—a rifle, a shot-gun, pipes, fishing-rods —all sorts of masculine belongings—and yet upon it all the unmistakable stamp of a woman's touch. The slight shadow, already fallen across the lonely man's spirits, deepened, while back into the gray eyes crept the smitten look of one who has too long waited.

Presently the sound of voices and the heavy gambol of dogs were heard, as Miss Powell, followed by her brother, returned. Instantly Pardon rose and went forward to meet them, his big frame towering above the slender six feet of the younger man, his large, roughened hand outstretched towards the small, shapely one, unhardened by manual toil.

'How d'ye do, stranger?' he said pleasantly, at the same time quickly running his eye appreciatively over his new acquaintance, much as he might have done over a young horse; and Bob Powell met his look with one equally frank and kindly.

Pardon at once detected not only a strong resemblance in colouring and manner between the brother and sister, but also the hall-marks of good breeding, which even the ill-fitting working-clothes that young Powell wore could not conceal. Greetings over, Powell offered cigarettes and a match, and asking Pardon to take a comfortable chair, perched himself upon the veranda-railing. Joy went inside, where Pardon caught glimpses of her as she fetched water to fill a huge brown jar in which to put her burden of manzañita, and then busied herself about the house.

An hour or more slipped quickly by while the young man unfolded his many plans and hopes for 'bringing up' the ranch, Pardon joyfully undertaking to do any amount of work for him with his team or his hands. It being agreed that he should begin on the morrow, he rose to go; but Joy just then appeared with a plate of toothsome cakes and two tall moist glasses, on the top of which bobbed thinly cut slices of lemon.

One she proffered Pardon, and as she handed the other to her brother, Pardon heard his solicitous aside, 'Aren't you going to have some too, Joy?'

'I've just had a glass of milk, Bob,' she replied, and the look of happy understanding that passed between the two made the Westerner's heart warm to these strangers who had come into his life from so far afield, bravely facing exile and unaccustomed toil.

They all parted as friends, even the dogs demonstrating their approval by doing their best to tangle Pardon's long legs on the veranda-steps. Then, mounting his horse and cheerily calling out, 'So-long!' he prodded 'Brady's' well-covered ribs, and loped away towards home. He hated to leave his new friends, but to-morrow would soon come.

GERMAN BRIGANDAGE IN CHINA.

THE REHEARSAL.

By Sir GEORGE SCOTT, K.C.I.E.,
British Commissioner, Burma-China Boundary Commission (1898-1900).

THE breaking of China with Germany on the ground of savage practices is the shrewdest blow the Boches have had. At the time of the Boxer rising the Chinese were fond of saying that they were fighting eight nations, and that of all of them the Germans were the true devils. They have a harmless outside appearance, like the bread-substitutes and soap-substitutes and leather-substitutes they produce in such abundance; but the real fact is that they themselves are man-substitutes. They are neither men nor women; they are ghouls.

There is reason to believe that the Boche contingent was sent out to China more for an exercise in the theory and practice of the war-book *Kriegsbrauch im Landkriege* than to avenge the death of Von Ketteler. That irascible person was almost as completely forgotten before the campaign was over as the Archduke Franz Ferdinand is now. The Kaiser sent the troops

out with instructions to behave like Huns, and they carried out his orders so completely that they proved his knowledge of Boche nature. For that reason they are still proud of the name of Huns, and resent being called Boche or Fritz, as the French and the British soldier label them. The one name suggests Von Eulenberg depravity, and the other assumes that the bulk of the race are waiters. There is truth enough in both assertions to make them feel uncomfortable.

They arrived much too late to have any share in the punishment of the Boxers. The Peking legations were relieved in the middle of August, and the Boche force did not land in Tien-tsin till the latter part of October. They made a brave show for their fellow-countrymen as they went in *Parade Schritt* up the main street; but others were more critical. The Japanese member of the Tien-tsin International Commission remarked, 'They compare favourably with the —— Chinese.' An Afridi *subadar* said, with a glint in his steel-blue eyes, 'What fun it would be to have them in the passes!' However, they went on to Peking to carry out the All-Highest's orders.

As soon as the Germans landed, the Russians left. They were not prepared to stay under the orders of Field-Marshal von Waldersee. So the Boches took over the Russian quarter, which was the greater part of the Forbidden City, with the palace of the old Buddha, the empress dowager, as headquarters.

The Boches wanted to go out forthwith to punish the Chinese. It was the Kaiser's *hukm*, and they were *jo-hukm* ('master order') *wallahs*. But it was only then that they realised that German organisation had flaws; that man-substitutes did not fulfil theoretical standards. There were no horses for anybody, and there were no transport animals for the munition and commissariat train. These had to be got from Australia and elsewhere; for the war-book did not countenance the use of rickshas, which the Japanese offered with a bland smile and a fleer of half-closed eyes.

Consequently it was well into the winter before the Boches were ready to start. The 'dear Allies' told them there were no Boxers within hundreds of miles; but they did not care about Boxers. They had their orders. As a matter of form, the Allies were invited to join in the 'campaign.' The Allies, with one accord, declined. They had already broken up the Boxer bands, and driven them away as far as was convenient and necessary.

So the Boches went out by themselves. They marched north, not so much because they thought there were Boxers there as because none of the international troops had gone in that direction. They fired on wretched villagers who came out to see the troops pass. They held up caravans, and helped themselves to whatever took their fancy. When they came to a walled town they announced that they would bombard it unless it paid a war-ransom. At first they fired a few shells, just to show that they were in earnest and to hurry up the payment, and justify the accounts of 'storming' sent home. When they got the ransom they as often as not proceeded to billet themselves on the town, in flat contradiction of the promise that payment would free the place of them. This was the opportunity for private enterprise. The officers conveyed jade, lacquer, silks, porcelain, furs. The men stole whatever took their fancy. They commandeered labour whenever they wanted it, and a great deal was wanted to carry the plunder. They paid for it with scraps of paper or with the butts of their rifles. There is no need to say what they did with the women. In a very short time no women waited for their arrival. The Kaiser had given his orders, and they were carried out on historical Hun principles. A great many men died of exposure and excess. Blizzards from central Asia are very trying, and Chinese 'wines' are usually about 80 per cent pure alcohol. The victims were returned as casualties to guarantee triumphal head-lines in the German papers. There was, as a matter of fact, no fighting at all. The whole thing was mere brigandage according to plan, *Kriegsbrauch* plan, and there seemed no reason why it should not go on indefinitely. It was good practice for the man-substitute, and it was reasonably profitable for some.

Before very long, however, it ceased to pay. The Chinese began to evacuate their towns whenever the Boches got near them. There were no more war-ransoms to be got, and what there was left to steal was hardly worth the lifting. Moreover, there were no more coolies to be seized. Finally, the general in command, Yorck von Falkenberg, on a particularly cold night, unwisely slept with a coke brazier in his room, and was found dead in the morning. Von Waldersee, who, for a Boche, was quite a creditable semblance of a human being, ordered the column back to Peking, and it was announced in the Berlin papers that the Boxers had been bloodily strafed.

While their comrades had been out on house-breaking and robbery with violence, the garrison in Peking had not been idle. There was not much left to steal. There had been too many enterprising people, with a spiritual home in Germany, in action before them. But there was plenty of room for Hunnish perversity. There was a marble bridge close to the empress dowager's palace, with a beautifully carved balustrade. Boches set to work to destroy this with as much zeal as if it had been Rheims Cathedral. It was so thoroughly done, and the bridge was so close to headquarters, that it seemed as if formal fatigue-parties had been set to the work. Only a little farther off was a temple with a magnificent library of carved wood printing-blocks of some of the most famous

Chinese classics. The lettering was strikingly well cut, and the blocks would have appealed to most people, if it were only as curios. But to the Boches they only suggested fuel, and when it was found that, since they were of black wood, they were of little use for this purpose, the man-substitutes proceeded to scatter them over the neighbourhood and stamp upon them.

This, however, seemed too impersonal a way of strafing the Chinese Boxers or others, so further measures were adopted. It was ordained that no Chinese should be out after dark without a lantern, and, if they went in parties, family or otherwise, each person was to carry his own lantern. It was not to be of any haphazard ordinary pattern, but of one approved by the *Kommandantur*, and generally supposed to have been specially designed by the All-Highest himself. These lanterns were only to be had at places specially appointed by the Boche staff—quarterguards and such-like genial establishments. The price demanded seemed to the Chinaman extravagant; but in addition a fee was charged for admission, and another for leave to go out again. This seemed sufficient for the staff, especially as lanterns from other adjacent quarters of the city, Japanese, Italian, or British, were ruled *unregelmässig*—in contravention of the sealed pattern, and therefore liable to confiscation; but it did not satisfy the 'other ranks.' With true Boche humour, they devised means of carrying out the imperial Hun's instructions. When a patrol met a Chinaman with his lantern, he proceeded to inspect it to see if it were of the prescribed pattern. Then he blew the light out. No Chinaman carries matches. Consequently the next patrol the unfortunate man met arrested him for going without a light, and he was taken to the guard-room, fined, and flogged. Still more humorous Boches would hang the lantern on a telegraph-pole, where the Chinaman, in wadded coat and felt shoes, could not get at it. There he remained till the next man on the beat arrested him for unseemly levity, or for being drunk, with the result of a night in the lock-up and a thrashing in the morning, besides rifled pockets.

Sanitation is not the strong point of the Chinaman. Most people in north China spend their mornings defecating on their neighbour's door-step. This was an annoyance to the Allies in all quarters of the city, but it enraged the 'Kultur'd' Boches. To stop the practice, they adopted the method used in making cats house-clean. The first person who came along, male or female, was seized, and made to realise the objectionable character of the offence in a way that it is not necessary to particularise. The Chinese are a docile race. They are almost as obedient to authority as the Boche *Unmenschen* themselves; but they resented this violently. An expectant assistant-magistrate, of the fifth grade, who was handled in this fashion went straight home and hanged himself after making a speech to the neighbourhood. The quarter-commandant treated this as *Majestäts Beleidigung*—confiscated the house, and turned the wife and family out into the street.

After this, the shameless carrying off of the astrological instruments from the Great Wall of the Tartar city created little surprise among the Chinese. It was no doubt suggested by the Kaiser, and it seems to show that the doings of the Crown-Prince in the Château de Baye reveal a hereditary taint. The Allied generals protested, one of them from the Great Republic, with sabre-cuts of Saxon speech. But it was quite in vain, and the instruments which the Jesuits had fashioned for the Hwang-ti in the sixteenth century now stand in the Thiergarten in Berlin. They may well be shipped back to Peking again when the Boche thieves' kitchens are being cleaned out.

The High General Staff had no chance of seizing objects of art and decorative interest in Peking. Before ever they arrived Peking was policed and restored to order. Shops were opened, and curios were being sold to visitors and officers of the Allied forces. But there were no shops in the German quarter, partly because the greater part of it covered the Forbidden City, and partly because the population found it well to get as far away as possible from the Boches. Hectoring officers tried to get what they fancied at prices fixed by themselves; but this was found to lead to unpleasantness when appeal was made to the police of the Powers other than Germany. It was necessary, however, to punish the Chinese systematically; so an order was issued that the Chinese Government was to pay two pounds sterling a day maintenance allowance to every German officer. The officers of the other Powers made no such rule. The Germans, partly from natural instinct, and partly perhaps as a concession to what they considered absurd prejudice, decided that the whole of the money was to be spent day by day, and that it was to be spent entirely on drink. It was said that some of them succeeded in getting through forty shillings' worth of liquor without assistance; but most of them were not so seasoned, and required guests to help them. King-pegs, in the shape of champagne and brandy, were the favourite drink; but there were some who poured libations to Bismarck in the form of champagne and stout. Guests were not easily got, for the German officer then, as now, was about as genial as a mandrill. But senior officers could not always refuse; some field-officers went because drink elsewhere was scarce; and subalterns found pulling the Boche's leg an irresistible attraction.

It was after one of these orgies, when much liquor had been drunk to the toast '*An den Tag*,' in which sundry unsuspecting but bemused British subalterns joined, that the mess-house

caught fire. It was an incombustible asbestos house, presented to the field-marshal by an enterprising Boche firm; but it was made in Germany, and therefore it was reduced to ashes. The plunder of a great part of the Forbidden City, and much other ill-gotten booty, disappeared in the flames. The chief of the Boche staff was also burnt to death. It was announced that he rushed into the burning building to try to save a pet dog. The story was accepted with polite sympathy, which was accentuated when the dog was found wandering about the neighbourhood next day. Quite a considerable cellar of wine perished with the mess-house, and the cost of this was debited to the Chinese Government.

The mess-house was part of the group of buildings which went to make up the palace of the old Buddha, the empress dowager. Fortunately for Chinese artistic feelings, the Boche staff did not think of rebuilding it in the style of German art. But if they were spared here, they were not spared in the town outside. It was decided to put up a monument to the murdered ambassador, to be a permanent warning of the sanctity of foreign representatives. Here again the Kaiser naturally had a part. He started with the initial idea of the *paifang* for the sake of local colour. A *paifang* is a sort of triumphal arch set up by the Chinese to commemorate people who have lived to a great age; widows who have refused to marry again, and have remained unwed for many years; and occasionally to officials who have attained to great dignities and have been a credit to the place of their birth. These *paifangs* very often stand out in the open country, and are always picturesque and sometimes strikingly artistic. William II. grafted the idea on to recollections of the arch of Hadrian and such-like, and with the atmosphere of the *Sieges-Allee* before him, evolved a huge monstrosity as a memory and a warning to the Chinese Empire.

At the spot in the Hatamên Street where Von Ketteler was shot, a huge pit was dug in the ground. Something like a shipload of cement was poured into it to make a foundation, and then the building began. It was rapidly finished, for labour was commandeered, and everything and everybody were left to be paid by the Chinese Government. The memorial uprears itself over the low one-storied houses of the neighbourhood like the 'Tower Bridge' east of Loos. It suggests the entrance of a Channel tunnel, or the gateway of a *Kadaververwertungs Anstalt*. It would be an appropriate doorway to the *Sieges-Allee*, and if the Chinese get their astronomical models back they might offer it for that purpose. It is the sort of thing the Hermes of Praxiteles might have become after a twenty-years' course of forty *schoppen* a day of Bavarian *schwartz-bier*. It is colossal; it is hideous; it is characteristically Boche; it is out of place anywhere but in Germany. It is a warning of what might have been seen in Louvain, and elsewhere in Belgium and north-east France, if the time-table of 1914 had come off.

The Boxer campaign was a rehearsal for the Great War, with the *Kriegsbrauch im Landkriege* as a text-book, interleaved for notes. Europe has only just escaped. It will be her own fault if the Boches are left capable of doing anything of the kind again. German sailors bombard villages and girls' schools from the sea and the air; German soldiers steal, ravish, and fell fruit-trees; German graybeards set wolf-hounds at prisoners, and give orders with the boot and the rifle-butt; German women wrench bandages off wounded men. They are neither brute nor human; they are ghouls.

SAUCE FOR THE GOOSE.

'IT'S no use talking, my dear,' said Mr Ampleford, registered chemist of Carronchester, to his wife, who was sorting medicine-bottles behind the prescribing-counter. 'My mind is made up. I have nothing to say to Mr Troop. I want to have nothing more to do with him; and I'm certainly not going to invite him to my house.'

'But, Robert, what have you against the young man?' asked Mrs Ampleford mildly.

'I've the greatest possible objection to him. I said, the greatest possible objection,' said Mr Ampleford, who was one of those people who think they strengthen their remarks by repeating them. 'I consider him a disgrace to our profession, and if I hear of his paying any further attentions to our daughter, I shall take strong steps to—ah—discourage them.'

'But he's such a nice, gentlemanly young man; and I believe he's getting on very nicely in business.'

'Oh, very nicely—very nicely indeed!' snorted Mr Ampleford sarcastically. 'As to his methods of getting on, the less said the better. I said, the better. Are you aware that in the last fortnight he has stolen two of my best customers?'

'Stolen? What do you mean?'

'It's the only word for it. Mrs Young deals with him now, because he sells hair-lotion at store prices; and Lady Sinclair told Walkden that Mr Troop had developed her snap-shots for her so perfectly sweetly that she wouldn't *dream* of going anywhere else for anything. Yah! Two people who have been coming to me for years!'

'Perhaps Mr Troop didn't know'—— began Mrs Ampleford.

'Nonsense! He knew perfectly well. Store prices, indeed! Photographs! It's not legitimate business. I don't mind fair, honest competition,' complained the chemist, who minded it a great deal, 'but this sort of thing is contemptible. He sells books too—and razors—— Certainly, sir,' he broke off to attend a customer who was rapping impatiently at the outer counter; 'I can recommend these tortoise-shell combs at half-a-crown. Quite the best quality. . . . No, sir; I'm sorry I have nothing cheaper. . . . Good-night, sir.—Did you hear that, Julia? He'll go over to Troop now, who'll sell him a shilling piece of imitation rubbish, and make fourpence on it. . . . Disgusting!'

'I don't see any harm in that, dear, if he doesn't pretend it's real.'

'It's not respectable, Julia; it disgraces the whole profession. Have you heard he's opened a new branch at Ravensea?'

'Mabel said something about it,' admitted Mrs Ampleford.

'She did—did she? She seems to know a great deal too much about Mr Troop's doings—a great deal too much. Does she happen to know how he attends to it? Are you aware he is compelled by law to have every prescription containing a scheduled poison made up by a qualified chemist, and he has only an unqualified assistant there and a boy here? How is it done, Julia? That's what I want to know.'

'Perhaps he makes them up himself.'

'Rubbish! The man can't be in two places at once. But our association has its eye on him. I said, we have our eye on him. The man's a quack, and the sooner he's exposed and driven out of the place the better.'

'I'm sure it will break Mabel's heart,' protested Mrs Ampleford.

'Enough, Julia! I have nothing further to say—nothing whatever. I'm surprised that a daughter of mine could condescend to notice such a whipper-snapper. I wouldn't have thought it—I wouldn't indeed.' And Mr Ampleford stumped indignantly towards the door to put up the shutters and close the shop for the night.

II.

'Don't let's go that way,' said Jack Troop to Miss Mabel Ampleford on the Tuesday following the last conversation, as the two came out from the choir practice, and his companion turned into the High Street.

'But it's the shortest, Jack dear,' objected Mabel.

'I know—that's why,' said he, and motioned towards a street at right angles that led out to the quiet, moonlit fields surrounding Carronchester.

Mabel laughed and obeyed the gentle pressure of his arm, and for a while the pair walked on in that silence which is full of the intense heart intimacy of two lovers, a silence in which a touch of the hand or a glance of the eye speaks far more eloquently than words. Mabel was the first to break it.

'Father wouldn't dream of it, dear,' said she. 'Mother told me; he was perfectly awful.'

'Sorry to hear it,' said Troop. 'What was his objection?'

'He doesn't like you, Jack.'

'Very bad taste on his part,' said Troop gravely. 'Any particular reason?'

'Mother says he's jealous because you've taken some of his customers away from him.'

'But, my dear girl, I can't help people coming to me if they want to. I didn't fish for them.'

'I know, dear; but that doesn't help us any.'

'I suppose not.'

'And, what's worse, Jack darling, I'm afraid he's going to do something against you at the association—get you stopped from practising or something.'

'He can't do that just by asking for it, little woman. I dare say some of the members would be glad to see the last of me; but they can't make me put up the shutters just because I've a bigger turnover than they have.'

'Yes; but dad says you can't attend properly to two businesses, and you must let your assistant make up prescriptions.'

'Oh! I see.' Mr Troop looked thoughtful and pulled reflectively at his moustache. 'Tell me, sweetheart, can you remember exactly what your mother told you?'

'She says dad is going to have you watched, and have a prescription made up in your shop while you're away at Ravensea. Would that be very dreadful?'

'Might be a bit awkward if it came off. I'll think it over. . . . But, hang it all, Mabel darling!—there's nobody looking—don't you think—— Just one!'

When you give back what you get, it is hardly fair to count it against you; otherwise the one kiss might have been reckoned up as a dozen before the pair came again within sight of the streets and said a hurried good-bye at the gate of Mr Ampleford's private residence.

III.

At 10 A.M. on the next Thursday Jack Troop left Carronchester Central Station on the slow train for Ravensea. At 10.1 A.M. Mr Ampleford stepped out of the waiting-room and made his way to the exit with a satisfied smile, as if the world went well with him. From 10.23 to 10.37 he might have been seen talking to a small boy at the corner of Hamerton Street, just out of sight of Troop's shop. At 10.40 the small boy entered Troop's shop. From 10.40 to 11.14 Mr Ampleford continued to wait in the rain at the corner of Hamerton Street. At 11.14 the small boy returned with an eight-ounce bottle wrapped up with the neatness peculiar to chemists, and handed it to Mr

Ampleford. At 11.28 Mr Ampleford deposited the bottle in the custody of the secretary of the Loamshire Chemists' Association, and returned home.

IV.

The heavy wetting gave Mr Ampleford a severe cold, and he was treating it with a mustard foot-bath on the following Saturday evening when his wife came into the back-parlour and told him Mr Troop wanted to see him.

'How dare he want to see me?' snorted Mr Ampleford. 'I won't have anything to do with him. Send him away at once.'

'He says it's a matter of the utmost importance.'

'Oh, he does—does he? I suppose he's got wind of the fix he's in, and thinks he'll get out by eating humble-pie. . . . Well, I'll see him. . . . Do him good to take him down a peg or two. Show him in.'

'Good-evening, Mr Ampleford!' said the fresh, hearty voice of Jack Troop a moment later when Mrs Ampleford ushered him into the room and withdrew, leaving the two men together. 'Sorry to hear you're knocked up. You ought to try Ampleford's Kofkure—capital thing! I use it myself.'

'I dare say, young man—I said, I dare say,' grunted Mr Ampleford, by no means certain that the praise of his proprietary remedy was quite sincere. 'You didn't come here to tell me that, I'm sure. What do you want to see me about?'

'Well, the meeting of the association is on Monday, and as I'm personally interested in some of the business, I'd like to talk it over.'

'So you've heard of that, have you? But it's no use appealing to me. I've a public duty to perform, and I'm going to do it.'

'Heard about what?' asked Troop.

'Don't play the clever fool with me, young man! You know as well as I do that a prescription containing a scheduled poison was made up in your shop last Thursday while you were away at Ravensea. I saw you catching the ten train myself; the first train back doesn't get in till past twelve; and I had the bottle in my hands before a quarter past eleven. I've witnesses for all the facts, and they'll be there at the meeting.'

'But, sir'——

'No, sir; I can't listen to you. I've no personal feeling in the matter. None whatever. But this sort of thing is a disgrace to the profession, and it's got to be put down. I said, it's got to be put down.'

'I'm delighted to hear it,' said Troop unexpectedly. 'I was afraid you'd take a personal view of it and be prejudiced against me. Now I can go ahead with a clear conscience.'

'What do you mean, sir?'

'It's like this, Mr Ampleford. I'd just got on the train last Thursday, when I remembered I'd an important 'scrip for Dr Stevenson that I'd forgotten to make up. So, instead of going to Ravensea, I dropped out again at the Upper Town station. And I'm afraid I did wrong.'

'I don't understand you, sir.'

'Well, your place was so handy that I thought I'd call in and get you to make it up for me; but unfortunately you were out, and I'm afraid I got your unqualified assistant to make it up instead. Assistants are so careless! He must have forgotten there were poisons in it, and that he would compromise you.'

'Do you mean to tell me you got a bottle made up here while I was out?'

'Don't blame your assistant,' said Troop tenderly. 'I told him how urgent it was; I was barely able to get back to my own place in time to make up your prescription.'

'You were back in your own place!'

'At ten to eleven. I came up the laneway behind the shop. I could see you waiting at Hamerton Street. . . . I hope you didn't get very wet.'

'And you're going to bring up an accident like this—a pure accident—against me at the association?'

'Exactly. That's why I'm so glad you don't take a personal view of it. It's just a public duty.'

There was a minute or two of hostile silence, during which Mr Ampleford shuffled his feet in the hot water and opened his mouth to gasp once or twice, but no remarks seemed to occur to him. He was not popular with the association, and he knew it; anything that could be used against him would be used. It might mean ruin.

Then Troop spoke again. 'Of course, if I had the honour to be your son-in-law, I dare say I could forget my duty to the public.'

It was the only way out. 'You'll find Mabel upstairs,' said Mr Ampleford.

A FATHER'S SONG:

TO A LITTLE TODDLER.

Oho, My Little Toddler,
I hear your eager feet
Scampering over mother's floor,
With childish joy complete.

Oho, My Little Toddler,
Too soon the years will show
Footpaths seldom are as smooth
As those on which you go.

Yet, O, My Little Toddler,
I would not have you barred
From all the great adventure
Of finding roads so hard.

Still, O, My Little Toddler,
If lost you e'er should be,
May some one show the pathway
When you are far from me!

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

NO better time may be given than this autumn season to record some experiences of a very unfamiliar kind in the chief wheat-market of the world, which is the Board of Trade in Chicago, or 'The Pit,' as it is more familiarly known the world over. If in days gone by this Pit seemed to stand for something most wonderful in its enormous power of control of what is perhaps the chief resource of the world, and in the throbbing romance of its high financial speculations, it is more than wonderful now as the market of the grain which is precious to us all as never before. This noisy spot in the middle of that amazing, roaring city of Illinois is indeed as the very heart of production and of food. It may be that in the mysterious workings of the financial world and as a consequence of the less mysterious decrees of war-time Governments, the wings of the Chicago Board of Trade are somewhat clipped, its enterprises moderated. Our minds would revolt at the idea of a financier, or group of such, making a corner and controlling the wheat of the world in times like these. But even without such a power, the Pit still remains the foremost wheat-market, a financial and commercial institution to which no other can properly be compared, and its consequence is heightened by the war. It was but the other day that one read in the daily paper, beneath startling headings in large type, that there was a 'slump' in wheat, and there had been an excited market in Chicago. It is difficult for some of us, having what can best be termed unfinancial minds, to imagine how there can be a slump in wheat at a time like this, a 'slump' meaning that it is being rejected by the buyers, that its holders wish to be rid of it, that its price depreciates, that it is, so to speak, a drug in the market. But this is merely one of the curious results that occur when money in millions and its marvellous properties of power, which can be exerted by the great financiers like alchemists, work upon some plain and simple world commodity. You may then produce the contradictory situation that there is a glut of a thing in the market and those financial seers are willing almost to give it away if you will take it in million measures, and yet starvation, or something approaching it, is abroad in the world for want of that very thing. Or the points of the situation may be reversed. When the world is hungry, Chicago may perversely complain that it suffers from an embarrassment of wheat; but when peace has been long established, when the husbandmen are at the soil again with a will, and the vast lands of Canada and Australia and all the world besides are giving of their golden best, the Pit may grumble that there is not an ear of wheat to be had, and the price for a day may soar accordingly. So there is no ordinary relation between the prices of a day at the Board of Trade and the facts of production—which is not the same as supply—as we know them; yet let it be said that these Chicago figures are truly not the mere result of gambling operations only, as some might hastily suppose, and they have an absolute, if devious, relation to the production and the supply. These prices are the changing results of action and reaction upon each other of a vast number of mighty and intricate forces in all parts of the world, from a farmer in Arkansas to a speculator in Europe, or it may be even in China. In the Pit you see all these forces brought together and to some extent handled. The ends of threads from every nerve-centre of the wheat world are gathered at the Board of Trade in Chicago. Here within the limits of a large hall you have the wheat of the world presented to you in figures; and, from minute to minute almost, you may see it growing at every centre, for there are telegraphed and cabled reports from all of them with the latest figures of production and price. These arrive every few minutes, ticked off on the enormous instruments in the great hall, and are marked on the huge slates that reach almost from ceiling to floor. And all around are excited men buying the crops of the world in terms of millions and millions again. It is not an experience, once seen, ever to be forgotten; if he who witnesses it has but a little imagination, it is one which must excite him at every after-remembrance.

* * *

Now, because the men are fighting instead of labouring in the fields, and destroying in place of producing in the workshops, the

 [*All Rights Reserved.*]

hunger spectre comes to grin sardonically on a misguided world. We read of strange things in the food-supply, as, for example, that at Stuttgart the authorities have fixed upon one egg per fortnight per person as the food ration for a time. Again, there are ominous tidings from many parts that the wheat crops compare but ill with those of last year; weather and circumstances seem to have been against them. This now is the supreme moment of the glorious miracle of nature, full achievement of the golden production has been again accomplished, the harvest moon has waned, and in the chapels and the churches there are wisps of corn upon the walls, bunches of fruit with them, and the people give thanks, and praise with thanks, for the great blessing of the harvest safely gathered in. It must appear to those who think that of all manifestations of sincerity in churches this must surely be among the most sincere. The summer has gone; there is a coolness in the air, and the long nights are deepening about us. The coppery leaves are fluttering from the boughs and leaving them nearly bare. A certain quietness and repose, with a sense of pathos enwrapt, seems to be settling down upon the face of Nature. It is an emotional moment, and we feel that in very truth the earth and the Power of the earth have been good to us—surely better than we merit. We indeed have been destroying, but the earth, unheeding, has wrought nobly on her way, and puts us to a pitiable shame. When the great fact of the harvest is presented to an ungodly man he must bow his head. Here is majestic evidence; here is something beyond a meagre philosophy. Here is wonder in infinity, grace and goodness beyond all thought, truly beyond all deserving. With the world crashing in war, should we not in finer humbleness and sincerity than ever before make our steps towards the temples, and with full hearts sing such a song as the harvest hymn translated by Jane Campbell?—

> We thank Thee then, O Father,
> For all things bright and good,
> The seed-time and the harvest,
> Our life, our health, our food.

* * *

Sometimes there is a sharp and certain sense in incongruities, and at a moment like this one's fancy may wander to that Board of Trade, or Corn Exchange, or Pit, in far Chicago, and remember that wild, fascinating scene of dealing and speculation daily enacted there as once we saw it. It is a rare experience. Few visitors to Chicago are permitted it, and I had special influence and kind favour to thank for it. I had been anxious for it from the time I had read the wonderful, realistic, enthralling novel of the late Frank Norris called *The Pit*, in which the full romance is so magnificently expressed. Many of you must have been impressed with that great story of hot humanity in the utmost, maddest financial fever. The tenth chapter is one of the finest in modern fiction; the tragedy of Jadwin is overwhelming. To those who have not seen, or cannot imagine clearly, such writing may seem but a tumult of exaggerating words, but in the Pit one autumn morning it was very real to me. A kind friend with whom I was staying at a country club had by exertion arranged the matter. 'Be at my office at 9.15 sharp,' he said. 'The Pit opens at half-past, and you should see a session through. You will see the food of the nations bought and sold, speculated in as futures, immense fortunes made and lost perhaps; in a way that to you may seem almost unthinkable—the most wonderful, terrible, awe-inspiring place of its kind on earth. That is what they say of it, but I am too much accustomed, perhaps.' He was one of the great dealers in the Pit. In the morning we strode together in the quick Chicago way down La Salle Street to the great building that seals the end of it. We swung through the big doors and turned towards a winding staircase on the right. Then a peculiar nervousness came upon me as a weirdness of distant man-made noise was heard, and I realised it was the Jadwins who were making it, that they were fighting each other again with the food of the world. The market was just opening; the roaring had begun. I thought it was like the noise of an army or a mob in the wings of a theatre multiplied by an American million. The sound increased at each step we made. At the top of the staircase we passed through open doors into an immense hall with a roof of coloured glass and great windows with gorgeous panels. Here was all the most amazing machinery for the lightning transaction of most gigantic business, and it was being worked at its utmost speed, while swarming around were hundreds of men, yelling, screeching, gesticulating. They seemed wild in their frenzy of speculative activity. These were Jadwins. To lend special importance to the occasion, in the west the corn was being harvested, and the crops were regarded as being among the finest ever known, while stories were coming in from Europe that wet had spoiled the eastern grain. It appeared that Chicago and its western supply might have to feed rather more of the world in the ensuing season than had been its recent share.

* * *

The Pit measures, perhaps, fifty yards each way. Really there are within it four little Pits, or special centres of business. There is the Wheat Pit, near to me on the left, and that, of course, is the chief. Beyond it is the Corn Pit; then on the right of that is the Provisions Pit; and near to me again on that side of the great hall is the Oats Pit. What constitutes or marks the Pit is a wooden octagon of three shallow tiers; that is to say, there are three steps from

the floor arranged in a great wooden octagon, and three down again on the inner side to an enclosure which is smeared with a thin covering of sawdust. The dealers, many of whom are in their shirt-sleeves, arrange themselves on the steps of this octagon, leaving the enclosure open, so that they may view each other all round. Then by shouting at each other, and by making simple and well-understood signs, they buy and sell the produce of the earth. Some of it is real, so to speak, and some is merely speculative; men buy or sell in the hope of selling again or buying at a profit without ever a thought of doing real business with the wheat itself, with which they are not concerned, or they do this for clients. I shall not attempt here to describe the scene. You should read Frank Norris and set imagination then to its own full range. In the casino at Monte Carlo one sees what a fearful spell—exceeding anything one had imagined as possible in human nature—can be exercised upon men and women by money and the passion for obtaining it; but really such a scene seems thin and poor compared with that of the Pit at Chicago. And it is different; for at Chicago it is, after all, business working a vast effect upon the world and dealing in real things, mighty things. Again, it is different in that at Chicago the speculator in his passion exhibits far less restraint. Years of experience have not dulled the senses of these operators for excitement; they seem to run the full gamut of passion each morning between half-past nine and a quarter past one, when the session closes for the day. It has become a habit with them, and sometimes it appears that they develop excitement upon a slender excuse; but when a hundred men or more are calling their offers or their wants at once, and are desirous of attracting attention, screaming becomes necessary, and then screeching in strange notes, roaring in a full volume, and finally, perhaps, some form of acrobatic performance. With all of this it is difficult to restrain excitement, and it seems that no form of effort on the part of any dealer would be regarded as unreasonable or would attract special attention. If a man who figuratively was handling miles and miles of western wheat were moved to stand upon his head, and in such attitude attempt to whistle 'The Star-Spangled Banner,' this might be regarded as a normal and even business-like proceeding. As I watched the Pit at its desperate work, I observed one man on the top step of the octagon suddenly turn his back to the enclosure, and for many seconds, while apparently in a tense state of emotion, attempt what I can only term—saying it respectfully—a form of Highland jig. Then he shook his clenched fists, and made a series of wild contortions upon his features such as would have convinced most strangers that he was in an unfortunate state of mind and hardly safe.

What a maelstrom it is! The noise is so deafening as, million by million of bushels, the wheat of the world is bargained with, that transaction by voice is really not done at all. A process of finger signs has been invented. It is well understood, is official and binding. Trading, be it explained, is always done in so many thousands of bushels. When wheat is being sold at ninety cents, a dealer gains the glance of another on the opposite side of the Pit having fifty thousand bushels to sell. Plain signs are not everything in this business; after watching it for an hour or two, studying glances, expressions, grimaces, and all else, I reached the conclusion that by intimacy, long experience, practice, and necessity, some kind of telepathy is established between these people, and that they half-understand their mutual requirements at the first look. The rest is by way of confirmation and a settling of the bargain. The man who would buy the fifty thousand signals by look, and then by finger signs that he will take the '50 wheat' at 90. But there is a hitch; the market is moving. The man with the fifty thousand bushels holds up his right hand with the forefinger extended horizontally, which means that he wants 90⅛ cents. The buyer motions acceptance and makes the signal back. Each man carries a printed card about with him, having his name or that of his firm upon it, with columns for figures, all printed in blue on one side for 'Bought,' and in red on the other for 'Sold.' And so here Milton writes down on his card that he 'Sold 50 at Shelley,' and Shelley, the buyer, pencils upon his, 'Bought 50 at Milton.' At the close of the morning they meet and confirm the bargain. Shelley may have sold his fifty thousand bushels to Pope in the meantime, and Pope to some other trader, and what the end of that fifty thousand may be no man may know as yet. Those finger signs are curious. They are sure; honour among these gentlemen of the Pit is very high, and disputes are unknown. If they were possible, the machinery would break down, the market in wheat would become chaotic, and the golden heads might wither in the west because of the collapse of the Pit; for, when you think of corners and the gambling and all the rest of it, and fancy that the world and wheat might be better without this traffic, do not forget that the market holds the fabric in a piece, that it controls each movement, and that it, and it alone, makes possible the sale and the distribution of the wheat. When the hand is held horizontally the clenched fist indicates the price in even cents, and then each finger held out represents an added eighth of a cent up to four-eighths; the extended hand with the fingers close together means three-quarters; with them all wide open it means five-eighths cent; and so on. The whole hand displayed vertically is a sign that twenty-five thousand bushels are to be dealt in, each finger counting for five thou-

sand; whether it is a case of buying or selling is indicated by a slight motion of the hand to or from the trader who makes the signal. This is just a trifle of the arrangements; the general mechanism of the Pit is almost as wonderful as its babel. It is marvellously fitted. Here it seems that we are in the most intimate connection with the world. There are innumerable long-distance telephones, and a dealer speaks to New York, nine hundred miles away, with as little concern as if he were calling his clerk in the next room. These things, particularly connections, are done in America with less waste of time and convenience than here. Then the cable companies offer their facilities at every hand for sending messages all over the world. The Pits for wheat and corn are connected by a high bridge on which are telegraph operators. Just below them, in seats overlooking the main pits, are reporters who indicate to them the prices that rule from moment to moment, and these figures are instantly flashed all over America and to other places that are interested. Wires connect the bridge with the reporting-boxes at the Pits for provisions and oats, and notes of prices are continually being transmitted to the bridge in small cases. On the left of the wheat and corn pits the trading for grain produced and sold for cash is carried on. There are samples at hand of all the carloads that are coming along. This, then, is a place for matter-of-fact realists; here is the veritable corn. But now we see it, we find its market is a dull affair; it is so easy to buy what you see and to sell when you have, just so much and not a sackful more. The other is the grander business; it is better for the spectator and the student of human possibilities to watch men hold their fingers up for a hundred thousand bushels, and be inspired, if they wish it, by the friezes on the walls showing the stock grazing and the wheat-fields producing in their plenty out in the ripening west.

* * *

There is another great hall beyond this one; it is a kind of temple. It is a rest-room provided with many chairs all set to face a platform, where a diligent officer is continually engaged in writing enormous figures with chalk on a Brobdingnagian slate, which measures, as I guessed it, about fifty feet by ten. What he is writing is the prices as they come in from all parts of the world. It seems to be that the quotations for the September, December, and May deliveries from New York, St Louis, and Kansas are those which matter most. Winnipeg also is closely watched. Seeing their place in the grand scheme of the Pit, I came to have an enormous respect for districts of which I had hardly ever heard. There is Duluth; how it looms in this tremendous affair! You may not have heard of Duluth, but it has more to do with your bread in peace and war than I could hope to explain. The whole world is examined closely every day for the state of its crops and its stocks, for it matters everything if it is found that the supply at some remote place in the Old World, for example, is running low and its wheat prospects are poor. They know then for certain that there must be buyers there, and the prices move accordingly. When the earth has been examined, calculations are made and chalked on the giant slate as to the available supply of wheat for bread, and how it compares with the same period in other years. These figures are considered by the traders, they reckon the demand, they see from a fresh-made map on the walls the state of the weather all over America at that very moment, and they make their plans accordingly. On the board are marked new and official statistics of every kind having reference to the food markets of the world. Unceasingly there is a loud, harsh clack! clack! clack! of a great Morse telegraphic indicator overhead, yielding messages from the distant world to the man who receives them here. He takes them, and with the huge piece of chalk in his hand he skips acrobatically from one end of his platform to the other and alters the figures as messages from the west, from London, from Paris, Odessa, and everywhere, acquaint him with the new prices that have just taken the place of others.

* * *

It is a marvellous drama. For a full session I watched it in a state of thrill, guided and assisted by a friendly trader who bought and sold his hundreds of thousands of bushels at intervals as his son came in with commissions. In the Pit I was the forbidden thing, a stranger, and at first there were the same signs of hostility and rough play threatened as when one who is not a member seeks to enter the Stock Exchange in London. But the old hand at travelling in America knows how to deal with situations such as this. Firmness, confidence, defiance, and a plain suggestion that though Americans may be magnificently smart, they are not yet kings of the earth—with a friendly smile after the defiance—and the matter is completely adjusted. Later no extra firmness was sufficient to prevent a part of the Pit from struggling against itself to entertain the stranger; it led the way to new wonders in secluded refreshment-halls. And afterwards, in the room of the secretary, with Lincoln looking from a great portrait on the walls, Mr John C. F. Merrill, the chief officer of the Board, completed a wondrous story. He told me how in a single year Chicago had handled 500,000,000 bushels of grain, nearly 300,000 tons of hay, 16,000,000 head of live-stock, 270,000,000 pounds of butter, 90,000,000 pounds of cheese, and so on, with 2,500,000,000 pounds of cured and other meats received and shipped. Mr Secretary Merrill, moreover, was pleased to deliver to me a lecture presenting the ethics of speculation in a new way, and a

convincing way. I saw the necessity of Chicago and the Board of Trade, and wondered more. What a wide separation between this din of the Pit where the traffic in precious wheat goes on and the little village church where thanks are given at the harvest festivals now!

JOHN PARDON'S CHOICE.

CHAPTER VII.

FOLLOWED upon that spring morning an unforgettable summer in the life of John Pardon. Toiling week after week at the Powells' ranch, he worked early and late; yet did each evening find him returning to his lonely home, filled with happy thoughts and in buoyant spirits. Years seemed to slide off his shoulders. He grew stouter, took to whistling again about the house, and to teasing old 'Sally,' until she, too, renewed her youth and waxed playful. Side by side with Bob Powell he built fences, repaired roofs, dug ditches, while the young Britisher's fair skin waxed daily browner, and the shapely hands callous with rough work. Always ready to do his full share and more of the dirtiest, hardest job, Bob quickly won not only the respect but the sincere devotion of the big Westerner, evidenced by the quiet way in which he contrived to spare the younger man's shoulders many a heavy burden. Never a word of complaint escaped Bob Powell's lips, and Pardon, having gradually learned from chance remarks that up till the time he and Joy left their home in the Old Country they had lived in the lap of luxury and ease, tacitly wondered and admired.

And through all the busy days of toil flitted, like one of the golden orioles which wove their nests in the tops of the swaying poplars, Bob's sister Joy, busy as a bee among her flowers and poultry, singing, playing with the dogs, always ready with cool lemonade or juicy fruit for the two men labouring in the hot sun, and constantly filling John Pardon's pockets or the wagon's jockey-box with some welcome addition to his simple meals. Sunday evenings still, as for many years past, found him, dressed in his best, sitting beside Mary Patrick, chatting pleasantly of the same old things in the same old way, though of his busy weeks at the Powells' ranch he said but little.

'John, you 're looking lots stouter!' exclaimed Mary on one of these evenings, when, after several attempts to smother a yawn, Pardon pleaded that he 'must pull out early to-morrer mornin', so had better hit out for home pretty soon.'

'Guess hard work agrees with you,' she commented, the while regarding him in a half-questioning manner.

John laughed; then, suddenly growing grave as he rose to go, he put the oft-repeated query. 'Well, Mary?' he asked quietly; then, carried away by a rush of conflicting emotions, he seized both her hands, crying out, 'Mary, for God's sake, how long do you expect a man to wait, and to eat his heart out livin' alone? I swore I wouldn't bother you—and, so help me. I don't mean to break my promise—but, Mary, it 's awful lonesome in the old house—and'—— He broke off, looking down appealingly into the woman's face.

Now, although her woman's quick instinct warned her that this was a critical moment in the lives of them both, it also caused her to sense that though John Pardon spoke passionately, it was no longer for *herself* but for his *own* self he was pleading. Besides, he looked, as she had said, stout and well—seemed to be in excellent spirits. Why, then, need he worry *her?*

All this flashed through her mind, made selfish and narrow by persistently shutting her eyes to the wrong she had done her lover; so, freeing her hands, she replied decisively and with ill-concealed petulance, 'Oh John! *You* eating your heart out! Why, you 're as fat and flourishing as one of Joe's turkeys. And as for being *lonesome*,' she continued rather breathlessly and with a sudden flash in her dark eyes, 'you are always at Powells' nowadays. I guess Miss Powell feeds you well.'

'Yes,' answered Pardon quietly, taking up his hat—'yes, Mary, she sure does. Well, good-night, Mary. See you Sunday. So-long!' then turned his steps homeward with a wild tumult of thoughts in his sorely tried heart.

Throughout the hot summer months work at the Powells' ranch continued incessantly, the while the friendly but never obtrusive man of the Far West became almost a part of the small family, whose surroundings and antecedents in the Old Country had been so antipodal to his own. Yet for him this self-same easy footing in their home was fraught with a wholly unsuspected danger, in his relations with the fair young English girl. Quite unwittingly, even to himself, Joy Powell became the very light of his circumscribed, disappointed life—literally the 'joy' of his heart, and although they were thrown together solely by the accident of 'the trivial round, the common task,' Pardon thus gained an intimate knowledge of the girl's character, and that which began as admiration ripened into absolute worship. Only on the rare occasions when, their fingers meeting as he took from her hand some too heavy burden, he felt a sudden thrill and the hot blood rushing to his face, was Pardon himself actively aware of the new passion

that in his maturer years was threatening to uproot the love of his youth; yet even at such times was his emotion instantly checked by the quiet unconsciousness of the girl herself. For across the mind of Joy Powell, inured from childhood to the almost impassable barriers of class distinctions, there never flitted the bare possibility that this plain man of the Western world could or would fall in love with her; and if not across her own mind, still less that of her brother. Between themselves they spoke of him with increasing warmth and thorough liking, while good breeding and quick intuition led to a frank acceptance of his friendship, neither word nor look emphasising the wide difference between them, of which, nevertheless, Pardon himself was fully conscious.

Yet sometimes, when, the day's work ended, Pardon, after a cheery, 'Well, so-long, Bobby' (for he never made pretence of addressing him as Mr Powell, and the young man himself, understanding, felt no resentment), and 'Good-night, Miss Joy; you 've sure bu'st the linin' o' my pockets *this* time!' set out for his lonely home, the girl would stand watching his tall figure, with its easy, graceful swing, disappearing through the bush, and, turning to her brother, would say, 'Poor John Pardon! How miserable it does seem for him to go back to that big, empty house, and no one to welcome him!' to which Bob would reply laconically, 'Must be beastly; but I suppose he 's got used to it.'

However, there came an evening when the shutter was to be lifted ever so little from the happy unconsciousness of the English girl. There was a brilliant moon, and Bob Powell having decided that some timbers had better be hauled the next day, saddled their horses, and he and Joy loped away through the sweet night-air to see Pardon and arrange for him to bring his team on the morrow. It was their first visit, and at the sound of the horses' hoofs fast approaching Pardon's heart beat faster.

In a moment he was standing bareheaded at his gate, longing to help Joy to dismount, but forcing himself to leave that to Bob, and calling out, 'How d 'ye do, folks? Just step right in. Glad to see ye!'

'Oh,' said Joy, 'you were sitting on the veranda. Mayn't we sit there too? It 's too glorious a night to go indoors.'

'Sure!' said Pardon; but to his eager offer to fetch chairs Joy again demurred, perching herself beside Bob on the veranda-steps; and while the men rolled their cigarettes her blue eyes glanced here and there, taking in her surroundings. 'What a nice old house it is! And such a wide veranda—and, oh Bob, do see what a lovely orchard Pardon has! And the view over those fields to the hills! It must be beautiful in the sunlight—isn't it, Pardon? I 'm sure you must love it all,' she continued, turning a glowing face towards him.

'Yes, Miss Joy,' he replied, 'it ain't a bad old shack—specially *night-times*, when you can't see where the paint 's off!' and he laughed. 'But,' he added, in a tone whose forced cheerfulness did not deceive the sensitive ear of the listener, 'what 's the use o' havin' a purty cage if you ain't got no little bird to sing in it?' Then, fearful of having thus exposed the thoughts stirring so loudly in his heart, he jerked his chair backward into the shadows, though not before Joy Powell had detected a look in his eyes that sent the colour flying to her cheeks and made the slender fingers tighten over the back of old 'Sally,' who, without apology, had taken possession of the unwonted luxury of a woman's lap.

Thereafter, while the men discussed the next day's work, Joy sat very quiet, gently smoothing the old cat, and now and again glancing at the dark silhouette of John Pardon; whilst he, from under the protecting shadows, feasted his eyes upon the girl's fair face and beautiful hair, among whose soft strands the silvery moonbeams shone.

'Tired, Joy?' queried Bob, on their way home, as the girl, unwontedly silent, loped her gray mare beside him.

'No, Bob; but I do feel dreadfully sorry for John Pardon; he seems so awfully alone in the world.'

'Yes,' assented Bob; 'but, you know, it 's only half-a-minute to Michael O'Keefe's ranch, and they spend most of their evenings together, so it 's not so bad for him as it seems.'

'Oh yes; I had forgotten O'Keefe,' said Joy, touching up 'Fay.'

(*Continued on page 710.*)

JOY-RIDERS AT THE FRONT.

By MARSHALL NORMAN.

OVERHEAD the sun shines in a cloudless sky. Its heat parches the wheat in the fields; the scarlet poppies droop their heads despairingly. Its rays scintillate from the white ridges that scar the cornfields. The effect is that of irregular rolling waves breaking into foam on a sandy shore. Not a sound disturbs the quiet of the afternoon. All nature is somewhat under the welter of the insufferable heat. The air dances and shimmers over the beautiful white ridges.

But for the stagnant whisper of decay, it is a pretty picture. No human is visible in the landscape. But behind and below the sparkling

ridges is a subterranean city. Above is a country of the dead. Below is a tortuous township of the quick. The beauty of the ridges hides the ugliness of war; but the scarlet of the poppies senses the trailing smear of blood.

Into the sullen quiet comes a distant, droning noise. It comes from the blue of the heavens; its vibrations dance with the shimmering air. From the trenches a hundred thousand men gaze heavenward. There is a compelling fascination in that low-toned drone. Up yonder, silhouetted against the blue of the sky, an aeroplane is flying eastward. The white wings glint and flash in the sunlight. They might be fashioned of silver gauze. The aeroplane seems evanescent, ethereal, utterly removed from the sordidness of trench warfare.

Suddenly from beyond the opposite rise comes a short, loud-mouthed bang. It is followed by others, ever faster and more insistent. A little white cloud opens out beside the white-winged aeroplane. A faint 'boom' punctuates the endless drone of the tireless engine. A little cluster of tiny puffs surrounds the white-winged wonder in the heavens—some near, some far off. But still the shimmering aeroplane pursues its unwavering purpose amid the growing puffs that tell of hate and death.

Yonder, say the men of the under-world, is Romance, the Glory of War, the *joie de vivre!* Yonder is Life. Here is but stagnation and Death.

The shining aeroplane flies onward to its accompaniment of the droning engine. The white puffs have grown and expanded, and all but disappeared in the blue of the heavens. Swish! patter, patter! the lead and iron that rose towards the shining wonder overhead fall back with hissing menace amongst the beings of the under-world—the Children of the Trenches. Here is but stagnation and Death.

. . . . . .

The aeroplane stands on the edge of the aerodrome—a thing of beauty. A bevy of mechanics flutter round it: riggers retting the wings and empennage with practised eyes; fitters testing the valve clearances with the pride of the mechanical lover; an armourer fitting the observer's gun on its mounting and placing the drums of ammunition in their boxes.

The pilot and the observer come down the cinder-track to the aerodrome. The pilot glances at his wrist-watch, and speaks to his companion; for our service aeroplanes run (or fly) to time. They button up their leather coats, strap their fur-lined helmets, and pull on their great gloves; their feet and legs are encased in monstrous sheepskin thigh boots. Their appearance is grotesque. They look like the bloated shadows of men that a candle sometimes silhouettes upon a wall. Yet no one appears to notice that; it is far too commonplace.

They climb into their seats—the pilot in front, and the observer behind. The latter tests his gun-mounting, and glances round to see that everything—ammunition-drums, verey pistol and flares, and revolver—is in its proper place. The pilot loads his gun, then wriggles himself down comfortably in his seat. He tries the controls, and looks quickly over his instruments. Then he glances up.

A watchful 'Ack Emma' is awaiting this moment. 'Switch off, petrol on, suck in, sir!' he calls from his position in front of the propeller.

The pilot grunts to himself, and seems somewhat restless in his movements. The sound of a pump is heard, then the clicking of levers. 'Suck in!' he replies.

Round goes the propeller, while the excess petrol dribbles out on the ground from a pipe beneath the engine. The propeller stops. The Ack Emma wipes his oily hands on his overalls. He scrapes his feet on the ground to make sure of his foothold. He strikes a somewhat graceful attitude, with his hands resting on the trailing edge of the propeller. 'Contact, sir!' he calls.

A momentary pause, then a click.

'Contact!' from the pilot.

The Ack Emma balances on one foot, then swings lustily on to the other. Round goes the propeller, and the engine tremors into life. For half-a-minute she runs steadily. The pilot's head is inside the cockpit. He watches his revolving-counter, glances at his pulsator-glass, and listens to the hum of the engine. He moves a lever and turns a tap. The engine roars full-throated. The aeroplane quivers with the pride of it. But the chocks under the wheels, the Ack Emmas on the wing-tips, and the grim-faced individual hanging on to the tail in the full blast of the slip-stream check its impetuous desire.

The roar changes to a gentle hum. The pilot waggles a hand above his head. The chocks are withdrawn. The suffering individual on the tail crawls from inside the elevator control-wires, and retrieves his cap from the cornfield. The pilot adjusts his goggles comfortably over his eyes.

The engine hums a little louder, and the aeroplane taxies out into the aerodrome. From the rear, as she rolls over the uneven ground, she looks like a huge butterfly. At the end of the drome she turns into the wind. The engine roars full-throated. The aeroplane, unchecked, gathers speed; her tail rises slightly; she rushes along the ground . . . and is in the air. For a moment she flies close to earth; then, gathering confidence, she soars upward and onward, climbing fast. The Ack Emmas gaze after her fondly. It was their care, their expression seems to say, that enabled her to do it.

The aeroplane circles twice round the aerodrome, the drone of the engine growing fainter as she gains height. A last sweep round, and she is off, heading east towards 'the lines.'

On the ground the heat was suffocating. The pilot and the observer left the ground with their pores running sweat under their huge flying-kit. But up here, at eight thousand feet, it is cold. As the pilot glances out from behind his cunning little wind-screen between the traversing arms of the machine-gun, the blast of cold air meets his face and penetrates the leather and fur that appear so invulnerable on the ground. The observer, poor devil! is always in that terrific hurricane that hurtles backward from the propeller. It is his birthright. He has no place for a wind-screen, and no time to shelter behind one if he had. Once across the line, he must look out for Huns, be ready to use his gun at a second's notice, watch where he is going, and take the photographs when they reach the pin-point.

Below them the country is spread out like a map but for one small difference. It appears saucer-shaped. The rim of the horizon rises to meet the sky, and where they meet there is a light haze. Overhead the sky is ethereally blue. Occasionally a light, trailing wisp of vapour drifts past—from the ground it is a fleecy cloudlet—scarcely obscuring their vision downward. As it passes, the machine lifts suddenly, and as suddenly falls again. A cloud 'bump' is a curious phenomenon.

Straight down the country is beautifully clear—roads, canals, rivers, lakes, and forests stand out distinctly. In between and all around there are little towns and villages that look absurdly close together. On the left the sea hangs dull and leaden, fringed by a sparkle of sandy foreshore. Blighty is over there somewhere, hidden in the haze of heat. Almost underneath is a perfect picture—a tiny, circular town; it is splendidly laid out in clearly defined lines; it looks clean and healthy; and round it, completely encircling it in loving embrace, run a river and a canal. Its beauty lies in its artistry of outline and its kaleidoscopic harmony of colour—the blue-gray of the town set in the silver of the enfolding water amid the greens and browns of the surrounding country. It is like a jewel of great price.

But on ahead a great smear lies across the land like the trailing slime of a giant slug. Dirty brown it looks; not the healthy brown of a pleasant land. It is the deadened brown of disease, the blotch of death. It is the living weal of war. And even from the air—where earthly tragedy seems so remote, where sordidness is ofttimes witched to charming beauty, and ugliness lies hid beneath a veil of rising smoke—it looks what it is, an open sore.

And towards it the aeroplane floats, rising and falling rhythmically, slowly, to the song of the engine. For an aeroplane seen from another machine in the air is quite unlike its appearance from the ground. It has a motion akin to that of a small yacht riding at anchor in an oily swell. An aeroplane seen from the ground may be a thing of beauty and of wonder. It is thrice so seen from the air.

The pilot glances at his altimeter; the pointer reads ten thousand feet. His watchful glance takes in the meaning of his many indicators; his ear reads the music that his engine sings. All must be well, now that they are about to cross the lines.

The dirty brown smear is hardly behind them; but things seem to move so slowly from that height that it may be three or four miles back.

'Woof! . . . woof! woof! woof!'

The sound of the bursting 'Archie' reaches him through the song of the engine; but he keeps almost straight on, for it is wide of its mark. Again and again the same sound comes to his ears like the unhealthy cough of a missing engine. He smiles quietly to himself.

'Crack—rack—rack—r-r—rack!'

The pilot rapidly moves his controls. The aeroplane heels up and swerves. Up, steady, then swoop to the other side. The pilot's face is fierce below its mask.

'"Archie" was ruddy good that time,' he mutters to himself.

He had smelt the reek of the smoke-fumes in his nostrils, heard the whine of metal hissing through the air. He saw a rent in his planes.

Again it comes, the hideous, horrible, sudden 'crack!' that 'Archie' mouths when he bursts close. The wuff of it forces the tail up, the nose goes down, and at the same instant the aeroplane has swerved and side-slipped. 'Archie' has got their height. They must go lower. Down they dive.

Nine thousand feet! warns the altimeter.

The pilot straightens out again. He glances hurriedly down to earth. There is the place they want. Good! He lifts the mouthpiece and calls down to the observer, 'How are the photos?'

'Got six still to go,' comes the muffled answer in his ear.

The bus turns in a quiet circle over the places they want to photograph. 'Archie' has stopped. The pilot looks around him, scanning the sky suspiciously. He can see nothing. Suddenly he hears the muffled whisper in his ear again: 'Finished. Turn for home.'

He turns and heads her westward; and as she banks on the turn, he sees ahead, and just below, the cause of 'Archie's' cessation—a Hun scout climbing up under their tail. He had been coming up, sitting on his tail, in such a position that the observer, intent on his pin-points, could not see him. He had very nearly got them 'sitting.' The pilot takes it all in automatically. He sticks his nose down in a dive, and shouts down the mouthpiece to the observer, 'Hun below!'

His engine off, he is diving fast; and suddenly,

as the Hun comes into his sights, his machine-gun goes 'poop-oop-oop!' The Hun swerves in a graceful Immelmann turn at the sound of the bullets cracking past his ears. But the observer has been waiting for just such a chance. As the Hun turns over, the sharp staccato of the observer's gun breaks out. He cannot miss—the range is too close. The tracers fly dead into his 'guts.' The Hun slips, dives; then goes spinning down in that terrifying, turning dive. Splinters fly out from his machine. Faster and faster he falls. The observer's gun stops. A wing folds back in the Hun machine, and seems to check its fall. Then it spins round slowly, drifting down like a handful of crumpled paper.

The observer looks round and scans the sky. Nothing above. He looks below. For a few seconds he sees nothing; then he spots three machines coming up fast. He grabs the telephone. 'Put your nose down and go like stink. Three Huns coming up.'

The engine roars once more. The pilot pushes a wheel forward. The air-speed indicator-pointer moves round the dial ninety, one hundred, one hundred and ten miles per hour. He glances at the altimeter. Seven thousand feet.

'Woof—oof—oof—woof!'

The line 'Archie.' Thank Heaven! there are the trenches. He puts his nose down a little steeper—one hundred and fifteen, one hundred and twenty miles an hour. He is going too fast for 'Archie.' 'Archie' can never touch him at this rate. The Huns have dropped out of the chase. The photos are safe. The 'woofs' of the 'Archie' become fainter, and die away.

The muffled whisper sounds in his ear again: 'It's all right now; you can flatten out.'

He cuts off the supply of petrol to the engine, and slowly winds back a wheel. The rush of air diminishes; the aeroplane is gliding sedately back to the aerodrome at a steady sixty miles per hour.

WITHOUT SANCTION OF ADMIRALTY.

IX.

BY this time it was 11.45, and the wardroom servants were laying the cloth for lunch, that meal being served at twelve o'clock in the navy. Rushbrook was having a bitters with a group of naval officers. 'Hurrah!' he cried when the staff-surgeon tapped him on the shoulder. 'Have something, O'Brien, and stay for lunch.'

'Right-o. When did you get back from the Baltic?'

'A few weeks ago; we've just finished our refit. O'Brien, this is Macmurdo, who's with me. Crawley'—indicating a staff-paymaster—'has just come home from the Adriatic, and been appointed to the *Prometheus*. Sedley here lost his seaplane yesterday, and nearly his life, so please overlook his personal appearance.'

This was a bit of a gibe on the commander's part, for Sedley's uniform was quite spotless. His legs, however, were appallingly small for his colossal body, and the wholesale 'pulling' of them, which his messmates had indulged in ever since he was a cadet at Osborne, eventually had led to his changing over to the Royal Naval Air Service.

By the time they sat down to lunch they were talking 'shop' and service personalities, and prancing from subject to subject in the way of naval officers.

'We're going for a spin on the surface in half-an-hour, doc.,' Rushbrook said. 'Why don't you come along?'

'I've got to take a case to the hospital-ship; otherwise I should be delighted.'

A signalman came up. 'Staff-Surgeon O'Brien, sir?'

'Yes; what is it?'

'A signal has come through, sir,' he said: '"No hospital-boat available until 4 P.M. unless case is exceptionally urgent." Any reply, sir?'

'Not at the moment,' said O'Brien.

'Why can't you bring him along in the submarine, doc.?' Rushbrook chimed in. 'I'm going in that direction. Is it a cot case?'

'No; he can walk all right. It isn't exactly a physical infirmity that's troubling him.'

'Well, then, you'd better come,' the commander urged; 'he'd be a jolly sight more comfortable with me than in a hospital-boat, from what I know of them.'

O'Brien hesitated. 'It would scarcely be in accordance with Admiralty orders.'

'I'll take any risk going in that direction,' the commander assured him, ordering a couple of glasses of port.

'Good,' the staff-surgeon said. 'Getting into trouble has been the specialty of my life. Well, here's to you, Rushbrook,' he murmured, raising his glass.

'Cheer-o,' replied the commander. 'We'll start at once, then; so you might see if your patient is ready.'

O'Brien found Joughins in the wardroom. 'We've changed our plans a bit, Joughins,' he said. 'A hospital-boat isn't available at present, but we're taking passage in O 2. Wrap yourself up carefully, and don't feel nervous; we're not going to submerge.'

'Oh, I'm not a bit afraid at this time of day, sir. In my saner moments,' said Joughins, who had had a couple of years at the university, and

was inclined to be poetical, 'I quite realise my trouble is but a fantasy of the night.'

X.

They were soon aboard the submarine, entering by way of the fore-hatch. Many of the crew remained on deck, where Lieutenant Macmurdo, R.N.R., was in charge. The weather was changing rapidly, and, in view of the approaching rain, Macmurdo ordered his men to go below for their oilskins. He then had all the hatch-lids closed except the conning-tower one.

Rushbrook, O'Brien, and Joughins sat in the amidships compartment, which contained a settee and a small leather arm-chair. The commander's cabin opened into it from the starboard side, while ranged along the other were chart-cupboards and lockers. There was scarcely any motion; they merely felt the throb of the Diesel engine. Rushbrook showed them some recent improvements. There was the speed-indicator, or log, for instance, which pointed to ten knots. Joughins was very keen to look through the periscope, but unfortunately a fog was rolling up, and he could not get a clear view of the O 2's surroundings.

On deck Lieutenant Macmurdo laboured under the same difficulty, and cursed a climate that made such an abrupt change in the weather possible. As he came under the lee of Borodino Point he was about to call the captain on deck, when a dark object, coming at great speed, loomed up on his starboard bow. Before he could alter course to avoid collision, the destroyer crashed into the O 2, hurling her aside, and causing her to vibrate from stem to stern. The submarine dipped at an acute angle as the water poured in, and Macmurdo, seeing the boat was sinking by the head, and not having time to go below, pushed the lid of the conning-tower down.

'Close the for'ard water-tight door,' the commander ordered within.

A couple of seamen carried out his orders. At the same time Rushbrook pulled the emergency-lever that released the O 2's heavy, but detachable, keel, in the hope that the added buoyancy would make the boat come to the surface again. The weight of the water shipped, however, was too much for the submarine, for she continued to dive, till she grounded on the bottom in ten fathoms of water. Unfortunately the sluice of the voice-pipe communicating with the for'ard compartment could not be shut, and water poured aft. It took some time to stop a flow that had such pressure behind it. By this time sea-water had penetrated into the battery-tank situated under the deck, and as it came into contact with the cells containing sulphuric acid, chemical combination took place. Hydrochloric acid gas was formed freely, and the occupants of O 2 began coughing and choking, and water commenced to stream from their irritated eyes.

'Respirators!' yelled O'Brien, in agony.

Rushbrook pointed to a locker. The staff-surgeon pulled out the sausage-shaped things, and helped officers and men to put them on, finally adjusting one on himself. Then they donned protecting-goggles. Naturally they could not speak to each other under such circumstances.

The commander got pad and pencil. 'I'm sorry, doc., getting you into this mess,' he wrote.

O'Brien replied in similar fashion: 'Don't worry about me. My only concern is our friend the patient.'

XI.

With death rapping on the sides of the submarine, and a fairly strong representative within in the shape of poisonous gas, these men sat there in acute possession of all their faculties. Standing up against the incongruous picture they made in their anti-gas dress, and the intricate mechanism of the submarine, were a few homely reminders such as mess dishes, a wine-glass, a pipe, or a small print or photograph tacked on a locker. Such awful situations, where it is a toss-up whether or not annihilation occurs, often steady the nerves of men, provided the tension is not kept up too long. Some of this lethal nonchalance was infused even into Joughins, who was about to be invalided out of the service owing to nerve-frailty. At the moment, he picked up a copy of the *Sketch*, and mechanically turned over pages which he saw through the yellow glare of his goggles. How flippant and futile seemed many of the items! There was perhaps Lady Flamboyant walking in the Park, or little Miss Smirks, the latest revue star. Apart from an odd reflection or two of this nature, the trio experienced few of the feelings one is supposed to have on like occasions, such as the events of one's past life passing before the mind's eye in a sort of strident and insistent panorama. It may be the many golden opportunities he had lost flashed over Staff-Surgeon O'Brien's brain, but the predominating feeling that throbbed and exulted within the breast of officer and man alike was an instinctive one, the heritage of countless years of animal evolution, development, and strife against adverse conditions tending to obliterate life—the desire to live, not for any particular purpose, but merely for the sake of living.

XII.

Rushbrook took up the indispensable signal-pad, and began writing briskly. 'The only way of escape is by conning-tower. Three of you will enter at a time, and I'll let compressed air in till the upper lid is forced open. Two of you 'll allow yourselves to be borne to the surface by the uprushing air. The third man will pull the lid down again, so as to prepare the way for the next lot; and the process will be repeated until you are all ejected.'

Goggles and respirators were now discarded for life-saving helmets containing a chemical 'purifier' of respired air. O'Brien, Joughins, and an engine-room artificer named Rogers were the first to enter the conning-tower. As soon as the lid was closed behind them Rushbrook opened the valves which retained air in iron bottles under great pressure. The sensation of being in a hermetically sealed chamber where air was being accumulated till its pressure was sufficient to overcome that of the sea at such a depth was intolerable. At least Joughins and O'Brien found it so. The life within them, which is normally a diffusible and impalpable affair, seemed to be compressed by some gigantic force till it became concentrated into a tight lump within their chest, tugging at its moorings, and endeavouring to leave the body. Rogers, on the other hand, did not appear to suffer much discomfort. He was a contortionist, and very thin, and possibly incapable of further compression. Hugging the side of the conning-tower, he stood by to close the lid after its 'pop' allowed the staff-surgeon and his patient to escape. This event happened quite suddenly, just like steam blowing off through a safety-valve; and, indeed, the action was similar. Joughins and O'Brien were instantly shot out, and found themselves being lifted up with a mighty gurgle. As they ascended, and the pressure became less, the viable force again expanded, and this time it felt as if all the pores of the body were being stretched and torn asunder so that empty spaces might once more be occupied. Up, up, they came, cerebrating agonised thoughts as quickly as films form impressions in a cinema-machine. When the two helmets bobbed to the surface, several picket-boats were on the scene of the disaster, and they were both hauled on board. So condensed were the impressions of those few seconds that when their helmets were removed they seemed to have come back to a world they had left a very long time ago. Seamen cast their great-coats upon them, and they lay there, thinking of the others who had yet to arrive. Rogers was the first, and he was secured with difficulty, turning over and over in the sea. The others followed in rapid succession, till everybody was up except the commander.

Fifteen minutes had elapsed since the last man had been taken on board, and still there was no sign of Rushbrook. A hospital-boat came up. 'I have orders from the flagship to take all survivors at once to the *Bengal*,' the skipper said.

'If I go, there 'll be no one to look after the commander,' the staff-surgeon objected.

'A surgeon is being sent by the flagship, sir,' said a gunner who was in charge of a diving-party; 'and, if I 'm not mistaken, here he comes,' indicating a picket-boat with brass funnels which was bearing down on them.

'Hold on a minute, skipper,' O'Brien said to the captain of the hospital-boat.

'Ay, ay, sir,' the latter responded.

The surgeon saluted O'Brien.

'Will you see these people off to the *Bengal*, Ingleby?' the staff-surgeon said to him. 'One is a surgeon-probationer, and he 'll tell you all about it.'

'Certainly, sir,' said the young surgeon, jumping across to the hospital-boat.

At the same time the men on board the diving-craft began heaving round the wheel of the air-supplying machine, and one of the divers descended to investigate the wreck.

XIII.

Some one had to be left behind in the O 2 in the uncomfortable position of having a conning-tower full of sea-water intervening between him and the opening through which the others had effected their escape. That man was the commander, for the *modus operandi* of the thing depended on his doing this. There was, however, a possible means of making his exit in another direction, which Rushbrook had already thought out. He was about to put his plan into execution, when an overwhelming feeling of poignant regret at having to leave his snug surroundings assailed him, and he paused on the very threshold, so to speak, of the chamber which had been his home for so long. There was still enough current in the batteries to keep the electric lights burning, and apart from the discomfort of wearing a respirator, and a sort of acrid taste in his mouth from the hydrochloric acid gas that had escaped the neutralising medium, there was nothing, except perhaps the deadly stillness, to suggest that he was not resting on the bed of the Baltic, in perfect security, as he had done many a time. There were no voices to break the silence; he did not hear the snores of his men slumbering in their bunks, for submersion seems to relax the soft palate and infuse a noise into one's sleepy breathing. The peacefulness of the scene was, in fact, more than soothing; it had a somnific suggestion about it that made him sit down on the settee and wonder whether it was worth while attempting to escape. For what would he live? There would be a court of inquiry into the accident, and his every action would be scrutinised. If he was not reprimanded, at least the tag of one disaster would cling to him for a long time. Now that he thought of it, too, it had been a strenuous effort ever since war began, and he felt tired and weary, and had not the heart to go on.

In this mood he went into his cabin, and his eye wandered over all the accessories that mean home to a naval officer, and then his gaze finally rested on *her* photograph. Here was one more reason for not living; the pain of her recollection would be obliterated, and yet the perverseness of his nature was manifested in his having kept her features

before him. She was a dark-haired girl, and when she originally smiled on his advances, his adaptability for feeling and doing things seemed to be as expansile and his view of life as mellow as a gold-beater's leaf. Later on she had declared herself frightened at his excess of feeling for her; and finally she decided she must have as a husband one whose career was such that she could depend on his presence. He wondered what she would say when she heard; probably 'How dreadful, poor chap!' over a cup of tea, and then she would pass on to some trivial subject. Yet Rushbrook kissed her picture before quitting the cabin.

XIV.

By this time the current in the damaged batteries began to give out, and Rushbrook, sitting down on the settee once more, watched it grow dimmer and dimmer, till even the glow died out. Then a new light seemed to appear, and he became aware of a persistent flashing, which kindled some chords of memory within him. 'Good heavens!' he thought, 'that can't be the lights;' and a shudder passed through him as the thing seemed to visualise in his mind the letters of his own name, 'Rushbrook, Rushbrook, Rushbrook.' He saw them being formed before him, and yet they were not real letters. His system, which had been recoiling from the continued strain, was elastic enough still to respond to the human wand which was endeavouring to touch him. It dawned on him that this was no phantasmagoria of a diseased imagination, but a diver outside the submarine flashing a signal to him down the periscope, in Morse code. 'Rushbrook, Rushbrook, Rushbrook,' it kept saying. Overcoming the inertia which had been leading him to his doom, he groped his way into his cabin again, and found the torchlight which he always kept under his pillow. With this he secured a hammer from the engine-room, and began tapping a reply on the side of the submarine, near the conning-tower.

'Rushbrook,' the diver flashed.

'Yes,' the commander tapped.

'Are you all right?'

'Yes.'

'Come out through engine-room hatch. I'll stand by to help you,' the commander made out.

'Right-o,' he answered. 'Why, that was my original scheme,' Rushbrook thought. 'What the deuce came over me?' The last half-hour seemed like a dream to him now, and, without delaying further, he went into the little engine-room, and closed the water-tight door behind him. After discarding his respirator, he opened the Kingston valve, letting the sea come in from below, and this, welling up, compressed the air as the chamber shrank in size. When the sea had reached his armpits, the pressure had become positive enough for him to work the geared wheel that opened the hatch-cover. The commander then felt himself being forced up; his head and arms were already through the opening, when a mishap occurred. The outrushing air, insinuating itself into the body-attachment of the helmet, so inflated him that he was unable to get out. He was becoming weak and limp, and consciousness seemed to be fading away, when he felt himself being pulled violently out by the diver; and the next thing he knew, a nursing-sister was bending over him on board a naval hospital-ship.

XV.

O'Brien, who was standing alongside the cot, put his finger to his lips, enjoining silence. 'You've had a narrow squeak, Rushbrook,' he said, 'and you'll have to be quiet for a few days.'

This admonition, however, was of little avail when Rushbrook's eyes met those of the nursing-sister. 'Vera!' he exclaimed, throwing his arms round her neck and kissing her violently.

'Forgive me for having followed you into the navy after treating you so badly.'

O'Brien left them softly. He met Macmurdo in the alleyway. 'Glad to see you're safe, sir,' the latter said.

'Thanks, Macmurdo,' replied O'Brien; 'I'd forgotten your crowd. Any casualties?'

'No, sir; they're down in the men's ward, waiting for their clothes to dry, and, incidentally, for instructions from the flagship regarding their disposal.'

'Good,' O'Brien said. 'I need a bit of drying myself.'

'They'll do that for you in the evaporating-room. If you like, you may use the cabin they gave me, and an orderly will look after you.'

'Thanks very much. Perhaps you'll also be so kind as to have them make a signal to the *Alcibiades* for a boat to take me back.'

'Right-o.'

The fleet-surgeon of the *Bengal* looked in to see if O'Brien was comfortable. He found him tucked up in bed. 'You're looking none the worse for your experience,' he said. 'They're bringing you in a cup of tea; and, by the way, a special effort is being made to dry your gear quickly. I've chipped in a collar, and one of my surgeons will lend you a cap. I know you'll want to return to your ship spick-and-span as usual.'

'I'm very much obliged, sir,' O'Brien said. 'Now that I think of it, could you tell me anything about young Joughins, the surgeon-probationer? I haven't seen anything of him since coming on board. How is he?'

'Gone,' answered the fleet-surgeon.

'Gone! Where?'

'Back to his ship.'

'The *Roister Doister*?'

'Some funny name of that sort.'

'Well, I'm blessed! The rascal! Why, I was sending him in.'

'We're somewhat cramped for space,' the fleet-surgeon said; 'and as he stoutly declared he was all right now, and wanted to go back to his ship, we let him have his way. Great shock, as you know, often works wonders in such cases,' the P.M.O. concluded.

'The staff-surgeon's boat is here from the *Alcibiades*,' a sick-berth steward announced.

A few minutes later an orderly came along with his clothes, and it did not take O'Brien long to get into them. He was a bit wobbly at first, but a stiff whisky-and-soda put him right, and when he went over the ship's side into the picket-boat he showed no signs of the strenuous afternoon he had experienced.

Lieutenant Deans, R.N.R., was on watch in the *Alcibiades* when he came alongside. By this time it was dusk. Deans had, of course, heard of the accident by means of intercepted signals, but he had not the slightest idea the staff-surgeon was involved in it.

'Had a good day, sir?' he asked as O'Brien came on to the quarter-deck.

'Fine,' said the staff-surgeon, going below.

THE END.

THE MONTH: SCIENCE AND ARTS.

APPLIANCE FOR ASSISTING THOSE LEARNING TO SWIM.

ALTHOUGH most boys and girls who have the opportunity learn to swim quickly enough, there is a certain nervous minority to whom the acquirement of the art is very difficult. To such the swimming-board invented by Mr William H. Roberts of Newburyport, Massachusetts, and described in a recent number of the *Popular Science Monthly*, should be a great help, as it gives the user confidence, while allowing free play to the arms and legs. The appliance consists of two pieces of board attached to each other at a wide angle. In using it the learner straddles the middle part, where the boards are joined together. This portion is made narrow, so as not to interfere with the legs, and the learner lies face down on the front board, while the back one inclines upwards at the rear. The position is the natural one for swimming, and the buoyancy of the boards is sufficient to remove any fear of sinking.

NEW SOURCE OF RAW MATERIAL FOR MAKING MARGARINE.

Margarine is now used in such large quantities by those who can and those who cannot afford to buy butter that it has become a necessity of every-day life. Every source of raw material for the manufacture of this valuable commodity should, therefore, be developed with a view to keeping the price within reasonable limits. Hitherto margarine has been produced largely from coco-nut and palm-kernel oils; but according to a recent article in the *Scientific American* by Mr C. W. Mell, a powerful rival to these raw materials is to be found in the nuts of the cohune-palm of Central and South America. In appearance this tree resembles a bunch of huge ostrich-feathers, the branches being in the form of leaves measuring thirty to sixty feet in length, which bend over in graceful curves. The nuts hang in large clusters from near the bases of the leaves, and are covered by an outer fibrous layer which forms the pericarp. A hard shell about three-tenths of an inch thick surrounds a kernel measuring two to three inches in length, and about one and a half inches in diameter. Until recently some difficulty has been experienced in cracking the shells of these nuts, but machines have now been devised which give satisfactory results. About a quart of oil is obtained from one hundred nuts, and an average tree produces one thousand nuts a year. Mr Mell estimates that in British Honduras there are twenty-five cohune-palms to the acre, in which case the colony should be capable of producing 275,000 tons of oil annually; while Guatemala and Spanish Honduras are each credited with a still larger number of trees. Cohune-nut oil is said to be superior to that produced from coco-nuts, and to be worth more in the open market.

FERRO-CONCRETE RAILWAY-SLEEPERS.

The uses of concrete, reinforced with steel bars embedded therein, and known as ferro-concrete, appear to be well-nigh inexhaustible, one of the latest being for railway-sleepers. These, though externally the same size as wood sleepers, are made hollow. Their sides are one and a half inches thick, except where the rails rest on them, at which points the thickness is increased to two inches, and added strength and resiliency are given by oak filling-pieces. Each sleeper contains thirty-two pounds of steel rods, and weighs about three hundredweights. Tests are being made on these sleepers at Riverside, California, where they are laid down along a stretch of railway.

FISH FOUND BY THE SOUND OF THEIR SWIMMING.

The presence of large shoals of mackerel, herring, cod, and other sea fish is seldom announced by any indications on the surface of the sea, and hitherto the best places at which to shoot the nets have been chosen according to

the experienced judgment of the fishermen concerned. Recently, however, an instrument has been devised by a Norwegian whereby the passing of large numbers of fish in the vicinity of a fishing-boat may be heard, and the nets shot accordingly. The device consists of a microphone fixed under-water, which multiplies the rushing sound made by shoals of fish when swimming, so that it can be heard through a telephone-receiver in the fishing-boat. This sound is discernible at considerable distances, and the instrument indicates from which quarter it comes, so that the boat can be steered in the necessary direction.

ANTHRAX INFECTION IN SHAVING-BRUSHES.

One would hardly expect to find danger lurking in shaving-brushes, yet such is the case. According to a report by Dr Coutts and others, which has been recently issued by the Local Government Board, the instances of anthrax infection traceable to shaving-brushes numbered sixty-five in the past two years (nineteen civilians and forty-six soldiers). An investigation into several of these cases revealed the fact that the infected shaving-brushes, although purchased at different shops, were all made in the same factory. Further inquiries proved that some of the horsehair used was imported from China as 'goat's hair,' which is not compulsorily disinfected, as is foreign horsehair. Other cases discovered involved other factories, and infection was also traced to brushes made in Japan, the United States, and Canada. Measures for preventing infection from this source in future are being considered by the Board.

HINDU MAGIC SQUARE.

The progress report for the year 1915–16 of the superintendent of Hindu and Buddhist Monuments contains the following interesting description of a Hindu magic square: 'On the occasion of my inspection of the monuments of Dudhai, Jhansi District, I found at one end of, and on the underside of, a fallen lintel in the shrine known locally as the Chota Surang, a so-called magic square.

7	12	1	14
2	13	8	11
16	3	10	5
9	6	15	4

'When the lintel was in position the square was hidden by the supporting column. The temple may be assigned with some certainty to the first half of the eleventh century A.D. Mathematically it is interesting as possessing the following properties: (1) the sum of each row, of each column, and of each diagonal is 34; (2) the sum of all the numbers in each sub-square of four numbers, wherever it may be taken, is also 34.'

LIFE-SAVING SUIT WHICH KEEPS OCCUPANT DRY AND WARM.

'It's an ill wind that blows nobody good.' Even the German submarine campaign is no exception to this rule, as a rich harvest of profit is being reaped by the inventors and makers of life-saving apparatus at sea, owing to the greatly increased risks sailors and passengers in ships are subjected to. Those who go to sea now must be prepared for immersion at any time, with only a few minutes in which to prepare for it, as, when a vessel is torpedoed, she may sink before the boats can be launched, or a rough sea may prevent the carrying out of this operation even if the ship floats long enough. Hitherto life-belts have been largely depended upon in such cases; but in winter, although they will support the wearer for any length of time, death from exposure is likely to supervene unless rescue is effected quickly. A recently invented life-saving appliance, known as the 'ever-warm safety-suit,' goes far towards removing this danger. It is made of rubber, and is put on over the clothes, bands at the neck and the wrists keeping out the water entirely. The upper part is padded with a special composition possessing great buoyancy; so that even if the suit were punctured, the occupant would be in no danger of sinking. In this suit a person who has to take to the water is kept dry and warm, and a pocket is provided for holding food and drink. Under such conditions a healthy man or woman should be able to stand a long immersion without suffering any ill effects. Although this suit has been on the market for only a few months, large numbers have been purchased by passengers about to make sea voyages, and they are often worn all the time that the vessels are in the danger zone.

AIMING A BOMB FROM AN AEROPLANE.

If a bomb be dropped from an aeroplane when it is, say, ten thousand feet up, and is travelling at a speed of one hundred miles an hour, the bomb will strike the ground at a considerable distance ahead of the point vertically beneath that at which it is released, the exact spot varying with the shape of the bomb, its relative weight compared with its size, and the direction and force of the wind. In view of the long distances travelled by bombs dropped from fast aeroplanes when at great heights, it is easy to understand how difficult is the problem of hitting any particular object, assuming that the airman simply throws out bombs to the best of his judgment. Up to the time of writing, the German air-raiders have flown at great heights, and it was a foregone conclusion that

they would use some form of instrument to tell them when a bomb should be released with a view to hitting a railway station or other important building. One of the 'Gotha' aeroplanes was captured by the French in February, and an interesting description of this machine is given in a recent number of *La Nature*. The aiming instrument carried is a very ingenious contrivance, the main feature of which is a telescope hung on gimbals and pointing downwards through the floor of the bomber's compartment. It is most important that this instrument should be truly vertical during sighting, and this object is attained by a form of spirit-level, in which a bubble comes into the centre of a glass disc when the telescope is correctly set. An image of this bubble can be seen by the bomber when he is looking through the telescope, and this enables him to keep it correctly pointed regardless of the irregular motion of the aeroplane. Such an instrument by itself would, of course, be useless for the purpose in view, as the observer would see only objects exactly under the machine. Just below the telescope, therefore, is fixed a prism, which acts on the principle of the prismatic field-glass; but instead of deflecting the image at right angles, it can be set to show an object at any desired angle ahead of the aeroplane. Now, certain angles correspond with certain distances at certain heights. We will suppose, for instance, that the aeroplane is flying at a height of ten thousand feet, and that the bomb must be released half a mile in rear of the object in order to hit it. The angle corresponding to this distance at such a height is roughly fifteen degrees. The bomber, therefore, sets his prism at this angle, and the pilot keeps his machine at the correct height, and points it towards the object being aimed at. When this object comes into the centre of the view seen through the telescope, the bomber releases his bomb, which should then score a hit, provided the weather is calm. Naturally the flight of a bomb is affected by wind to some extent, and as its force in all probability does not remain constant, but varies in the different layers of air through which the bomb passes, the correction necessary for this factor can only be roughly estimated. Hence bombs can only be aimed with anything like absolute accuracy in still weather.

NEW RESCUE BREATHING APPARATUS FOR MINES.

A recent number of *Engineering* contains a very interesting description, and comments thereon, of a breathing apparatus for mines and other places where poisonous gases are to be met with, the article being based upon a report lately issued under the authority of the United States Mining Bureau. The apparatus described is of the type in which the noxious gases exhaled are absorbed, while oxygen is added as fast as it is consumed. Some idea of the importance of using effective apparatus may be gathered from the fact that even 5 per cent. of carbon dioxide in the air breathed produces a feeling of suffocation, and gives the wearer a conviction that the tubes are blocked up, 'a belief so terrifying and unfortunate that even one trained and experienced cannot resist the temptation to tear off the apparatus even in the midst of deadly gases.' Carbon dioxide is the chief poisonous constituent in exhaled breath; consequently, unless the apparatus is very carefully devised, the above percentage may easily be reached. A still more deadly gas is carbon monoxide, against which the apparatus is especially designed to protect the wearer, as this gas is generally encountered in mines where rescue-work has to be undertaken. Being odourless, and having no irritating effect upon the lungs, no warning of its presence is conveyed to the victim. The mouthpiece of the apparatus is very carefully designed to render impossible the breathing in of air from outside. At each side of the mouthpiece is a valve so arranged that when inhalation takes place, air is taken from the purified and oxygenated supply, while the spent air breathed out is discharged through another tube into the absorption apparatus. In this the carbon dioxide is taken up by sodium hydroxide cast in plates upon wire gauze, the quantity being enough to absorb about sixty cubic inches a minute, or more than is exhaled during violent exercise. Oxygen is added by ingenious appliances which vary the supply to suit the rate of breathing. The entire apparatus is carried on the back, and consists of two oxygen cylinders, a breathing-bag for the recuperated air, breathing-bellows whereby the supply of oxygen is regulated, and the various tubes and valves needed for distribution and safety. No helmet is used, but goggles are worn to protect the eyes. Similar apparatus is employed by the London Fire Brigade.

GERMAN PRE-WAR PREDOMINANCE IN THE ARTIFICIAL DYE INDUSTRY.

In an address to the Société des Amis de l'Université de Paris, recently reviewed in *Nature*, Professor Auger gave some very interesting facts in connection with the production of dyes and the German share in this industry before the war. Up to nearly the end of the eighteenth century only natural dyes were in use; but the development of modern chemistry during the first half of the nineteenth century added a number of new substances suitable for dyeing. Since that time thousands of synthetic dyes have been produced, and the industry has been captured by the Germans. Incidentally this development provided, ready made, a number of poison gases and liquids for the nefarious methods of fighting introduced by the Huns. Mention is made of the adoption of red trousers by the French army to encourage the cultivation

of madder, and the supersession of this dye by an alizarin dye purchased from a German company. Speaking of the employment of chemists by German firms for the discovery of new dyes, Professor Auger says that the employers did not impose the crippling task of obtaining immediately profitable results, a far-sighted policy which enabled them to become masters of all industries dependent upon chemical synthesis. Having acquired a practical monopoly of the substances needed for producing dyes, the Germans allowed, and even encouraged, the establishment of foreign factories for the production of the actual colours, this being a comparatively simple process. In this connection, examples are quoted of factories in France and England which imported the intermediate dye-making materials from Germany. It is satisfactory to note, however, that both of these concerns have discovered, and are now carrying on, the complete synthetic processes, and that their production of dyes is now on a larger scale than when the materials were supplied by German manufacturers.

INCOME-TAX ON TREASURY BILLS.

The following income-tax note is very valuable to all who hold British or other Treasury bills. Eminent English counsel has advised that the 'discount' is not taxable income of the investor except when it forms part of the profits of a business. This means that if a private investor has paid, say, £950 to the British Treasury for a £1000 bill with one year's currency, the £50 is not income liable to income-tax, and does not require to be set down as part of his income either in the year when the investment is made or in the year in which it matures. If this is sound its importance is obvious, for not only is it £50 free of tax, but the omission of the £50 from the statement of income may so reduce the total income as to entitle the investor to exemption of all his income (which is improbable), or to (1) an abatement when otherwise he would be entitled to none; or to a larger abatement, say £120 instead of £100; (2) the 'children' allowance by bringing the total income down to £700 or less; (3) a lower rate of tax; (4) the special war-service abatement by bringing the total income down to £300 or less; (5) escape from super-tax. It is expected that the case will go to the law-courts as a matter of course, as the amount involved, especially as regards certain companies, is very large indeed. If the immunity view be sustained in the courts there will no doubt be amending legislation, but probably not so as to touch the past, and 'the past' in this sense may include the present tax-year to April 1918. This prospect makes it all the more important to protect one's self this year if at all. The course of prudence is to hold one's hand with the tax in it, or to pay under an arrangement in writing that, if a case be taken and if it be decided against the Crown, the payer's position will be restored in all respects. We advise no one meantime to suppress the existence of this source of profit or income in any tax document, though a protest may be added that it is not taxable income. It is interesting to note that, even though the Crown were to lose the tax and were not to change the law by legislation, the Exchequer's loss in future would not be total, and might possibly be very little. These securities would then have a special value added by their income-tax immunity, with the result that the Government would be able to borrow on these bills at rates more favourable to the nation, and thus what was lost in tax would be largely saved in discount.

MEATLESS MENUS.

A *chef* of the highest standing and an eminent scientist form an admirable combination for the production of a series of menus in which the dishes shall be both appetisingly cooked and ideally suitable for the proper nourishment of the body. Such a combination has been at work in the preparation of a recently published volume, entitled *Meatless Menus*, by M. Alfred Arm, Chef de Cuisine, North British Station Hotel, Edinburgh, and Dr Laurie, Professor of Chemistry to the Royal Academy of Arts. The book has been drawn up on novel lines. It begins with a number of attractive meatless menus, carefully planned so as to secure not only that the nourishment provided shall be sufficient, but also that the various kinds of foods shall be in the proper proportion for the due maintenance of health. A meal perfect from the scientific point of view is thus provided for in each menu. The menus also contain reference numbers to the various recipes, where full instructions are given for the preparation of many dainty dishes and appetising and nourishing sauces familiar enough on the Continent, but rare in this country. Many of the recipes, which number over three hundred, are original; all have been tried in the fire of actual experience.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal
SEVENTH SERIES

FROM THE ENDS OF THE EARTH.

By ASHMORE RUSSAN.

CHAPTER I.

And soon from field, from mine, from mart,
The Home-bound legions mustered fast;
The Mother had spurned the Judas part,
True to her pledge, as in the past;
Stern-lipped, she held to the holy right—
Undaunted, turned on the Hunnish might;
Held poltroon peace at its shameful worth,
And called us all from the ends of the earth.

DON ANDRÉS—by which name he was known in the part of Mexico whither, by a series of chances, he had drifted—otherwise ex-Private Andrew Martin, once of the British army, was officially dead so far as England was concerned—dead with a big D—dead beyond likelihood of resuscitation—almost as dead as a door-nail. It could not be said that he was in the habit of bragging about the escapade—the mildest term—which had eventuated in his official demise; nevertheless, it was no secret amongst the few compatriots who, also mostly by chance, had become *finqueíros* and *hacendádos*, otherwise farmers and estate-owners, in his neighbourhood.

Often they had heard the story, told not in a spirit of boastfulness, as already testified, but with a concentrated bitterness and scornful contempt for the military service of his country, which were a measure of his own great disillusionment.

A boy of twenty, Andrew Martin had enlisted in the Midshires, with the long-cherished idea of seeing the world, and escaping from the terrible torpor of his native village of Ditchington. Also, he thought his heart was broken. Jessie Osborn was the name of the faithless damsel. In a prospective wild whirl of adventures in Europe, Asia, Africa, Australia, and several other places freely promised by the tale-pitching recruiting-sergeant, regardless as to whether some of the places were on or off the map, he hoped to realise his youthful aspirations and forget the unfortunate and abrupt termination of his 'lad's love.' But, to his bitter disappointment, the whole period of his service was spent at Aldershot, Colchester, and other garrison towns in England. Drafts left for Egypt, India, South Africa, the Antipodes, the Near and Far Easts, wherever a battalion of the Midshires might chance to be; but his luck was not in. Many times he asked to be included; but it was his fate to stay at home, perforce, and eat his heart out.

In consequence he grew sick of army life and contemptuous of discipline, which led to numerous spells of 'C.B.' and worse. Classed as a 'bad soldier,' his officers made his life a misery. A route-march, which took his battalion to the sea, gave him his chance. A shelf of rocks, generally above water, lay a few hundred yards from the beach near which the camp had been pitched. To obtain a suit of civilian clothes was not easy, but he contrived it. Two boats were necessary, and those he borrowed without a 'by your leave.' Rowing out to the rocks one evening after sunset, and towing the second boat which contained the civilian clothes hidden under a heap of seaweed, he made the second boat fast in a cleft of the rocks, and rowed back.

Next morning he got away alone to bathe, undressed, folded up his uniform neatly, left it on the sands, and swam out to the rocks, where he dressed, and presently put to sea; that is, he drifted into the Bristol Channel on the outgoing tide. A tramp-steamer, bound for the West Indies, picked him up, and his adventures began.

His uniform was duly discovered, and the official record of his death by drowning eventually appeared in the regimental archives. His people kept the adjutant's letter and the War Office notification. They mourned for a space; but as they all believed that Andrew was bound to come to a bad end, this tended to assuage their grief. It was said, however, that Jessie Osborn cried a good deal.

In Jamaica the ex-soldier picked up a working knowledge of sugar-planting; in Trinidad, of the cultivation of cocoa; in the state of Vera Cruz, Mexico, he learned coffee-planting and the Spanish language; in Cuba, tobacco-planting. Finally he drifted down to south Mexico, to the Guatemalan border, where he became administrator of the Bella Vista coffee *finca*, on the foot-hills of Mount Tacana. By this time he had become something of a citizen of the world, and being a good-looking, smart, soldierly fellow, he made friends. But Jessie Osborn had no successor.

 [*All Rights Reserved.*]

Only those whose fate or fortune it has been to reside in foreign countries—as distinct from the Colonies—for long spells know what Home means to these wanderers, so often outcasts—how frequently it is upon their lips. But the ex-British soldier had no pleasant recollections to discourse upon.

'I've no use for that palaver,' he would say. 'I don't want to see the Old Country again. It's a rotten place, run by a rotten lot of old women, lawyers, and army officers—damn them! I wouldn't go if I had six months' leave, my passage paid, and a thousand dollars to spend—not I.'

That sort of talk was listened to avidly in the Club Alemania—the only club in the nearest town of size, Tapachula, which Don Andrés frequently visited with half-a-score of German and other planters, his neighbours from the hills. The Germans knew he was a deserter from the British army; they made it their business to know everything about every *verdammlich Englander* in their part of the country, and, as indicated, he had made no secret of it; so their conversation before him was less reserved than it otherwise might have been. Consequently he had gathered many months before July 1914 that war was imminent. Like most other Englishmen in Mexico—one might say every other Englishman—he would have known as many years before what was preparing, had he been there. But his chief enlightenment came from Heinrich Henkel, the biggest braggart and bully in the whole of the German colony, which is saying a great deal.

'You say you don't vant to England to go, Don Andrés,' he remarked one day. 'Vould five tousand dollars Americano a year tempt you, mit a first-class passage dere—und back ven you comes?'

'It might. It's two years' pay. What would you want me to do?' asked the ex-soldier.

Henkel lowered his square, closely cropped head, having first glanced over both shoulders. 'Vell, you in der British army vas. Dere's sometings der Kaiser vants to know. You vas der fery man der information to get.'

'Thanks. Where do I get the five thousand dollars?' asked the ex-soldier dryly.

Again Henkel glanced over his shoulders. 'I gives you an order on der Deutsche Bank in New York,' he whispered. 'I vill pay your fare to New York any vays you vant to go. I am der commandant of der Sharman army in sout' Mexico—I you confidential tells.'

'The dickens you are!' rejoined the ex-soldier. 'Didn't know the Germans had an army in Mexico.'

It was in the Club Alemania, and several Britishers were about. Henkel appeared to be very fearful of being overheard. 'Vell, not an army,' he whispered; 'but efery Sharman in Mexico, in Guatemala, and Central America a soldier is, and vat to do vhen der day comes vill know. Der Kaiser vants dis country, Don Andrés, and all dose who help great reward vill haf.'

The ex-soldier laughed. 'Don't you wish you may get it?' he said; adding, 'I'll have to think it over. I'll let you know in a day or two. Five thousand dollars are worth thinking about.'

Not a word did he utter in the club of the extraordinary proposition; but when riding homewards with Christy, an English neighbour and old resident in the district, he told him about it.

'It's nothing new to me,' Christy rejoined. 'I've known what was intended ever since the Boer War. Get one of those fellows drunk, and he'll tell you in your own house that they mean to have Mexico, and turn every American and Britisher out of it. They mean, too, to have Guatemala, Honduras, San Salvador, Nicaragua, Costa Rica, Colombia, Brazil, and the best part of the Argentine; also Peru, Chili, Ecuador, Venezuela, and all the rest of South America, except Patagonia. I've never heard they wanted that. It's not sufficiently in the sun, I reckon. The fellows who come here are not emigrants strictly. They're mostly soldiers, sent here by their Government to get a grip on the country. They don't own the properties they manage—not often, anyway. You're rather a new-comer, or you'd know how they go to work. Get 'em drunk, I say, and you'll soon learn.'

'Do you say none of those fellows own their *fincas?*' asked the ex-soldier, much interested.

'Well, Baron Hammerstein owns his, and so does Henkel,' Christy rejoined. 'I've gathered that the baron's a Prussian general, and Henkel is a colonel, an *ober* something or other. Suppose you're a Mexican planter, and want money for development. It's much the same if you're a Spaniard or an Englishman. You want money. Well, you can get it—practically any amount of it—from Hamburg, on a hard-and-fast mortgage. Your produce all goes to Hamburg for sale, of course, and you have to take the price the produce-merchant says it realises, and pay from 8 to 10 per cent. interest on the money lent you.

'Well, bad seasons come in cycles—two or three together, either poor crops or low prices. That's about the only thing you can be certain sure of in coffee-planting. Second bad year you can't pay your interest, or repay the principal, or the part of it that has fallen due. You're in default, and you're foreclosed on *pronto*, and out comes one of these swashbuckling bounders to kick you off your *finca* and run your show. And you'll find his Government'll interfere *pronto* if you make a fuss; and the Mexican Government'll send soldiers to keep you in order and see you do no damage. Why? I'll tell you why. The money lent on mortgage is German

Government money, mostly. The real mortgagee is the Reichsbank. The produce-merchant you send your coffee to may have an interest, but he 's backed by the Reichsbank. Lord! Why, the German Government has been playing the same game for more than twenty years pretty well all over the world, but particularly here and in Central and South America. There 's plenty of German Government money in the British Colonies also—Australia, New Zealand, Jamaica, Trinidad. Oh, it 's a great game!'

'So it seems,' returned the ex-soldier. 'What do you think Henkel really wants me to do?'

'Go to England as a spy,' said Christy promptly. 'You 'd be a great catch. A deserter from the British army, with an almighty grouch against it, and everything connected with it—a fellow who has been about the world and knows things. Lord—man! Five thousand dollars a year? Why, you 'd be worth five hundred thousand! You 've only to say five thousand isn't enough. Put it up to Henkel and see.'

'I 'll be hanged if I will!' returned the ex-soldier. 'I used to think, if ever I got the chance, I 'd shoot the colonel of the Third Midshires—Malleson, his name was. He made it hot for me every time *he* got a chance. I 've wanted to shoot a colonel—dreamt about it; done it in my dreams. I 'll shoot one now, sure—but he 'll be a German colonel.'

Christy laughed. 'I thought you were English all right,' he said, 'for all your talk. But you don't want to spend the rest of your life in a Mexican prison. Keep quiet. Swallow the insult. Lead the fellow on. Get everything you can out of him, and report to our minister in Mexico City. It might do a bit of good at Home—open their eyes a bit. Lord! they need it, for they 're the blindest bats in all creation.'

They parted at the track—the rocky bed of a mountain stream—which took Christy to the Moctezuma *finca*, and the ex-soldier rode on alone to Bella Vista, very thoughtful. 'Sell the Old Country!' he reflected. 'The dirty swine! If I meet him in a safe place, I 'll risk all the prisons in Mexico—I 've got to kill a colonel, anyway.'

The insult continued to rankle, and the news given him by Christy—all of which he firmly believed—to work in his mind; so that when he chanced to breakfast with a number of Germans, all strangers to him, although he was not altogether a stranger to them, he was quite ready for the inevitable quarrel, but not for the startling information he received. This happened at Tonala, on the Pan-American Railroad, where the ex-soldier had, perforce, stopped on his way to Puerto Mexico on business. As trains did not run on the Pan-American at night, and there were only two trains daily—one up and one down—the train staffs, when the state of the bridges and permanent way permitted, contrived to meet before sunset at Tonala, for the reason that the town possessed an hotel, where the passengers could put up. The ex-soldier was aware that the north-bound train, his own, would leave at nine o'clock, and the south-bound at eight-thirty, and he entered the one and only eating-room at eight. The one and only table was occupied by half-a-dozen unmistakable Germans. There was one vacant place, and he sat down and ordered breakfast.

'Dis is not your breakfast!' immediately exclaimed one of the Germans, a tall, stout fellow with a bristly, upturned moustache. 'Get out!'

'Get out yourself!' retorted the ex-soldier.

'But I say dis is not your breakfast. You an hour haf. Ve haf only half-an-hour. Dere enough breakfast for us is not. So I say again—get out!'

'And I say—go to the devil!' rejoined the ex-soldier, and turned to the waiter. 'Here, *mozo*, bring me eggs and coffee.'

'He vill not,' intervened another of the first-comers, also tall, stout, and bristly. 'Ve know you, Don Andrés—Misder Andrew Martin, if you like better de *verdammlich Englander* name—and soon you out of dis country vill be kicked, mit all de oder Englanders. I someting you don't know tells you, Don Andrés. Der Kaiser's army in Paris is, or close dere. Der English army in France is, whipped and running avay from anoder Kaiser's army. Next week anoder Kaiser's army in London vill be. Den ve your colonies takes and kicks you out all ofer de vorld. Now vill you out get? Dis is our country—efery bit of it. Vill you out get?'

The ex-soldier laid a black, long-barrelled Colt beside his plate. 'No,' he said. 'Tell your lies to somebody else. But I 'll tell you something. If you don't dry up *pronto*, your share of this country will be six feet by two.—*Mozo*, bring me eggs and coffee.'

As none of the would-be inheritors of all the earth seemed to fancy having to put up with such a small part of it, and certainly did not, in accordance with Mexican law, wish to be locked up as witnesses of a killing, Don Andrés was permitted to eat his breakfast without further interference. But he did not continue his journey to Puerto Mexico. He returned to Tapachula by the eight-thirty train, and because there was only one first-class carriage, he travelled with the inheritors, who left him severely alone.

The news had reached Tapachula two days before by cable. A big placard on the wall of the Club Alemania informed all and sundry, including many Spaniards and more Mexicans, that the Germans had invaded Belgium and France, that Britain and Russia had declared war, and a British army had landed in France. Within the Club Alemania there was great

rejoicing, and an equally great consumption of Scotch and rye whiskies and schnapps in honour of *Der Tag*, which had at last arrived.

It was no place for Don Andrés or any other Britisher. On his meeting Christy, the two men went to the house of the British Consul, where all the other Britons in the town had gathered.

(*Continued on page 728.*)

GOOD, GUILELESS GERMANY.

By Sir GEORGE SCOTT, K.C.I.E., Author of *The Burman: His Life and Notions*, &c.

POOR, innocent Germany is being very sadly put upon by the world just now. The Boches cannot convert their cannon-fodder into glycerine and hogwash without being told that it is devil's broth. All their carefully contrived intrigues in Persia, Egypt, South Africa, the United States, India, China, Mexico, Ireland, and where not have failed. Patient persistence for so many years deserved a better fate. One could almost pity them as Burns commiserated 'Nicky Ben.'

Everything was so well and thoroughly planned. There was a young assistant in the firm of Hollweg, Tirpitz, and Company, in Rangoon, who became the father of a baby-boy. The mother was a Burmese woman, and the child was what the office baboo called a 'demi-official infant.' The father called him Fritz, but Ma Pu, the mother, like all Burmese, could not pronounce the letter *f*, so she called him Parit. Before very long she got tired of Boche ways with women, and walked off with Parit and set up as a seller of silks in the bazaar. The father was annoyed at this disregard of discipline; but there are plenty of Burmese girls, so he made no attempt to get her back.

Ma Pu did very well in the bazaar, and before long started business as a rice-broker, and made a lot of money. She sent little Parit to the Government school, and he proved quite a smart little boy. He passed all manner of standards, and went on to the Calcutta examinations, where he got the length of 'failed B.A.,' a distinction which many baboos put on their visiting-cards. Ma Pu now thought that he ought to enter Government service, which is the one idea of all Burmese parents.

She did a good deal of business with Hollweg, Tirpitz, and Company, and saw the father frequently. The Burmese have no prejudices on the subject of conjugal separations, and Parit's father and mother were quite friendly in their relations. Besides, Ma Pu had got very fat. She told him of Parit's school triumphs, and asked the father to get their boy's name entered for the Subordinate Executive service. The young assistant had by this time become head of the firm in Rangoon, and, like all Germans, had a very high opinion of the future of Burma. He was also a very firm believer in Pan-Germanism; so he said that up to now he had done nothing for the education of his son, and he thought it was time he did. He offered to send Parit to Europe to complete his education, and said that when he came back he would be fit for something much better than provincial Government service.

Ma Pu was dead against the proposal; but Parit was delighted, and eventually persuaded his mother to agree. She consented that he should go to England on condition that he did not stay very long, and that he should marry no English wives. In her mind Europe meant England. The father told her it was Germany that Parit was to go to; but Ma Pu thought Germany was a mere district of England, and protested that if Parit was to go at all, he should go to the 'headquarters' place. The agent of Hollweg, Tirpitz, and Company was obliged to settle the question by the promise that the boy should certainly go to the best place.

So Parit was shipped off to Singapore, where he was consigned to the care of a Norddeutscher Lloyd boat, and he got safely to Hamburg. There a clerk from the head-office of Hollweg, Tirpitz, and Company met him, and carried him off to a Moravian school in south Germany. After a couple of years there he was quite fluent in German, but cordially detested the Spartan strictness of the establishment, which he said was no better than a monastery school in Burma.

Therefore he was delighted to hear that his father had come home from Burma and wanted to see him. He lost no time in taking the train to Hamburg, and the first news he got there was that his mother was dead. Ma Pu had been carried off suddenly through eating too many durians, so he was told. Parit's father had taken out letters of administration, and had realised the estate, which amounted to two or three lacs of rupees, and this he had put into the firm of Hollweg, Tirpitz, and Company in Parit's name. He said it was the best investment he knew of. Meanwhile, he said, he wanted to take Parit to Berlin, to get him instructed in matters which would be of great value to the firm—his own firm—and to his country, which, he was now told, was Germany. Parit was inclined to demur at this, because he had found that German boys did not play football, and he had been rather a useful wing-forward at the Government school in Rangoon. However, he concluded that anything was better than going back to the Moravian school; so he

said he was quite ready, and after he had got a new suit of clothes more suitable to his years, he was taken off to Berlin and introduced at the Reptile Department in the Wilhelmstrasse.

There he spent some years learning all the artifices of the system, and having steadily impressed upon him that the British Government was a curse to human society, and especially to Germany. Every now and then, when a rice-steamer came from Rangoon or Maulmain, he was sent to Hamburg to see any Burmese there might be on board. This was intended to keep his knowledge of the language from getting rusty, and to test his capacity for getting information.

Finally, in 1914, he was sent out to begin his work. He had gathered from all he had heard that it was no use trying to spread sedition among the Burmese of Rangoon (which is really not a Burmese town at all) or in the Delta. The only chance was among the natives of India, and there were already several of them in the pay of the Reptile Bureau. He would have to go up-country. He had never been there, and the question was how he was to get there without attracting attention. He came to the conclusion that the best thing to do was to travel as a *pōngyi*, a Buddhist monk. Monks can travel anywhere all over the country at any time, except during the rainy season of Lent, when nobody wants to travel. They have only to say that they are visiting holy shrines, and no further questions are asked. Moreover, they are welcomed and fed everywhere by the pious.

But to figure as a monk it was necessary that he should learn some Pali prayers and rubrics. All he knew were the ordinary formulæ which every Burman learns. So he went off to a big fishing-town in the Delta, entered the first monastery he came to, and said he wanted to become a novitiate. The old abbot was rather interested in him, and was further impressed by his zeal and quickness in learning. Very soon, however, Parit got into disgrace. The monastic rule is that no food can be eaten after midday. Parit was a gross feeder by heritage and German education, and he was discovered by some of the little day-scholars eating corned-beef at dusk in a corner of the curtilage. The abbot was scandalised, imposed penance, and announced that it would greatly delay Parit's promotion from the novitiate.

Parit did not mind this much, but he did object to going without food for two-thirds of the twenty-four hours. So he took to going to the shop of a native of India in the afternoons. He found that this man took in *Ghadr* (*Mutiny*), the organ of the *Bande Mātaram* baboos, which he knew very well to be printed at German expense in San Francisco, and thence despatched all over India, and wherever there were Indian communities. So he cautiously revealed himself, and found that the shopkeeper was in the pay of the Reptile Department, and had travelled a good deal in Indo-China.

The baboo assured him that it was no use trying to preach rebellion among the Burmese of the plains. The hill-tribes were the people to get at, all the more because trouble among them would seriously interfere with the Government of India's military plans if an expedition should have to be undertaken in their very difficult country. He told Parit it was the easiest thing in the world to stir up the tribesmen by denouncing the payment of taxes, and putting the blame for them on British officials. Religious texts, he assured him, were of no use among them. Any sort of gibberish—German, for choice—would pass with them, if it seemed necessary. If he started a rising there it would be very effective; for the tribes could get about very fast in their hills, and a British column would find the foot-tracks quite hopeless for their guns. There were places where even mules could not get about, and, as the Chinese say, a mule can slip with three legs and hold on with the fourth.

The first battle of the Aisne had already been fought, and Parit thought he might as well start at once, all the more because he was sick of the monastery discipline and of memorising Pali collects, which he only partially understood. So he sent off a cipher letter to the Wilhelmstrasse, got the names of some *Bande Mātaram* agents from the shopkeeper, and made a moonlight flitting from the monastery.

He made his way to the Shan States without difficulty. Here and there he met some of the *Ghadr* propagandists and spies, one or two of them treasonous sepoys; but they all told him the work was hopeless in the Shan valleys. The people there were as little likely to rise as the Burmese. So he branched off from main roads and went into the hill-ranges. Even there he had not much success to begin with; but at last he came upon a cluster of villages which were in a state of great indignation. A native of India had made his appearance among them, and had demanded a rupee a head poll-tax for every adult in the village, and had gone away with quite a lot of money. They had protested to the political officer, and were told that the man was not a Government official at all, but was the absconding servant of an officer who had accused him of stealing. They wanted their money back, but were told that was impossible till the culprit was caught, and they were advised to catch him.

Parit found his chance here. He scoffed at the political officer's story, and said that this was just what the 'Great Universal Monarch' was making war on the British for. They had perhaps heard of the war in the West which was then going on. The Great Universal Monarch was fighting the British to put an end to their tyranny and their exactions. What the villagers

ought to do was to join in the fight, and he would show them how to do it. They must begin by forming a league, and then, bit by bit, they would get hold of the whole country, and the Universal Monarch would grant it to them free from taxes for ever. The idea quite appealed to them. They had always been noted as cattle-thieves, and they thought a rising against the British Government would only be a slight extension of that pursuit. As a matter of fact, they began lifting cattle immediately; but Parit incited them to steal guns as well from the Shans in the valleys, and to invite all the villages of their clan to join in the enterprise. The valley-dwellers, he assured them, would join in the rising as soon as it promised success.

The nearest British post was quite a long way off, and news did not travel fast; so before long Parit had quite a considerable band at his disposal. Then he made a more ambitious move. He descended with a big party on the camp of a teak-trader in a gorge at the foot of the hills. The camp was rushed; the staff were massacred; and besides some rifles and shot-guns, he got a considerable supply of dynamite-cartridges, together with the fuses and detonators. Parit explained that with these they would be able to attack the British post, and get a great supply of guns and ammunition, which would bring them supporters from all sides. He set himself to teach some of the more enthusiastic how to use the dynamite-cartridges.

As he expected, the news of the murder of the teak-traders brought out a party of military police. According to the incorrigible British habit, there were not many of them, and they were ambuscaded on their way up the narrow foot-track that led into the hills, and were beaten back. Parit made preparations to meet the stronger force which he was sure would come. He fixed places where men were to lie in wait for the attackers, and stationed among them those who had been practising with the captured rifles and shot-guns. He himself, with two others, took his stand well down the hill, over a narrow ravine along which the sepoys must come, and scouts were sent out to warn him of their approach. The main body, armed with cheek-guns and crossbows, and other miscellaneous weapons, remained behind, ready to join in the pursuit which Parit promised them. They had been largely reinforced by men from other villages attracted by prospects of plunder. Parit told them that success in this fight meant the immediate rising of the whole of the hills, and recruits from a great many of the valley villages. The end of the tyrannical British Government was at hand, and the Great Universal Monarch would richly reward them.

A party of about a hundred sepoys was reported. They camped for the night about a mile from the foot of the hill, and with the first dawn started the ascent. About a thousand feet up they came to the gully over which Parit was posted. Flanking-parties were impossible. Parit let the advanced guard pass, and then lighted the fuse and threw the dynamite-cartridge on the main body. There was a deafening report. The man on Parit's right, who had instructions to light the fuse of another cartridge to be handed to Parit, was so startled that he let it drop, lighted, on the small pile of cartridges. Parit was too late to snatch it away, and he and his companions were blown to atoms.

It is uncertain whether the Reptile Department in the Wilhelmstrasse ever heard what became of their promising Burma recruit; but they were extremely annoyed that a most carefully planned scheme should have failed. They had expected a costly and troublesome frontier war, and hoped that it would stir up the baboos. After a decent interval, they put *verunglückt* after Parit's name in the register. About the same time Parit's father heard that the mills and premises of Hollweg, Tirpitz, and Company had been sold. He got a steam-organ to play the *Hassgesang* opposite his office in Hamburg for four hours every day.

JOHN PARDON'S CHOICE.

A LITTLE ROMANCE OF THE FAR WEST.

By Mrs W. F. Irvine Bell, Author of *Ole Cam'ron*, &c.

CHAPTER VIII.

SUMMER with its brazen skies of blue, and earth baked to brownness, waned to autumn, until one morning in late September which found John Pardon, under the shade of some tall oaks, busily greasing the axles of his wagon-wheels, preparatory to hauling the Powells' winter supply of wood. The last wheel set, he was jauntily whistling, as was his habit at the finish of any tiresome piece of work, when his solo was disturbed by the clatter of a horse, and, looking round, he saw Bob Powell's black mare, flecked with foam, and Bob himself riding with white, set face. Pardon's instant thought was of Joy, and for the moment his heart stood still with nameless dread; but as young Powell pulled up his dripping horse, his friend had recovered himself and was at his side.

'Hello, Bobby!' he cried; 'you 've sure bin *goin'* some; and you 're lookin' tired, boy. This blessed old sun is pretty hot still for all it 's most

October. Leave your hoss to cool a bit, and come inside, won't you?'

'No, thanks, Pardon. I'm going straight back,' said Powell. 'The fact is, we've had bad news from home. My father is dead, and they've cabled for me to come at once; but, of course, I had to see you first.'

The Powells going back to the Old Country! For an instant everything whirled before Pardon's eyes, and he caught at Bob's saddle-horn.

'I say, Pardon, you aren't well yourself! What a selfish brute I am to keep you standing in this sun!' exclaimed Bob. 'Here—I'll tie "Meg" and come in for a moment; but I mustn't stop long, as there is lots for Miss Joy and me to do before I start.'

They entered the kitchen, and Pardon motioned Bob to a chair; but the young man, mechanically taking out his tobacco and rolling a cigarette, said hurriedly, not looking at Pardon, 'Pardon, I hate like anything to have to go; but I must. And I only hope it won't be long before I am back again. You've been such a good friend to us both that—that I'm going to ask whether you won't stand by Miss Joy, and help to fill the breach until I return.'

'Stand by Miss Joy! Why, what d'ye mean, boy? Ain't she goin' with you?' exclaimed John Pardon in amazement, while a storm of contending emotions raged within him.

Powell took a quick turn up and down the room, saying, with a gesture of hopelessness, 'No—that's just it; she's determined to stay here; and I suppose she's right in one way, though it seems all wrong in another. You see, if we both go it means sacrificing all our things here—and, of course, I expect to come back. Joy says it would be an awfully expensive journey for both of us, and now that my father is dead, and my brother Dick comes in for the property, there won't be much coming to Joy and me. No fault of Dick's,' he added hastily, taking another turn up and down the floor. 'I've said all I can to Joy, but she is quite determined; and so I thought'—— He broke off as Pardon, jumping up, laid his two great hands on the younger man's slight shoulders.

'That's all right, sonny. Don't you worry. I'll be proud to look after Miss Joy,' he said heartily; 'and, please the Good Man, we'll have you back again before the snow flies. Not that we're much troubled with them kind o' flies *here*,' he added jokingly, striving to infuse a note of cheerfulness into his voice. 'But it's awful sudden-like. When are ye startin'?'

'To-morrow,' replied Powell. 'Perhaps you could come up and be there when I leave—if it's not asking too much.'

'Not the least bit in the world, boy. I'll be there,' was Pardon's answer, as he untied Bob's horse. Then, as the two sped down the lane, he stood watching the vanishing figure, while a flood of wild thoughts raced through his brain. At length he turned slowly away from the gate, his strong face set and very pale. 'I reckon the boy can trust me—so help me God,' he said, instinctively removing his hat.

The next day found him bright and early at the Powells' ranch, unobtrusively but diligently helping the brother and sister to prepare for the sudden hard parting, his steady cheerfulness buoying up their own spirits, and his quick hands relieving them of many a usual household task. Then, when the last moment came, and Joy, her great blue eyes swimming in tears, though the brave lips strove to smile, clung to the dogs' collars lest they should attempt to follow their adored master on his long, long journey, it was John Pardon who, having slipped out of sight till the parting was over, presently reappeared with a cup and saucer and a pot of steaming tea in one big hand, and, gripped in the other, a plate and an array of cakes.

'Now, Miss Joy,' he cried, 'you just let them hounds loose, and come and have a cup o' tea. You've never tasted any tea o' my makin', and I'm a grand cook, you know!'

So poor Joy, fearful of hurting his feelings, resolutely gulped down the tea and made pretence of eating a cake, though Pardon's watchful eye noted how close to her hand were the moist noses of two greedy dogs.

Afterwards Pardon insisted that Joy should go for a walk, saying, 'It'll do you good, Miss Joy. And I'll do them dishes and feed the chickens, and stay till you come back;' and Joy, turning quickly towards him, her fair face paler than its wont, but lit up with gratitude, said impulsively, 'Bob and I can never repay you for all your goodness, John Pardon!'

'Repay? Repay the devil!' was John's unexpectedly gruff reply.

CHAPTER IX.

CHRISTMAS had come and gone—a Christmas which, in that wonderful climate, Joy Powell, in delighted astonishment, had been able to spend astride of her gray mare, among those evergreen foot-hills, the dogs panting beside her in radiant sunshine, and the only suggestion of Yuletide being the sprig of so-called 'holly' in the front of her light cotton blouse. The rainy season was due with its sombre skies and soaking rains, but although ranchers and herdsmen watched with anxious eyes for the dark clouds upon which depended grass for cattle and meat for man, to Joy, living alone in the old bungalow and bravely trying to carry on until her brother's return, the bright, warm weather, with its treacherously early dawnings of spring, was the greatest help and comfort. So, while John Pardon and Joe Patrick shook their heads over leaf and bud already 'crowding to be born,' and daily measured the water-supply in well and creek, Joy, with the

tears shining in her eyes, but with a happy thrill at her heart, gathered the first wild cyclamen to send in a letter to Bob—to Bob, still all those weary thousands of miles away from the golden-haired girl so pluckily 'holding down' the ranch. For in Bob's case, as so often in the affairs of 'mice and men,' plans had miscarried, and his return to his Western home had been postponed from month to month. His father's estate, heavily embarrassed, took long to settle, and as Joy's as well as his own future interests depended upon his presence, he had no choice but to wait with what patience he could command, while executors and lawyers, trustees and legatees, agreed or disagreed. To John Pardon he wrote from time to time—short, ineffusive letters, but between the lines the man upon whom had been laid so great a charge could read deep gratitude and an absolute trust; and as the slow weeks slipped away the girl herself came to depend more and more not only upon her rough friend's ungrudging devotion of time and labour, but also upon his unfailing good spirits and chivalry.

Rain or shine, wet or wind, John Pardon duly arrived at the Powells' ranch, resolutely crushing down the passionate longing to seize the girl's slight figure in his arms—ever on guard not by word or look to reveal his feelings or shake the happy confidence with which she admitted him into the full measure of her home life and of her longing for her brother's return. Yet, in spite of his heroic self-control, and the girl's own sweet dignity and trustfulness, the 'little more' that in an instant so completely spans the gulf between friendship and love was fated to happen in the lives of these two, and it was on this wise.

Pardon, on reaching home late one afternoon, found Joe Patrick awaiting him to ask whether he would haul out from Orangeville the next day some sacks of seed for the spring sowing. Nor, though his thoughts flew at once to the prospect of Joy Powell being without his help all day, could he very well refuse. But after his live-stock were fed and his own supper was disposed of, he tidied himself and swung off across the hills to the Powells' ranch—'to let the little girl know,' he said to himself, and see whether there was any errand he could do for her in town. The nights were still cold enough for the log-fire in the Powells' big living-room to be acceptable, although, as usual, the door on to the veranda stood open. Pardon came up the steps, announcing his approach by whistling a tune (for the dogs no longer barked at sound of his step), and pausing on the threshold, he discovered Joy perched on a low stool before the fire, gazing dreamily into the glowing logs, her small pointed chin propped in one hand, while the other held a much-crumpled handkerchief, which, at sight of Pardon, she quickly hid, turning her face with a bright smile of welcome. The firelight, playing upon her hair and darting little shadows over her flushed cheeks, made her look very sweet and beguiling, cuddled up on the low stool. Half-laughing, she stretched out a deprecating hand, saying, 'Oh, Pardon, is that you? Do come in. See how *lazy* I am to-night!'

Carried away by a rush of feeling—scarcely realising what he did—the man strode towards her, and seizing the slender white hand, covered it in his own coarse palms. 'Miss Joy—my dear little girl—you've been cryin'! Tell me what's the matter, dear. You know I'd do anythin' in the world to help you, little darlin'!' He stood bending over her, pressing the captured hand against his rough woollen jersey. Now trembled in the balance, so delicately poised, the honour and happiness of this man and woman, whom darkness and the wide wilderness enwrapped, and the loneliness of whose lives had drawn thus strangely together. A good man and a strong was John Pardon, but love can be a cruel master, and he had suffered long and been sorely tried. Must he be for ever a slave to conscience, nor ever take the cup of happiness for which his whole being cried out?

Then rose gloriously to his succour the sweet, sound nature and blue blood of this slip of a girl for whose sake he would willingly have sacrificed his soul. Not even attempting to withdraw the hand which trembled in his, but letting it lie quietly on Pardon's breast, Joy Powell, though her heart beat furiously and the colour fled from her face, said very softly but steadily, 'Thank you, Pardon. Indeed I *know* that no one in the world has so splendid a friend as have Bob and I in you. Without you I couldn't possibly have carried on all these long, sad months—and it is very silly of me to cry.'

Silence, broken only by the snapping of the burning logs and the heavy breathing of the man, reigned in the dusky room, but slowly his strong fingers relaxed their hold on the poor little shaking hand. But Joy, suddenly tightening her grasp, as though to assist in raising herself from the low stool, stood up, and for the fraction of a second, while a swift blush mounted from chin to brow, bravely and unflinchingly met his eyes. Then, turning quickly, as the heavy end of a burnt stick fell upon the hearth, she dropped on her knees, and, seizing the iron claws, began clutching at the smoking faggot. 'Oh—oo—it *is* hot!' she cried, laughing lightly. 'Do come to my rescue, please, Pardon. Here are the tongs;' and she retreated, making-believe to rub the hot places on her hands. Then, tactfully trying to give the man further time to recover himself, she chattered on. 'I'm so glad you happened to come back to-night, because I quite forgot to give you something nice that I made to-day;' and she hurried away to the larder, the dogs clumping after her. Returning in a few moments with a spicy-smelling parcel, she said, 'Here are some buns, made after an old English recipe. Perhaps you would like to share them with Michael O'Keefe—and this bundle of English papers. But won't

you sit down, Pardon?' she added kindly, but in a voice that to the man's sensitive ear betrayed the effort it cost her; nor did he fail to notice how she steadied herself against the mantelshelf, as though a great weariness possessed her.

Ever quick to understand another's suffering, John Pardon's better self at once regained its poise; so, controlling his voice and resuming his usual manner, he rapidly explained the reason of his late visit. 'So, Miss Joy,' he concluded, 'if there bain't nothin' you kin think of that you're wantin' from town to-morrer, I'd best be sayin' good-night—must pull out early in the mornin'.' At the door he turned again. 'God bless you, Miss Joy!' he said in a voice tense with feeling, then hastened away and out of the gate.

For a moment the girl stood listening to his retreating footsteps, then suddenly flung herself down on the black bearskin before the ruddy fire, and burying her face in the collie's soft white ruff, burst into an agony of tears. 'Oh Bob, Bob—come home!' she sobbed. 'It is more than I can bear.' No answer; only the whisper of the night wind in the encircling pine-trees, and a low whimper of the dog, distressed because of his beloved mistress's distress.

Outside in the darkness, stumbling along the rough short cut he was following, scarce heeding his steps, so deep in an abyss of conflicting thoughts was he, John Pardon was suddenly roused by a gleam of light among the trees in the direction of the Patricks' ranch. The accusing thought rose in his mind that never in all these years had he, on the eve of a trip into Orangeville, failed to ask Mary whether she had any commissions for him. Struggling between disinclination and the claims of long-established habit, he turned his steps sharply in the direction of the light, and soon reached the Patricks' home. Forcing his lips to the customary whistle, he knocked at the door, at the same time calling cheerily, 'Anybody home?' as Mary, lamp in hand, came to open it. 'No, thank ye, Mary; I bain't comin' in,' he said, as she motioned him to the kitchen. 'Just stepped round to see if there's anythin' you want from town to-morrer. Joe'll likely have told you I'm haulin' some stuff over for him.'

'Come in, John! What's your hurry? 'Tain't late,' said Mary. 'No? Well, I guess I don't want anything this time. But, my word!' she suddenly exclaimed, 'you're awfully white and scared-looking! Aren't you well?'

At this Pardon, making a great effort, and taking the lamp from Mary's hand, said, 'Oh, there bain't nothin' wrong with me, Mary. I'll come in for a bit,' and followed her to the cosy kitchen.

'Still working over to Powells'?' Mary questioned. 'When's that young man coming back? Seems to me it's kind of queer his leaving that girl there alone all this time.'

Pardon, in spite of himself, felt himself flushing hotly—felt, too, that Mary was observing him closely. For Joy's sake he must not betray the sweet secret in his heart, which he now felt to be dearer than life itself. And in his anxiety to avoid further catechising from Mary, he committed a man's mistake by rising abruptly and reaching for his hat. 'Oh, I reckon he'll be along in the spring,' he said carelessly, and making for the door. 'Well, Mary, I guess I'll mosey along home. Sure there's nothin' I kin do for you in the shoppin' line? No? Well, then, good-night;' and passing out, he quickly disappeared up the garden path.

For some seconds Mary Patrick, lamp in hand, stood staring into the darkness. Then, with knitted brows, and a half-bewildered, half-angry expression in her eyes, she closed the door, and suddenly feeling strangely tired and old, climbed the stairs to her bedroom. John Pardon had forgotten—yes, *forgotten*—to put to her the old, old question at leave-taking, and Mary, with a woman's unerring instinct, had guessed *why*.

(*Continued on page 723.*)

SANDS FOR GLASS-MAKING.

By Arthur L. Leach, Secretary of the Geologists' Association.

BEFORE the war, when British glass-makers drew their supplies of sands from abroad, large and regular shipments were made at cheap rates from France, Holland, and Belgium. From Fontainebleau, near Paris, came a beautiful white sand, highly prized by manufacturers of camera and telescope lenses and of the best table-ware. Holland and Belgium exported sand suitable for the production of common sheet-glass and bottle-glass. This came frequently as ballast, the cost upon delivery in this country varying, in pre-war days, from four shillings to sixteen shillings per ton. Fontainebleau sand, shipped at Rouen, and delivered in east coast ports at about ten shillings per ton, was worth twenty shillings to thirty shillings per ton in English glass-making districts. Since 1914 difficulties of freight and labour have raised the prices of Continental sands to three or even four times their pre-war values, and rendered supplies not only abnormally expensive, but irregular in amount and delivery. The cessation of imports of lenses and prisms from Germany made an increased home production of high quality optical glass essential. Thence arose a demand for substitutes for the foreign sands which hitherto had held the market.

In this country fortunately, even before the

war, a beginning had been made in the systematic examination of British sands with a view to testing their constituents and degrees of fineness by scientific methods. The ground being thus to some extent prepared, the consideration of British sands from the point of view of their suitability for glass-making appeared to afford an opportunity of linking scientific research with industrial needs. Investigations were carried on with the support of the Imperial College of Science and Technology, aided later by the Ministry of Munitions; and the publication of Dr P. G. H. Boswell's memoir on the result of his work marks a new, practically a first, stage in the study of British deposits available as substitutes for foreign glass-sands.

Let us consider briefly the raw materials required by the glass-manufacturers. Very obvious differences appear between the dull green or brown glasses used for bottles and the clear, lustrous 'crystal' of lenses and cut-glass table-ware. Colour roughly indicates the presence of certain constituents, permissible in coarse bottle-glass, but highly injurious in glass for optical purposes. All varieties of glass contain silica (oxide of silicon), known as quartz when in the form of translucent six-sided crystals. In addition to the silica certain special ingredients are required—namely, potash and red-lead in 'flint'-glass, and the carbonates of soda and lime in sheet-glass; common bottle-glass may contain salt (in place of soda), crushed felspar, limestone, fusible slags, &c. The bulkiest constituent, silica, is used in the form of sand, 52 to 65 per cent. by weight, calculated quantities of alkalies, powdered limestone, red-lead, &c. being added according to the kind of glass. As with metals, small percentages of undesirable substances—for example, iron oxides—may seriously affect the quality of the final product. Sands for common window-glass may contain one or more per cent. of iron oxide, but a far smaller proportion would quite destroy the transparency and refractive powers of optical glass. The quality of the sand being all-important, it is necessary to ascertain exactly what are the properties or constituents which cause certain sands to be in great demand for the choicest glass-wares, while other deposits are valueless even for the coarsest bottle-glass. Such inquiries are bound up with the development of the glass industry, and must precede the search for new supplies of sands.

What, in brief, is sand? Like many familiar substances, it is easy to recognise and yet difficult to define. Its chief constituent, quartz, in hard angular grains, causes a peculiar grittiness; but no sand consists wholly of quartz particles. Even the purest quartz sands, those of Lippe in Saxony and of Fontainebleau, contain small proportions—sometimes less than ·03 per cent.—of other minerals. Ordinary sands dug from inland sand-pits in many geological formations are often vividly stained by iron oxides and stiffened by fine clay or chalky silt. A pinch of beach-sand may be quite a little museum of minute mineral specimens, oxides of iron and aluminium, heavy grains of rutile, tourmaline, zircon, and other silicates being present in addition to the quartz. Moreover, sand grains vary greatly in size and shape, not only in different localities, but in samples from the same pit. Why does the manufacturer choose one kind of sand for cut-glass table-ware, and reject as only suitable for coarse bottle-glass another sand which to the uninstructed may appear almost indistinguishable from the former? Methods of selection based on experience, however extensive, and mere 'rule of thumb' have obvious disadvantages, especially when new supplies of material must be sought. Clearly, if the essential qualities of a good glass-sand can be stated, the quest for substitutes will be facilitated.

To ascertain exactly the characteristics of sands, three analyses have been found necessary—namely, (1) chemical, to measure the actual quantities of iron, silica, carbon, &c. in a sample; (2) mineral, to isolate the various minerals—for example, quartz, felspar, alumina, &c.; (3) mechanical, to test the grade or average size of the sand grains.

Chemical analysis needs no further reference, but special methods of great interest have been developed to complete the analytical processes. Thus, by treating sands with certain liquids of high specific gravity—for example, bromoform, in which zircon and other heavy minerals sink, while the lighter quartz particles float—the dense silicates can be abstracted and estimated in bulk. For the mechanical analysis, streams of water regulated to different velocities, and passed through elutriation apparatus, carry away successively the fine, medium, and large grains, which can then be graded according to size.

From long series of such analyses the qualities possessed by typical sands used for many kinds of glass can now be stated. A thoroughly good sand should contain at least 98 per cent. of quartz; it should be free from clay, calcareous particles, and grains of heavy silicates; not more than a minute amount of iron (·04 per cent.) should be present.

To facilitate even and complete melting of the materials, the grains should be nearly uniform in size, and 70 per cent. at least should be particles of medium grade—that is, between ·01 and ·02 inch in diameter. For the very best glass a larger percentage of silica (99·5 per cent.) and a higher degree of evenness in grain may be essential. Good sheet and window glass may be made from sand containing upwards of 1·0 per cent. of iron oxide; and the standard of purity for green and brown bottle-glass is considerably lower; but even for these, uniformity of grain is highly desirable.

It is somewhat disappointing to find that, judged by these standards, no large reserves of British sands appear to be available of such uniform excellence as the pure quartz sands of Lippe and Fontainebleau. Small quantities of selected sands from Aylesbury and other localities are nearly, if not quite, equal to Fontainebleau sand, and quite suitable for high quality glass. Excellent optical glass has even been made during the past year from British sands; but if any large deposits of first-class sands exist, they have yet to be discovered.

Good sands, quite equal to those formerly imported from Belgium, and suitable for making window-glass, white bottles, laboratory-ware, lamp-chimneys, &c., exist in plenty at Aylesbury, Huttons Ambo in Yorkshire, Godstone and Reigate in Surrey, Leighton-Buzzard, Lynn, and elsewhere. For the cheaper varieties of dark bottle-glass, abundant supplies are available and are worked at Charlton and Rochester in Kent, in addition to the localities mentioned above. From the geological point of view, it may be noted that the best British glass-sands are associated with the formation known as Lower Greensand, as at Reigate, Leighton-Buzzard, and Lynn. Sands long worked for window-glass near St Helens in Lancashire belong to the Glacial Drift, and fairly pure deposits of similar character exist in the Kames of Carstairs, in Lanarkshire. A sand much used in the bottle-industry of Belfast and Dublin is obtained by crushing a soft sandstone in the Keuper Waterstones at Spital in Cheshire.

It should be evident that British resources of sand for glass-making are capable of great development. Supplies of the best sand from Lippe cannot be anticipated in the near future, and even those of Fontainebleau may not be so freely available as in the past. The British Empire probably contains vast undeveloped stores of most valuable glass-sands which might provide home industries with materials for the finest optical glass, thus remedying the deficiency which seems to exist in these islands. Manufacturers have now before them methods of testing sands, and recording the results in consistent schemes, which in the hands of skilled chemists would ensure the purity of consignments from well-known sources and permit thorough examination of proffered substitutes. Investigation and development of resources should render the Empire independent of external supplies. Therein lies the value of the precise methods of testing sands developed at the Imperial College of Science and Technology.

MR TEACHILD'S TRANSFORMATION.

By B. Paul Neuman.

I.

'OLD T.,' an irreverent pupil, now a K.C., had once named him, and the name had become a tradition of the pupil-room, as much part of it as the dust that lay thick on the windows, or the smell of damp leather that clung lovingly round the bookshelves. On the board at the entrance in Stone Buildings he appeared as 'Mr Teachild,' and it was characteristic that his line was the darkest and dingiest of the lot.

Yet, as a matter of fact, he was hardly more than middle-aged—forty-eight, to be precise. But the tall, lean figure, the bald head, the grizzled beard, the spectacled eyes, and the stooping shoulders, all seemed to suggest a bygone generation. As if these suggestions of age were not sufficient, his dress, which never varied in cut or colour, supported them. A long, dusty-gray frock-coat, a vest of the same sad hue, and black trousers—it was wonderful that any self-respecting tailor could be found to supply, year by year, such poor advertisements of his skill. The finishing touch was given by the big 'Gladstone' collar, and the black silk scarf tied in a stiff bow.

With these outward indications the habits and temperament of the man seemed quite in accord. Even as a child he had been prematurely old. Circumstances, no doubt, had a good deal to do with it. His father and mother had died while he was still in the nursery, and he had been brought up by an austere spinster aunt, one of whose many peculiarities was a great horror of schools. The boy's education was committed to the care of an ancient clergyman, who took snuff and used the cane with about equal liberality. But he was a good scholar, and at seventeen Martin was already quite a prodigy of learning. His father had destined him for the law, and as his aunt lived in Bloomsbury, he was sent to University College, where his career was highly creditable, if not exactly brilliant. He took his B.A. and M.A. with considerable distinction, and then entered at Lincoln's Inn.

In the year of his call to the Bar his aunt died, leaving him a modest fortune of about a hundred and fifty pounds a year. From the first it was evident that conveyancing would be his line, and the famous John Rutters, with whom he read in chambers, not only prophesied distinction for him, but helped to fulfil the prophecy by putting work in his way. The young man's father had been a solicitor, and his old firm soon showed that they had not forgotten the connection. Slowly but steadily his practice

grew, his pupil-room filled, and by the time he was forty he held an assured position as one of the leading conveyancers in Lincoln's Inn.

II.

Since the death of his aunt Martin Teachild had contributed to the directories only two addresses, a fact of which he was rather absurdly proud. One was in Stone Buildings, where he received his clients; the other was in Church Row, Hampstead. His chambers were on the third floor, a choice originally prompted by motives of economy. Within a few years he could easily have afforded a descent to the second floor, or even to the first. But wherever he once established himself, he took root, and the very idea of a change was abhorrent to him.

It was just the same with his private address. When he started housekeeping for himself he had taken two empty rooms on the first floor of a pleasant, old-fashioned house in Church Row. He was fond of solitary walks, and—except on Bank holidays—the famous Heath appealed to him strongly. His landlord, a German waiter named Wegler, had saved some money, which he invested, partly in an English cook, whom he made Mrs Wegler, and partly in a lease of the house, which the shrewd and thrifty couple proposed to let to eligible tenants. The two rooms taken by Mr Teachild were large and pleasant, and he furnished them with the best and most ancient of his aunt's belongings. He paid a pound a week, and Mrs Wegler acted as his housekeeper. Every Thursday evening (he had gone in on a Thursday) with his dinner she brought in the rent-book and the tradesmen's books. Two hours and a half later she carried away on the supper-tray the little pile of books, each with its right amount of cash inside it, for it was one of his peculiarities that he never paid by cheque when he could help it.

When he had occupied the rooms nearly three years, Mr Wegler represented to him, with many flourishes and apologies, that, the superior landlord having cruelly and wickedly raised the rent on renewing the lease, he was, though with endless sorrow, obliged to make the two rooms yield a higher contribution.

'How much do you want me to pay?' asked Mr Teachild.

Wegler rubbed his hands together softly, and almost whispered that he thought perhaps, under the unfortunate circumstances, twenty-five——

'Very well,' said Mr Teachild; 'twenty-five let it be.'

Whereupon Wegler went down to the wife of his bosom and lamented that he had not said twenty-seven and six. Still, as the rise in his own rent had been only five pounds a year, and as there were two or three other tenants to be exploited, he was not really dissatisfied.

As time went on, the rent of the first floor rooms was raised, on one pretext or another, till it reached thirty-five shillings a week.

'He'll pay anything sooner than quit,' said Wegler to his wife.

'Don't push him too far,' she counselled. 'Where should we be without his money?'

'There's fish as good in the zea,' he quoted; but he knew well enough that the specimen they had landed was an unusually fine one.

III.

For a good many years Mr and Mrs Wegler did all the work of the house themselves, with only occasional help; but as time went by, and their income increased, they began to take life a little more easily. First of all, they had a boy regularly to clean the boots and knives. Then a girl fresh from school took his place, to be trained by Mrs Wegler in the domesticities. When she left to better herself—not a difficult matter—her successor was an elderly widow with a slight limp and a chronic sniff. These changes were gall and wormwood to Mr Teachild, and when the widow gave notice he showed a spirit that astonished and dismayed his landlord.

'Wegler,' he said, 'I'm not going to stand this sort of thing. I've been here more than twenty years, not so much because it's a particularly attractive house, but because I particularly dislike change. But change inside is just as bad as change outside, and I'm tired of seeing a new face every six months. I know why you get raw children and poor worn-out women; it's because they are cheap. Now I know, and you know, that I pay you just about twice as much as the rooms are worth—no, I have not finished yet—and I think I am entitled to decent and regular attendance. Still, as I said, I dislike change, and I am willing to pay you twenty pounds a year more if you will get a competent person to help Mrs Wegler in the house-work; get her, and keep her, mind. If she leaves without my approval, I shall leave too. That is all I have to say.'

Wegler was thoroughly frightened. 'I'm sure, zare,' he stammered, 'I'm very, very zorry. I know you to be always most liberal, but my landlord is a most unreasonable man. It quite cuts the gold off the gingerbread.'

'Never mind about that. What do you say to my offer? You had better talk it over with Mrs Wegler.'

'Oh zare, there is no need. We will do exactly as you wish.'

'Very well, then; get some one, as soon as you can, and do not let us have any more changes.'

When Mrs Wegler heard the news, her first remark naturally was, 'There! What did I tell you? I always knew he had it in him to be nasty.' The twenty pounds, however, brought out a broad smile on her face.

'Our luck's in, after all, Carl,' she exclaimed.

'I've just had a letter from Cousin Grace at Folkestone. A great friend of hers has died, leaving a girl of nineteen. She was being trained for a teacher, but there 's no money, and she 'll have to do something else for a living. Grace asks me if I know of a place where this girl could get some training in domestic work, so that later on she might go somewhere as housekeeper. It 'd be the very thing. We could give her board and lodging, and there 's not much in the way of housekeeping that we couldn't teach her. And we might offer her a pound a month. We wouldn't call it wages, because, from what Grace says, she 's a superior sort of girl; but we could make the arrangement a friendly one, and call it pocket-money.'

'It zounds good,' said her husband, 'but we couldn't keep her on those terms, and there are to be no more changes, he zays.'

'We could afford to raise her pocket-money for a year or two, at any rate, and one never knows what may happen. Even then, we should be getting the work done for next to nothing.'

Mr Wegler rubbed his hands. 'Good business, that,' he said.

IV.

A week later, when Mr Teachild came from his bedroom to the sitting-room for breakfast, he found his *Times* drying in front of the fire. It was a wet morning, and, under such conditions, the paper was often disgustingly damp. In fact, he had often been obliged to dry it himself. Of course, he could have asked the Weglers to do it for him, but that was not his way.

As the clock struck a quarter to eight there came a knock at the door. Mr Teachild, standing with his back to the fire and the *Times* in his hand, said, 'Come in.' Whereupon the door opened, and, instead of Mr or Mrs Wegler, a young woman entered.

Mr Teachild was ridiculously shy of the other sex, and the instant he saw the strange face he turned round to the glass. There, however, he met her eyes, and immediately, in great confusion, dropped the paper, and, seizing the poker, began a most unnecessary assault on the fire.

'Good-morning, sir,' said the new-comer, and, even in his confusion, he noticed that her voice was refined and very pleasant. But his shyness made his answer unintentionally gruff.

She set the things on the table, and then looked over them. 'Is that how you like them, sir?' she asked.

He turned from the fire and looked critically at the table. 'Not quite,' he said. 'I like the toast on the left side, and the teapot on the right. Then I can lean the paper against it, and get the light from the window.'

'I see,' she answered, with a little nod and a smile. 'I won't forget—sir.'

He noticed the pause before the last word. For the first time in many years, he omitted to prop the paper against the teapot, though he had just been insisting on the importance of the ritual. In his surreptitious glances through the glass he had noticed a good deal. The girl had a pleasant face; nay, she was certainly what people commonly called pretty. She did not wear either cap or apron. Her voice made it quite a pleasure to have a few words with her. If it was she who had dried the *Times*—and it could hardly have been any one else—that spoke volumes in her favour. New brooms swept clean, no doubt; but this was certainly a very good-looking broom.

The cleaning of Mr Teachild's sitting-room had always been a sore point. It was done once a fortnight, and it took him two evenings at least to replace his books in their proper order. The Friday after the new arrival was cleaning-day, and as soon as dinner was over he got up to begin the weary business of rehabilitation. To his amazement, there was nothing for him to do. Every book was in its proper place, the long lines without a single break. Yet the books had evidently been dusted and cleaned with scrupulous care; he took out half-a-dozen and examined them. 'Wonderful!' he said to himself. 'If only it lasts.' But he shook his head. It was really too much to hope for.

V.

The days and the weeks and the months went by, and Mr Teachild's doubts melted away. Beyond all question, Norah—that was the new girl's name—was a wonder and a treasure. There was not one of his little fads and fancies that she ever forgot. Sometimes he almost wished that she would forget, and give him the opportunity of showing that he was not the crusty old curmudgeon he began to be afraid he must appear.

By this time he was quite at his ease with her, and had even begun to consult her on matters of high importance.

'Norah,' he said one morning, speaking with a certain air of determination and effort, which was not lost upon her, 'I want to ask your opinion, and I wish you to be quite frank, and tell me the exact truth.'

'Yes, sir,' she answered, putting down the tray that she was just about to carry out of the room.

'These collars that I am in the habit of wearing—they are old-fashioned, I know. Do they make me look very eccentric and old?'

She considered for a minute. 'I think they 're rather picturesque,' she answered. 'But they do make you look different from other people, and I 'm sure they add on ten years to your age.'

'Thank you, Norah,' he said. 'That is exactly what I wanted to know.'

A few days afterwards he gave the Weglers the surprise of their lives by appearing in turn-down collars.

'I would not have believed it,' declared Mr Wegler, 'if I had not seen it with mine own eyes.'

'If it had been any one but Mr T.,' said his wife, 'I should have said he'd fallen in love.'

Norah smiled and held her tongue.

One evening, a few weeks later, when she brought in his supper, she found him with a couple of tailors' pattern-books before him on the table. 'Norah,' he said, 'I believe you have very good taste. For the last twenty years or more I have always had exactly the same cloth for my suits—the same colour and pattern, I mean.'

Norah stooped to a double atrocity; she giggled and punned. 'I suppose lawsuits are very much alike,' she remarked.

Mr Teachild looked up in quick surprise. Then, as the full extent of the outrage dawned upon him, his face relaxed into a smile, which was followed by a hearty, almost boyish, laugh.

'Law suits—lawsuits,' he chuckled. 'Very good, very good. Well, I was going to say that I think perhaps a change might be desirable. I want you to tell me which of these you fancy.'

'I'll do my best, sir,' she said, with the smile that he was now always trying to provoke, and bent her head over the patterns, and held them to the light, and at a little distance; while he stood behind her, looking at her hair and her lithe young figure a good deal more than at the cloth. 'I like these two the best,' she said at last. 'I don't think there's anything to choose between them.'

'Turn down the corners of both, then, my dear,' he replied, and, the moment the words were out of his mouth, seized the poker and set to work on the fire.

When, a fortnight later, Mr Teachild came from his bedroom arrayed in a beautifully cut morning coat and vest, with trousers that hung without a wrinkle, Mrs Wegler, who was the first to see the apparition, hurried downstairs.

'Carl!' she cried to her astonished husband, 'what *has* come to Mr T.? First the collars, and now he's dressed like a fashion-plate. It must mean something. Why, he looks younger than we do.'

'I only hope he will not make of himzelf a fool,' answered her husband, shaking his head.

'We'd better make our hay as fast as we can,' said Mrs Wegler.

VI.

Norah was certainly a pretty girl, and as shrewd and clever as she was pretty. Before she had been a week in Church Row she had taken the measure of the Weglers. But she was alone in the world and almost friendless, and she was only just beginning to recover from the blow that had robbed her at once of her mother and of the work she loved. So, whatever the disagreeables of her new position, she determined to put up with them for a time, and earn her 'pocket-money,' and learn all that she could.

From the first she had taken to Mr Teachild. The Weglers did not trouble to hide their contempt for the simplicity upon which they imposed and fattened. The tradesmen's books, which he paid without a murmur, covered half their housekeeping as well as his own, while the demands made upon him under cover of the landlord's name could hardly, one would have thought, have deceived a child. But beneath the apparent simplicity and the obvious eccentricities she was quick to detect the ability as well as the kind-heartedness of the man. The Weglers were vulgar cheats, but he was a gentleman and a scholar.

It took him a good deal longer to discover that she had the education as well as the manners of a lady.

'There's the best biography that was ever written,' he said to her one day, pointing to Boswell's *Johnson*. He had been praising her care of the books.

'And there's the third best,' she answered, touching Lockhart's *Scott*.

'What is the second best, then?' he asked.

'Trevelyan's *Macaulay*, I think,' she replied.

Now Trevelyan's *Macaulay* was too recent a book to have found a place on Mr Teachild's conservative shelves, but the very next day he bought a copy.

'Norah,' he said a few days after, 'I am not sure that I do not agree with you about Trevelyan.'

She smiled and looked very pleased. 'I felt sure you'd like it, sir,' she answered.

Mr Teachild walked to the window. 'Norah,' he said, speaking very distinctly, for his back was towards her, 'will you be good enough to give up calling me "sir"? It is unnecessary and unbefitting.'

'I will,' she replied, 'if you really wish it; though I've got quite used to it now.'

'I do wish it, my dear,' he said with emphasis.

. . . . . .

Mr Teachild was a very regular church-goer, morning and evening. The Weglers had a sitting between them, and it was generally occupied, morning or evening, by Norah. One Sunday evening, soon after he had forbidden the use of 'sir,' Mr Teachild went out, as usual, while the bells were still in full swing. Instead of going inside, however, he waited about, in the shadows of the churchyard, his eyes fixed upon the gates. It was nearly ten minutes after the bells had ceased before his patience was rewarded. He came out of the shadows and met Norah just inside the gates.

'We are both late,' he said—'terribly late.'

'Yes,' she replied; 'Mr Wegler was out, and I had to wait till he came in. Mrs Wegler doesn't like being left alone.'

'I really do not like going in so late as this,' said Mr Teachild.

'It isn't very pleasant,' Norah assented.

'Suppose, for once, we go for a quiet little stroll,' he suggested.

She hesitated, too much astonished to have an answer ready.

'I am an inquisitive man,' he said, with a smile that she liked, 'and there are one or two questions I should very much like to ask you. It is not mere inquisitiveness,' he added quickly. 'Do you think you can trust me?'

'I know that I can,' she answered.

The questions and the answers took some time, but Mr Teachild was not too engrossed to keep count of it, and they came back into the Row just as the church was emptying. She was going down the area-steps, but he stopped her.

'No, Norah,' he said softly, 'not any more,' and opened the hall door with his latch-key.

Mrs Wegler was coming downstairs. As Mr Teachild went up to his room she said sourly, 'You should have gone to the other door. It 's great presumption to come in here.'

Norah's face flushed scarlet. 'I know it looks like it,' she replied; 'but Mr Teachild insisted on my doing so.'

VII.

Mr Wegler had used his landlord as a stalking-horse so often, so long, and so successfully that it came like a thunderbolt when, the next evening, he received a letter from the solicitors who collected the rent reminding him that his term expired at midsummer, and adding that if he desired a renewal he could have a lease for seven years at an increased rental of twenty-five pounds per annum, on paying a premium of a hundred pounds.

'*Himmel!*' he exclaimed, throwing the letter across to his wife. 'It 's ridiculous—monstrous—an outrage—robbery.'

'We shall have to leave,' she said, 'just as we 've got the best lot of tenants we 've ever had. They must have found out how well we 're doing. I wonder'——

'Eh?'

'Old T., Carl. He 'll never leave this house if he can help it. This time you could show him the letter. If he would find part, it might be worth our while to pay the rest.'

'Yes,' said her husband. 'If he 'll pay two pounds for the rooms and half the premium, we might raise the others a shilling each, and then we shouldn't be zo much out of pocket after all. I 'll shpeak to him on Thursday. I believe he 'll pay anything zooner than turn out.'

'If we have to move, will he come with us, do you think?'

'Ah, I 'm not sure,' answered Wegler meditatively.

'If not, we 'll get rid of Norah,' declared Mrs Wegler. 'I can't bear the girl, with the airs she gives herself and her sly ways. I believe she 's set him against us. I always feel she 's watching and spying. I saw her looking at the butcher's book the other day for ever so long.'

Mr Wegler nodded. 'She zeems sheap,' he said; 'but if she 's that zort, she 's dear at any prize.'

For some time the Weglers had been none too pleasant with Norah, but for the next few days they were openly and unbearably insulting. Just before tea on Thursday she went out for a few minutes. When she came back Mrs Wegler demanded angrily, 'Where have you been?'

'To fetch a cab,' Norah replied.

'Who for?' Mrs Wegler's syntax varied with her temper.

'Myself.'

'Oh, indeed! Are you going to the opera?' inquired Mr Wegler, with ponderous sarcasm.

'No; but I 'm going to say good-bye to you.'

'What do you mean, girl?' Mrs Wegler's voice showed that she was startled.

'I mean just what I say. I 'm going to leave now. You know how you 've behaved to me the last day or two. I don't feel like putting up with any more. My box is in the hall, unlocked. You can look through it if you 're anxious about your spoons.'

'But you can't leave without notice. I 'll give you in charge,' Wegler blustered.

'Oh no, you won't. You know the law too well.'

He tried another tack. 'Your month's money 's due to-morrow; you won't get a penny of it.'

'Then I must manage without pocket-money for this month,' she answered, smiling.

'Be off with you!' cried Mrs Wegler shrilly. 'A good riddance. If we miss anything, the police will find you out.'

'I 'll let you have my address as soon as I am settled,' said Norah, with a little wave of the hand, as she went up into the hall.

VIII.

That evening Mrs Wegler, reverting to her former custom, brought in the dinner and placed the housekeeping books on the bureau. Some time after the meal was over and the table cleared her husband appeared, rubbing his hands with the mournful and deprecating air that always indicated finance.

'I 'm exceedingly zorry to zay, Mr Teachild,' he began, 'that we have two very unpleasant and distressing things happened.'

'Oh, indeed!' said Mr Teachild briskly; 'and what may they be?'

'The girl Norah has taken herzelf off—gone away in a cab without notice—left us zingle-handed to do what we can.'

'Well, Wegler, you know what I told you about changes.'

Wegler spread open his fat hands with an exculpatory flourish. 'But, zare,' he pleaded, 'you are always zo reasonable—you will zee it is not our doing—it is hers.'

'The result is exactly the same. What is number two?'

'Number two,' answered Wegler, with a little smile intended to propitiate, 'is still more grievous. The landlord'——

Mr Teachild shook his head. 'No, no, man. Give the landlord a rest. There's reason in all things. If you want to raise my rent again, you really must think of something else.'

Wegler twitched his cuff, and a letter fell into his open palm. He handed it eagerly to his tenant. 'You can zee for yourzelf, zare,' he said.

Mr Teachild glanced over it, and threw it on the table. 'It's your business, of course,' he remarked; 'but I should not have thought it worth your while to pay all that.'

Wegler's face fell. 'It is not possible. I shall, after all these years, have to give up the house.'

'The best thing you can do. I'll tell you what it looks like to me. I believe your landlord wants to occupy the house himself. I suppose he has never told you so, has he?'

'I have never even zeen him, zare.'

'Oh, come, Wegler,' said Mr Teachild, shaking his head again, 'I cannot credit that. I believe you know him as well as you know me.'

Wegler became almost apoplectic. That the absolute truth, on one of the rare occasions when it passed his lips, should be doubted was intolerable.

'I give you my word of honour, Mr Teachild, I have never zeen the gentleman,' he protested. 'I am not sure that I even remember his name. The zolizitors have always written the letters. I have zertainly never zeen him.'

'Well, you see him now, at any rate,' said Mr Teachild, a shrewd little smile playing round his clean-shaven lips.

Wegler gave a great start. His urbane manners, of which he was inordinately proud, deserted him for the moment. 'Eh?' he exclaimed, and stared, goggle-eyed.

'Yes,' Mr Teachild went on, 'I've been your landlord for about five years now; so, you see, some of your fairy-tales about his extortionate demands have been rather entertaining.'

A change came over Wegler's face. A bland, ingratiating smile appeared, and with it his beautiful manners came back. 'Ah zare,' he said, 'you are having your joke with me. You have given me a bad panic. We go on as before—is it not zo?'

'No, it is not. Now, look here, Wegler. I have been over the figures of what you have been screwing out of me, and I think that twenty-five pounds a year for seven years and a hundred down will be about right. If you like to pay it you can stay, though in that case you will have to let my rooms to some one else. If you do not like the terms you can go, and then we shall have the house done up, and live here ourselves.'

'We—ourzelves,' Wegler repeated. 'I don't understand.'

'Oh, Norah didn't tell you?' said Mr Teachild with great composure, though his cheeks showed a tell-tale flush. 'We are going to be married on Saturday. I have taken a furnished house for the summer at Harrow. This furniture is going to be warehoused; the vans will be here to-morrow. You need not hurry over your decision. Any time before quarter-day will do.'

Wegler seemed more than half-dazed. He said nothing, but turned to leave the room.

'There are the books,' said Mr Teachild, pointing to the row on the table, each with its little pile of coins. 'They seem a bit wickeder even than usual. I am afraid you will miss my weekly contributions to your housekeeping. Good-night, Wegler, and good-bye, if I don't see you to-morrow.'

'*Der Teufel*'—— Wegler began; but he said it under his breath, and as he said it he went out and closed the door softly behind him.

THE SECRET OF THE WIND.

WHENCE came the night-wind? O whence came he
  Who travelled to greet us from far,
When in the darkness she walked with me,
  On that night with never a star?

What did the storm-wind? O what loosed he
  In the dim blue darkness there?
He loosed strange dreams in the heart of me,
  As he loosed the strands of her hair.

What said the wild wind, stirring in the trees?
  'Now shall I stir you as well;
Ye shall both be movèd, as I move these,
  By the secret I come to tell!'

What said the strange wind, blowing from afar?
  What was the secret he told?
'O ye who are here were other than ye are,
  In a bygone age of old!'

Thus said the storm-wind, sighing as he went:
  'Meet it in joy or in pain,
But this is the last hour together that ye spent;
  Ye tread it together again!

'What do I bring you? O what brought I
  On that starless night long past?
I brought you a sword, and I brought you a sigh,
  But never the thing that ye asked!

'What canst thou say to the one at thy side?
  And what can she say unto thee?
Better (as then) in your silence abide,
  And leave all that telling to me!'

Heard she the secret he told ere he passed?
  O, most surely she heard it; yea!
And I rest content, for she knows, at last,
  What none but the wind could say.

SEVENTH SERIES

SOLDIER POETS.

By E. B. OSBORN, Editor of *The Muse in Arms: a War Anthology.*

IN the past the making of war poetry has been left to the non-combatants who, both in France and Great Britain, have been brilliantly successful in producing the munitions of patriotism. Indeed, we have to go back to the far-off days of folk-song to find songs and ballads of battle which are manifestly the work of fighting poets. The late Lord Kitchener once told me that he felt sure that the noble ballad of 'Chevy Chase' must have been made by some man-at-arms who fought in the historic border-fray. The rough lines and rugged stanzas of the oldest version extant certainly remind one of the pithy yet picturesque utterances of the modern soldier, who would not, if he could, use any of the neat tricks of rhetoric. Now and again, in the long interval between the raids and counter-raids of the Douglas and the Percy and the present war, we do find an occasional piece which might well have been the work of a fighting poet. A case in point is 'Agincourt, or the English Bowman's Glory,' which contains the following significant stanza:

> Agincourt, Agincourt!
> Know ye not Agincourt?
> Oh, it was noble sport!
> Then did we owe men;
> Men, who a victory won us,
> 'Gainst any odds among us;
> Such were our bowmen.

Then, as now, the fighting islander insisted on regarding warfare as a sport; a point of view which has been regarded by his enemies in every age as a proof of his inability to grasp the true meaning of an appeal to arms. Spaniards, Dutchmen, Frenchmen, and Germans have all complained, even while they were being beaten, that the English never would take war seriously enough. They did not know, they do not know yet, that 'sportsmanship' is our homely name for the *chevalerie* of the Middle Ages, being one of many terms of apparent belittlement originating in a racial tendency to compare great things with small things. Coming down to the long agony of Napoleonic wars, we find the British soldier more than ever inarticulate. The celebration of the immortal personalities and undying days of the great struggle was left entirely to the professional poets. But when we read such crude, half-forgotten ballatry as Sergeant Grant's 'Battle of Waterloo,' with its quaint, matter-of-fact final stanza:

> Here's a health to George, our Royal King, and long may he govern;
> Likewise the Duke of Wellington, that noble son of Erin!
> Two years they added to our time for pay and pension too,
> And now we are recorded as men of Waterloo;

or 'Sahagun,' the song of the 15th Hussars that was sung every 21st of December, which begins:

> It was in quarters we lay, as you quickly shall hear,
> Lord Paget came to us and bid us prepare,
> Saying, 'Saddle your horses, for we must march soon,
> For the French they are lying in the town of Sahagun,'

we cease at once to be literary critics, and are as strangely touched to the heart as Sidney was when he heard 'Chevy Chase' (which had no literary allurement for Elizabethan men of letters) sung by a blind crowder at the door of a tavern. For such artless doggerel possesses a quality which the finest art-poetry lacks; it has what Ruskin called the beauty of memorial. It was written with a sword or a bayonet, so to speak; the dust of an heroic heart sighs in the silence before and after.

The amount of war verse written by civilians since August 1914 is simply appalling. It is said that the German output alone runs to more than a million pieces! In Great Britain and America the aggregate production has been very large indeed; a friend of mine has a *selection* of six thousand pieces, all of which have actually been printed. France, more deeply engrossed in the war than any other of the Entente Powers, has been much less prolific than her English-speaking Allies. Very little of all the verse written by non-combatants will survive; even the established poets, such as Mr Rudyard Kipling and Dr Bridges, have failed in their few attempts to write poems worthy of so tremendous an occasion. But much of the work of the soldier poets will live on—at any rate, in anthologies; and it may be that the prophecy of Captain Robert Graves, perhaps

 [*All Rights Reserved.*]

the least conventional of all, may in the end be fulfilled:

> On Achi Baba's rock their bones
> Whiten, and on Flanders plain,
> But of their travailings and groans
> Poetry is born again.

The English muse, having played her part as a spiritual *cantinière*, and seen the squalor and splendour of modern warfare, will in the near future care more for the realities of life than for the fantastical word-play of the later and lesser Victorians. Truth will be her chief quest; beauty, particularly the beauty of words, merely incidental treasure trove.

The best of the soldier poets are educated young men—many of them, alas! fallen in action—who would have written verse even if they had never been drawn into the vortex of Armageddon. The true soldiers' songs—rough-and-ready reflections, mostly humorous, set to some favourite tune—are infrequent, and hard to come by. Some of them are authentic folk-songs which reflect a mood of the army, and have come into being nobody knows how. A good example is the chaffing ditty which used to be sung up and down the trenches by Territorials and Regulars alike, when it seemed that the men of Kitchener's Army would never arrive to relieve them:

> Who are the boys that fighting 's for?
> Who are the boys to win the war?
> It 's good old Kitchener's Army.
> And every man of them 's *très bon;*
> They never lost a trench since Mons,
> Because they never saw one.

In these days the popular music-hall song has put such spontaneous minstrelsy more or less out of court. None of the true soldiers' songs has had anything like the popularity of 'Tipperary' (never heard to-day in the British lines), or of that grim revival of the old Salvation Army song which begins:

> The bells of hell ring ting-a-ling-a-ling
> For you, but not for me.

Perhaps the most popular of the improvisations was the famous gibing rant against Von Kluck and his army. It greatly annoyed the Germans, and almost always brought about a renewal of the daily 'hate' from their machine-guns and rifles and trench-mortars. It is much too Rabelaisian to be quoted in print.

At least a dozen of the soldier poets whose work has been published in book-form will be read by posterity. Rupert Brooke hardly comes into the category, though his sonnet beginning,

> If I should die, think only this of me,
> That there 's some corner of a foreign field
> That is for ever England,

is perhaps the best known of all the war-poems. Captain Julian Grenfell's 'Into Battle,' a wonderful vindication of the fighting-man's fellowship with all living creatures, has also been very widely quoted, and well deserves Mr Kipling's sentence of praise: 'His lips must have been touched when he wrote it.' He left only half-a-dozen pieces—of which 'The Hills,' written in India, is a most noble act of nature-worship—but is sure of his place in the national remembrance. Already it is recorded that a young officer has been killed while reciting two lines from his ecstatic battle-hymn,

> The thundering line of battle stands,
> And in the air Death moans and sings,

and awaiting the 'zero' moment for leading his men over the parapet in a triumphant attack.

Several poems which are not nearly so well known are worthy of comparison with these famous pieces. The one and only sonnet by Lieutenant Geoffrey Howard, entitled 'England,' is a tribute to the greatest littlest land, which is written in the grand style throughout:

> Her seed is sown about the world. The seas
> For her divide their waters. She is known
> In swamps that steam about the burning zone,
> And dreaded in the last white lands that freeze.

This soldier poet has a Miltonic sense of the value of open vowels, and it is to be hoped we shall have more of his organ music. Love of the Motherland is a constant inspiration of the soldier poet, and another fine example is the poem in which Lieutenant Robert Nichols, while awaiting the signal for attack, remembers the beauty of the country-side in which he was born, and understands that a price is required for it all:

> The gorse upon the twilit down,
> The English loam so sunset brown,
> The bowed pines and the sheep-bell's clamour,
> The wet lit lane and the yellow-hammer,
> The orchard and the chaffinch song,
> Only to the Brave belong;
> And he shall lose their joy for aye,
> If their price he cannot pay.

The same poet has also taken for his theme that all-engrossing love of the regimental officer for his men, which is the secret of the unbreakable strength and incorruptible discipline of our New Army. Walt Whitman never wrote anything more poignant on comradeship in war than the poem which begins:

> Was there love once? I have forgotten her.
> Was there grief once? Grief still is mine.
> Other loves I have; men rough, but men who stir
> More joy, more grief, than love of thee and thine.
>
> Faces cheerful, full of whimsical mirth,
> Lined by the wind, burned by the sun;
> Bodies enraptured by the abounding earth,
> As whose children brothers we are and one.

The same thing is even more powerfully treated in a poem by Lieutenant E. A. Mackintosh, M.C., addressed to the fathers of his Highlanders fallen in action, which contains the lines:

> You were only their fathers;
> I was their officer.

The whole inner history of Scotland's famous regiments is latent in those few simple words.

The British conception of the regiment as a 'clan in action,' in which all are equal as gentlemen though of various ranks, is a gift of the North to the South. It is the principle on which a national army can be completely democratised without the slightest loss of power and precision—nay, with a great increase of moral fervour and of that impregnable discipline which was so well defined by Baden Powell as 'confidence in one's pals.'

Many of the best of the new soldier poets have fallen in action or died of wounds. The passing of Captain Charles Sorley, Captain Colwyn Philipps, Lieutenant W. N. Hodgson, M.C., and other singers and makers of much achievement and even more promise, is a sad loss to English literature. But others, such as Lieutenant Siegfried Sassoon, M.C., and Lieutenant F. W. Harvey, now a prisoner of war in Germany, still live to carry on the high task of interpreting to future generations the significance of a war which is really a crusade against scientific savagery and a non-moral plan of world dominion. None of the poets I have named are experimentalists in technique, though most of them are scornful of the social conventions, 'bloody-rooted, though leaf-verdant,' of the régime of luxurious indolence and bitter logomachy which has been so ruthlessly wrecked. Each has his own vision of a happier Britain, of a new Jerusalem to be, built up in sunshine and with singing, when the warrior-nation can sheathe its victorious sword. All of them hope that the comradeship of the trenches will survive as a vital factor in the national life to come. Voices of rebellion are not lacking to preach revolution rather than reconstruction. But they are few and incoherent, though at times their songs have a strange and piercing sweetness. In conclusion, let a word be said of a characteristic of all this real war poetry which distinguishes it from that of the German soldier poets. I have read in print and in manuscript some two thousand war-poems written by men actually serving, and not one of them can be called a song of hate. When Mr Kipling told the world how 'The English began to Hate,' he forgot that hatred is rooted in fear, and must never be imputed to this nation in arms. Our soldier poets will see to it that justice is executed on a felon race. But it is the offence, not the offenders, that they loathe and despise. Charles Sorley, the most ruthless of all these militant thinkers, could even find it in his heart to write a sonnet 'To Germany,' in which these lines occur:

> You only saw your future largely planned,
> And we the tapering halls of our own mind,
> And in each other's dearest ways we stand,
> And hiss and hate. And the blind fight the blind.

It has been left to civilian versifiers to abuse and argue with the enemy, and attempt imitations of Lissauer's song of the *furor Teutonicus*. The singers of our New Army are too mighty and merciless to fall into any such wordy folly.

JOHN PARDON'S CHOICE.

CHAPTER X.

THE late spring rains of 18— will long be remembered by the older generation in that particular section of the Sierra Nevada foot-hills. Following upon an exceptional winter of warmth and sunshine, with, latterly, drying north winds, which scorched every living green thing and hardened the ground to the consistency of a brick, the long-hoped-for, well-nigh-despaired-of rains at last set in with unprecedented violence. Nature, as though impatient of man's impatience, opened the vials of her wrath, and for three relentless weeks poured down a veritable avalanche of long-stored waters. Day after day anxious ranchers, clad in oilskins and high gum-boots, strove to combat the pitiless deluge, hurriedly hoeing gutters in the hillsides from which the winter grain, just flushing into green, was being washed into the flooded ditches and roads. Cattle and horses, already lean from protracted want of fresh grass, were driven back and back into the bush by the cruel fury of the slashing rain; calves and colts were born, only to perish in the soaked wretchedness of mother earth; while foliage and blossom, forced forward by the treacherously warm winter, were bashed and battered into tattered semblance of leaf and bud. April rains, hitherto accounted a blessing because of spring sowings and the 'wild' grass, now became first a menace, then disaster, to man and beast. Mountain roads were washed away; the river, swelled beyond all possibility of carrying the accumulated waters, undermined its banks, tore away the trees, flooded every small 'flat' and reedy meadow, swept away bridges, and obliterated long-established fords.

When at length the wearied, discouraged eyes of men once more beheld a golden sun sailing through a sky of unimaginable blue, it shone, as it were, upon the wreck of a fair world, whose nakedness and bruises showed all the more pitiful for the revealing brightness. In the district about Beestop there was no one but had suffered injury and loss, though the Patricks, with their usual good luck, owing to the peculiar location of the ranch, came off better than the majority of their neighbours. Not so with John Pardon, whose property had been punished so severely that, strive as he would to

accomplish the work of two men with one pair of hands, he could spare but little time to help Joy Powell in the hard and lonely task of 'holding down' the ranch until Bob's return. This was, to a certain extent, a relief to them both; for, although John Pardon, having emerged victorious from the terrible battle of that memorable night when first he realised the depth of his love for the English girl, never wavered in his resolve to abide by both his self-undertaken troth to Mary Patrick and his promise to Bob Powell to protect and befriend his sister, the strain of constant contact with her was almost more than he could endure.

As for Joy, recognising and understanding the man's pain as well as his passion, she helped him by every power of mind and body, and many an anxious prayer, to be true to himself and to the man who had trusted him—helped him, though her own heart was growing sorely troubled, and the blue eyes strangely wakeful and full of tears in the long, lonely hours of night.

Of the occasion when Pardon's secret had been suddenly wrested from him no word ever passed between them. When next he came to the house and mounted the steps, his face pale beneath the tan, and his heart thumping so heavily that he felt the girl must hear it, she had met him with frank ease, and though crimson flooded her face, and the long fingers tightened on the veranda-rail, her eyes were bravely raised to his. In their depths John Pardon, discerning a mute appeal which struggled with an expression of tender sympathy and understanding, read also a fearless confidence, which he would have sacrificed his own right hand rather than have destroyed.

Thus, each helping the other, the old comfortable relations between them were, at least to all appearance, re-established. Yet the mere fact of this mutual effort to bear an unlooked-for burden inevitably became a bond of strange intensity between the well-born English girl and this rough product of the Far West—a bond fraught with a wholly unsuspected danger to Joy, and of increasing torment to Pardon. There were times when some household task with which he was helping her brought her lithe frame and fair face so close to him that he would clench his teeth and grow almost faint with passionate desire to snatch her to his heart; whereupon Joy's quick instinct would warn her to slip quietly away, presently returning with some commonplace request or small task for Pardon to do, thus restoring his tottering self-control. But the battle, as all battles are bound to do, was leaving its scars on the heroic pair.

Pardon's spirits, despite all endeavour, lost some of their buoyancy, and from his face fell away again the happy, boyish expression born of the unruffled summer months; while poor Joy's piquant little countenance, with its elf-like chin and smiling mouth, grew thin and wistful. Hence the ensuing relief when circumstances obliged Pardon to devote most of his time to his own belongings, only now and again going to the Powells' ranch, where, working furiously in order to catch up with many neglected things, he and Joy scarcely did more than exchange a cheery word or two as they passed each other, intent on their respective duties. So it came about that Pardon almost welcomed the opportunity of some days' work for the county, repairing roads, which, bad enough before the heavy rainstorms, were now well-nigh impassable. He made a point, however, of first getting in some hours of extra hard toil at the Powells' ranch before saying one evening to Joy, cheerily but with a wretched ache at his heart, 'Fraid I sha'n't be able to git round for a week or so, Miss Joy—got a job on the roads that 'll keep me and the hosses hustlin'. But,' he added, miserably noting how white and worn the girl looked, 'things are pretty well tidied up again, and now that we 've got the blessed sunshine once more, you must git out and ride a bit—take some of the fat off old "Silversides," and' (his voice full of tender concern) 'try to git some of the colour back into them cheeks o' yourn; else, sure, Miss Joy, your brother 'll be thinkin' we 've bin treatin' you bad while he 's bin back home!'

'Treated *badly!*' protested Joy, laughing. 'Why, I've never been so spoiled in all my life, Pardon. Bob will have to train me all over again to be a useful member of society! But I *can* saddle "Fay," and shall enjoy some good rides; so don't have me on your mind. I shall manage beautifully, while you and old "Kate" and "Custer" are making splendid new roads for "Fay" and me. See, here is an extra supply for the "jockey-box"!' she added gaily, filling his hands and pockets with good things.

'Thank ye ever so much, Miss Joy. So long—and take good care o' yourself,' said Pardon.

'Good-bye, Pardon!'—and yet again 'Good-bye!' floated sweetly towards the yearning man's ear as he faced homewards, resolutely refraining from glancing back until he reached a bend in the road, whence he knew he could see and not be seen.

In the gathering darkness he could just make out the shadowy silhouette of her face and figure against the evening sky, where he had left her standing—such a lonely little figure on the edge of the far-stretching wilderness. Was it solely a fantasy of his own overwrought mind that made him fancy he saw the girl's arms outstretched as though in silent appeal for some one to come to them? 'Joy—my own little girl!' broke in a low cry from John Pardon's lips as, with a wild hope tearing at his heart, he started back—only a pace or two; then, with a groan, he turned on his heel and swung rapidly down the road. The following morning was devoted to seeing that his wagon, harness,

horses' shoes, &c. were in good order for the strain that would presently be put upon them; then, early in the afternoon, he struck away through the bush behind his ranch with intent to discover whether the short cut which crossed Dry Creek by a ford to the Cañon Hill would be possible for his team to travel after the great rains. If so, it would save him and them a good few miles of the way to where his work was to begin. It was a superb day—spring at her gayest and brightest—every outside circumstance in cruel contrast to the misery in the man's breast. As he pursued his way, his thoughts rushed back to just such another afternoon, now nearly a year agone, when first he saw Joy Powell, on the windings of that same famous Cañon Hill whither his steps were now again leading him. Every sight and sound of the spotless day—the intense blue of the sky, the hot sun dancing on bud and leaf barely recovering from the recent havoc, the voice of birds, the tinkle-tinkle of cow-bells—all seemed to emphasise his own pain in the memory of that fateful meeting. Suddenly, however, the swift current of his thoughts was arrested by a sound that swelled up through the trees from the cañon below—the sound of rushing, roaring water. Abruptly Pardon halted to listen. 'What's that?' he ejaculated. 'Sure there must be mighty big water in that there Dry Creek!'

Quickening his steps, he soon reached the cañon-bottom, and stopped short, an exclamation of astonishment bursting from his lips. That which met and amazed his sight—was *that* Dry Creek? That turbulent torrent, tearing along over rock and prostrate tree—could *that* be the same trickling stream, with its shallow ford, that in summer-time was wont to be nothing but white, sun-parched stones? To solve the problem, however, did not take Pardon long. There must have been a 'break' somewhere up-country, and the accumulated mass of waters had sought and found a highway in the bed of what, ages ago, had been a great river.

'Lordy!' exclaimed Pardon, removing his old hat and scratching his head in speechless astonishment. 'Well, John Pardon,' he at length remarked slowly, and with a grim chuckle at his own discomfiture, 'that settles *your* little scheme for to-morrer. There *bain't* no ford—clean gone, I reckon!' Then, all at once, a hazy recollection that quickly became a certainty forced itself into his mind, causing his face to grow grave and thoughtful. Wednesday? This *was* Wednesday! Yes—surely it was to-day that Mary Patrick had said, when last he saw her, that she was going to take the old horse 'Tom' and the ancient vehicle known as 'the phaeton,' and drive herself over to Oak Clearing to see Annie M'Coon's parents. Annie had been writing from her married home asking Mary to go and see the old people. The heavy rains had prevented her, and it was no use, she said, waiting for Joe or Henry to take her. Pardon had promptly offered to drive her over on the first day that his work on the roads should be finished; but Mary had persisted in her own plan, and secretly poor Pardon, though he would not admit it even to himself, was relieved not to have the prospect of the long, hilly drive alone with her; she seemed of late to have grown critical and querulous. Now, however, reflected Pardon, had Mary carried out her purpose, she would almost surely be returning by the nearer road which crossed Dry Creek ford and climbed Cañon Hill. At any moment she might be coming. He must wait—for hours if need be—to warn her, unless indeed a glimpse through the bush along the road or the unwonted roar of water had already turned her back. Otherwise, so sharply did the road descend to the ford, she might have old 'Tom' floundering in the stream before she realised the danger. In order, therefore, to get as long a perspective as possible up the road, Pardon forced his way among the bushes along and above the usual bed of the creek, tied his neckerchief to a stick by way of flag, rolled and lit a cigarette, quite prepared to wait until all chance of Mary coming that way was past.

(*Continued on page 739.*)

MODERN MAGIC.

By E. Fearon.

EVER since man possessed a brain sufficiently developed to enable him to think logically, he has been demanding to know, 'Why do certain things happen?' 'What is the meaning of the various phenomena with which I am familiar?' And for countless ages a few great men in each generation have devoted their lives to answering, so far as possible, these and other questions that Nature propounds; and, taking everything into consideration, it is surprising what knowledge those pioneers have gained; for we should now regard as very crude the appliances with which they had to work. But within the last fifty years or so science has made such enormous strides that, to those who keep in touch with the latest developments of chemistry, physics, biology, &c., it is evident that we are on the threshold of discoveries that will make all that have come to light in past years seem insignificant. Even the power of producing life itself may some day be discovered, so vast and far-reaching are the possibilities of

modern research, aided by the appliances now available.

The pity is that so few people take the trouble to make themselves conversant with what is going on round about them. The average man, and more particularly the average woman, daily make use of the results of applied science without taking the slightest trouble to find out anything about them, with the result that any one with a smattering of knowledge can fool the public almost *ad lib.*, as we see in the advertisements of nearly every paper and magazine that is published.

But deplorable as is this lack of ordinary knowledge in everyday matters, it is comforting to know that there are a number of scientists who are steadily working away at the numerous problems that still remain to be solved in the domain of chemistry and allied subjects; and one of these, of which but little is heard outside the charmed circle of scientific societies and their publications, is catalysis, a miracle-worker which may help the race to win a victory over the material world that was undreamt of a few years ago.

There is little need to point out that, apart from conditions due to the war, the cost of nearly everything we use has been gradually rising for a long time past. Wasteful methods of the past, the exhaustion of virgin soil in countries such as the United States and Canada, and the steady increase in population are all factors that have had their effect, and constant effort is needed so to cheapen industrial processes that material of inferior quality, which was formerly neglected, can be utilised. If the urgent need for research-work required emphasising, the history of many of our industries, which have been galvanised into new life through some method of using what had formerly been regarded as valueless, would supply it; for one of the most interesting chapters of that history is that which deals with the discovery, by some patient worker or other, of ways of obtaining a commercial article from low-grade material, or even so-called 'waste-products.'

But the study of catalysis holds out hopes of dominion over natural forces that will render the little victories that chemists have so far won appear paltry in the extreme; for here we seem on the brink of discovering how Nature performs her miracle of changing one substance into another without any of the violent methods that man has to employ. By means of heat, pressure, or vacuum we can perform many wonderful things in our laboratories and works; but in all living organisms these wonders are brought about naturally and gently, and recent research has shown that they are due to catalytic influences at work within the organism. If we consider our own bodies as chemical laboratories, we find that various glands produce substances which are necessary for digestion, for making the blood-cells, and generally keeping us in health; and that the imperfect working of a certain gland may result in idiocy, as in the case of the thyroid gland; or in diabetes, if the pancreas fails to do its duty.

Some of these natural catalysers can be manufactured, and it is to that curiously complex body, coal-tar, that the chemist turns for at least one of them, which is known as adrenalin, and by means of which a surgeon can control the blood-pressure during an operation. This substance was isolated from an extract secreted by the suprarenal gland, and its composition investigated; then it was built up again, and the synthetic product can now be obtained commercially, and used in such a way that, before an operation, the part of the body to be operated on can be rendered almost bloodless—which is, of course, a great help to the surgeon.

In the vegetable world, by means of a substance called chlorophyll, trees and plants are able to resolve the carbon dioxide gas present in the atmosphere into carbon, which they retain for their own use, and oxygen, which they exhale, as it were, through the pores of the leaves. The little glow-worm, again, has solved the problem of producing light without any sensible amount of heat, which is more than man, with all his array of dynamos, retorts, and crucibles, can yet do.

But Nature yields up her secrets with great reluctance; or shall we say that man has hitherto been too much occupied with affairs that really don't matter, and so has missed great opportunities of advancement in the past?

However we put it, the fact remains that although man has existed on the earth for many thousands of years, he has, comparatively speaking, advanced very little in his knowledge of the marvels by which he is surrounded. We are like travellers in an unknown country, without map or compass, wandering blindly along, and counting ourselves lucky if we can find a fire to warm us and a crust of bread to stay our hunger. For the great majority of the human race, life is still a sordid struggle for bare existence; monotonous toil in field or factory makes up the daily round, and there is little of that *joie de vivre* that ought to be man's rightful heritage.

True, we know at what speed the waves of light travel, how many millions of miles Saturn or Neptune, or some other celestial body, is distant from our own little planet, and we speculate on the possibility of Mars being inhabited, and so on; but these things do not help us to earn our daily bread more easily, or to make more pleasant the hideous slums of our cities and towns.

For over three years almost all the great nations have been at war. One of them has prostituted science to gain her end, with the result that all the best brains of the race are thinking out ways of killing their fellow-men as quickly as possible, and imagination reels when

we think of the awfulness of war if ever man should unlock the door that hides the forces of Nature still undiscovered. Perhaps some *modus vivendi* will have been found before then, and the nations of the world will have recognised that scientific achievement may be more usefully employed than in battering down works of art and flinging thousands of tons of iron and steel at each other!

Be that as it may, many serious problems will continue to force themselves on our attention in the years to come; among them, greater supplies of food and cheaper industrial methods of all sorts must be found, and it is to the chemist that we look for the solution of many of our problems. And it is to this wonder-worker, catalysis, that the chemist turns in his search for better ways of effecting chemical reaction. The importance of cheapening and hastening chemical reaction is obvious when we consider that almost all the various articles of commerce—whether they be food-stuffs, clothes, or building material—depend, more or less, on chemical processes. Thus, large and cheap supplies of sulphuric acid are necessary in the manufacture of fertilisers, in the dyeing industry, and for many other purposes. The hydrogenation of oils is another important chemical process, as there are large quantities of whale-oil, for instance, which might be turned into hard fats for use in the manufacture of margarine and soap. At present it has only a very limited application for lubricating purposes, and to some extent in tanning. In other processes, such as the production of atmospheric nitrogen, surface combustion, in the manufacture of salt-cake and chlorine, and many more chemical industries, quicker and better methods of bringing about the reactions would greatly cheapen the ultimate product, and be of benefit all round; and although the influence of catalytic agents is not very well understood, there are great possibilities latent in its application, and it is being closely studied in scientific circles.

Briefly, what is known concerning the subject is that a very small quantity of a certain body (the catalyst) is capable of effecting chemical action between other bodies, without seeming to undergo any chemical change itself, and without the necessity for the employment of great heat, pressure, &c. A catalytic agent has been defined as 'that material which affects the velocity of a chemical reaction without appearing in the final products;' and although the definition is not strictly accurate, it sets forth the two principal properties of the process.

A chemical change which occurs so slowly under certain conditions of temperature and pressure as to be inappreciable may take place with immeasurably greater rapidity in presence of a suitable catalytic agent. Thus, in the case of sulphur dioxide and oxygen, when platinum is absent the gases combine very slowly indeed; but when platinum is present in a suitable form, all other conditions remaining the same, combination occurs rapidly, the sulphur dioxide and the oxygen uniting to form sulphur trioxide. A small quantity of platinum suffices for the production of a practically unlimited quantity of sulphur trioxide, and yet the metal is quite unchanged at the end of the process.

Another illustration may be found in the ordinary method employed in the chemical laboratory for the production of a considerable quantity of oxygen. Potassium chlorate is mixed with about 2 per cent. of pure manganese dioxide, and on the mixture being gently heated in a flask, the potassium chlorate is rapidly decomposed into potassium chloride and oxygen, the oxygen being set free. When the process is complete, the manganese dioxide is found to be quite unchanged; and yet in its absence a much greater heat would be necessary to effect the decomposition of the potassium chlorate, and the process would go on much more slowly.

One or two further examples may make the point still clearer. Hydrogen and oxygen can be made to combine, to form water, by the application of heat or an electric spark; but the action is very violent, and results in the production of a great deal of heat. Now, by means of a minute quantity ($\frac{1}{12000}$ of a grain) of colloidal platinum, a cubic foot of the two gases will combine without heat, and without the activity of the catalyst being impaired. Or, put in another way, one part of the catalyst brings about the union of four hundred and forty thousand parts of the gas in question.

The production of synthetic indigo is another instance of catalytic influence, and also of the part that chance sometimes plays in affairs. This process, which is worked by the German Badische Anilin und Soda Fabrik, starts with the oxidation of naphthalene to phthalic acid, and it was the accidental breaking of a thermometer bulb, allowing the mercury to fall into strong sulphuric acid, and so forming mercuric sulphate, that gave the required catalytic action to render practicable the commercialism of this synthesis.

An interesting illustration of catalysis is seen in the fermentation of beer, one part of yeast so acting upon the sugar of the sweet worts, without entering into combination with it, as to compel one hundred parts of sugar to pass into alcohol and carbonic acid gas.

It would take too long to give details of the many applications of this new means of dealing with chemical reactions, and, as yet, too little is known about the whole subject to make any definite assertions; but the experience of the last few years is enough to render us hopeful that in the near future many processes will be cheapened and many greatly improved by it.

The catalysts usually employed are the heavy metals and their oxides, such as platinum, nickel, cobalt, iron, thorium, titanium, &c.; but there

are wonderful possibilities in systematic research, and it is to this that we must look to see these possibilities developed. Only, it is to be hoped that we shall not allow Germany to reap the benefit of our research-work, as we did in the case of the coal-tar dyes. If the manufacturers will back up the scientists as they ought, there is no reason why we should not build up as huge a chemical industry as Germany's was before the war.

FROM THE ENDS OF THE EARTH.

CHAPTER II.

And for her sake, and not for gold,
At her clear call we faced her foe,
Upheld her trident as of old,
Her sons—her own—in weal or woe;
In shattered trench, in bloody fray,
Grim Death alone could give us stay;
No whit we cared for Hunnish boasts—
His hell-hounds bayed—we held our posts.

AT the British Consul's house on the *plaza* the jubilant uproar at the Club Alemania could be distinctly heard. It was not pleasant hearing, though anything but unlooked for. Indeed, except Don Andrés, there was not a man present who had not been expecting it for years. At home, in Germany, prudence in speech may have been compulsory; at any rate, it appeared to be the rule in public. Abroad, and especially in Latin America, there was no such thing. Loud boasting from the house-tops had drowned its feeble voice, if it had ever lived; and it was dead.

'Well, boys,' said the popular and usually jolly Consul, looking round the assemblage, 'the Old Country 's up against it, and no mistake. I suppose we 'll be able to steer clear of trouble here. Let the bounders shout, and leave 'em alone. Anybody anything to say?'

'What 's the latest news?' asked Christy.

'The British army is retreating, very hard pressed. The French are retreating also. A lot of men have been lost—killed, wounded, prisoners.'

'Damn!' cried the ex-soldier.

'I have a private code-telegram from the Legation,' the Consul went on. 'The Old Country 'll want all the volunteers she can get. Who 's going home? I can take your names.'

'Then take mine!' cried the ex-soldier—'Andrew Martin, Third Battalion, Midshire Regiment.'

'You, Don Andrés?' exclaimed the Consul, surprised.

'Just to give the boys a start. Christy 's lame. He 'd be turned down if he went,' was the reply.

'That 's true, worse luck,' said Christy.

'I 'm too old, which is worse luck still,' said the Consul. 'There 's paper and a pen on my desk. Those who can go, put your names down.' There was a move to the desk. The Consul turned to the ex-soldier: 'Going to join your old regiment?'

'I am.'

'You 'll be shot.'

'I 'll risk it.'

'All right. It 'll be your funeral. You 'd better ride round to all the English *fincas* up your way and let them know. The Brown boys 'll go when they hear of it. And there 's Jack Thomson and Sinclair. And don't forget Cuthbert. He 's Canadian, but he 'll go.'

'Right-o! I 'll enlist 'em. Say, it 'll take a week to get round, and another week to fix up things at Bella Vista. You 'd better find out what boats 'll be leaving Puerto Mexico in about three weeks' time.'

'I 've done it,' said the Consul. 'French boat for Havre; Ward liner for New York; English boat—Lamport & Holt—for Liverpool.'

'All right. English boat. Book me a passage, second class,' said the ex-soldier, and presently left with Christy.

On the foot-hills of Mount Tacana there are some scores of coffee-plantations, but not one decent road. To many, like Moctezuma, the only approach is the rocky bed of a small river. Visiting all the British owned or managed *fincas*, and the one Canadian, occupied Don Andrés a week; but he had called at several American-owned plantations and a French one. The French *finqueíro* was simply furious. The Americans were almost as disturbed by the news as the English and the Scotch.

'I guess Mexico won't be big enough to hold their swollen heads,' said Van Dunnop, of Finca Nord Americano. 'Reckon I 'll go to Frisco, and wait there till their Kaiser is licked to a frazzle, as he will be—sure.'

That was the general opinion. In bucking the British Empire the Kaiser didn't know what he was up against, and he was going to get the surprise of his life. The result of the ex-soldier's journeys as a recruiter was eight volunteers. They gathered at Bella Vista, and, with *mozos* to take back their horses, all rode down to Tapachula together. On the way they met Henkel and several other Germans, who were returning to their *fincas* after a debauch lasting ten days in honour of *Der Tag*, which was to be the beginning of German world domination.

Don Andrés reined up in front of Henkel. 'Here 's the answer to your dirty proposal that I should go to England as a spy, you swine!' he cried. 'We 're all going to England as volunteers. I meant to plug you for your

infernal insult, but that'll keep till I come back.'

The *ober* something or other laughed scornfully. 'Goot!' he answered. 'Ve vill meet in London at der Kaiser's coronation.' He rode on, convulsed with laughter, amid drunken shouts of '*Hoch der Kaiser!*' from his companions, some of whom could hardly keep in their saddles.

'The best joke of all,' said Charlie Brown of Finca Inglaterra, 'is that the darned fools are cocksure their Kaiser is going to be crowned Emperor of Great Britain, India, and all the British Dominions beyond the seas, in London. If I've been told so once, I've been told it fifty times. By the way, is that chap Henkel on the telephone?'

'Yes, of course,' said the ex-soldier.

'Then to-morrow we've to look out some railway bridge isn't dynamited with our train on it. The railroad agent is a German.'

The provision which the German Government had made for all sorts of happenings in far-away foreign countries was amazing, but apparently the blowing up of British volunteers from south Mexico had not been taken into its calculations. Fifteen in all, they arrived safely at Puerto Mexico, and with a score or so from other parts of the republic, they embarked on a Lamport and Holt liner.

On board ship there was much discussion as to what regiments they should join, the Legion of Frontiersmen being first favourite, as likely to be less 'starchy' than any other corps. In these discussions the ex-soldier took small part. His course was decided upon; and, for reasons which he kept to himself, he did not desire that anybody else should join the Midshires. On arriving at Liverpool, he took train to Crowling, where the Midshire's depot was situated.

Of an old, gray-haired non-com. in the orderly-room, whom he recognised at once as Sergeant-Major Cadman, perennial depot officer, he made inquiries.

'First and third battalions are in France. Second's in India; coming home soon. Fourth's training,' replied the old non-com., with soldierly brevity.

'So there's a fourth, is there?'

'Ay, and likely to be a tenth before this war's over.'

'Where's Colonel Malleson?'

'France, with the third. And mighty well he handled 'em in the retreat from Mons. There's a couple of V.C.'s in the battalion. The colonel got one.'

'He used to be a hard officer.'

'Fine disciplinarian. Rough on the bad uns, maybe. But you seem to know a fairish lot about the old battalion. What's your name, and what d'ye want?' And the old sergeant-major looked keenly at the ex-soldier from under his bushy eyebrows.

'Alfred Maddick's my name, and I want to join up with the third battalion,' said the ex-soldier, adding, 'I've come back from Mexico to wipe a German or two off the earth. Got a grouch against 'em. Also to do a bit for the Old Country.'

''Tention!' sang out the non-com., suddenly and vociferously.

Ex-Private Andrew Martin had been out of the army more than five years. Yet he stiffened, and his hands flew to the seams of his trousers.

The old sergeant-major laughed. 'I reckoned so,' he said. 'Your outlandish clothes and that broad-brimmed hat didn't take me in. Your face seems a bit familiar. Just take your tile off, will you?'

The ex-soldier obeyed, and the sergeant-major scrutinised his features narrowly. 'Seem very familiar, but I can't just place you. Did you serve in the third battalion?'

The ex-soldier nodded.

'I reckon you know me?'

'Oh yes—Sergeant-Major Cadman.'

'Staff sergeant-major now. Well, that settles it. You're welcome. If you join up at once, and haven't forgotten your drill, you can go out with the next draft. That'll be in about a month's time.'

'That will suit me. But I want a couple of days' leave to see my folks.'

'That'll be all right.'

Fifteen minutes later, as Alfred Maddick, Andrew Martin was once more a private in the Midshires—for the duration of the war. It was not surprising that the sergeant-major had failed to recognise him, or, at least, to place him. Five years of exposure to tropical suns had darkened his complexion. Hard riding and living had fined him down. In the army at the time of his disappearance he had sported a moustache. He was clean-shaven now, and looked very American in his Stetson.

Feeling pretty safe, now that he had re-enlisted, he went to Ditchington in his Mexican rig, walking the three miles from Podsbury Station. It was singular, but almost the first person he met was Jessie Osborn, who, he thought, did not look a year older, and was prettier than ever. Without hesitation, he stopped her.

'Well, Jessie, how are you?' he said, and held out his hand.

The girl stared. 'I am very well, thank you,' she answered. Then, in the direct country way, 'But I don't know you.'

'You've a short memory. Have you forgotten Andrew Martin?'

The girl almost screamed. 'He's dead! Andrew was drowned years ago.'

The soldier took off his hat. 'Was he? I reckon not. Have a good look.'

The girl obeyed, her face alternately white and red. 'No,' she faltered, 'I don't remember ever seeing you before. You're not Andrew.'

'No wonder Sergeant-Major Cadman didn't know me, if you don't, Jessie,' he rejoined. 'Don't you remember telling me in your father's orchard that you liked Bob Palmer better than you did me, and were going to marry him some day? I suppose you're Mrs Palmer now? I don't see a wedding-ring, though. I enlisted next day, you'll remember? I told you to do what you liked, and go where you liked. Remember that?'

'Oh!' she cried, convinced at last; 'it is Andrew! But you were drowned?'

'I guess not. They thought I was drowned, I dare say, but I reckon you never heard that they gave me a military funeral. There was no "Reverse arms!" and "Last Post" for me,' he replied, quizzically. 'Well, and how's Bob?' he added.

'Oh!' she wailed, half-fainting; 'I didn't want him. I never wanted him. I was only teasing. I was a little fool. You told me to go —somewhere—and I let you go'——

'I went all right,' he interrupted grimly.

'And you never wrote, and you never came any more, and it nearly broke my heart. But, oh!' in sudden fear, 'you must have deserted, and if the police see you they'll arrest you. Inspector Jones is still here. He'll know you immediately.'

Andrew Martin laughed. 'Never mind him,' he said. 'Are you married? That's all I care about.'

'No,' she faltered. 'I never meant to marry. But—but what are you going to do? You can't stay in Ditchington.'

'Never mind that either,' he said, again removing his broad-brimmed Stetson. 'What I am going to do first of all is to kiss you, and I don't care who sees me.' They were standing at the entrance to the village, opposite a group of cottages, but he took the girl in his arms and kissed her until she was breathless. 'Do they feel like a ghost's kisses?' he laughed, and kissed her again.

'No, Andrew—no,' she answered, as she clung to him, equally regardless of spectators at the cottage windows; 'but,' as her fears for her old lover returned, 'they'll send you to prison. It's war-time now, and you may be shot. Oh, what would I do then? What will you do?'

'Don't worry, Jessie. I'll tell you all about it. Let us walk along.'

He told her everything, pointing out that as Cadman and herself had failed to recognise him, there was small likelihood that Alfred Maddick would be spotted as Andrew Martin, a deserter, supposed to have been drowned more than five years before, and officially dead. 'Besides,' he added, laughing, 'suppose somebody does spot me. What's going to happen? Seven days' "C.B." while they think it over, and then a lance's stripe, and perhaps a medal for coming back just when I was wanted. That's about all that'll happen to me. What's going to happen to you is more important. So I'm going to ask you a question. Will you marry me when I've done my bit?'

'I will marry you gladly any time,' she answered. 'If you'd been really dead I should have died an old maid, with your death on my conscience all my life. And, oh,' she sobbed, but joyously, 'I didn't want to die an old maid.'

'I should think not,' said Andrew Martin, or Alfred Maddick, which name he had chosen, by the way, mainly because his shirts, handkerchiefs, and collars were marked 'A. M.,' and he kissed her again.

Of course, the Martin family were greatly surprised to find that their ne'er-do-well Andrew (and all enlisted men were ne'er-do-wells in country estimation before this status-altering war) had not, after all, come to a bad end. They were also quite anxious to keep their own counsel, or, as old man Martin put it, 'their mouths shut,' until Andrew had properly joined up, which he did at the end of his forty-eight hours.

As he had not forgotten his drills, or his old skill with the rifle, which happened to be about the only redeeming point in his previous career as a soldier, he was sent out to France with the first draft, as Sergeant-Major Cadman had promised.

(Continued on page 745.)

THE POTTERS OF ALBISSOLA.

By J. B. Underwood.

ALBISSOLA, as many who have travelled along the Riviera, say, from Nice to Genoa, know, is situated in Liguria, not far from the city of Savona. Less known, however, is the fact that the name Albissola is applied to three different localities: Albissola Capo and Albissola Marina, which lie directly on the shore of the Mediterranean; and Albissola Superiore, which overlooks both of these places from the top of a little hill all green in the picturesque depths of the mountains. These three districts, especially the second, are associated intimately with an art which was famous in olden times, and one which also made illustrious the neighbouring city of Savona—namely, the art of pottery, or ceramics, the origin of which is almost lost in classic obscurity. It is certain that the glazed tiles of Savona were already in great vogue in

Genoa and other cities of Italy in the fourteenth century. On this subject Professor Vittorio Poggi, in his descriptive catalogue of the Municipal Art Gallery of Savona—of which he is the director—informs us that the Savonese 'in the good old times' used the majolica tiles, in polychromatic designs, not only for their floors, but also to cover, to a height of about six feet, the walls of the porticoes, as they called, and call to-day, the *atria* and vestibules of their palaces. A fine example of this tiling is to be seen in the palace in Savona known as the Vacciuoli, in the street of the same name. The elements of this decoration were not all of an ornamental design; but alternating with ornamental scenes were figured representations composed of many tiles joined together. There still remain some very excellent specimens of these in the City Museum of Ancient Art at Turin, collected at Savona and bequeathed to the museum by the Marquis Roberto d'Azeglio. These products of the Savonese potteries were exported not only to Genoa and to other towns along the coast, but also to the neighbouring province of Piedmont, where, in fact, are still to be found numerous examples.

As at Savona, ceramic art flourished in Albissola. In the first half of the sixteenth century it fell to the painters of Urbino (whose duke was of the Della Rovere family and of Albissolese origin) to teach there the technique of painting on majolica. And the Albissolese learned the art so well that they were afterwards called to teach it in France.

Professor Poggi, describing a valuable French sculpture of the fifteenth century (now in the Savona Gallery), which for many years was attached to the wall over the entrance to a pottery factory at Albissola, where it served the *gamins* of the town as a target for stones, says: 'It constitutes an interesting record of the relations which existed for about a century between Albissola and France, from the time that Louis of Gonzaga, Duke of Nevers, gathered about him a constellation of Albissolese artists to establish in the capital of his duchy a manufactory of Italian pottery. It is well known that in 1578 King Henri III. gave letters of naturalisation to Domenico di Conrado, a gentleman of Albissola, and that the latter, designated in the parochial register in 1602 as a "master potter," was the founder of the Nevers factory. This Domenico di Conrado was succeeded in the direction of the factory by his son, Antonio, who was appointed in 1644 by Louis XIV. as "*gentilhomme servant et fayencier ordinaire du Roy.*" Antonio, in time, was succeeded by his son, Domenico, of whom all trace has been lost since the year 1673.

'The productions of Nevers from the factory of the Conrados, rightly very celebrated, preserved until towards 1660 the original character of the Albissola majolica during the period in which the influence of the School of Urbino predominated. In design and colour they resemble the stylistic and technical manner of the Urbino pottery; the colours, however, are fewer and less vivid; above all, great use was made of violet of manganese and of orange-yellow, as one may observe in the many specimens that are still preserved in the museums of the Louvre and of Cluny.

'The intercourse of the Albissolese majolica-workers with Nevers, and also with several other regions in France, where they carried on their industry profitably, is sufficient to explain the presence in Albissola of an object of art like this.' Thus concludes Professor Poggi.

Albissola, however, is no longer the enviable nursery of exquisite majolica of the time of the Duke de Nevers. The secret of those marvellous artificers died with them, and as testimony to it, in the fertile country which produced them nothing remains at present but a single relic—a magnificent altar-piece in enamelled tile, representing the Manger at Bethlehem, composed in 1576 by Agostino Salomone and Geronimo Urbinato, to be seen in the sacristy of the church at Albissola.

. . . . . .

There are to-day in Albissola two factories for the making of artistic pottery, but they have only been in existence for a few years, and only one of them is dedicated to the imitation of ancient ceramics. The imitation, however, is good, inasmuch as it finds purchasers even in Holland, a country which is famous for its own pottery productions. But it is always an imitation. The true, original, glorious art is dead. And it is certain that one cannot pretend that it has been revived or substituted, however estimable the present industry of common white and coloured earthenware products may be.

There has, on the other hand, arisen and steadily grown in size and importance an industry much more modest, and without any pretensions to art, which constitutes the most striking characteristic of this region—namely, the industry of pots and pans. At Leghorn, Viareggio, Castellamonte, and Pontedibrenta, Ligurian towns all, there are also to be found numerous potteries. But Albissola surpasses and vanquishes them. Albissola is the land of pottery; in Albissola everybody is a potter, and engaged in the manufacture of pottery. The last census gives the number of adult inhabitants as two thousand one hundred and eleven, and one can rely upon it that there are at least two thousand potters, male and female, old and young, distributed amongst the workers of about thirty furnaces. Pottery is the resource of the country. The Albissolese alone manufacture in the neighbourhood over five million pots annually, in addition to over two millions of various other earthenware utensils. This explains the plethora of these humble products in the streets and

piazzas of the place, extending in long rows for the sun to dry. One sees pottery everywhere, in the centre of the town as well as on the outskirts, on the main street and in every little alley, on the banks of the river and along the sea-coast, drawn up like soldiers of a fantastic army in gray uniforms. And if one walks along the principal street, at almost every door and window one encounters in a hundred different forms the homely but useful domestic pot or pan.

In the backgrounds of the shops, the walls of which are covered with scaffolding holding rows of opaque pots, from time to time one catches glimpses of caverns lit by the vivid glare from a furnace. Human forms are discerned. They are the potters at work. Bare feet working a treadle that operates a revolving wheel; hands that stir and knead; water that trickles drop by drop; visions of phantoms moving in an unknown world, in a life of mystery, in an atmosphere of dampness and of silence. No beating of hammers, ringing of anvils, rasping of files, or harsh buzzing of saws; in these strange workshops the wheels turn silently; the barefooted workers make no noise; the ground is deaf. But the work is hard, just the same. Faithful to the primitive systems of pottery-making, everything here is entrusted to the hands and feet of man.

The refractory earth of Antibo, brought hither by lazy sailing-vessels, is first pounded fine with mallets, and then rubbed through a sieve like flour, after which it is mixed with water and worked into a paste. Great piles of this ash-coloured composition are placed in the caverns destined for the work. A woman takes a lump of it, and after a short manipulation with her hands she passes it to the man, who places it upon the wheel, which he causes to revolve with his foot. The earthen lump is transformed; and the hands of the potter, shaping, pressing, smoothing, assist in the transformation; and presently the pot is completed. It goes to join the others on the long boards to dry by the fire or in the sun, until ready for the process of glazing. Thus, from the rising to the setting of every sun, thousands of pots are born, and in squads, battalions, regiments, go to fill the holds of sailing-vessels or the trucks of railway-trains, which carry them far away from Italy to the wholesale and retail shops of other countries, other cities, whence they finally, one by one, reach the arms of the housewife, and fulfil their mission thereafter on the domestic hearth.

THE BURNING OF KULIMEH.

By W. H. Adams.

THE great world war recalls to one's mind many curious incidents, and the following little adventure, which occurred on the borders of Togoland, the first of the German West African colonies to fall to the Allies, may be of some interest.

Some years ago I was commissioner of a district at the extreme eastern end of the Gold Coast Colony known as the Kitta District. It abutted on Togoland, the boundary being marked by stone pillars which ran straight inland from the beach for some miles, then turned at right angles, then bent off again to the right. In the first of these angles, and just within British country, lay a nest of villages known as the 'Poglu Villages,' some half-dozen in number. These were all fetish abodes, and much dreaded by the natives, being an Alsatia for bad characters from both sides of the frontier. Though some thirty miles from my headquarters at Kitta, these villages lay only a few miles from the German capital town of Lome, and the Germans made a point of driving their undesirable characters over the border into them. The intercourse between the Kittas and the Poglu Villages was very slight, though complaints were being constantly preferred against them. But the Government knew it was a very risky matter to try to enforce the law there, and the villages were left alone as much as possible.

One morning a girl arrived at the fort at Kitta in a very bad way. On her head she bore a large block of heavy wood, to which her left hand had been fastened by a rude staple. She was 'in log,' as the natives express it, an efficient manner of custody; for though, while she balanced the block, she could move about, yet if it fell off she was anchored by it. She had a nasty cutlass-slash across her left thigh, and a smaller one below her left knee. When I saw her she was lying on the ground exhausted, covered with dried blood and with her arm badly wrenched by the fall of the log. She was about fourteen, and not at all a bad-looking girl.

When she recovered she told me that she and her mother were slaves to one Bossoo, a sub-chief of Kulimeh, the largest and most important of the Poglu Villages. Being suspected of trying to run away, she had been put 'in log' by Bossoo, who, in his rage, had inflicted the wounds. Nevertheless, she had escaped, hiding by day and crawling along at night. Always balancing her log, and unable to rest except by leaning against some tree, she had reached the fort after three days' tramp.

This was a matter that had to be taken notice of, for the complaint had been publicly made, and the town of Kitta was agog, but I proceeded as diplomatically as possible. I despatched a polite message to the head chief of

Kulimeh through one of the chiefs of Kitta, to the effect that I should be pleased to see Mr Bossoo at the fort, mentioning the reason why, and saying that I hoped further trouble would be avoided. The messenger took his time, and returned at the end of a fortnight. He informed me that he had seen Bossoo, who said he could not come, as he was going for a walk—a reply that amused everybody but me.

I then despatched a native bailiff who knew the villages well. He returned rather damaged in forty-eight hours, having been compelled to eat the letter I had given him and a portion of his official cap as well. The policeman whom I then sent with a warrant was more fortunate; for, having been seen and chased before he got near the town, he had embarked on a long-distance run which had ended only at the fort. This closed the matter for the present. Making war on the Poglu Villages was a serious business, for which the forces at my disposal were quite inadequate. The girl recovered, and at her own request was absorbed into the household of one of the chiefs of the town.

The little incident which I shall now relate seems funny, though it did not strike me as being so at the time. The native bailiff presented himself the day after his return, looking rather peeky and piney. His wife, a very voluble brown lady, produced a large brass button. She stated that the bailiff had been compelled to swallow two of these. One had been recovered at the instance of a violent emetic; the other was still missing. She requested, not that the bailiff's internal arrangements might be further assisted, but that compensation might be given for the loss of the button. This was done to the extent of two shillings, and the bailiff departed with the button, as his wife expressed it, 'yet concealed about his person somewhere.'

About six weeks after these events I left the fort in my hammock with my interpreter, a police orderly, and the usual crowd of carriers and servants, to inspect a road the Government was making directly inland and towards the angle of the German frontier. Its superintendence had caused the death of my predecessor from blackwater fever. The road crossed a dry lagoon, a vast evil-smelling embankment of black mud, straight into the low, hot scrub. My hammock passed between rows of toiling natives digging out the ditches on either side; and at last, after a long and exhausting march, I reached Road-Head, a temporary leaf-made village, where I passed the night. The people seemed perfectly friendly, bringing the usual gifts of eggs and yams.

I had no map, nor was I well acquainted with the lie of the country, though I was aware that I was travelling parallel with the Togo boundary-line, and only some few hundred yards away from it. Next morning I determined that, instead of returning by the way I had come, I would branch off to the left and try to find a way along the back of the lagoon. I knew I must be close to the Poglu Villages, but this did not trouble me, as I had not the least intention of interfering with them, and they certainly had the laugh on their side as regarded Bossoo.

I left Road-Head fairly early, and struck off into the scrub along a track so narrow that the hammock had to be slung sideways on the pole, and I had to tramp it. The country was very rough, the path rising, falling, and twisting till I had lost all idea of direction. The bushes grew thicker and more crowded, till we marched between two walls of green twelve to fifteen feet high. Still, we made good progress, and marched on till past eleven o'clock, when my interpreter pointed to great trees rising above the smaller vegetation, and said we were close to some village, where we had better halt. I agreed, and, rounding a clump of bamboos, we found ourselves in a large 'kroom,' the mud-houses of which were heavily thatched and separated from one another by heavy, coarse mats. In the midst of the open space stood a great baobab—evidently the 'palaver' tree, beneath which the village council assembled—and a small cluster of tall coco-nut trees in full fruit. I sat down under the big tree, whilst the carriers scattered in search of food, and my servant began to prepare breakfast.

It did strike me as peculiar that no one was to be seen, for, though the men may be absent when a white man halts in a village, the women and children flock out to stare at him, and the chiefs and elders are in evidence. But this large and well-kept kroom seemed absolutely deserted. My simple breakfast was soon eaten, and having told the orderly to warn the carriers to be ready in half-an-hour, I was watching my servant, who had placed his boxes on a small mound of sand and hard clay, when a little man suddenly appeared, and crossed the open towards me. He was naked except for a loin-cloth and a peaked straw hat, but carried a long-necked calabash covered with a network of cowries, which he rattled as he walked. He came straight up to me, and, after a good stare, began to promenade backwards and forwards. He was not an ill-looking man, and I was beckoning him to approach, when my interpreter, whom I had not seen since we entered the kroom, touched my arm and asked me if I knew where we were.

'I suppose we are in one of the Poglu Villages,' I said, 'but I don't know which.'

'It's Kulimeh,' he said quietly; 'and that man in front of you is Bossoo, the man we have been wanting.'

Now, there were two danger-signals confronting me, either of which, with my experience, I ought to have read easily—one, the emptiness

of the village, which meant the people did not want to see the white man, and therefore were purposely keeping out of the way; the other, the arrogance of Mr Bossoo. I should have departed quickly and as quietly as I had come. But I lost my temper, and paid the penalty.

'Ask him,' I said, 'if he is Bossoo, and if he is the man that attacked and logged the girl, and was told to come down to the fort.'

To this Bossoo nodded his head.

'And is he coming?'

'No, sir,' said the interpreter. 'He says he has no time.'

'Then why,' I demanded, 'has he come before me like this?'

'He says, sir, he wanted to see what you looked like.'

Most of my hammock-men had come up by now, having been unable to procure food, and were staring at Bossoo, who was quite unconcerned.

'Tell him,' I said roughly—for I was very angry—'that he is now under arrest, and that I shall take him down to Kitta.'

Immediately this was interpreted Bossoo began to walk off. I caught hold of his waistcloth, but he broke away, leaving it in my hands. The policeman then jumped on him, and they rolled over together. Again Bossoo broke loose. He sprang on to the top of the little mound, sending my boxes spinning, and began to shake his rattle.

Then things happened. The open space filled with a mob of howling savages armed with guns, cutlasses, and long sticks. We were surrounded at once, and though the open space was packed, more and more men came pushing out from the houses, where they had been hiding, and tried to force their way towards me. The policeman, who was a plucky man, produced a pair of handcuffs and made another grab at Bossoo. Very fortunately he missed him, and was sent staggering with a blow over the head from a long stick. I saw my carriers, who were standing by the hammock, which they had replaced on the pole, spinning round and round in the press, and I caught a glimpse of Mr Bossoo being slapped on the back by his friends. Evidently he was not destined for the fort that time. So great was the riot that the interpreter had to shout in my ear.

'We must go, sir,' he said, 'if we can get away now; but I don't think we shall.'

When I looked at the furious crowd I was inclined to agree with him. It is difficult in such circumstances to be very accurate, but there must have been between three and four hundred grown men there. I saw one brute hit at a carrier with his cutlass and cut his arm very severely.

I jumped on to the mound, waving Bossoo's rattle, which he had dropped when the orderly had grabbed at him, and which I still possess. 'I'm going! I'm going!' I shouted. 'But I will return!'

The men with the hammock having by good fortune been pushed up close alongside of me, we threw the stunned policeman into it, and started to shove our way through the crowd out of the village.

I believe an Irish mob is not wholly inarticulate, and I understand that Indian rioters can make themselves heard; but for real solid uproar I can recommend an infuriated crowd of West African savages engaged in baiting a white man. Guns were thrust in our faces and sticks fell heavily as we shoved our way to the forest. There was no question of irritating the people to be considered now, so we pushed our way and kicked our hardest. I do not know how we got out, but I think it was due to our having failed to secure Bossoo. Had the policeman managed to handcuff him I feel sure we should all have been killed. At last, however, we reached the mouth of a little track that ran into the bush, and I was hoping that we were through with the worst of it, when a line of men slipped past us, each carrying a gun. One of them hit me heavily on the back, shouting that they were going to ambush us. There was nothing for it but to go straight ahead; and ahead we went, and raced along the track. We heard the voices of the men with the guns shouting and calling, and we could hear the village behind us humming like an overturned hive. But we were not molested, and after a breathless twenty minutes we left our enemies behind us and were clear of the scrub. I called the roll, and found we were all present. Then, after we had recovered ourselves, we made our way, sore and bruised, to the fort.

This business was the last drop in the Poglu Villages' cup of iniquity. The Kulimeh people had been several times reported to different governors, once in particular for shooting a Hausa orderly dead as he stood by his officer's side under the big baobab-tree; in memory of which feat they had, as I afterwards found, erected the little mound on to which I had jumped. Though the outrage was absolutely unprovoked, they had gone scot-free. But the present governor was not a man to be trifled with.

At the end of a very unpleasant week, during which I received many furtive sneers and glances from the Kitta people, a telegram in cipher arrived from headquarters to the effect that a force of Hausas was on its way down, that I was to go up and burn and utterly destroy Kulimeh, to pull down any walls that the fire might leave standing, to use rifle-fire if necessary, and to see that the matter was settled once for all. To this the private secretary had added, '*Delenda est Kulimeh*,' and though his Latinity might be faulty, his meaning was clear.

The next day, accordingly, as I watched the crowds in the busy market-place, and had just

heard the word 'Kulimeh' mentioned with a sarcastic laugh and a wave of the hand by a native who was just setting out for the bush with a heavy load upon his head, a force of fifty Hausas, headed by Native Officer Ali, a fine fellow who had grown gray in the service, and was an extra A.D.C. to the governor, swung into the market-place. The people scattered in all directions, and the gentleman who had alluded to Kulimeh dropped his load and fled shrieking in the direction of Timbuctoo.

It was unfortunate, though not surprising, that I should go down with fever the next day. I had been off colour for some time, and was very much run down. I had a bad time of it, for I dreamed of ambushes and of men shot in hammocks, and my nerves began to go. But the matter had to be carried through, and directly I was better we started off in great style. Each chief of the town sent representatives, and what with the civil police and the hammock-men, and servants armed with weapons assorted, and the taciturn Hausas in their blue knickers and shirts and red sashes and fezes, we made quite a show.

As we traversed the dry lagoon-bed I saw a crowd of men hovering in our rear. These, I learned, were civilian Hausas, armed with sword and spear, who were accompanying their professional brethren in hope of loot. Three times I sent a message that they were to go back; but though they disappeared for a time, I saw them afterwards in Kulimeh.

We crossed the lagoon and the hot, scrubby plain, and stopped as darkness fell at Echi, a hamlet three miles distant from the doomed town. The night with us passed quietly, but there was no sleep in the Poglu Villages. Nemesis was upon them, and I do not think Mr Bossoo was a popular man just then. Drums roared and boomed and horns screamed all through the dark hours. The fetish priests were endeavouring to avert the disaster they had so long courted. What sacrifices were offered in the Poglu Villages that night I do not know.

There being no question of a surprise, we took matters easily, and did not march till eight o'clock. Then came the nerve-trying part, for, though I was sure the people would not face the Hausas, the forest was exceedingly dense, and Dane guns fired at close range are deadly enough. There was drumming in the villages around, but Kulimeh itself was deadly quiet as we approached, though there were movements in the bush on each side of the track, and every minute I expected to hear the roar of the guns. But my apprehensions were allayed when I saw the soldiers were marching with slung carbines.

We entered the village without opposition. The soldiers formed up, and I sat down on the familiar little mound. I had been there some few minutes, when the civilian Hausas whom I had seen at the start and ordered to return suddenly appeared, pushing through the bushes. I then understood they had been acting as beaters on the flanks of the little column, which accounted for the noises I had heard. Three of them entered a house near by, but came out quicker than they went in, one with his hand nearly severed. Two soldiers then went in, and, after a struggle, hauled out the defender and tied him up to a tree. Incidents of this nature were in progress all around me, for, though the great body of the people had gone, some had remained to protect their hearths. The open space became covered with things that were fetched out of the houses, such as stools and clothes, and there was a little puppy, which my servant secured. Drums and horns were going in the neighbouring villages all this time, and old Ali decided to wait an hour to give the people a chance of fighting if they wished to.

I seized the opportunity of taking a good look round. I found that the town was built in a circular clearing, the forest wall which surrounded it being very thick and high. It was a larger place than I had fancied, the houses being very closely packed, and surrounded with great straw mats ten or twelve feet high. After I had finished my survey, I turned to look for Ali, and found him standing by a pile of these mats which the soldiers had pulled down and heaped up as high as a hayrick.

'I shall begin now, sir,' he said. 'There is no sign of the people.'

'They are watching from the forest,' put in the interpreter.

'Jump on to the mound and call Bossoo,' I said.

He jumped up and shouted, 'Ho, Bossoo! Ho, Bossoo! The Government has come for you. Bossoo! Bossoo! Bossoo!'

There was no answer. Two soldiers set fire to the heap of mats, and others ran among the houses with lighted brands. The weather had been very dry, and the thatch caught like tinder. Great masses of sparks flew in all directions. The huge pile of mats ignited with a roar and a blaze. Kulimeh was fairly alight.

Suddenly a great drum roared from the forest, and the concealed natives poured a volley of slugs from their long Dane guns. The soldiers lay down and returned the fire. The noise and confusion were very great; the heavy smoke, which had no room to rise and spread out, began to cover everything. The roaring of the flames as the fire took hold drowned even the noise of the guns and the carbines. Dozens of little red kegs of gunpowder hidden in the thatch exploded like shells, and even the damp evergreen forest crackled and blackened. The smoke grew so thick that it was almost impossible

to breathe and quite impossible to see or move about. The risk of being shot by the natives or the Hausas had compelled me to keep quiet, but the place was becoming a furnace, and I grew alarmed. I could find no one, and my loudest shout was unheard. To make matters worse, the great baobab-tree caught fire, as did the coco-nut trees, waving and bending like enormous torches, and dropping their heavy nuts from a height of fifty feet or so. I threw my coat over my head and shoulders and stumbled blindly forward. By great good fortune I collided with my servant, who was looking for me, and he and a hammock-man helped me into the forest, where I found most of the others assembled. I got rid of my charred and burnt clothes, and after a long drink of whisky-and-water felt revived. Two Hausas and fifteen men of the auxiliaries had been hit by slugs, but none were badly hurt. What damage had been inflicted by the soldiers' fire, of course, we did not know.

When the fire had died down sufficiently we saw the ruin we had caused. Not one house was left intact. The heat had been so great that the thick mud walls had split and crumbled to dust. The great palaver tree was gone, and not a vestige was left of the palm-trees. In fact, so fierce had been the heat in that confined space that the ground itself was powdered and loosened. I walked about among the ruins, pushing down bits of wall that were still standing, when I heard a crying in the forest, and went to the spot, to find a small and very ugly soldier standing over an ancient and very bald man, and slapping his face. When, in response to a smack, the old man's head rolled on one shoulder, the soldier would knock it back again with a bang on the cheek. At each smack the aged man wailed, and the soldier remarked on the slain orderly in memory of whose murder the Kulimeh people had erected the little mound.

Rescuing the aged man, I found he was a sub-chief who had crept back to see what had happened. He told me the people had been gathered together to attack us under cover of the smoke, but the fury of the fire had so terrified them that they had dispersed in panic. Probably he spoke the truth, for all sounds of drumming had ceased. I questioned him as to the whereabouts of Mr Bossoo. He said that gentleman had fled into German territory the previous day.

With a last look at the ruins of the village that had been such a thorn in the side of the Government, we formed up and departed for home. Next day I telegraphed the result of the expedition to the private secretary, and, not to be outdone by him, added, '*Deleta est Kulimeh.*'

But I never got Mr Bossoo.

Togoland was the first German colony to be taken over by the French and the British. The Poglu Villages are quiet enough now, for there is no frontier for the natives to jump over and escape their misdeeds. Perhaps even Mr Bossoo may mend his ways and become a recognised supporter of the British Government, and he may remember with mixed feelings his little adventure when he refused to obey the law and come down to the fort.

THE VISION.

By Lady Alice M. Buckhill.

I LAY me down to sleep; and, lo!
A Vision came:
A great white throne,
And on it seated God: alone.
And, as to earth His eyes He turned,
A righteous anger in them burned.

Below, the nations of the world
Waged furious war
On every hand,
Unceasing both by sea and land.
And God turned to the Christ, who stood
And gazed upon the scene of blood.

'Was it in vain I let Thee go?
For this Thou diedst
And suffered so
Nearly two thousand years ago?
Where all should have been peace and joy,
Men plunder, murder, and destroy.'

Then from the earth there seemed to come
Straight up to God
A people's prayer:
'Hear us, O Father, hear, and spare.'
And God turned to the Christ again:
'Such prayer must never be in vain.

'Some monster hath from hell broke loose
With all his band,
Thinking to be
Omnipotent and conquer Thee.
Send forth my messenger to chain
This monster back to hell again—

'And bring my people back to me
Repentant now;
Just for a time
They had forgotten they were mine;
All careless that the path they trod
Led them *away from*, not *to*, God.'

And then a myriad tongues I heard,
Sending, it seemed,
With one accord,
A great thanksgiving to the Lord.
Breathless I watched, to see it there—
A world upon its knees in prayer.

And as the voice of prayer and praise
Rose on the air
Christ's gentle hand
Touched, as it were, that sorrowing band.
'Nay, weep not for your noble slain;
Their lives have not been given in vain.'

Then in an instant all was dark;
The vision fled.
But in my mind
A holy calm it left behind—
A peaceful trust to lead us on
Till final victory be won.

THE MYSTERY OF ANDRÉE.

By REGIMENTAL No. 5626.

THE brilliant summer of 1897, ever memorable as that of the Good Queen's Diamond Jubilee, is for other reasons memorable also to two widely different spheres of thought, the aeronautical and the geographical; for it was in July of that year that Andrée made his attempt to reach the North Pole by balloon.

To-day the aeronautical world treats the balloon as a mere toy, so rapidly has man acquired the instincts of the birds; and for the geographical world whatever there was of mystery in the North Pole has been dispelled. In consequence, the history of Andrée (which is pitifully short) has mostly been forgotten.

At the north-western extremity of the Spitzbergen group of islands is the tiny Dane's Island, separated from the North Pole by a distance of approximately six hundred geographical miles. From this frozen spot Andrée rose in his gigantic balloon in the month of July in the year 1897. In those days Count von Zeppelin was still an experimenter; so Andrée's balloon was entirely at the mercy of the wind. He rose, then, with a favourable southerly breeze, hoping to cross the Pole. Close to his point of departure he let fall some buoys with messages attached, three of which were afterwards picked up. And that closes the history.

Twenty years ago. It may fairly be presumed that the party perished; and if they are dead, there is not much mystery about them, you will say. Quite so. The mystery is—did they reach, or pass over, the Pole; and where do their remains lie? To that there is an answer. Is the answer true or false?

It must here be stated that the story we are about to relate was told in the Canadian press about thirteen years ago, with what fullness the writer is unable to ascertain. Nor can it be discovered how much attention it attracted at the time, if any; but it would seem to have been very little. It so happens that the present writer has been considerably interested in both aeronautics and Arctic travel for the past fifteen years, and cannot recollect having read a single statement on the subject of Andrée's balloon which pretended to give anything more definite than what has been related—that he rose off the earth, and was never afterwards heard of.

The foreword to Peary's book, *The North Pole*, published in 1910, deals with the history of Northern polar research. In it we find these words: 'Andrée, with two companions, sailed in his balloon toward the Pole in July 1897, never to be heard from again.'

So the following story, if not fresh to all, must nevertheless be so to the vast majority.

It will be understood that the Barren Land of Canada is a land of far distances. Over its vast area are scattered portions of a race, the Eskimo, divided up into tribes, which further split up into groups of families; a proceeding very necessary when it is remembered that the deer, on which these people are entirely dependent for their food and clothing, are as widely scattered as the people themselves. But, man being a gregarious animal, these families are constantly intervisiting; and, further, there is, so far as one can see, an annual meeting of portions of each tribe. This meeting serves a double purpose; for on these occasions the more northerly tribes trade the furs which they have caught during the past season to their southern neighbours, who, maybe a year later, trade them again with their southern neighbours. And so the chain goes on, until the trading outposts of civilisation are reached. So we see that here, as in all other quarters of the globe, the moccasin telegraph is a service of high efficiency.

Andrée, long before his start, had been in communication with the Hudson Bay Company, with the result that all their remote northerly trading-posts knew of the possibility of his landing in Canada. This information was handed on to the Indians and Eskimo who came to the posts, so that the less isolated Eskimo were aware of the possible entry of a white man into their country by the strange medium of the air.

In what must surely be the bleakest and most depressing spot in all the sub-Arctic and sub-Antarctic regions, at the mouth of the long arm of the sea running in from the north-west coast of Hudson Bay, at the entrance to Chesterfield Inlet, there stands a lonely mission station, from which two priests of the Order of Oblates carry on their work. The head of this mission, the Rev. Father Turquetil, was at one time stationed at Reindeer Lake, on the edge of the Barren

 [*All Rights Reserved.*]

Lands. It was through him that the story about to be related was first sent out to civilisation, and it is through him that the present writer is able to redirect attention to it.

About thirteen years ago, and long after the tragedy, Father Turquetil made a trip by dog-team and sled north of Reindeer Lake. At the edge of the Barren Lands he fell in with a party of Eskimo bringing in a load of furs to the trading-post. They, of course, camped together, and during the evening the Eskimo, whose intelligence is equalled by their curiosity, inquired from the priest what kind of a ship it was in which the white man travelled through the air. Many questions were asked and answered; after which there was a long talk amongst themselves in the rapid, guttural form of speech which they sometimes adopt when they do not wish the white man to follow the conversation. Then they once more approached the priest with their story.

The men who were speaking had, on a previous occasion, gone northwards to trade with some northern Eskimo. Whilst they were in camp a deer passed. An old man of the northern tribe ran out with his bow and arrows—till recently the only weapon of the more remote Eskimo—to stalk and slay the deer. The southern Eskimo, to play a trick on him, let him go; but as soon as he got within the short range required for a kill with bow and arrow, a rifle was brought into action, and the deer shot dead from the camp; for the southern Eskimo, being closest to civilisation, were armed with its weapons.

The old man, returning to his fellows, inquired with much astonishment how the deer was killed from that distance. He was shown the rifle and its working by his amused companions; whereupon he, in his turn, surprised them by remarking, 'Then there was a narrow escape for me when the white man did that at me with a little gun, like that one, but shorter.' He then went on to tell how one day, long ago, he shot a deer with his bow and arrow. As he commenced to skin the beast two white men ran up, and claimed the deer as their own—a statement obviously untrue to the Eskimo, because impossible. A quarrel ensued. The native, fearing the odds (let it be remembered that timidity is at the basis of the Eskimo character), drew his bow and shot one of the white men dead. The other white man, from but a little distance, began to fire with his 'little rifle,' but the Eskimo, with the courage of utter ignorance, calmly loosed another shaft, which found a billet in the right side of the *kabluna*, wounding him mortally. A dog, 'a very little dog, with hair all curly like a young fawn,' ran up to the old man, barking at him. He kicked it away. The old man added that the white men had made a kind of tent out of the bag of the balloon.

From this point the southern natives become the chief actors in the story. They inquired of Father Turquetil if there were things made of white iron (aluminium?) and red iron (copper) in an airship. Had it got this? Would it have so and so? Was there a such and such? All manner of questions they asked; so many that the priest was at length forced to tell them that he had never seen a balloon, and could not answer all their questions, which were extremely technical. They spoke also of having seen a large net which the bag was enclosed in, and of having seen parts of the rigging of the balloon in use on the sledges of the northern Eskimo. So much for the story.

The place where the fatality occurred is somewhere between Baker Lake and Bathurst Inlet, a large stretch of country lying to the north of the centre of the Barren Lands. Father Turquetil, by means of moons and winters, managed to calculate back to the approximate time of the disaster, and this corresponded with the probable time of descent.

Follows a truly native touch. The day after the tale was told to the priest, the leader of the little party came to him, and told him that the whole yarn was false! Later, however, while he was questioning a young man of the party about it, it transpired that the head-man had told them to say nothing further. If they did, he said, the white men would come into their country and kill them all. Of course, no more was to be got out of them after that. If any one doubts the Oriental origin of the Eskimo, let him study the impassive secretiveness they can, on occasion, assume.

There are at least two remarkable points about this story. If it is untrue, a savage has invented a new weapon and a new animal. The Eskimo is intelligent, even remarkably so; but such flights of imagination are beyond the reach of most white men.

But the creative faculty is not the strong point of the Eskimo. How can it be? He has his weapons, long since invented by his ancestors, and the country is so sterile in every resource that invention dies from lack of sustenance. The Eskimo has all that he needs except a plentiful supply of food. And the genius who can invent that has yet to see the light.

The story is too circumstantial to be anything but true. And since it must be true, then the mystery is solved. Andrée missed the Pole by about one hundred and fifty miles, and he and his companions lie silent in a silent land.

JOHN PARDON'S CHOICE.

CHAPTER XI.

AS time slipped along and there was still no sign of old 'Tom' and the phaeton, Pardon began to feel less anxious; his mind strayed to other subjects, and inevitably led back to Joy Powell. Thinking of her, he raised his eyes to the bend high up on Cañon Hill, on the same side of Dry Creek as himself, and above, though opposite, the road by which Mary Patrick might come from Oak Clearing. And, as he looked, suddenly there broke upon his ear a sullen, reverberating roar, a thunderous rattle of loosened rocks and falling earth, and Pardon, starting to his feet, beheld a great yawning scar in the side of Cañon Hill, where tons of rock, soil, and trees had broken loose and fallen into the depths below, causing a perilous cave-in of the road winding along the edge. Staring with wide-distended eyes at this second assault by Nature's forces on the long-travelled road by Cañon Hill and Dry Creek, Pardon muttered to himself, 'Well, they do say "it never rains but it pours," and, sure enough, here's not only the ford clean swep' away, but a "gouge" like the Kentucky Cave in the side of the hill. Can't quite make it out,' he continued, craning his neck and straining his eyes in the direction of the wash-out, 'but I reckon it's pretty well chewed out the road—nothin' but a shelf left. Lucky thing, after all, that Dry Creek is all afloat, for if Mary or any other body *had* crossed the ford'—— He broke off with an involuntary shudder and an anxious glance again up the road by which he felt there was still a chance of Mary coming. No sight of her, however; and once more the keen gray eyes narrowed themselves in a searching look towards the sore red gash in the cañon's side. Then all in an instant, as though some deadly blow had struck him, the man suddenly reeled, caught at an overhanging bough, and with iron will steadied himself—steadied himself to stare, with cracking eyeballs, at an object moving among the trees, slowly but surely, towards that awful, hidden death-trap. Yes—oh God! there was no mistaking the silver-gray flash of a horse glinting among the trees, no mistaking the light figure and the blue scarf fluttering in the sunshine. It was Joy—Joy—Joy—*his* Joy—his sunshine—the darling of his heart—Joy and her silver-gray mare mounting at foot-pace up that sunlit road, moving step by step to an almost certain death! A cry of anguish rent the air as John Pardon, fighting a faintness that nearly overcame his senses, dashed through the bush, wildly—but, alas, how vainly!—waving his feeble little flag. Useless—utterly useless. That dark speck far below in the shadows of the cañon would not, *could* not, be seen. Half-mad with despair, Pardon buried his face in his hands, not to *see*—oh God, not to *see*—— If he could but *pray*. Yes, with parched lips he sent forth the utterance of his whole soul to the 'Good Man,' and there was a chance—just a *chance*—that the wonderful instinct implanted in the horse might hold her back even on the very edge of that yawning chasm. Even as the thought, fraught with so faint a hope, rushed through the man's distracted mind, there was a sudden dip of the mare's fore-quarters. Pardon, unable to keep his eyes from the fearful sight, saw her lose her footing as though she must surely pitch forward—saw Joy bravely pulling on the lines—saw the mare with mighty effort scramble to her feet and recover herself, as her rider, in an insane but utterly self-immolating impulse to save her horse, disengaged her feet from the stirrups, and pitched forward—forward——

CHAPTER XII.

WHETHER it was seconds or hours that had passed when next John Pardon was conscious of a living world around him his dazed mind had no conception, but in an instant the whole horrible scene flashed back upon him, and, staggering to his feet, he forced himself to look. With eyes trained to far-sight by his early years spent on the plains, where a man must sweep dim horizons for dots of missing colts or calves, he now, in an agony of hope and fear, searched the cañon-face, and presently made out the object he sought. Not many feet below the wash-out over which Joy Powell had fallen, a young birch-tree, carried down by the caving earth, was flung forward, outstretched over the abyss like a supplicating arm, yet still clinging desperately by torn roots to its native cliff. There, in the slight cradle of slender bows, the falling girl had lodged—safe for the moment, but, as John Pardon realised only too clearly, still in great peril. Well he knew that at any instant the birch, its feeble hold on the earth weakened by Joy's weight, might altogether break away, and, bearing with it its precious burden, dash to destruction among the rocks far below. The need for instant action recalled him sharply to his senses, and all his powers of mind and body, recently so shaken by shock and suspense, were now braced and steadied. Not a moment must be lost if Joy was to be rescued from her awful position. With utmost speed he must race up that steep hill—must get the long lines from the mare's bridle (he could see her, all-unconscious of her gentle mistress's fearful

plight, browsing quietly on the roadside)—must—must—— His mind rushed forward faster than the feet which seemed to hinder rather than help him as he struggled through the dense undergrowth, and which suddenly seemed to be rooted to the ground as something moving on the opposite side of Dry Creek caught his dismayed eyes. It was Mary Patrick slowly descending the road, steadily urging old 'Tom' towards the well-known ford, where now were only swirling waters.

Desperate at even briefest delay, and scarcely crediting that Mary could fail to understand his signal, he flapped his flag, waved his arms, and shouted with all his strength. Yet on she came—nearer—nearer. Another moment and the old horse would be floundering in the deep stream. For Mary—poor foolish Mary—*had* seen, but, with pique and anger in possession of her heart, fatefully, if not wilfully, misunderstood. Far up the road from Oak Clearing, through a break in the pines, she had chanced to glance across the purple, misty cañon to the opposite side—had seen Joy and the gray mare emerge from a bush trail. Then the dense leafage shut out further view; she knew nothing of the terrible accident that followed a few moments later. So, when, as she neared the sharp abutment of the road upon the creek, she descried John Pardon waving to her, the jealous resentment long smouldering in her mind flared into sudden flame. Without doubt, she angrily assured herself, she had surprised a tryst between John Pardon and the English girl in this sequestered spot; there was no truth in his plea of working on the roads as excuse for not driving her to Oak Clearing; it was all a miserable subterfuge. With a savage cut of the whip she spurred her horse into a brisk run down the last bit of hill, jerked him sharply round the bend, and then—but, alas! too late—realised her own blind folly. Old 'Tom' struggled and slipped, the light body of the phaeton tipped and rose on the flood, and a cry of terror escaped from Mary Patrick's lips. Above the roar of the water Mary's cry of distress reached John Pardon, torn between anxiety for the woman to whom he felt himself in honour bound, and anguished haste to succour her who had become the absorbing passion of his maturer years. But for such as John Pardon there could be but one choice where duty and desire pointed diverse ways. With one last agonised look at the far speck on the scarred face of the cañon, he retraced his steps a bound at a time, tore off his heavy boots, and battling against the swift current, seized the horse by the bridle, with quick strokes of his knife freed the poor creature from the traces, and rescuing the panic-stricken woman from the whirling phaeton, fought his way back with her just as old 'Tom,' snorting and trembling, scrambled up the bank beside them. Although to the tortured man every moment seemed an eternity, he controlled himself until poor Mary, sorely shaken and miserably wet, had sufficiently recovered herself. Then, tersely and in a voice full of such suffering as Mary had never heard before, he explained all the circumstances—how, finding Dry Creek in flood, he had waited there to warn her; of the cave-in on Cañon Hill; of Joy Powell and the terrible accident. 'And now, Mary,' he hurriedly concluded, 'for God's sake, go home as fast as you can! Take the bush trail up to my ranch. You will probably soon meet Michael O'Keefe, for he was to cut poles there this afternoon. Tell him to bring ropes and a wagon. I may need help if'—— He broke off, unable to voice the terrible fear at his heart.

'Oh John, John,' sobbed Mary, now filled with remorse, and completely breaking down, 'can you ever forgive me?'

But John Pardon neither heard nor heeded. He had already forgotten Mary, and with starting eye-balls and ashen face was staring upwards to where a light cloud of red-brown dust floating above the misty depths of the cañon told that the stricken birch, no longer able to retain its precarious hold, had dragged its last anchor and fallen to its doom. Then indeed such a cry of despair rent the air, so cruelly sweet with the thousand scents of spring, that affrighted jays fled screaming from the trees; while its echo rang for many a day thereafter in the ears of Mary Patrick, whose horrified eyes beheld John Pardon tearing his way through bristling bush that guarded the cañon, and vanish from her sight.

CHAPTER XIII.

OF how John Pardon, reckless of sliding earth and rolling stones, accomplished the perilous descent no tale can be told, for from his own memory was every incident blotted out until, with bleeding hands and torn clothing, he knelt beside the still, white form of Joy Powell, lying limp and shattered like some fair flower wantonly plucked and tossed away. Tenderly lifting her in his arms, he carried her to the cool shadow of a giant boulder, and gently laid her down among the vivid green of moss and fern. Then, filled with an awful fear, he laid his head closely but reverently against the full, rounded bosom, listening intently for the beating of her heart. Yes—thank God!—faint, very faint, but still beating. Then surely she shall—she *must* live; else better far that his own life be wiped out with hers, far dearer than his own. Oh for some power to rouse her from that awful stillness—to make the pallid lips speak, the closed eyes open! Cradling in his arms the small head, about which, riding-hat and pins being torn away, the masses of sun-gold hair tossed in bright waves, John Pardon chafed alternately

her cheeks and the slender fingers lying so cold and nerveless in his own hot, brown hands. Still no sign or movement in the slight form resting all-unconscious so close to his strong, throbbing frame, and, in anguish of spirit, John Pardon began calling her: 'Joy! Joy!—darlin' little girl!—it 's me, John Pardon. Open those dear eyes and sweet lips! Speak to me, Joy—for God's sake, speak—I cannot live without you!' A tremor through the light body stretched across his knees, a short, sharp sigh, a quiver of the white lids; then the large eyes opened, so full and dark with pain that their blue was like the distant vault of a tropical summer night. And in their depths poor John Pardon, gazing, beheld—beheld, and in infinite sorrow recognised—such a look as once, years before, he had seen, never to forget, in the eyes of a doe which by some wretched mistake he had mortally wounded. At sight of this look in the eyes of the girl who had become so closely and strangely bound up in his own life, John Pardon's great, loving heart, so long tried, at last broke. With tears pouring down his tanned cheeks, he bent his head, passionately kissing the sweet, pale face.

'Joy! Joy!' he cried. 'Live — live — you *must* live! Don't you know that I, John Pardon, love you—love you, dear?'

Then, as his own eyes, full of mingled love and grief, searched hers for he knew not what ray of hope or comfort, lo! into the beautiful eyes of the dying girl sprang a glad light; over her face, white as ivory, crept a flush, faint and fair as the last pulse of twilight; while an expression of perfect peace and content seemed to envelop her.

Once again the bright smile which John Pardon so well knew and loved curved the small mouth, and upon his ear, straining to hear, fell, very low but clear, 'And I—love—you—John!' The cold white fingers sought and intertwined in his work-roughened ones, tightened their hold, as though seeking support for the last long step, while the fair, bright spirit of Joy Powell, unfettered and quite content, broke away from her lover's close embrace, again to mingle, so it seemed to John Pardon, with the golden sunshine, of which for a brief while it had been a tangible part. Henceforward for him—gray skies and a darkened world; then 'Joy at the last!'

. . . . . .

A few years later than those during which the foregoing chapters are laid, summer tourists, with luxurious motor-cars, *en route* for the mountains, passing through the sun-baked town of Orangeville, might speedily ascend by a well-built, easily graded road that swerves away sharply from the great, misty-blue cañon. Possibly the man at the wheel, fresh from the pages of the 'local guide,' pointing out a ragged line against the cañon-face, might remark above the purr of the engines, 'What do you think of *that* for a road? Understand it was the pioneer trail—cowboys, coaches, and all that sort of thing. Bad accident here. Girl and her horse went over the precipice.'

'Accident! *Suicide*, I should say!' may be the laughing rejoinder, as, quickly dismissing from his careless mind this tragic bit of 'local colour,' the traveller becomes engrossed in the merits of his car.

Now striking the level road, the car glides along through the broad acres of a thriving ranch, perhaps for a brief moment slowing down before a neat modern house, set about with trim flowerbeds and young shrubs, from whose gate emerges the tall, well-built figure of a man in loose shirt and broad-brimmed hat, who, waving a salutation in kindly Western fashion to the passing strangers, crosses the road. Then, while in a swirl of hot, gray dust the car vanishes out of sight, he unlocks the door of an old bungalow with close-drawn blinds, and passing through the empty rooms, steps out into a shady porch, lavishly wreathed about with fragrant honeysuckle and climbing roses. There, baring his head with its thatch of grizzled hair, he stands looking long and steadily towards where the westering sun just begins to touch into gold a pine-crowned ridge of hills. In the gray eyes gazing so earnestly a close observer might have felt puzzled by an expression of ineffaceable sorrow, while yet about the kindly mouth were engraven solely lines of tenderness and gentle humour. Presently, with an abrupt start, as of one who recalls his thoughts from journeying into a forbidden country, he dives into his trousers-pocket, and pulling out some lumps of sugar, utters a shrill whistle. A loud neigh answers the familiar call, as from among the trees of a well-grown orchard there gallops a gray mare with flowing silver tail and mane, and stops short eagerly to accept the proffered sugar and caresses. Then, when, satisfied, she returns to grazing, her master stoops, and with kindly hand fondles an old gray cat, who, hollow-eyed and with shrunken quarters, had followed him through the house, and now rubs herself enthusiastically against his legs. 'Good old "Sal"—poor old pussy!' he croons. 'Wantin' your milk, eh? Come along, then;' and with 'Sally' trotting stiffly before him, he re-enters the house. Taking a dish from a bare shelf, he fills it with milk, and, rolling a cigarette, waits patiently while the old cat slowly laps it up. But when, the milk finished, he leaves the house, and calling 'Sally,' closes and locks the door, his faithful friend remains on the worn mat. 'Not comin' across, eh, "Sal"? Still determined to stick to the old shack? Better come along with me, "Sally,"' he coaxes; but she merely stares at him with a half-reproachful, half-questioning look in her green eyes, then settles herself resolutely in her long-accustomed place. 'Queer beasts cats!' ruminates her master, as

he recrosses the dusty road to the opposite house. 'Never seemed to take to the new place. Well, I don't blame you, "Sally." Can't say I feel quite at home there myself, even yet,' he adds mentally, with softened glance backward at the deserted bungalow and its stoical guardian.

Quickening his step, he goes round to the back of the new house, calling, 'Hallo, Polly! Oh, there you are! Here, give me a hold o' that there basket; it 's too heavy for you;' and with his big hands he lifts a hamper of clothes which, fresh and white as soap and sun could make them, a stout, pleasant-faced woman had been taking from a line and deftly folding.

'Where 've you been, John?' she asks, and, without waiting for an answer, 'Better come along in and have your supper. Guess you must be hungry,' she adds kindly, and with a grateful look in her brown eyes, as he shoulders the heavy basket and carries it to the house. There, in the comfortable kitchen, spotlessly clean, a goodly meal is waiting—fresh-baked bread, butter new from the churn, with savoury-smelling ham sliced ready for the frying-pan. Stepping briskly about, she quickly adds a shining pot of fragrant coffee, and from the cupboard produces a plate piled with cakes of tempting brownness. 'See here, John. I made some dough-nuts for you! My, how you used to devour them in the old picnic days!' and laughing cheerily, she spreads a white apron over her broad lap, and seats herself opposite the man, a look of great content on her plump, round face.

For Mary Patrick, now Mary Pardon, had at length, through sorrow and loneliness, come to the place in John Pardon's home so long kept waiting for her, and having at last wakened to an appreciation of his long-tried devotion and her own cruel selfishness, strove to fill the residue of his days with the comfort and companionship for which he had hungered.

And John Pardon, what of him? Strange and unexpected things, indeed, had the fates woven into the web and woof of this man's life, so spinning their threads that the tragedy on Cañon Hill, which broke his heart and robbed him of its dearest treasure, indirectly wrought for him such an increase in worldly prosperity as had never entered his simple dreams. For the great cave-in on Cañon Hill at last induced the State to build a new, safe road, the survey for which passing through Pardon's ranch, he not only received goodly compensation, but his property thereby became so easily accessible to Orangeville that it was eagerly sought by small householders, and for Pardon the building and letting of houses was a profitable investment. Hence in a very brief time, in that country of rapid enterprise and restlessness, there sprang up a little community in and about Pardon's ranch, where but recently had flourished nought but bush, and the lonely man had neighbours in plenty did he so desire. With little heart, however, for such changes, he continued to live alone in the old bungalow, amusing himself by planning and erecting the new house opposite—peopled, however, by no happy dreams.

But the same turning of the wheel that had carried the fortunes of John Pardon upward had to a large extent reversed those of Mary Patrick. The village of Beestop, left stranded by the wide sweep the new road had taken, soon began to dwindle to insignificance. One family after another, following the new highway, moved to more lively places; the small store closed; finally the post-office itself, for lack of any one to keep it, was shut down. Beestop, like so many of its 'old inhabitants,' was sleeping its last sleep.

Thereupon Mary's younger brother Henry, not relishing the new order of things, suddenly struck out for himself, betook himself to a distant settlement just bursting into life, and, to the surprise of all his old friends, married a young girl from 'back east,' and made a home of his own. Shortly after this poor Joe Patrick was thrown from a loaded hay-cart and instantly killed. Thus Mary, for the first time in her comfortable life, found herself alone, and tasting of the same cup which for such long years she had held to the lips of John Pardon.

Now, it befell one evening, some months after poor Joe Patrick had been laid to rest beside his parents in little Beestop cemetery, that Mary, returning to her lonely home from taking flowers to his grave, came suddenly upon John Pardon at the old familiar cross-roads, now disused and grass-grown. John saw her first. She had been weeping bitterly; the brown eyes were red and swollen; her hair was streaked with gray, her step slow and heavy. Little, indeed, survived in the stout, middle-aged woman in her black dress to remind John Pardon of the merry maiden who had stolen his heart long years ago beside the dripping well. But at sight of her, alone, in grief, all that was chivalrous and noblest in John Pardon's nature answered to the call. Stepping out of the shadows, and, his face all tender pity, looking down into the tear-dimmed eyes, he held out both his hands to her, saying gently, 'Well, Mary?' Mary Patrick laid her own hands in his.

THE END.

CURES FOR PETROL DEARTH.

By the Right Hon. Sir J. H. A. MACDONALD, LL.D., G.C.B.

MANY years ago the late Field-Marshal Viscount Wolseley gave an address in Edinburgh on 'War as a Schoolmaster.' His words were weighty, and many of them have demonstration in the present world-wide conflict. But there are new illustrations of his theme which are showing themselves day by day. One of the most important in the practical world is the present condition of road locomotion. On the one hand, the power-vehicle is daily showing its infinite value as an aid to armies, whether the service be on the ground or in the air. Time and again both belligerents have been able to effect war work with a speed and on a scale which would have been impossible in the days when road locomotion was only to be carried on by animal traction, and the amazing feats of the airman far eclipse all that in former wars was accomplished by the non-dirigible balloon. But, on the other hand, this war has, while developing great powers by the use of the petrol-engine, brought about a condition of things which hampers, and in a great degree puts an end for the time to the use of, the power-vehicle in civil life. Necessity has caused restriction in the use of vehicles for passenger conveyance and for mercantile traffic, and this has come now to such a pitch that the use of the autocar for any purpose is much reduced, and its use for pleasure is practically prohibited. The community is bearing all this cheerfully, in view of the great issues for the world that are being fought out. But it is satisfactory to know that once more it is proving to be true that 'necessity is the mother of invention.' It is seen by those who feel the present want that it will not do to sit with folded hands, and hope for things to come right. The scarcity of petrol is not caused by the absorption of vast quantities for war purposes, except to a certain extent. Those who think are awakening to the fact that so long as the supply of means for motive-power has to be imported from abroad, any check on supply, such as is caused by war, must inconvenience the users of power-vehicles, and that any scarcity, from any cause, must inflate the price of the motor fuel, and thus hamper trade, checking the successful manufacture of vehicles, and reducing the facilities for the transport of passengers and goods. At the present time there would be no shortage of petrol, as there is abundance stored, ready for delivery, but for the import being restricted by the want of sufficient sea tonnage to bring the fuel to the market. The price of petrol had been steadily rising before the war, owing to the petrol-tax, and also to the great demand caused by the phenomenal increase of the use of petrol-driven vehicles; and this might of itself have stimulated invention to provide substitutes. Invention was partially successful in producing fuels in similar liquid form; but these fuels are now included in the embargo laid by authority on 'motor-spirit,' and thus afford no relief from the restrictions imposed during the war.

The difficulties which have thus arisen in the development of motor traffic have led to efforts in two directions, which are proving successful. These are, the use of ordinary coal-gas to produce with air an explosive mixture by which the motor-engine can be driven, and the application of electricity as a driving-power by the use of storage batteries. The first of these is simplicity itself. It consists simply in using a gas-engine, such as has been long employed to drive fixed machinery, to drive a wagon or carriage. This can be done by carrying a quantity of gas compressed in a steel cylinder, so as to reduce the bulk, and to pass this gas mixed with air into the engine cylinders, and explode it, as the mixture of the vapour of petrol with air is exploded in the automobile. This mode cannot be easily followed at present, as, in consequence of the exigencies of the war, neither the metal can be provided nor the labour found to construct the steel gas-holders in quantities. Accordingly, ingenuity has evolved a mode by which, in the case of many vehicles, the necessary gas can be stored and carried upon the vehicle. There are already several hundred vehicles on which an oblong gas-bag is fixed on the top, and by gas drawn off from this bag the explosive power is obtained. Gas already takes the place of petrol to the extent of 700,000 gallons of petrol per annum. These gas-cases are being turned out by one firm at the rate of fifty per week, and other firms are taking up the manufacture, the orders being largely in excess of the present power of supply.

This mode of vehicle-driving not only overcomes the difficulty of want of liquid fuel supply, but it is already proved that there is a saving in the annual cost of running a wagon carrying three tons of over £100 if the gas costs 4s. per thousand feet, or of more than £150 if the cost is 2s. per thousand feet. It is calculated that a motor-omnibus, which does a large mileage per day, will cost £1 a day less when using coal-gas as compared with petrol.

There is only one drawback to this mode of carrying fuel. The distance that can be run on one charge of the holder is limited. But this is no disadvantage in the case of most commercial vehicles, as the distance they run in a day is not great as a rule, and one charge is sufficient for at least thirty-five to forty miles.

And as regards business vehicles, it is to be remembered that those running them are entitled to a certain allowance of petrol; so that, if on any occasion the gas-holder is emptied before they reach home, it is only necessary to turn on the petrol, and use a pint or a quart or half-a-gallon to complete the distance. It is also to be remembered that commercial vehicles, whether for passengers or goods, invariably run between populous places, where the gasworks can supply a refill when necessary, and as the gas-bag can be filled in ten minutes or a quarter of an hour, the delay is trifling.

Even the private autocar can well be used for many moderate purposes by the use of a gas-bag. Short runs into town and out again, or to and from stations by business men living some miles outside the town or at a distance from a station, could easily be made by the use of a moderate-size gas-bag strapped on behind, and, if need be, supported from below by light brackets. Also, the lady could do her shopping in the forenoon, or her calls in the afternoon. No doubt such a bag might not be considered sightly, but *à la guerre, comme à la guerre*, this need not be considered. In the old days a 'boot' at the back of a carriage was not considered unsightly, because it was useful, and we are quite accustomed to carrying trunks and hold-alls on the back of our cars without thinking of the look of the thing, because we wish to have the contents with us. The gas-bag could easily be made and fitted so as to be no more objectionable than the large tired spare wheel, which is not looked upon as a disfigurement.

Altogether, the gas-bag may be held to be, at least for the time, a solution of the petrol difficulty in a great number of cases, and if this be supplemented by a saving in cost, its adoption will be rapid.

The other substitute for the petrol-driven engine is the electric storage battery. This is not a new idea at all. Several years before the present war, vehicles driven by electric energy were used in considerable numbers in the United States. At first the great difficulty was that the weight of the storage batteries necessary to provide sufficient energy was so great as to cause unpopularity. But since, by Edison's inventive power, the weight has been reduced to about one-half, the progress of the electrically-driven vehicle has been very great in America, and in this country it is already taking its place as a practical tractor. It is not well suited for very long distances, unless there are stages where trays of batteries can be changed, just as the horses were changed in the old stage-coach days. But there are many services for which it is eminently suitable. For any work within the bounds of a populous district, and particularly for what may be called intermittent work, it commends itself as eminently suitable. Wagons delivering and taking up goods, parcel-vans, tradesmen's vans, municipal refuse-vans, watering-vans, and many other 'stop and go on' vehicles can be most satisfactorily driven by electric power, and at an economical rate, both as regards output of power and as regards wear and tear. In proof of this it may be mentioned that in one of the principal and most busy cities of England, the saving in the collection of ash-pit refuse was 1s. 6·2d. per ton, and the saving for the year over the whole city as compared with horse haulage was £1050, 12s. 6d. Such figures speak for themselves. The maintenance cost is also smaller. There is little or no strain or shock in starting or changing speed. There are few working parts, such as valves, pistons, gears, pumps, all liable to rapid wear.

Of course, in large cities, where the electric-supply is in the hands of the corporation, it is an advantage to have an addition to the day load on the electricity works, which must be kept running by day as well as by night.

Where the work to be done is suitable, there are several advantages in electric driving from storage batteries. Apart from the question of wear and tear, there are no starting difficulties, no loss by an engine running loose at short stops, no fuming of engines, no trouble with magnetos, no slipping of clutches, no difficulties of advancing or retarding the spark, no throttle adjustments and questions of rich or poor mixture, no elaborate engine-cleaning, no risk of valves giving way or plugs cracking. The driver has the simplest of duties, and the whole control is practically by one handle. In every way, complication of parts, and the risk of mishandling and breakdown which accompany complication, are avoided.

The gas-bag is a good makeshift, but it may prove to be more than that, unless petrol becomes very much cheaper than it has been for several years, including years before the war. The storage battery is likely to prove a serious rival of the petrol-engine in the work of populous places.

Since this paper was written, the announcement has been made that the price of petrol is raised 1s. 9d. per gallon by the wholesale merchant. The petrol on which the above estimates were made was at 2s. 9d. a gallon. The price now is 4s. 6d. At that price the saving by using gas as a substitute will be proportionately greater.

FROM THE ENDS OF THE EARTH.

CHAPTER III.

And through the years, when war shall cease
Upon God's world—pray God it be—
To children's children on our knees,
We'll tell the tale—across the sea—
Of those who fell, so young, so brave,
Of that dear land they died to save,
And glory in the grand new birth
Of love from death in the ends of the earth.

THE months passed. Don Andrés saw service—lots of it—at Ypres, at Loos, at a score of other places whose names will be household words in Britain and beyond the seas for hundreds of years. Of the overseas soldiers—volunteers at that period, like himself—he saw plenty: Canadians, Australians, New Zealanders, for the Third Midshires were brigaded with them; but except for Charlie Brown from Finca Inglaterra, he had not run up against one of his neighbours from the foot-hills of Mount Tacana. Charlie was driving a motor-lorry, and Sergeant Maddick let him pass without a hail. He did not wish to be addressed as Don Andrés or as Mr Martin just then.

His promotion had been rapid. The best-trained man in the draft, which was rather raw, he had received a stripe before he had landed in France, and was a corporal when the draft was shaken into the hard-bitten battalion.

Letters from Jessie he received regularly, which letters, indeed, caused much astonishment in Ditchington, where everybody knew everybody else's business, and generally his or her handwriting, and the postmistress was an ancient maiden lady, and a notorious gossip. Part of her duty was to affix the Ditchington post-mark, which she did, with comments.

'Another letter for Lance-Corporal Maddick. Wherever did Jessie meet him? It's her writing. Besides, I saw her post it. Letter for Corporal Maddick? Dear me! He must be one of the Maddicks from Sudeley. I had no idea that Jessie was acquainted with them. Letter for Sergeant Maddick? Deary—deary me! I wonder, now, if it's the same young man! She writes most every week. They must be engaged.'

Of course, a large number of partly printed cards addressed to Miss Jessie Osborn passed through her hands; but they told her next to nothing, not being intended to tell anybody very much. She spoke to Farmer Osborn about the lively correspondence, but he did not appear to understand her gentle hint. The ancient postman, indeed, egged on by his superior, asked old Martin if he happened to know the young Maddick who was Jessie Osborn's soldier-boy, but was curtly told to mind his own business.

In the Third Midshires several of the called-up reservists remembered that particularly bad egg, Andrew Martin, having served with him, and now and then Sergeant Maddick had to listen to stories of his own delinquencies, which sometimes ended with the remark, 'He was drowned, poor devil!' But Sergeant Maddick never gave himself away, and could never be got to talk of his previous service, or even utter the name of his regiment. Of course, the veteran Staff Sergeant-Major Cadman had remained at the depot.

Opportunities to carry out an old threat to shoot Colonel Malleson were afforded in plenty, for the colonel was a leader; but Sergeant Maddick felt no inclination to make good Private Andrew Martin's promises; indeed, quite the contrary. The old grievances had been effaced. Andrew Martin had seen a lot of the world under more favourable conditions than are generally afforded to a mere private, and—which was exceedingly comforting—Jessie Osborn, instead of being a flirt and a jilter of men, had been, and remained, true as steel.

In common with the great majority of the self-reliant boys from overseas, and far too many of the authorities in London, ex-Private Martin had believed that a year would see the enemy beaten, and the war practically over; but Sergeant Maddick, after more than a year of fighting, knew that the war was only just beginning. From the owner of Finca Bella Vista he had obtained twelve months' leave of absence, but what had happened on that plantation he did not know, nor did it trouble him. Life at the front was far too strenuous. Besides, Sergeant Maddick was debarred from writing to Mexico, and Andrew Martin could not very well receive letters. Had he been able to do so, he most probably would have learned that a considerable number of his German neighbours had contrived to get home through Guatemala and the West Indies, among them Heinrich Henkel.

. . . . . .

It was the autumn 'push' of 1916. Scathless, Sergeant Maddick, now Sergeant-Major Maddick, had fought nearly two years, with an occasional rest behind the lines, but never a holiday home.

The Midshires had gone 'over the top,' their colonel with them, Anzacs to right and left. There was bitter, savage fighting in the German trenches, and no quarter asked for. Sergeant-Major Maddick saw his colonel go down in a deadly 'mix up,' and stood over him, thrusting viciously with his bayonet, foiling every attempt to bomb or bayonet the British officer. It was near the entrance to a big dug-out, and the trench was several times the normal width, all

the space being filled with struggling, writhing, cursing men. But through all the awful uproar the sergeant-major heard his colonel's shout, 'Look out, Maddick! On your left!'

It was the dug-out. A burly German occupied its mouth, firing at him with an automatic pistol, and shouting words which were lost in the din, until a savage push of the Midshires cleared the space.

Then he heard, '*Buenos dias*, Don Andrés! You von't der Kaiser's coronation in London see! Dere, Mr Martin! So! I told you!'

It was Henkel. One of his rapid bullets had found its billet. Sergeant-Major Maddick went down, falling across Colonel Malleson. Henkel's bullet had struck him in the head. But although himself badly wounded, the colonel had got his pistol arm free.

'You won't either!' he shouted, and fired three shots at the exulting enemy, who crumpled up and fell backwards down the staircase. But of that Sergeant-Major Maddick knew nothing until some time afterwards. He was insensible.

About a month afterwards Colonel Malleson, with his left arm in a sling, and limping, entered a certain base hospital.

'Morning, Cathcart!' he called to the R.A.M.C. captain. 'How's my sergeant-major getting on?'

Interested at once, the surgeon put down some instruments he was carrying. 'Maddick? Oh, he'll pull through, I think; but he may be a bit touched. That bullet went mighty near the brain. He doesn't seem to know who he is. Says he's Private Andrew Martin. I've tried to prove to him that he's Sergeant-Major Maddick—shown him his identity disc, &c.—but he seems to have forgotten the name of Maddick altogether. There's something else he says, also. By the way, there's a letter for him this morning—post-mark, Ditchington. That's in your county, isn't it?'

'Yes,' replied the colonel thoughtfully. 'That's queer—what you tell me. Andrew Martin? The German who shot him—a colonel, I fancy—knew him. He called him Don Andrés, also Mr Martin. I'm not likely to forget, for I plugged that German. I was on my back. Maddick had stood over me a good five minutes. Saved my life I don't know how many times. I would like to see that letter.'

'No reason why you shouldn't,' said the surgeon. 'The O.C. will open it. But as the fellow saved your life, I'll tell you something more that he said. He's a deserter from the Third Midshires, according to him, and he's talked a lot about wanting to shoot Colonel Malleson.'

'The devil!' exclaimed the colonel. 'Well, he's had plenty of chances. Sort of Jekyll and Hyde business, seems to me. Sergeant-Major Maddick's about the best non-com. in the battalion. What Private Andrew Martin may be I don't know. Just look inside that letter, and see who his correspondent thinks he is.'

The letter was opened by the adjutant of the hospital, Sergeant-Major Maddick being asleep, and not in his right mind when awake. It was from Jessie Osborn, was properly addressed to Sergeant-Major Alfred Maddick on the envelope, but the letter began, 'My dearest Andrew.' It also contained family news, references to various Martins. That the name of Sergeant-Major Maddick's father was Martin was made perfectly clear.

'All right,' said the colonel. 'Andrew Martin is his name; but Maddick must get the medal, I suppose. Let me know when his brain's clear, if it ever is; and keep this quiet, please.'

One of the Third Midshire officers, Major Burroughs, had been in the battalion from his sub. days. As he also had been wounded in the push, and was get-at-able, the colonel asked him if he remembered a soldier named Andrew Martin. The major thought for a while, racking his memory.

'Andrew Martin?' he said presently. 'Yes, I remember him. I was in charge of the squad who searched for his body. He was drowned—at Ilfracombe, I fancy—somewhere in Devonshire, anyway. He was a pretty bad lot.'

'Ah! Thanks! Did you find his body?' the colonel asked.

'No. It was washed out to sea. His uniform was found on the beach.'

'Thank you, major; I'm very much obliged,' said the colonel, and that was all he did say at the time. He also remembered Private Andrew Martin.

A few weeks later Captain Cathcart sent a message to the colonel commanding the Third Midshires, who was back with his battalion. It was brief: 'Maddick's all right in his head. Seems all right, anyway. He doesn't remember any Andrew Martin. I resealed his letter. He has had two or three more from Ditchington. I didn't look inside them.'

Colonel Malleson laughed to himself. He paid another visit to the hospital shortly afterwards. As Cathcart had written, he found Sergeant-Major Maddick much better, though feeble, but perfectly sane.

'Pleased to see you're getting on all right, Maddick,' he said, as he shook the sergeant-major by the hand. 'I suppose you'll be off to Blighty pretty soon? I've brought you a bit of ribbon to take home with you.' He produced the ribbon of the Military Medal. 'I might have got you the V.C.; but as there's such a dashed lot of publicity attached to it that you might not care about, I didn't put in for it. Here you are.'

'Thank you, colonel,' said the sergeant-major, as he took the ribbon.

'I thought you might also like to know about

the German officer who plugged you?' the colonel went on, smiling. 'I wiped him out. Hit him twice. I made inquiries. Your company cleaned up that dug-out, and buried him with the others.' He paused. 'By the way,' he added presently, 'the fellow seemed to know you. Spoke to you in Spanish. What was his name? Where did you meet him?'

The sergeant-major answered without hesitation: 'Heinrich Henkel. He was a neighbour of mine in Mexico. Wanted me to come home as a spy for Germany. I came home, all right.'

'And joined up with your old regiment—third battalion—served under your old colonel, and made good—very good. I know who you are, Martin—know what you were. You take that medal as Sergeant-Major Andrew Martin, my lad. As you are not likely to be fit again for a long spell, I can fix it up, and, if you would like it, get your discharge. Good-bye now. Don't say anything, or you may get a temperature, and I'll have Cathcart on my track.' The colonel marched away, still smiling.

Sergeant-Major Andrew Martin did not say anything, being incapable of speech just then. He was able to think, however. 'I wanted to shoot him!' was one of his reflections.

How Colonel Malleson worked the oracle is hidden in a mountain of red tape; but it was Sergeant-Major Andrew Martin who was gazetted, and who married Jessie Osborn some two months afterwards.

And it was Sergeant-Major Andrew Martin who returned to Mexico with his wife, and a couple of the boys from Mount Tacana, also invalided, a little later still.

THE END.

LIFE ON THE GERMAN FRONTIER.

A VILLAGE IN AARGAU.

THE tumultuous Rhine is a curiously narrow border between the acute suffering of the German people and the untroubled daily life of their Swiss neighbours. Little villages of Aargau that face their sad and silent counterparts in Baden are all but untouched by the war, and go about their farming and gardening, while the opposite bank of the river of strife swarms with frontier troops, every daybreak bringing the last volley fired over some officer's grave, the only music to speed the dead, for all the bells have been removed to make fresh cannon for the slaughter. Yonder are the twin steeples of the old church of Saeckingen, but only the big bell, whose voice has called good Catholics to prayer these three hundred years, is left, for its lesser brethren went into the melting-pot early in June.

In this riverside hamlet of Aargau, which faces Murg, a notable centre for the manufacture of asphyxiating gases and other devilment, there may here and there be some little grumbling against war prices, some shortage of butter and meat and sugar; but, compared with the conditions under which life is supported across that narrow strip of moving road, we live in surfeit. The Swiss peasants know it, and go forth to reap their harvest or gather their cherries singing as blithely as the little brook that here finds peace in Mother Rhine. Many of their sons and daughters formerly found work and wages in the ribbon-factory of Saeckingen; but the food is so bad, and the customs inquisition so irksome—every one is stripped to see that no papers are carried that might tell the outer world of Germany's straits—that the Swiss prefer to earn less and live more comfortably at home.

All through, the Frickthal life pursues its even course untroubled by the guns booming out there in Alsace. During the first two summers of the war the people did, it is true, forgo their beloved singing clubs. They have two passions, these burghers—part-singing and mountain-climbing. The first is the outcome of the second. All the best natural part-singing is found in mountainous countries, and it was probably suggested by the echoes. But two seasons without the Sunday *Gesangverein* were sufficient for a Swiss lifetime, and this year once more the men and maids go the old round with brave banners and flower-decked hats, making the villages ring with the old folk-songs. Our village was their chosen rendezvous one Sunday in June, and their songs attracted little groups of wistful women and children to the farther bank.

The Frickthal is the 'Valley of Rest.' Battles that rage within a day's march of its meadows and orchards leave it at peace. It has had its share, and was, indeed, the last district hereabouts to free itself from the Habsburg yoke. So recent was the bondage that to this day any veteran sufficiently behind the times to criticise the new machinery for the cider-factory or any other innovation is contemptuously dubbed an 'Austrian.'

Here and there the scene is marred by the smoking stack of a boot-factory or a ribbon-factory; but for the most part the Frickthaler are agriculturists, and never were there more untiring tillers of the soil. Many a fine June night they shoulder their scythes in the moonlight and go forth in the small hours, men, women, and children, all tramping to the land. Even babies are wheeled in little barrows, since they are too small to leave at home and can sleep as well in the fields. The home-coming at sunset is easier,

for the women and their little ones then ride on the fragrant stack of hay piled high on the cart drawn by two white cows. As smallholders these peasants of Aargau can have few rivals. The postmaster, the stationmaster, even the village dominie, have their patch of orchard or kitchen-garden, their poultry, their bees; and the orchards yield not only fresh fruit in abundance, but a surplus for the manufacture of cider, *kirsch*, and apple-brandy.

To these little villages, so near Baden that we can see the birds flying over trees in the Black Forest, the Kaiser's subjects, who swarm in Bâle and even as near as Rheinfelden, rarely penetrate. Perhaps they know how cold a welcome would await them. In time of peace their commercial travellers came and went freely; but these German-speaking Swiss hate their overbearing neighbours across the water, knowing well that they themselves were the objects of a contempt so thinly veiled that whenever a German had an idle day he would say to his friends, 'Let us cross the river and rob the stupid Swiss!' He has not held his hand even in war-time, but is still the master-robber, and, under the guise of 'compensation,' which the unfortunate Swiss must give in return for coal and iron, he is not only stealing their purse, but also robbing them of their good name as neutrals. That is the hardest blow of all.

DÉBROUILLEZ-VOUS.

A STORY OF THE FOREIGN LEGION.

By Captain T. P. Sutton-Page.

'*MAIS débrouillez-vous, mon gar; débrouillez-vous!*'

It was about the thirtieth time since reveille that I had heard this injunction addressed to one member or another of my squad. At last it had come my way, to mark the culminating point of a lengthy harangue hurled at my head by the section adjutant.

Now, of the regrettably numerous list of French verbs not included in my vocabulary when, a couple of weeks before this, I had joined the ranks of the famous *Légion Étrangère*, the one I had found most difficult to understand, despite its constant reiteration, was *se débrouiller*. Every one, from the commandant downwards, seemed to have the word everlastingly on his lips, and always, apparently, with a new meaning. Captains absolutely revelled in the use of it, our own chief generally making it the text for the strenuous lecture in which every morning he tried, with the aid of much stamping and shouting, to teach us some section of the art of soldiering. As for the adjutants, they used it as often—and this was very often—as they did '*Nom de Dieu*' or '*J'm'en fiche;*' while the corporals repeated it quite as forcefully and almost as frequently as they rapped out their more startling substitutes for these terse expressions of the mighty.

Eventually I should probably have discovered its meaning, as I did that of most of the other argot-jargon words of the Legion, through inculcation. The finely turned sample of cursing I had received that morning because I had failed to *me débrouiller*, however, whetted my curiosity, and I resolved to seek an explanation from an English-speaking Belgian in my squad.

'*Se débrouiller*,' he drawled, 'has a thousand and one meanings, as you would say. The adjutant who very naturally cursed you just now for not having a cover to your *képi*'——

'But I have never had one issued!' I expostulated, still smarting from the slanging I had undergone.

'Exactly,' continued the Belgian; '*il faut se débrouiller*. You must make one—and perhaps not return it, you know!'

'Oh, it means to steal on this occasion, does it?'

'Well, yes, more or less. But it does not often mean that. Look here; its literal meaning is "to clear up the fog." Perhaps that makes it clear.'

It did. I began to understand, or, at any rate, to think I understood.

But later on I knew it was only a beginning; for I had a long way to travel and much to learn before I was to come to a full realisation of the meaning of *se débrouiller*.

. . . . . .

In the fullness of time we were slung off to the front, closely packed in cattle-trucks which, by order of some unconscious humorist, had been labelled, '*40 hommes—8 chevaux*.'

It was a long journey, Avignon to Noisy-le-Sec, Noisy to Épernay, whence we foot-slogged our way to the trenches.

At first I devoutly wished I had been born a horse. Then, a Polish comrade having commenced to occupy more than his legal share of truck-space, I punched him into servility, and resumed my seat—and his. I was learning at last, I told myself, to *me débrouiller*.

Of course, I was really doing nothing of the kind. 'Fog-clearing' was still, so far as I was concerned, a more or less unknown art.

It was Jean Marteau, our new *caporal*, who drew my attention to this fact. Poles, he explained, were not at all bad chaps on the whole, and, anyway, it was not wise to fall unnecessarily foul of them.

'I'll teach you how to clear up the fog,' he

concluded; 'that is, if you really wish to learn. It has taken me some little time to pick it up, but I'm becoming an expert now.'

And from that day onward Caporal Jean Marteau, *matricule* 13442, took me under his wing, and taught me, among many other things, the whole science, and some certain amount of the art, of fog-clearing.

At that time I knew very little about the *caporal;* and even to this day, much as I know of Marteau the *Légionnaire*, I still know practically nothing of the Marteau of pre-Legion days.

I know that in those days his name certainly was not Marteau, for he was an Englishman. But what his real name had been I not only never knew, but never asked. In the Legion he was Caporal Marteau, with four years' service, eight campaigns, and four medals to his credit. Whether he had anything to his credit or discredit out of the Legion was not my business; and one does not ask indiscreet questions in that corps, especially when one is only a volunteer *engagé pour la durée de la guerre*, and the other person concerned is a full-blown *Légionnaire engagé pour cinq ans*. To do so would be more than impolite; it would be dangerous.

For three long, weary months Marteau and I grubbed together, worked together, and fought together, and throughout it all he was not only my guide, philosopher, and friend, but my hero, my *fidus Achates*, and a veritable supply-depot all rolled into one.

Both his example and his precepts, Marteau once or twice reminded me, must be looked upon as instruction in fog-clearing. 'But, of course,' he added, 'it's only elementary instruction.'

This was true. The advanced stage was to follow.

. . . . . .

We had been seventeen days in the trenches, alternating between the passable sport and the frequent casualties from rifle-fire of the first line, and the inexpressible boredom, and the much more frequent casualties from shell-fire, of the second; and, in accordance with the method of the Legion, four more days had yet to be done before another battalion would march in to take our place and thereby allow us to retire to V——. At V—— for the space of some six days we should enjoy what it pleased the authorities to call *repos*.

The *repos* would in reality be merely a series of guards, pickets, and patrols in and around V——, with probably one or two 'aeroplane ambuscades' thrown in, this diversion consisting in sitting and shivering on the roofs of the village and waiting for German aeroplanes which probably would never come. If they came we fired at them—and missed. 'Looking for aeroplanes when we should be looking for lice,' Marteau used to call it.

Nevertheless, the *repos* would be welcome, for it meant a change from our troglodytic filth, and a break in the sickening monotony which war always becomes after the gilt is once worn from the gingerbread. There would be opportunities, too, of washing ourselves and our clothes, of smearing ourselves with fresh supplies of camphor-oil, and of indulging in various other orgies of cleanliness not possible in the trenches.

Hence we were looking forward to the relief; and when, on this seventeenth day, with four more days to go, we heard that, for some mysterious reason, the greatly desired liberation was coming that very night in the form of two newly raised battalions which had been pushed up to the front, there was much rejoicing all along our line, and the clay-plastered and unwashed savages whom we were wont proudly to describe as '*Nous Autres*' felt happier than they had done since the last advance.

As soon as I heard the news I paddled my way along the slimy trench to tell it to Marteau.

'*Repos!*' he roared almost before I had time to speak. 'Confound their rotten *repos!*'

Evidently he was extremely annoyed. Marteau swore all his casual oaths in French. English curses he looked upon as works of super-excellence, and when he used them it was a sure sign of considerable emotion.

'What's up?' I asked.

Without answering, Marteau turned on his heel and stalked off, the image of disgust and irritation, down the *boyau* (communication-trench) leading to the second line.

I did not see him again until a little while after daybreak the following morning, when I found myself standing at a loophole cursing the consummate ass who had started the false rumour about our premature relief.

Marteau approached with a grin widespread over his face. Fumbling with his right hand in the folds of his *capote*, he produced a *bidon* of hot coffee, very liberally flavoured with *tafia* (rum).

'Have a gargle, *mon vieux*,' he said, thrusting the bottle into my hand.

Before I had recovered from the shock of this bolt from the blue, Marteau was well under way with his story.

'When I left you last night,' he began, squatting down on the muddy *banquette* where I stood, 'it was because an *espèce de cochon* of an adjutant had warned me to go and conduct one of the relieving battalions from the Guichet.'

The Guichet was the entrance to our *secteur* of the trenches, and was so called because some facetious *Légionnaires* had there erected a notice-board bearing the inscription: '*Le Théâtre de la Guerre. Admission libre. Ce soir et tous les soirs une comédie autorisée par l'arch-cochon Guillaume, en plusieurs actes par jour*' . . . and so forth.

'Well, I set off, feeling about as fed up as a *foie-gras* goose, for there was a fellow up in

Compagnie D 4 who had just got a packet from Paris, and had invited me to the inauguration. In time, however, I forced myself by D 4's turning and—— Here, hold hard, *mon agneau;* you 're not a bally decanter; too much *tafia* will make you ill, sonny.

'*Merci!*' he continued, as he slipped the *bidon* once more into the fold of his *capote.* 'Eventually, then, I got to the Guichet. Just as I turned the corner on to the railway to have a look round I nearly tumbled over old Parducci. You remember him—a one-eyed Italian cuss who used to be motor-cyclist to *Nous Autres?* He left us a while back, you know, because he was too friendly with our Greek bugler, whom he afterwards tried to knife when we were up at the Haricot. Well, I asked him for news, of course, and fag-papers, and most of the other commodities which are the chief *raisons d'être* of a motor-cyclist, and learnt that he had become cyclist to *Bataillon A* of the *3me Regiment de Marche,* the crowd which ought to have relieved us last night. He was on his way, he told me, to our commandant's bureau with a message to the effect that all moves in our *secteur* had been postponed for twenty-four hours, and therefore his battalion wouldn't be on show in our lines until to-morrow morning.

'Like a fool, I went back at once to the adjutant and told him the move was off *pro tem.*, and asked to fall out. It was old Pinard, who, as you know, is a *voyou de première classe.* He slung me *quat' jours'* prison for coming back without permission, and another *quat' jours* for asking if he wanted me to return and wait for a battalion which wasn't coming till the morning after next.

'There was nothing for it but to return to the Guichet—or, at least, I imagined so. But on the way back I bethought myself of the parcel I 'd promised to help to unpack. The dug-out where my friend was was on the way down, and so I decided to call.

'I was just in time. He 's an *apache,* is my friend, and gets the usual *apache* comforts from his *petite amie,* who has migrated, it appears, from Belville to the Boul' Miche, where she is able to do herself—and him—very well, don't you know.

'It 's remarkable,' he continued meditatively, 'what an extraordinarily fine taste in liqueurs is possessed by the species *gigolette.* Grand Marnier, by gad!'

'The education of the Boul' Miche beginning to tell,' I suggested. 'But go on with your yarn. There 's no need to lick your lips in that reminiscent and totally vulgar manner!'

'*Oh, là, là!* Is the little man envious, then—even after being allowed to swipe most of my share of the *tafia?* Well,' he continued, 'when I 'd finished the bottle—Grand Marnier was like giving a peach to a rhinoceros as far as my friend was concerned—I wandered on down the *boyau.* I was still magnificently wet through, of course, and it was beginning to snow. Adjutant or no adjutant, a night *à la belle étoile* wasn't good enough. Might have caught my death of cold, don't you know, sleeping in the snow with a bellyful of Grand Marnier.'

He smiled reflectively, probably recalling the number of times he had risked death from more or less similar causes.

'Well, what did you do?' I asked. 'You didn't come back to our dug-out.'

'Come back to the dug-out! My dear child, I 'm not a plurry lunatic. Old Pinard, I am told this morning, sent at least five scouts to find out if I had done so. He 's not a real *Légionnaire,* you know. Came to us from a convict prison, and fancies he knows a thing or two because he was a chief warder. Lot of use that is to him in the Legion, ain't it?—poor unsophisticated ass!

'Down in the second line, which I had to pass to get to the next *boyau,* I found *Bataillon C,* who were also waiting to move. They are comparatively new to trench-work, of course, and so they were waiting, poor devils! with blankets rolled, *sacs* packed, and everything ready placed on the ledges outside their dug-outs. Now, old Parducci had told me all the moves were cancelled, you understand?'

'M'yes,' I said. 'Suppose you borrowed a blanket and made yourself comfy in a tunnel—what?'

'I suppose I did nothing so darned sloppy,' Marteau retorted. 'Don't you understand? There were fifteen *sacs* and fifteen blankets, my son, all getting beastly wet through, and fifteen poor little *dureés-de-la-guerre* all huddled close inside the dug-out trying to keep warm. I thought I 'd like to help 'em, so I hopped inside and cuddled up too. There was plenty of room in the corner.'

'I think I should have borrowed a blanket,' I said.

'Yes, probably you would. I unstrapped and borrowed eight of 'em, and after the best night's sleep I 've had for months, got up an hour or so ago, and left 'em in a heap in the corner.'

'Humph!' I exclaimed. 'A fairly saucy trick. Didn't they twig what was going on?'

'Did they what? You wait a bit, my son. When I cleared out I thought it would be good tactics to walk down as far as the Guichet in case old Pinard came down to see why the new battalion hadn't turned up. It proved to be an excellent idea, for I hadn't been there five minutes when the old devil arrived. I reported that though I had waited all night, I had seen nothing of the battalion; and I also hinted that the weather had been a trifle humid. By Jove, the old savage became quite remorseful! Gave me a two-sous cigar and cancelled the eight days' prison.

'He then went on to the village, and I proceeded slowly and contentedly homeward. So far, I'd had a first-rate outing. But the real sport was to come.

'Just as I turned the corner once more into the second line I heard the most infernal row. "*Espèce de salop . . . espèce d'abruti . . . espèce de* various other things!" My laddie, but the dear little *durées* of *Bataillon C* are learning to curse, if they're learning nothing else. You should join their school!

'Every blighter in the squad I had visited was giving it mouth for all he knew—all accusing each other of unstrapping the *sacs* and sleeping in the blankets. The chap who seemed to be getting it in the neck worst of all was the Spaniard I had for bedfellow last night. I knew it was the same fellow, because quite inadvertently I'd trodden on his face in the middle of the night, and he had cursed me for at least ten minutes. So I recognised the voice—and the swears.

'Of course, the poor devil was getting the blame because he had been dossing nearest my heap of blankets. Eventually a couple of them went for him bald-headed, and he was precious near being knifed by a hulking Italian.

'However, it quietened down after a bit, and so, thanking 'em for the entertainment—I wasn't indelicate enough to mention the lodgings—I cleared.

'Altogether it was an amusing night—a most amusing night,' he concluded. 'Have you got any bread? I'm as hungry as a horse.'

'Here you are,' I said, as I handed him a half-loaf of stale bread. 'But where did you get the *tafia?*'

'Oh,' he replied, 'that was a gift from the Spaniard. No, no, I didn't pinch it. He gave it to me for outing the Italiano, just as the latter artiste was letting him have the point of a stiletto. . . . The Italiano's in hospital now.'

'You're a first-class bally old rascal,' I mused, as, his story told to our mutual satisfaction, he sat munching the bread and washing it down with the remainder of the *tafia*.

'*Il faut se débrouiller, mon ami,*' replied Marteau with his mouth full. 'And, anyway,' he added, handing me the *bidon*, 'the *tafia's* good, *n'est ce pas?*'

And so it was—extraordinarily good.

. . . . . .

Some weeks later, in consequence of a 'ministerial decision' which ordered my transfer to the British Army, I left the Foreign Legion.

In many ways I was glad—almost overjoyed—when the day of my liberation came. Good food, good clothes, baths, and many other creature comforts had, much more often than not, been sadly lacking in the Legion; and all these and many other blessings would soon be within easy reach. Further, I should be serving with men of my own race—in itself a great consideration anywhere, and, above all, in the field.

However, for other reasons I was not glad—indeed, I was quite the reverse—to leave the Legion. True, in our ranks we had hordes of *apaches*, Russian revolutionaries, Italian bravoes; indeed, the devil only knows what we had not. But whatever this human flotsam and jetsam had been before it was whirled into the swift-flowing and not-to-be-escaped-from waters of the Legion, there it had proved itself good, sound material, and just the material that France in her sorest hour of trial had most needed. Those I had known and served with had shown themselves to be brave men and steadfast comrades; and a few of them, I had begun to find out, were very dear to me—closer and more loyal friends than I had ever known before.

All adverse circumstances, of course, will teach you to value your friends, but life in the purgatory of the Legion trenches teaches you much more. It teaches you that most of the things you formerly regarded as the essentials of friendship are very tiny and negligible, after all; that even the most miserable and absolute outcast may have all the qualifications that really count. It teaches you, too, that there is a friendship which—whatever the Good Book may say—is greater than even the great love which prompts a man to lay down his life for his friend. For the real friend there is he who will stand by you day in, day out; who is patient, forbearing, and true to you right through the misery and terror of it all; who keeps staunchly by your side right through the Valley of the Shadow—and the Valley of the Shadow is much more terrible than Death itself.

This was the kind of friend Jean Marteau had been to me. And he was being left behind—a five-year *Légionnaire*, and therefore ineligible for transfer.

As I looked into his big red-brick face—to the uninitiated eye so rough and case-hardened, but to mine so loyal and so honest—grinning at me at the end of the *boyau* whence I was making my exit from '*Le Théâtre de la Guerre*,' I felt sick at heart, and I knew then that I would have thrown all the creature comforts in the world to the dogs—would even have renounced my race and thought nothing of it—in exchange for permission to remain, to be still one of '*Nous Autres*,' with Jean Marteau.

Poor old Marteau! I should never see him again—of this I felt certain. Sooner or later, in those 'lean locked ranks' of the Legion, the fog would become too thick even for him to *se débrouiller*.

. . . . . .

But in the Great War the only thing certain is the totally unexpected; and so it came to pass that I did see Marteau again.

It was in hospital at B——, whence a sister

had written to me saying that an old pal of mine wanted to see me.

I found Jean lying in his cot, his dear old face grinning as it always grinned when the fog was thickest, but so pale and pinched that I was scarcely able to recognise him. The explanation lay hidden beneath the white bedclothes; one of his legs was gone, the other shattered.

How we greeted each other does not matter; and, anyhow, I forget. But a few minutes later he was telling me a story; not his story, but how one day in the early spring, near La Bassée, the Legion had attacked the German positions, and taking them by surprise, had in the space of an hour pierced through three lines of trenches and advanced three kilometres farther than the enemy's last line.

'We captured over two thousand men, old boy, two batteries of 77's, and twenty machine-guns; and we killed their blasted brigadier *à la baionette*. *Nous Autres* went right over the heads of the Germans without stopping, every company detaching twenty men with hand-grenades and revolvers to clear out their dug-outs. Most of the blighters were still in their dens, some five yards below the ground, and were caught like rats in a trap.'

Thus he chattered on, his face lit up and that strange dark flash in his eyes—'the Legion look' it is sometimes called—that told of his intense, yet only half-revealed, passion—the *Légionnaire's* passion for fighting. He had clean forgotten his wounds. It was the Legion—ever and only the Legion—the immortal '*Nous Autres*.'

'Even the Jews, dam'me! of whom I'd never taken much count, fought like fiends. Do you remember that little devil, Kio Chiqot—used to be *ordonnance* to our lieutenant? He was only sixteen years old, but he kept on fighting though twice wounded, and at the end brought in twelve prisoners! . . .

'A few days afterwards the general came to see us, and told us the feat of arms we had accomplished was the greatest since the battle of the Marne. . . .

'Of course,' he continued, 'we got it in the neck pretty badly, especially our old company . . . . machine-guns placed in the villages on our flanks. Our old Colonel Pein, who was acting as brigadier, was killed; so was the commandant. De Montgomerie had his face blown off; Junot was shot through the lungs; Svarti, Nowakowski, Dognon, Theodoresco, Matheos, Giordano, Phillipides, Belkasim—all killed. I don't know how many of *Nous Autres* were blotted altogether, but out of the four battalions there was considerably less than two left. The old company went in two hundred and twenty-five strong . . . and came out seventy-three. A bit thick, yes . . . *mais c'est la Légion, ça!*' . . .

'But, old man,' I asked when he paused, 'your wounds?'

'Oh, I'm lucky, really. I ought to have been in Kingdom Come,' he laughed.

'But how did it happen?'

'Oh, there was nothing much in it. I was in a bit of a hole . . . and managed to get out—like this. That's all.'

'Tell me all about it, old man,' I begged.

'Well, if you must hear, I was one of the grenade-party told off to clear out the dug-outs. By chance I tumbled into a cave full of Boches. They had me covered, so it was no good trying to turn back. . . . So I just heaved a percussion-bomb against the roof and blew 'em—and my legs—to hell. There wasn't a Boche left alive when they dug us out. *Il faut se débrouiller*, you know,' he added dreamily.

. . . . . .

Late that night I left the hospital, promising to come again next day. But next day my regiment had to move, and it was nearly a fortnight before I could obtain leave to visit B—— again.

As I entered the hospital I was met by one of the sisters.

'I'm afraid you can't see poor Marteau,' she said. 'However, I'll ask the doctor.'

A few minutes later I was ushered into a separate ward containing only one bed. I knew—and Marteau knew—only too well what that separate ward meant.

'Good-bye, old boy,' he murmured as he slipped his poor, withered hand into mine. 'I knew you'd come.

'It *is* good-bye, you know,' he mumbled on. 'But you're the only one left I want to say good-bye to. . . . There weren't many at any time . . . but since that day last spring . . . I told you about it, didn't I? . . . two thousand prisoners and three lines of trenches. . . . Show your regiment what the Legion was, boy. . . . Teach 'em to SE DÉBROUILLER. . . . It's great to clear up the fog. . . . That's our job . . . the Legion's job . . . TO CLEAR . . . UP . . . THE FOG.'

The quavering voice ceased, and the poor, weary eyes closed.

Jean Marteau had given me my last lesson. He had cleared up the fog once and for all.

PARTING.

You did not say good-bye, dear, when you went
Upon your outward way.
Oh, did you think that I could be content
Without a word until the close of day?
Did you forget that I should wonder why
You did not say good-bye?

You left me with a weight of things untold
That I had meant to say—
Gone unaware when I had thought to hold,
Leaving a memory where you would not stay:
Oh, tell me from the deep, beloved, why
You did not say good-bye.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

IN latter days two or three men, particularly noticed, have been seen striding along the streets in different parts of the middle of London. We have just noticed them in the Haymarket. Even in the strange London of to-day, where are collected all the types and transformations of war, and where few things cause wonder now, the passers-by turn their heads and look with a touch of admiration and even affection upon the square, flat backs of these retreating figures. These men stand out distinctly—and with a significance that strikes the senses of the beholder without a moment's explanation—from all the other forms of busy humanity that are about. We know at a glance who and what they are, and not merely by their uniforms, though these give an indication. They are black naval uniforms, and on fine days these smart officers have been wearing the usual white caps. Certain stars may be observed on the uniforms, and the jackets are cut rather shorter and are tighter to the figure than those of our own naval officers. A peculiar thing about these men, as we have seen them in Whitehall, the Strand, and Pall Mall, is that on most days their hands have been covered with dark gloves, and even when the sun has been shining they have carried umbrellas, which, at a hasty glance, have not seemed conspicuous for any close and neat folding. The carrying of umbrellas is doubtless a wise and commendable precaution; but in the circumstances there appears for the moment to be a touch of incongruity in it. We have seen numbers of gentlemen in this uniform about the town since July, but these three in particular—sometimes reduced to a pair—cross one's track from time to time, conveying an impression of being 'hard among it,' so to say, and one remembers them. They have a stern set of countenance upon—in the case of two of them—round, clean-shaven faces, and they look neither to right nor to left. It is that peculiar, confident, and daring expression often found upon the faces of Americans, which can best be described as a 'sitting-tight' expression. This is the stolidity of the sphinx, with a small suspicion of a twinkle in the eye. Again, two of the trio are rounder and thicker of body than our young naval officers, and their tight-fitting uniforms accentuate the fact. They walk along the streets with a long, solemn, and somewhat heavy tread, keeping themselves carefully in step. You see a difference when there flashes by one of our own young captains or lieutenants, so lithe and tripping on his toes, for of all the men who skip about in town in these times none is nearly so conspicuous for agility as the naval officer. One but points out differences of nationality and service, making no comparisons for classes of merit, for it is hardly to be indicated in these ways. And even if such indiscretion seized a man, he would find more and more to admire and be thankful for in that staid and solemn gait, that solid and dignified tread, of these officers, our good and real American friends; for you will have guessed that these three officers—and we have liked it when there have been three of them, for they have helped romantic fancies and the imagination, bringing to mind old sets of triple heroes from the naval romance of Marryat, the Three Musketeers, and other gallants of world fame—are officers of the United States Navy, here in British and French waters with their ships, doing their country's business and that of the world's best peoples. Of course, there have been comparatively few of them about the town; the many are otherwise and very considerably engaged elsewhere, a circumstance which has assisted us to make special note of this small group. In particular we have remarked that while there was a clean-shaven man on one side, and another bare-faced officer on the other, the middle man wore a beard, which is very unusual in an American naval officer. But his features were none the less keen, and his eyes gleamed. At a glance you knew him for a man of deep purpose and stern resolve. He seemed to be not of the type of our Jellicoe or Beatty, but yet he had sharp, angular features, like the former. This bearded officer is a very important man, for he is Admiral Sims, on whom the British Admiralty conferred a unique and indeed almost incredible distinction by placing him in the command of our own naval forces in an emergency in the Irish Sea soon after his coming over.

* * *

There is much to say of him; but let us tell you first why Admiral Sims, unlike most other American naval officers, wears a beard. The

 [*All Rights Reserved.*]

story, in its significance, may mean something to the future, and even to the progress of the war. He was only a young lieutenant—or he may not have been as high as that—and daily shaved his face quite clean, like his brother-officers. But once his father borrowed his razor, and two days passed without his returning it to him. Then said young Sims, 'Father, if you do not give me back my razor in the morning I will never shave again.' The elder Sims did not return the razor in the morning, and his son has never shaved again. I liked to remember this story when I saw Admiral William Sims advancing up the gentle brow of the Haymarket. The American ships have work to do, as much and great as the American men, for the saving of mankind, and they can do it well. Four years ago, when crossing the Atlantic, I sat on deck one sunny afternoon alongside an American naval officer, who told me something of the service in which he was engaged, of all that had been done since the affair with Spain, of the keen sense for experiment and advance, and a certain invaluable independence they had over European navies, which were to some extent closely occupied in copying each other's example. The teachings of Mahan, his naval philosophy, had been an advantage. My friend of that voyage assured me that if opportunity came, as seemed no very likely thing, the navy of the United States would do something that would make a deep impression upon other peoples; and he invited me to pay him a visit on one of their biggest ships in the yard by Philadelphia.

* * *

This Admiral Sims, in command of the naval forces of the United States in European waters, is a remarkably interesting man. All the great characters of the war, fate fastening so much upon them, are necessarily figures for curiosity and consideration; but some of these Americans, having our own blood and ideals in them, and yet having made of themselves a new race with special characteristics, are fascinating subjects now, and one can scarcely tell why so little has been told in our country about such stimulating men. These personalities, indeed, are not good material for our almost universal secrecies. One cannot know too much of such men; there is nothing about them that does not hearten. The British Government, at the same time that it imposed new restrictions and turned the screw one twist further upon the people, should have told us the human tales of Sims and Pershing, who then were coming along to help us, to show us what manner of men were glad to be of us, for then the people could bear many more twists of those departmental screws. What I know and have heard of Admiral Sims has come from abroad, and one of the things told me, in the way of characteristics, is that this stern man, cold to the look, of steely inflexibility of purpose, a man who, as we shall see, has in a special way improved the art of necessary killing to a high point of perfection, is incapable himself of shooting game or angling for fish, and so, if you wish to phrase it that way, he cannot be an active sportsman. The idea of inflicting death upon any beast or bird or other living thing—not considering human enemies in battle—is deeply repugnant to him; and more than that, he recoils from it. That is interesting, but perhaps it is not wholly unique; and it is reasonable, after all, as some will feel after a little reflection. Some of the greatest soldiers have been the gentlest men; they see such sincerity and innocence in the other creatures of God as, alas! are not often to be found in the human kind. The recreations, then, of Admiral Sims are of the simpler sort. If there is one of them that, for his devotion to it, is much more conspicuous than all the rest, it is—you could not guess it in a thousand times!—the composition of that peculiar form of verse embracing surprise, discovery, and usually some quaint satire, which we call limericks. This leader of the United States Navy, having a considerable load laid upon him now for civilisation's sake, is also the laureate of the limerick. He dabbles in humorous verse of other kinds, but the limerick he likes most, and it is said that he has composed hundreds and more hundreds of them. One would experience no surprise on being informed in a whisper that such material substances for satire as Wilhelm, Tirpitz, and others of the German crew have already served their purpose with him. I am told that one night, while the American fleet was lying at anchor in the bay of Guacanayabo, the officers assembled, and were discoursing eagerly upon all manner of naval and other subjects, when it was noticed that Sims was leaning close down upon a table and applying himself most earnestly with pen and ink to the paper before him. They did not disturb him; they thought the Admiral was occupied with an important order or despatch. But at the end of an hour he handed to each officer a slip of paper with a limerick written upon it bearing on a subject that he had just been discussing.

* * *

One is accustomed to the curious, the irregular, and the unconventional in great and successful careers. Genius is ill harnessed to convention; it meets with rebuffs and difficulties, and keeps its own way of salvation and victory upon an independent course. The career of Admiral Sims, forced by an iron will and enormous energy, is still conspicuous in the group of the great personalities of the war. Some of the best American qualities seem to be intensified in him in a remarkable way; the main facts of his story are delightful. He is a farmer's son, and he rose originally in Canada—that is to say, at Fort Hope in Ontario. He was not brilliant as a boy; much the opposite. He had the reputation of being slow and careless as a pupil; it was his greater

pleasure not to learn. Those were days in Pennsylvania, and he was sent along in due course to the Naval Academy at Annapolis. Here there was a strange and sudden awakening of moral force. Young Sims failed piteously at his examination; it seemed that he was doomed; his neglect had found him out; he had not noticed that the hour of responsibility had struck; but now he knew it. He begged of the examiners that a second chance might be given to him, and they agreed. They gave him a month, and at the end of that time he was examined again, and this time with success; but not, as it is averred, without much pain. Thus he came to graduate in 1880. There were two forms of study for which he had a most special aversion, but they were two which it was highly desirable he should like and be assiduous upon. His dislike of them was curious, and weighed heavily against him. He hated mathematics, and yet one needs mathematics as one needs the alphabet for calculations of the most essential kind at sea. It is by mathematics that we apprehend unmeasured distances, by the angles and sines of mathematics that ships set courses and reckon times and places of their meeting. Admiral Sims had some difficulty in curing himself of his repugnance for mathematics; but it was done. The other aversion was the French language, which is very desirable if the young officer has ideas of treading upon the higher paths where a little official diplomacy walks in arm with simple ship command. Realising the necessity, he adopted the most drastic measures. He went to Paris for a year solely to learn the language thoroughly, and at the end of the term he could speak it as well as his own. It has been said of him that he was to the American Navy what Sir Percy Scott was to ours, the organiser of naval artillery. There is something peculiarly interesting in this matter. Sims had met Scott in Asiatic seas, and at once experienced a great admiration and friendship for him. At that time the ideas entertained by Sir Percy were regarded as revolutionary, but Admiral Sims adopted them. They both maintained that superiority of shooting was the secret of success on the sea. Admiral Sims at once began to let Washington know of his newly rooted and vigorous views, and Washington was not at all impressed. Having prepared a scheme of his own, he sent a statement of it to headquarters, and pleaded for its adoption. There was no answer. He begged, he supplicated, that his system of instruction in target practice should be put to the test; but it seemed that the high authorities would not listen to him. At length he determined to go to the Navy Department and press the matter in person. When he arrived he found that his letters and statement had been placed in a packet without having been opened. Thereupon he began a vigorous campaign in favour of his system, but the chief result for long was that he set all the leaders of the old school against him, and they were men of influence and power. He suffered for it; but at length his insistent criticism exasperated the Navy Department, which determined to make a shocking example of him and to discredit him utterly by carrying out a practical demonstration of the fact that the American Navy knew how to use its guns. An old lightship, long since out of service, was fixed up as a target in the offing at Newport, and a portion of the navy was brought along to fire at it. They did so merrily for long and long. It was good business. At the setting of the sun they brought the old lightship in again to have a look at it, and, lo! it bore the mark of but a single hit, the result of a projectile fired from short range. There was nothing to say. Sims was justified. Some of the old gang looked for a place of seclusion where they might rest their weary heads, while others made confession and adopted the creed of Sims. Everywhere there was a violent movement of opinion in his favour. He was appointed inspector of target practice, and was set to institute his own system. This was based on constant practice and incessant firing at long range, on the principle that the number of shots fired a minute is an essential factor in the efficacy of the fire.

* * *

Clearly this is a man of imagination and resource; he is a fine man for war, for his method is to do that which is necessary, and consider some of the niceties of expediency afterwards—without, of course, meaning that he is for any unmoral system of 'necessity knowing no law,' as favoured by the people of central Europe. What is meant is best indicated by the anecdotal method. When war broke out between the United States and Spain upon the Cuban question our friend was naval attaché to the American embassy at Paris. The United States Government in this crisis was badly short of munitions—as is a common thing with nations when they go to war—and it placed an order for a million dollars' worth with a Liverpool firm, at the same time moving Sims on from Paris to Liverpool in order to hurry on this affair and superintend the shipment. When the order was completed, there came the news that the Spanish fleet, under Admiral Cervera, had set sail for America. All at once a serious risk arose, and the Liverpool firm which had supplied the munitions, and the owner of the ship which was to transport them, refused to let ship and goods take the water until the total value of both had been guaranteed to them. Time just then was one of the most valuable things in the world, and Sims would stop at nothing in gaining it. In a tranquil manner he declared that he would be personally responsible on condition that the ship was on her voyage before sunset. Since those memorable days Admiral Sims has frequently asked himself how long it would

have taken him to pay off the million dollars, and the value of the ship, if the vessel had been sunk.

* * *

He was inspector of target practice of the navy with the Bureau of Navigation for his department for seven years. His intense specialisation on ordnance, gunnery practice, and the mechanism of watching, recording, and shaping the shooting skill of a fleet or a navy's marksmen has been of immense value to the United States Navy, and incidentally of service to himself. His ideas, his convictions, his knowledge, and his experience are good factors for the Allies at present. In 1913, when the Atlantic fleet torpedo flotilla was formed, he was put in charge. He has had more experience of craft built to combat the submarine than any other American, and he has shown a remarkable inventive skill in devising methods for accomplishing special and unexpected objects. He looks a stern man, one who attends to his business and thinks everything of it; and that is what he is. But, as we have seen, there is a light and happy side to the character and disposition of Admiral Sims, and let it be added that he has the finer social graces, which assist him in his peregrinations and his duties in the European capitals. These were latent in him when he came to marry a charming girl in the daughter of Ethan Allen Hitchcock of St Louis, who assisted in his most excellent development on the social side. And, all in all, one might say, in a form of expression that is sung in chorus at some American gatherings, that Admiral Sims is all right, that so far as nations and governments can discover at a period when their perspicacity is most intense and their standard most exacting, there is nothing at all the matter with Admiral Sims. We think of this trim figure striding along Whitehall and Pall Mall, and some of us think of it again as a strange emotion twitches at the heart on first observing an American warship in our British waters, Old Glory at her mast-head. You must see this thing to know the emotion; it is one of the rare delights of man, knowing the best of the world is with him as he goes fighting on.

'BATH-BUNS.'

By 'ÆSCULAPIUS.'

I.

THE *Alcibiades* had actually become a 'good-morning' ship! How different from those dreary winter-times when she was attached to the northern base! Then officers came in to breakfast looking glum, fed-up, and choleric. With averted eye, they snatched up a paper or a magazine, not so much for the readable items in it, but because having it in front of them at table was an excuse for ignoring their messmates.

Chatting early in the morning presupposes a feeling of lightness in one's vitals, which they sadly lacked. Close confinement, potted air, and indifferent food had done them in the eye in that respect.

To say 'Good-morning' was to ask for trouble, and everybody knew it. Poor defunct Mackellar was rash enough to make the experiment. In the early days of his life on board, he persisted in inflicting that ill-starred greeting on the torpedo-lieutenant. Finally the much-tried 'Torps' so drenched him in a torrent of acrimonious verbiage that Mackellar never repeated the offence.

II.

On this particular morning, when the *Alcibiades* steered a southerly course, and the wardroom was bright with the flowers the first-lieutenant had brought back with him from Cornwall, it was 'Good-morning, pay; good-morning, commander; 'morning, O'Brien;' and so on, through the whole gamut of officers.

The engineer-commander did not say, 'I'll have a pot of tea this morning,' in a loud voice, the moment he entered, as if the smashing of the Hindenburg line depended on his momentous decision. Rather was it his gracious pleasure to wait until the marine servant politely broached the fateful question, 'Tea or coffee, sir?' and he astounded the whole mess by not complaining it was too strong for him. Neither did the staff-surgeon, who detested tea in the morning, drop dark hints to the effect that his coffee reminded him of a certain murky river he had once visited in the East.

The corporal of the servants, whose felicity depended on the moods and fancies of his officers, exulted in their changed demeanour.

'They 're eatin' out of my 'and,' he told the pantry, speaking metaphorically of course, because the *Alcibiades* had made good all crockery defects during her extensive refit at Devonport. 'Goodness knows, too, it 's about time,' he reflected, sneaking a little Devonshire cream for the strawberries he had stowed away in the ice-chest. 'There ought to be a spirit of give-and-take in the wardroom, anyhow,' he murmured, eating his berries with great relish; 'otherwise it 's hell. On their bad days they seem to forget we men of the royal corps are not brought up as ruddy waiters. After all, it 's our genius for compromise

that 's made us Turkies great, isn't it, "Stripey"?' he asked the sergeant of marines, who looked in to tell the sceptical wine-steward the staff-surgeon had said he might put him down for a beer later on in the day, and was much too busy looking after his own interests in this direction to mind what his understrapper said. 'I say, it 's the glorious art we have of adapting ourselves to circumstances that 's made the royal corps what it is,' the corporal of the servants concluded; 'else how could I, a soldier, carry on flunkeying?'

III.

It was perhaps the new spirit of complaisance that made it possible for the wardroom officers to bear up cheerfully under the exceptional hardships of that self-same July morning. The bathroom plumbing had broken down during the night, and the metal baths which are suspended, canopy-like, over officers' heads in their cabins came into their own again. While their masters were still wrapped in slumber, servants stole cautiously in, and releasing these glorified soup-tureens from their fasteners, laid them gently on the deck of the cabin. As soon as they had filled them with the proper proportions of hot and cold water, they woke up their gentlemen.

'Bath 's ready, sir,' they informed them before stealing back to the marines' mess.

A few minutes later officers were already entrenched in a posture suggestive of happy babies in soap advertisements, when a horrible discovery was made. They could not find their sponges!

'Sentry! Sentry!' a dozen distressed voices cried out in quick and startling succession.

'Yes, sir; yes, sir,' said that dazed individual, darting from one to the other like a hen in search of her favourite chick.

'Send my servant to me at once,' was the agonised command.

The servants responded in none too good a spirit, and no wonder, seeing they were being disturbed at their breakfast. In fact, Private Barlow met O'Brien's piteous look with the stony glare of a marine on parade.

'I knows nuthin' about it, sir,' he said emphatically in reply to his master's frantic inquiries respecting the defaulting sponge. 'I missed it meself this morning, and thought you had thrown it away. Yes, sir, I really did,' he murmured, softening, as if he felt in duty bound to pay a last tribute in passing to the memory of the emaciated sponge in question. How pygmean it was compared with that of his other gentleman, the first-lieutenant's! Now, that was some sponge.

'There ain't no more on board, sir,' was Barlow's outward response to the staff-surgeon's suggestion to 'take up' one for him in the ship; 'the canteen-manager ses as how we 're going to a country of sponges, he didn't take on any fresh stock.'

'Tell the canteen-manager from me,' O'Brien said, getting on with his bath, 'he oughtn't to sponge too much on possibilities.'

'I must say I thought it rather odd, sir,' Barlow went on, somewhat mollified by this sally, 'that the first-lieutenant's was also adrift; and his ain't no small one to get away with, as you know, sir,' he added, scarcely able to repress a snigger when he thought of how the water-laden missile had once brought down the staff-surgeon. 'Not only his, sir; but from what I heard at breakfast, there 's been a general weeding out of sponges on this flat, and all the orficers are complaining.'

IV.

This was not by any manner of means the only fly in the ointment of the mess's happiness. There was another trouble, which cast a gloom over them before divisions were sounded off. Direful tidings had reached the wardroom regarding Nicholas III.'s illness.

Ever since the recall of Stoker Struldbrug's pet, the revered tortoise, the *Alcibiades* had not possessed a real mascot. It is true, a black ram had scampered about the decks for a time; but he soon died, under chloroform, while the staff-surgeon was amputating his ungainly tail. Dogs were too common, for does not every halfpenny paper contain the picture of such a one? The officers and ship's company generally brooded in vain over their need in this direction, until a happy opportunity gave them a truly ideal mascot.

During their stay at Devonport, H.M.S. *Cheeryble* had come in to 'pay off,' after doing a commission in the White Sea. Before leaving that icy station, the Czar Nicholas II. had not only decorated them, but presented their mess with a fine young bear, whom they had christened Nicholas III., in commemoration of his imperial donor. On their arrival in England, however, his future became somewhat of a problem. Many of the *Cheeryble's* disbanding complement would have liked to take the bear to their new ships, but quarantine regulations stood in the way of his being landed at all, so it was decided to hand him over to the *Alcibiades*.

V.

Nicholas III. came on board in a blaze of glory, and the details of his nocturnal exploit made every living part of the ship vibrate with ear-splitting guffaws. It seemed that Nicholas III. had landed, after all!

The *Cheeryble* people, loath to part with their mascot, kept putting off from day to day the fatal hour of his departure, until Nicholas III. ended the intolerable stalemate by going off, all on his own, in the dead of night.

H.M.S. *Cheeryble* had docked in a slip abutting the park-like grounds of the Royal Naval Barracks. The ruminating eye of the bear must have dwelt on this charming vista of green when

he stretched his legs on the after-bridge. The wonder is that Master Bruin did not choose to gambol on its grassy softnesses in the brilliant light of a summer day.

The great outstanding feature happens to be that, under cover of darkness, Nicholas III. left his snug billet on the boat-deck of H.M.S. *Cheeryble*, and ran the gauntlet of half-a-dozen sentries, for the sole purpose, it would seem, of breaking into the art-reveries of Temporary-Surgeon Newcome, R.N.

VI.

Surgeon Newcome was attached to the sick-quarters of H.M.S. *Vivid*, as the Royal Naval Barracks at Devonport are called, and it was part of his duties to make rounds somewhere about 4 A.M. whenever he had a 'day on.' Most of the other young doctors had an awful moan over this unearthly-like-hour visit; but Newcome looked forward to it with complacence, and he was even known to anticipate the time.

For one thing, the doctor was inordinately fond of anything relating to either Greece or Rome; and was not the path between the officers' quarters and the sick-wards literally strewn with statuary of all kinds, in the shape of dismantled figure-heads which had once stretched themselves becomingly under the restless bowsprits of anything from a frigate to a three-decker?

Walking through these grounds in the uncertain light of early morning was almost as pleasurable to this day-dreamer as a visit to the Vatican galleries, with the bucolic charms of the Villa Borghese thrown in. It is true, the *Vivid* collection lacked anything so sublime as a 'Laocoon,' but the place bristled with gods and goddesses of all kinds. The mirthful Bacchus was there, looking askance at his kinsman Juniperus for hobnobbing with the dusky Angostura; while Neptune's brow was dark and scowling, as if meditating revenge on the usurping under-water boats.

VII.

Newcome had gone out of his way to commune with the awful Cerberus. The light was fitful enough for him to use his electric-torch in contemplating the monster which had once embellished an early H.M.S. *Vigilance*. That is just where Nicholas III. came in. The bear loved torches. Had not the officers often surprised him by flashing one in his sleepy eyes on the boat-deck of the *Cheeryble*? What more natural than to steer a course straight for the doctor? Up to a certain point, his 'seamanship' was most proper, but as he came within the sphere of Cerberean influence it degenerated into a series of jerky zigzags, one of which brought him into violent collision with the 'stand-easy' legs of Surgeon Newcome. That officer toppled over, and as he was brought face to face with Nicholas III., the baleful light gave him the impression that one of the three Cerberean heads had come to life. Without pausing to think what a strange transformation the dog-like commissionaire of the infernal regions had undergone, the horror-struck young doctor up and ran as if for dear life, with the playful bear in close pursuit. Newcome uttered a fearful yell when he discovered the frolicsome animal was leaping after him, and the attention of the sentries being directed to the unusual scene, they promptly joined in the chase.

The temporary-surgeon got in all right, but the person of Nicholas III. was apprehended on the hallowed steps of the officers' quarters, and he was put in the 'lock-up' for the night.

VIII.

The incident was referred to the R.N.B. commander, who glared fiercely at the animal.

'According to his identification disc,' the master-at-arms said gravely, looking at the oval-shaped silver plate on the bear's collar, 'this prisoner's name is Nicholas III., and he's a supernumerary on board H.M.S. *Cheeryble*.'

'What has that got to do with me?' the commander asked irritably. 'What's the *raison d'être* for his being here?'

'Date, sir?' ejaculated the master-at-arms, catching at what was to him the only intelligible word-sound in this irrelevant question. 'Why, it's the 7th of July, sir.'

'You silly ass,' the commander exploded, 'what I'm trying to get at is, why have you brought the brute before me?'

'He was found loitering in the grounds and creating a disturbance early this morning, sir,' the master-at-arms replied mechanically.

'What the blazes is he doing ashore, anyway? Do they think we're running an animal-canteen here?' fumed the commander.

A corporal of marines from the *Cheeryble* fell-in before the commander. 'Nicholas III. has never been ashore before, sir. It's just like this, sir; last night being his last one on board, sir'——

'What do you mean by "his last night"?' the commander interrupted him.

'Nicholas III. is in process of being transferred to the *Alcibiades*, sir. Them are the exact words of the captain of marines'——

'Oh, I'm sick of all this infernal twaddle!' the commander roared. 'Will no one rid me of this pestilential beast? Do you propose taking him back to the *Cheeryble*?' he asked more calmly.

'No, sir. I've been ordered to escort him on board the *Alcibiades*.'

'Is there any one here to back up this statement? I mean, from the *Alcibiades*? What assurance have I they'll take him at all, and that this tomfoolery will not be repeated?'

'I'm from the *Alcibiades*, sir,' responded a petty-officer, stepping up smartly. 'We'll take

him all right, sir, and I 'll see he 's kept under restraint until we sail, which will be to-night, sir.'

'What 's your name?'

'Grease, sir.'

'Well, be careful he doesn't slip through your hands, with a name like that,' the commander cautioned, going on to his defaulters.

IX.

Nicholas III. arrived on board the *Alcibiades*, therefore, with a lurid past, and, as Petty-Officer Grease put it, the loss of at least one good-conduct badge.

The bear became at once uproariously popular, and the news of his sudden illness, coming so soon after, filled the mess with genuine sorrow. This became acute when the bald-headed chief-yeoman of signals, that harbinger of good and bad tidings, came up to Staff-Surgeon O'Brien, just as the latter officer was finishing his breakfast, and said, 'Beg pardon, sir, but would you mind seeing Nicholas III.? He 's getting worse, sir.'

O'Brien went along with him to the starboard battery, where Nicholas III. was lying on his back near one of the six-inch guns, surrounded by a number of commiserating marines.

'Give Nicholas III. hair,' Corporal Bassett called out.

'He 's got too much as it is, for this hot weather,' the marine barber grinned.

'Gangway!' the sergeant of marines ordered, as the staff-surgeon appeared on the scene.

O'Brien made a careful examination of the bear, who was in a very inflated condition, and apparently suffering great pain.

'Nothing seems to ease him except drinking water, sir,' the sergeant of marines remarked. 'If he goes on like he has been, he 'll drink our fresh-water tanks dry.'

The staff-surgeon sent for'ard for the best and strongest pill the navy produces. Alas! Nicholas III. was beyond all medical treatment, and within half-an-hour the poor fellow had made a painful exit from this vale of tears.

Luckily there was a taxidermist on board, who had joined up 'for hostilities only,' and he undertook to stuff and mount the bear, so that he might be placed on a pedestal in the captain's lobby, as an eloquent reminder of the mess's appreciation of his brief sojourn on board.

X.

Staff-Surgeon O'Brien assisted the process by performing a post-mortem, which proved illuminating to everybody, including Ship's-Corporal Grubbins, who had come for'ard to the sick-bay on an errand connected with the missing sponges.

Sick-Berth Attendant Pickles walked in his sleep, and on the occasion of his last bout of somnambulism he had visited certain officers' cabins, and abstracted medicine-bottles therefrom, stowing these commodities away in one of the dispensary lockers. The sleuth-like Grubbins had, therefore, come hither in search of his quarry.

The result of the staff-surgeon's post-mortem examination, however, disabused the ship's-corporal of his plausible theory, and completely exonerated the somnambulistic Pickles. The bear had died of pressure on the heart, caused by a greatly distended stomach.

As O'Brien said, 'Nicholas III. might have got away with the others, but the first-lieutenant's was too much for him.'

This referred, of course, to the spongy state of the organ in question.

'I think that 's mine,' the A.P. said, pointing to one which was curled up in a *cul de sac;* 'it always had a funny colour.'

'You 'll have a funny colour, and a thick ear in the bargain, my lad, if you make light of my scientific investigations,' the staff-surgeon warned him, handing over the remains of Nicholas III. to the taxidermist.

The mess was betwixt tears and laughter, when a cipher message came through from the *Cheeryble:* 'Trust Nicholas III. has not misbehaved himself. Forgot to tell you he is passionately fond of sponges, which, like a true sportsman, he seeks in their natural habitat, officers' cabins. So beware. *Au revoir.*'

THE SOLDIER PIONEERS OF SINAI.

By Herbert T. Grant.

SIMULTANEOUSLY with those great events in France which see the Allied armies at last coming into their own, the operations of the British Expeditionary Forces farther afield have again sprung into the limelight. Possibly the presence of a British force in southern Palestine came as a surprise to many people. What is it doing there, and whence did it come? The first question will in due time answer itself, but on the latter hangs a tale of soldier pioneering successfully completed, but so far unsung.

It is a tale of very human men who for a weary year faced without a break the rigours and privations of a climate and a soil where only the lowest forms of animal and vegetable life survive; a tale of the victory of science and civilised perseverance over the waste which swallowed up the Children of Israel for forty historic years, and where nomad peoples wander

still as primitively and more aimlessly than did those seekers after a 'Promised Land;' a long tale, a plain tale, a tale of drudgery and weariness of the flesh, unguessed at and unpraised, rather than the blazoned deeds of violent war.

Turkey's entry into the war and the German machinations to rouse our Moslem dependencies to a 'Holy War' were a cause of the gravest apprehension in those latter days of 1914 when the tiny British forces in the field were fighting for the very existence of our Empire; and nowhere was the danger greater than in Egypt, where the seizure of that greatest of all our imperial communications, the Suez Canal, would have been an incalculable menace to the assembly of our power, both military and economic. Turkey, with undisputed possession of Egypt as the prize to lure her on, greedily assented to act as Germany's cat's-paw in the undertaking. Most of us can remember how, the arduous crossing of Sinai accomplished, the Turkish expedition, bearing all the paraphernalia necessary to drive the British out of Egypt, actually launched its pontoons upon the coveted waters of the Canal, only to be driven back, broken and disordered, by English Territorials and our Antipodean contingents. It was a far-seeing policy, this making of the burying-places of the Pharaohs the training-ground for the Australian and New Zealand troops. So far, Egypt had been saved; and the attempt to force the Dardanelles, although a failure in itself, served, in addition to other military reasons, as a means of protecting Egypt from further invasion. Thus we kept the Turks with their hands full defending their own territory until the final evacuation of Gallipoli in January 1916. And now we come to the phase when Egypt once more lay open to invasion.

The Suez defences at that time consisted of a rough system of trenches on the *western* side of the Canal. It is perfectly obvious to any one, no matter how little versed in military affairs, that, had the Turks succeeded in establishing themselves in force within striking distance of the Canal, though we might have prevented them from setting foot in habitable Egypt, any position from which their guns could have commanded the Canal would have rendered it, as a practical waterway, to all intents and purposes *non est*. The new G.O.C. had at his disposal only the battered remnants of a few of the divisions which had fought on Gallipoli, men so weary and overwrought with the privations of that short but heroic campaign that only the imminence of danger could justify the curtailing of their much-needed rest. The flooding of the country east of the Canal limited the possible points of attack, but at every vulnerable section the troops were set to building an adequate system of defences. At various points advanced posts had been established, and light railways and metalled roads were quickly run out over the desert from Kantara and Ismailia, on the Canal, towards these posts. These operations were in direct relation to the establishment of a permanent first line of resistance at the Romani Oasis, twenty-five miles north-east of Kantara, and, to ensure the soundness of our communications on the adoption of this new position, a route for a standard-gauge railway was surveyed and construction work commenced. Behind the scenes, too, all was activity. Recruiting was going on apace for those new and invaluable branches of the service, the Camel Transport Corps and the Egyptian Labour Corps, both drawn from native sources, with British and Colonial officers and N.C.O.'s in charge. At the same time that fine fighting force the Imperial Camel Corps came into being, formed, as its name implies, from volunteers from British, Australian, and New Zealand regiments. By April the Kantara defences had been completed; so, when the Turks made their brilliant but futile raid upon our advanced infantry post at Dueidar, twelve miles away, and the covering yeomanry screen at Romani and Katia, on Easter Sunday, part of the Kantara garrison was early transported to the rail-head, then in the vicinity of the old Roman fort of Pelusium, twenty miles out in the desert. A strong force of mounted Anzacs was also despatched to this area to relieve the yeomanry; and from that time onwards, throughout the tedious mastering of Sinai, these superb horsemen and dashing fighters were ever scouring the country in advance of our operations, tirelessly guarding the main body against surprise, and in frequent contact with the enemy.

Hard put to it though our troops had been while encamped by the Canal, they were now to experience real hardships. The country in which they found themselves was a tumbled waste of yellow sand, bare and forbidding. The hot season was well under way, and, engaged as they were holding a hastily assumed line in case of further Turkish activity, they had to lie out shelterless, exposed to the pitiless sun by day, and drenched at night by heavy dews. But worse was yet to follow. The Turks had retired upon their bases before our mounted troops, leaving the way open to the execution of our plans to make the Canal impregnable. Pushing on ahead of the railway, the infantry established themselves on a front of several miles, along the line from Mahamdiya on the coast, south through the Romani Oasis to Katib Gannet. Distant though this new line was from our bases on the Canal, its natural advantages rendered it peculiarly suitable for our purpose. Before Mahamdiya lies the western limit of that vast inundation, Bardawil Lagoon, which extends roughly in the form of a razor-blade to within a few miles of El Arish, outpost of resuming civilisation, eighty miles ahead. Rapidly drying though this area was under the scorching summer sun, when, in

time, it would yield a rock-like bed over which even the heaviest guns might pass, its barrenness and salt-encrusted surface would make of any advancing force such a target as could not live in the face of artillery and machine-gun fire. Inland from Mahamdiya a ridge extends, culminating in the lofty sand-peak known as Katib Gannet; and outwards to the east and south of this lies an immense tract of scrubby plain, broken here and there by a few clumps of palm-trees, to where the far-flung strip of the Katia Woods fills the horizon. More important still, our new positions commanded the point where any hostile force, following the watered and only practicable route from Syria, would break off to attack any point on that half of the Canal between Port Said and Ismailia, thus enabling us to concentrate our strength to the best advantage.

Wherever our men had to entrench, it was in soft, heavy sand. Under these circumstances the shovel proved mightier than the pick; but let those who might imagine that trench-construction was an easy matter dispel that idea from their minds. Every foot of bay and traverse of fire-trench and communication-trench had to be revetted—that is, built up with sand-bags from top to bottom—a tedious process, and one requiring an almost incredible width to be shovelled clear to permit of the even laying of the sand-bags to form a trench three or four feet wide. The work on the new line was urgent, and daily every available man spent five or six hours in the fierce summer heat, by this time at its height. No hotter summer had been experienced in Egypt for twenty years. The thermometer rose to 125° in the shade in this abomination of desolation where shade was not, and the *khamsin*, that blasting wind which blows annually from the desert fastnesses of the south, filled it with an added misery. One can gain some idea of the nature of the *khamsin* when one pictures our men in that oppressive heat, huddled in an ordinary bell-tent, with curtains down, sheltering from its withering breath. Water-bottles were given the place of honour around the tent-pole, and then those who were lucky enough to be first on the spot crowded in, in as small compass as they could, till they were packed like herrings in a barrel, by no means enjoying the acme of comfort, but better off than those who found no entrance and had to shift for themselves outside. A shortage of water was the crowning infliction which made life almost unbearable. The precious liquid had to be brought by rail from Kantara to the water-tanks at the rail-head, and transferred from them to *fanatis* (galvanised copper tanks holding from ten to twelve gallons), and slung one on each side of the camels which carried it to the various units. The railway was working at full pressure bringing up engineering material, rations, guns, ammunition, horses, tents, and the thousand and one things necessary for an army in the field; and even with the water-supply at a minimum, the troops had to give of their scanty allowance to establish a reserve in case of breakdown, so that a quart, and sometimes only a pint, per day per head was all they had to drink. Poor water at the best, by the time the sun had worked its will upon the unprotected *fanatis* it was hot enough to make shaving, under happier circumstances, a luxury. It served, indeed, to keep body and soul together, but it gave scant relief to parched tongues and craving stomachs.

Fortunate were those the scene of whose labours in these trying days was Mahamdiya. The sea was a veritable godsend, and the daily bathe became a solemn rite which even the delighted revellings of the Tommies as they dived and splashed in care-free abandonment failed to rob of its portentousness. Full advantage was taken of such a healthful recreation-ground by shifting the troops about as much as possible, so that all might reap the benefit of it in turn.

The regulation dress consisted of sun-helmet, drill-tunic, and shorts; but all parades were done in shirt-sleeves. The wearing of the sun-helmet from dawn to dusk was strictly enforced, a most necessary precaution, for in the first hours of sunshine the heat was as intense as at noon. Owing to this, cases of sunstroke were rare; but, in spite of the suitability of their costume for the climate, a large number of our men were prostrated by the heat. The end of June saw the Romani positions fully consolidated, and preparations were forthwith made to give the troops a well-deserved rest. A splendid rest-camp was established at Sidi Bisher outside Alexandria, to which several hundred men were despatched at a time for a full week's holiday, free of all parades. Those who got there made the most of their freedom, but all were not fortunate enough to enjoy this period of change and recreation. Abdul was bestirring himself again, and advancing upon our outposts in force, and many a disappointed Tommy cursed him for the loss of that precious promised holiday, in a way he had never thought of doing in the grim reality of Gallipoli, as he climbed upon the train at Kantara to return, with eyes and senses unrefreshed, to the drab scenes of those weeks of heavy toil. On the 4th August the Turk struck his blow at Romani, only to be met with a reception which cost him half his force in killed and prisoners. Estimates of the Turkish strength on this occasion range from 14,000 to 18,000 men. The Turk is no fool when it comes to war, and it is extremely doubtful if this were intended as a second determined attempt to take the Canal. Possibly our strength was underrated, but one can hardly conceive of any responsible commander expecting to accomplish such an end with so small an expedition. More likely it was nothing more than a German

exploitation of her subservient Ally to influence us in keeping our Egyptian Expeditionary Force from furnishing reinforcements for the Somme. Support is given to this theory in the light of the report that the German officer who led the attacking force was court-martialled for the fiasco on his return to Constantinople.

Various irresponsible writers in the press had up till now been earning a tainted livelihood by ignorant criticism of the waste (*sic*) of men on so unimportant a front as Sinai. The battle of Romani was as much a lesson in restraint to them as an eye-opener to the Turks that their dream of ever winning back Egypt had vanished like a castle in the air. The policy of silence, which had been pursued in respect of our progress in Sinai, had brought no reward to our men except an inward satisfaction in work well done, and to the higher command an invaluable base when the time should be ripe for further operations. The day was now approaching when we would be able to attempt the advance which would reclaim all that part of Egypt, valueless save from military and political standpoints, which the Turks had made a marauding-ground since the commencement of hostilities, and carry the war into Turkish territory.

How futile words are to describe the peculiar attributes of Sinai! All that immensity of space between the vivid blue of heaven and the glaring sandy floor beneath is, in the almost never undimmed sunshine, a maddening, quivering film of light, which makes the dusty, stringy scrub and the straggling, shadeless palm-tree a mockery to the aching eye. Even the unladen back is bent as the feet sink gropingly for the stable foundation which they never reach; and on the march the head falls forward, and the soldier stumbles on beneath his load, blind to even the ceaseless panorama of death-like landscape in the hypnotism of the 'river of feet' which flows hour by hour before him. Only an actual residence in Sinai under campaign conditions can give one any idea of the difficulties with which we had to contend. In the cooler weather conditions would be more bearable, but nothing yet discovered could render these unfathomable sands any easier to march over.

The regulation full marching order of the British Army was an impossibility, so the kit was wisely reduced to a haversack on back in place of pack, containing the soldier's small kit, with the tunic strapped on underneath. All other personal necessities, greatcoats, blankets, &c. were carried on camels in rear of the desert column. Later the pack was readopted, as the haversack was found not sufficiently capacious to receive the various little odds and ends which every soldier carries about with him. At the same time (October) a general order was issued laying down the ordinary service dress of serge tunic and long trousers as the winter wear. Perhaps the wail which went up to heaven reached the ears of the G.O.C. on his throne in this lesser and more doubtful kingdom where he held undisputed sway. At any rate the Tommy was allowed to retain his beloved drill shorts, and the serge tunic found a resting-place in the daytime in his pack. Wide rims fitted to the wheels of guns and limbers made them less liable to sink in the sand, but very large teams of horses or mules were necessary to pull them even with this expedient.

Not a single well lay on our route from Kantara to Romani. From now onwards the ancient caravan-trail, with its occasional wells, marked the scene of our activities; but the water they yielded, even the best of it, would wreck the constitution of the average British soldier. Therefore, though they proved invaluable for watering our horses and camels, they could not be reckoned as suitable for human use except in cases of emergency, and for this contingency each man carried a small bottle of steriliser. Even the horses did not always find the well-water palatable, and in more than one instance they would not touch it unless they were excessively thirsty. Curiously enough, this brackish water is not always salt in taste. It is, indeed, frequently sweet and cloying, but, while refreshingly cool and sparkling, revolting to the stomach. Our somewhat barbarous enemy was less difficult to please. Throughout all his operations in Sinai he made constant use of the wells; but then he could advance to action in bare feet, by order, as he did at Romani, across those blazing sands—a performance which would have landed half our men in hospital—so he must be looked upon as a different animal entirely. A pipe-line, however, had been laid by this time from Kantara to Romani to provide drinking-water, and this was extended and pumping-plants erected at various points as we progressed, so that hereafter there was never any lack of water.

Our men were all eagerness to get started. They had had a fair experience of the desert, and had not found it altogether to their liking, but that spirit of enterprise which has made the British flag known in every corner of the earth was stirring in them, and would not be denied. A waste of awful miles lay between them and their goal, but that name sacred to the British Tommy, which had carried him through more than two years of war, and saw him fighting towards it still, was replaced by one older far than his religion, and more sacred yet! The Holy Land! What inspiration, what romance, did it not hold for him? There was indeed 'a long way to go,' and for all he knew there might be many a hard-fought action ere a footing was won there. He had yet to learn, too, that romance is apt to die an early death in the face of realisation, so he had no thought of evil on the morrow.

It was a magnificent sight to see the troops as they marched out from Romani in the bright

sunshine of an October morning, spread out over many miles of country in artillery formation, with yeomanry screens in front and on flank, and the guns bringing up the rear of the fighting forces. Many of the men, since the day when they sailed for Egypt in the early days of the war, or direct to the ill-fated shores of Gallipoli, had never spent a single night under a roof. From now on they had not even a tent to shelter them, as our movements had to be hidden as much as possible from aerial attack and reconnaissance. Makeshift bivouacs consisting of blankets hung on poles or palm-sticks formed their only shelter. The woods of Katia, where they spent the first night, provided the last patch of green which would meet the eye for many a day to come. Beyond Bir-el-Abd, some fifteen miles ahead, there is an extensive palm-grove, but this lay some distance south of the route we followed. The palm is rarely seen between this point and El Arish, and the much-prized oasis is only a few holes in the ground in an uninviting region of sand and scrub.

The salty solitude of Bardawil, too, now lay between them and the sea, and every step would take them farther away from it until they swung north again on the last stage of their journey to El Arish, and its wadi which marks the eastern boundary of Sinai. Next day they marched away through the thinning trees, crushing beneath their feet the dates which lay rotting in untold millions for want of their usual Bedouin harvesters. It was hard for those who had seen the dates gathering on the palms, from their first appearance as tiny green pellets upon a slender stalk, gaining bulk as the months rolled by, green giving place to red, and red to yellow, and who had visioned many a tasty addition to their unpretentious rations when a hue of golden brown or black should proclaim them at maturity, to have them tabooed by the medical authorities when the prize lay within their grasp. As it was, many a surreptitious handful found its way to the mouth of the irrepressible Tommy. Never before had he tasted the fruit fresh pulled, and he pronounced it good. Try to imagine the wonderful organisation and indomitable spirit which conquered little by little a desert as unchanged as at the dawn of history: huge gangs of native labourers of the Egyptian Labour Corps at work on fill and cutting for the railroad grade on which the Engineers were laying the steel as fast as it rose clear defined from the surrounding dunes and dips; others joining up the water-pipes which would rob the arid sands of half their terrors for the camel caravan of future years; convoys of the Camel Transport Corps, winding here and there by devious and trackless routes, bearing water, rations, and supplies to the infantry engaged in consolidating each fresh advance, and past the infantry to where, far ahead, the yeomanry and Anzacs were driving back the Turkish outposts.

It would be tedious and unnecessary to go into detail regarding the marches from point to point. One stage was like another, a deadening, almost progressless, plodding from dawn till dusk; a throwing out of outposts of exhausted men, who sometimes spent half the night digging themselves in, only to leave their hardly excavated trenches in the morning to resume their march. As a rule the route lay over a tumbled assortment of ridges and basin-like depressions. The topping of one ridge would give perhaps a momentary glimpse of some more outstanding ridge ahead, and, spurred on by the hope that at the foot of this would be their bivouacking-ground for the night, down, down they would go in a stumbling slide, with the sand rising half-way to their knees, to a world confined to the sand-walls which encircled them; a bitter struggle up the farther side—the ridge they had expended a last effort to attain gained at last; and then—alas for their vain hopes!—on again through a like succession of miles.

Sometimes the way lay along the actual caravan route. The path of the caravan route is naturally ruled by the position of the wells, but between these every advantage is taken in the way of the easiest grades and a natural feature of the country—the *sabkhet*. The *sabkhet* is a species of salty swamp, which when dried up furnishes a solid and welcome foothold after the surrounding sands.

It is a noteworthy fact that the health of the troops, in spite of the hardships, was excellent. A writer in the early days of the war remarked that the path of the German troops was marked by empty bottles, and that of our own men by bully-beef tins. Cholera and para-typhoid inoculations would be severely tested under an Eastern sun by these conditions, but they exist not, wherever circumstances permit, under the eagle eye of an A.D.M.S. and his red-crossed staff.

Now the men from Lancashire went on ahead, again 'the Jocks,' and each in turn built and held defence lines, and sent out listening-posts at night, and patrols which groped about in scrub and valley in the chill morning mists for any signs of Abdul, whenever a lengthy halt was called. Parties of Turks and Bedouin families, with their camels and flocks, now and again slipped through the cavalry cordon to the infantry posts. It was pitiful to see the Bedouins, with their toddling youngsters, herding their few miserable sheep and goats through sun and dust, crying out, '*Moya / moya /*' ('water') when they saw our men. Those who learned to know Sinai like a book by harsh experience can vouch that it requires no additions or subtractions of the chronicler to emphasise its hardships, and it is but right to state that in that portion which concerns this story the nomads whose home it is would no doubt be surprised to read of the only land they know as lacking in that first necessity of man—water. Our cavalry, however, were in

possession of all the wells, and it was doubtless in an endeavour to avoid falling into their hands that the Bedouins who penetrated our lines were reduced to such dire straits before they were discovered and their distress relieved. Nevertheless, it is difficult to reconcile the thirst-producing effect of dates, which form their staple diet, with conditions which demand the carrying of a large water-supply whenever the Bedouins migrate. Many weeks passed sometimes without a move, for we were advancing with the steel; and surveying and constructing a railway practically mile by mile was no enviable problem for the Engineers to grapple with. During these periods the troops in reserve were busy preparing for the day when at last the Turks would make a stand. Field-days were the regular order of things, and ranges were laid out at various places for musketry practice. Save for almost daily visits from the ubiquitous *Taube* (every make of hostile aeroplane in these parts, by the way, is a *Taube*, or, rather, *Tawb*, to our men) with the intent to bomb the dumps, all was peaceful enough.

One landmark, and one only, broke the monotony of the dreary landscape. Away to the south-east the bulk of the Maghara Hills loomed above the horizon. The Blue Mountains our men called them, and the passing of them meant as much to the British soldier as these same 'blue hills of Judea' must have meant to the wandering children of Israel so many thousand years before. For the rest, each halting-place provided nothing of interest, nothing eventful; just so many milestones passed on the laboured way to happier campaigning-grounds ahead. The forging of each fresh link meant no further severance from pleasant pastures. Hope lay ahead, and it were better to meet a soldier's death and sleep eternally amid those wind-swept wilds than ever to retrace their steps across the nightmarish miles which they had come. Pelusium, Romani, El Rabah, Aby-el-Affein, El Abd, Gannadil, Tilub, Mazaar, Madaan, Bittia—these are but some of the names which will conjure up memories in after years for the men who tramped across Sinai. Already stone station buildings are springing up at some of them; of others, temporary dumps and reservoirs, the day is done, and no stone is left to mark the place to the globe-trotter of the future.

The culmination of the whole undertaking was the occupation of El Arish. It was expected that the Turks would make a stand there, and our men accordingly pushed on ahead of the railway to give them battle. A march of twenty-four miles by stages from Mazaar, over as terrible a piece of country as they had yet encountered, brought them there at noon on the 23rd of December. On the way word was passed back by the Anzac reconnaissance patrols that the Turks had evacuated their positions, and our infantry passed the eastmost town of Egypt unopposed to the long-craved relief of sea and palm-grove. Thirty miles still lay between them and the frontier post of Raffa, but their further progress was through a country in which the desert wages a losing war against hard ground and cultivation. For our troops the crossing of the Wadi-el-Arish meant a signal victory over nature in one of her most forbidding aspects, and for the general and his staff a triumph of careful preparation and faultless execution. Various expedients had been tried to make things easier for the infantry on the march, such as canvas boots and sandals of wire-netting on the principle of a snow-shoe; but none of these had been found of much advantage.

Fresh troops have made the Sinai crossing, but only those who won through it in its primitive state are qualified to share the honour of the undertaking. In advance of the rail-head, as our army was at El Arish for some little time, they were dependent solely upon the wells for water. These were the best wells as yet encountered; but then El Arish is a town boasting a considerable community more or less civilised, and the water was found quite drinkable. New wells dug by our men on the shore within a few feet of high-water mark, it is interesting to note, supplied water which was constantly used throughout our stay at El Arish. It was transferred from the wells to tanks and chlorinated before issue. Varying from day to day in salinity, it was nevertheless always quite wholesome.

Other armies have made the passage of Sinai. The hosts of forgotten ages have poured across it from Egypt into Syria, and from Syria into Egypt. The Romans, Napoleon, and the Turks in the present war have all made the arduous journey, with what privations we shall never know; but none of them have left their stamp upon it. Of the ancient occupations no vestige remains. The crumbling ruins of a few Roman forts furnish nothing of value except to the antiquarian in the shape of broken pottery and coins; the traces of Napoleon's 'Old Guard' have vanished as completely as their footmarks have been swallowed up in the ever-changing sands; a telegraph-line and a few rude windlasses on the wells are the only improvements that two years of Turkish domination accomplished. It remained for the unassuming, unimaginative Tommy to render a lasting service to mankind by paving the way for those twin lines of steel which now make the fearsome desert route from Africa to Asia as easy of accomplishment as any hundred-mile journey in his settled homeland.

THE MONTH: SCIENCE AND ARTS.

NEW BRITISH SOURCE OF THE MINERAL NEEDED FOR MAKING GAS-MANTLES.

THORIUM is a most important mineral product in that its oxide is needed for the manufacture of gas-mantles. It is interesting to note, therefore, that beach deposits of monazite sand containing this metallic element have been discovered in Ceylon. Tests made upon samples of the sand by the Imperial Institute have given such promising results that the necessary machinery has been ordered by the Government of Ceylon, which intends to work the deposits. The mineral survey by means of which monazite sand was discovered has shown that the island also contains several other minerals from which thorium can be extracted.

RED CROSS AMBULANCE-LAUNCHES ON THE TIGRIS.

As the fighting in Mesopotamia has proceeded along the banks of the Tigris, this river has inevitably formed the chief means of communication between the front and the sea. Water transport of the sick and wounded affords marked advantages over conveyance by road or rail, for journeys by water involve none of the jolting or vibration which often cause such pain to seriously wounded men. A special type of ambulance-launch has been devised for the British Red Cross Society, which has over forty launches in service in this part of the world. In the kind of launch referred to a cabin 'right forward' houses the engine, and contains sleeping accommodation for the two men who form the crew. The remainder of the boat, which is open save for a double awning and side-curtains, is available for stretchers and 'sitting cases.' Thirty-six 'sitting cases' can be comfortably accommodated, or eight stretchers and sixteen 'sitting cases.' An interesting account of the operations carried out by these launches recently appeared in *The Times of India Illustrated Weekly*, from which it seems that the first of them were put into service towards the end of 1915, the others having been sent out at intervals since. Their main duties are to act as feeders to river and sea-going hospital-ships, to transport sick and wounded to hospitals along the river-banks, and to evacuate the wounded from the advanced dressing-stations to the field ambulances.

A MACHINE-GUN WHICH FIRES CONTINUOUSLY.

The war has demonstrated the value of the machine-gun in no uncertain manner; consequently great efforts have been made to improve this weapon, and many new types have been put into service by the belligerents. Hitherto ammunition belts or drums holding about two hundred and fifty cartridges have had to be put on by hand at intervals to take the place of those used up. A new American machine-gun, according to *Popular Mechanics*, is capable of firing continuously, ammunition being carried in an endless belt which is automatically filled from a container holding any number of cartridges up to ten thousand. The barrel of the gun is cooled by a jacket in which water is circulated, the hot water leaving the outlet being pumped into a spiral radiator through which air is blown by a fan, thus cooling the water ready for use again. Naturally a machine-gun of this type is more cumbersome than the ordinary pattern. On the other hand, it has certain important advantages besides the ability to fire continuously. For instance, in trench warfare the gun can be mounted on a special electric carriage and made to proceed across 'No Man's Land,' while the operator remains in the trench and controls both the movement and the firing through electric cables. Another method of using the gun is to mount it on a tripod from which the controlling cables lead to a protected position several hundred feet to the rear, where the gunner controls the direction and speed of the firing. This gun should also be of great value when mounted in aeroplanes, motor-boats, armoured cars, or motor-bicycles, where its mechanism can be driven by the motor.

VALUE OF REINFORCED CONCRETE AS A PROTECTION AGAINST SHELLS AND BOMBS.

The resistance to high explosives of concrete reinforced with steel bars is discussed in an interesting article recently published in *The Times Engineering Supplement*. From it we gather that structures built of this material have 'stood up' to shell-fire better than those made of steel. Reinforced concrete was first exposed to the fire of heavy guns at Port Arthur in the Russo-Japanese war, where it proved very successful in resisting the impact of high-explosive shells. Moreover, experiments made by the Italians on steel and reinforced concrete armour-plates of equal weight are stated to have resulted in favour of the latter. The Germans were the first of the belligerents to use reinforced concrete for trenches, gun-emplacements, block-houses, and other protective structures. Especially successful have been the block-houses, shells simply ricochetting off the cupolas which formed the tops, while steel cupolas have been blown to pieces by similar punishment. An instance is given of a German block-house with eight observation-chambers and a tower which withstood a bombardment that destroyed all the surrounding fortifications. Ordinary buildings, also, constructed of reinforced concrete, and situated in the battle area, have often stood up against heavy bombardments which have destroyed all brick and steel structures. Further evidence of

the resistance of reinforced concrete to high explosives is to be found in the difficulty of destroying bridges built of this material, masonry and steel bridges being far more easily demolished.

NEW METHOD FOR UTILISING HOUSE REFUSE.

Alcohol can be produced from practically all vegetable matter, a fact which indicates the possibility of manufacturing spirits from house garbage. With this end in view a process has been patented in the United States by means of which both grease and alcohol are obtained from house refuse. The garbage is first treated with sulphuric acid and steam, which transforms the starch into dextrose, a form of grape-sugar. This process is followed by the separation of the grease, and the neutralisation of the acid to allow of fermentation, which is carried out by adding yeast. Alcohol is thus produced from the dextrose, and recovered by distillation in the ordinary way. A ton of garbage is said to produce about four and a half gallons of alcohol at a cost of a trifle over seven shillings.

NEW 'HIGH-SPEED' STEEL FOR METAL-WORKING TOOLS.

One might well be excused for supposing that every possible kind of steel for tools had already been tried, and either adopted or rejected as valueless. Such, however, is not the case, and a new tool-steel for which valuable qualities are claimed has been recently placed on the market. Of late years metal-working tools have been mostly made of 'high-speed' steel, so named from the fact that drilling, turning, and other operations can be performed with it at far higher speeds than were possible with the old-fashioned tool-steels. In fact, the tools heat up to a dull red and still remain hard and tough, whereas the steels previously used became soft at far lower temperatures, and were more or less brittle at all times. The main advantages of the new steel, which will also cut at high speeds, when compared with the original high-speed alloy, are that it hardens at a lower temperature with less liability to deformation and cracks, and that castings made from it possess all the good qualities to be found in rolled bars. Cobaltcrom is the name of this new brand of tool-steel.

PROJECTED RAILWAY ACROSS THE ANDES IN PERU.

Among the few parts of the world which have not yet been opened up to trade by railways or other means of communication are certain portions of South America, where fertile districts rich in minerals and timber have scarcely been 'scratched.' One such area will shortly be connected with the Pacific seaboard by a railway four hundred miles in length which is to link up the Peruvian portion of the river Amazon with the port of Paita, on the Pacific coast, thus providing rail and water communication right across the continent. This development is expected to shorten by a month the journey between the rubber district of western Brazil and the ports of North America. The new railway will have to cross the Andes at an elevation of sixteen thousand feet, so that the difficulties of construction are likely to be considerable. According to the plans, work should already have begun. It is estimated that the line will take three years to complete.

NEW UNSINKABLE SELF-RIGHTING LIFEBOAT.

The risks caused by German mines and submarines to those who make sea-voyages have given an immense impetus to the invention of all kinds of apparatus for saving life at sea. As regards lifeboats, some might suppose that every practicable form had long since been tried; but this is by no means the case, a new design having been recently tested before the Steamboat Inspection Service Committee in the United States. The hull of this craft is built of galvanised steel, and it is entirely closed in except for apertures provided with water-tight covers through which the crew enter. In fine weather these apertures are kept open, but should a storm come on they can be closed, when no water can enter, although special apparatus admits fresh air. An iron keel weighing one thousand pounds causes the boat to right herself at once should she be capsized, and she can be rowed by six oars projecting through water-tight ball-and-socket fittings in the sides. A mast and sail are provided for sailing. This boat is authorised to carry twenty-five persons, and weighs, complete, two thousand six hundred pounds.

MOTOR ATTACHMENT FOR HARVESTING AND THRESHING.

Any contrivance that will reduce the amount of labour needed for harvesting corn will be welcomed in all belligerent countries, where farmers are experiencing great difficulty in finding enough helpers for reaping and threshing their crops. An American invention whereby harvesting and threshing can be carried out by apparatus attached to an ordinary motor-car should be of some value in this connection. No attempt is made to gather the straw, the cutting arrangement in front of the car being adjusted at such a height as to cut off the ears of corn only, which are carried by a conveyer to a threshing-tackle at the back of the car. Here the wheat is separated from the husks, and the latter are thrown out as the car proceeds, so that only the actual wheat is carried. The apparatus can be quickly installed on almost any make of car, the chief alteration being the replacement of the back-wheels by others suitable for gripping soft ground. Such an equipment would undoubtedly reduce the labour of harvesting and threshing to a minimum, but

the rejection of the straw, which is a valuable by-product, would be considered a serious drawback in this country.

DEVELOPMENT OF THE OIL REGIONS IN ARGENTINA.

Side by side with prophecies that the world's supply of petroleum will be exhausted in the comparatively near future are announcements of new sources of this now indispensable commodity. It is not so long ago (April) that reference was made in these notes to the probability of considerable supplies of petroleum being obtained in this country. Recently, according to an article in the *British and Latin American Trade Gazette*, a great development in the yield from the deposits in Argentina has been projected, the Government having reserved a large area for this purpose. Oil was discovered in the republic nearly ten years ago, and the yield from the partly developed area close to Comodoro Rivadavia amounted to nearly two thousand tons in 1911. Since then development has proceeded rapidly, and the output for 1916, based on the rate of increase up to 1915, is estimated at one hundred thousand tons. A marked feature of the oil is the small petrol content—5 per cent. —when compared with that extracted from oil found in other parts of the world. This, however, is not a serious drawback, in view of the general tendency to adapt all kinds of oil-engines for the use of the heavier petroleum derivatives, some progress having been made even with aeroplane motors, which can use paraffin, or still heavier oils, instead of petrol. Besides the area already referred to, three other petroleum districts are known to exist in Argentina, so that there is every reason to expect a large output of oil when further development has taken place.

GOVERNMENT BILL FOR REGULATING PROSPECTIVE ENGLISH PETROLEUM INDUSTRY.

Our readers will remember a note in our April issue suggesting the possibility of considerable quantities of petroleum being found in England. So important is this supply considered that a Bill has been introduced to give the Government 'the exclusive right of searching and boring for and getting petroleum within the United Kingdom,' the meaning of the word petroleum being defined as 'all petroleum and natural gas and their relative hydrocarbons (excluding coals and bituminous shales) existing in their natural condition in strata.' After the war those desirous of carrying on this industry will be authorised to do so under schemes approved by the Board of Trade, and they will pay royalties to the Government at the rate of ninepence a ton on the oil raised, and a penny for every ten thousand cubic feet of natural gas. The Government in its turn will compensate the landowners and tenants affected. If this measure, known as the 'Petroleum Production Bill,' becomes law next session, as in all probability it will, boring will be commenced at an early date, and the whole matter will be pressed forward as quickly as possible.

NEW POWER SCHEME FOR NIAGARA WHICH WILL NOT AFFECT THE FALLS.

The proposed scheme to harness the whirlpool-rapids at Niagara would have the advantage of yielding a million horse-power without interfering with the amount of water passing over the Falls. This is an important desideratum, as the volume of water now taken from above the Falls for power purposes has already appreciably reduced the amount available as a display, and the consumption of the American and Canadian companies is already limited to sixteen thousand and three hundred and forty-eight thousand four hundred cubic feet a second respectively. The whirlpool-rapids being below the Falls, these limits would not be affected by the proposed scheme, and the fall of one hundred and four feet in the run of seven miles to Lake Ontario should be enough to produce the power anticipated, in view of the immense volume of water available.

EDUCATION AND RESEARCH IN THE COTTON INDUSTRY—A SPLENDID EXAMPLE.

This country has never lacked scientists of the highest possible attainments, but it is undoubtedly the fact that she has lagged far behind some other countries, and notably Germany, in forming that close alliance that should exist between science and industry. Many industrial processes can only be satisfactorily and economically carried on when placed on a scientific basis, and for this purpose a staff of trained scientists and technologists is essential. But this staff must not be so immersed in the routine of insuring regularity of production and in the solution of difficulties which daily present themselves that no time is left for the pursuit of fresh knowledge. Some members of the staff must be free, during at least a part of their time, to conduct research-work, if the most valuable and the most lasting results are to be obtained. Bearing these facts in mind, a wise decision has been arrived at by a leading firm of cotton manufacturers, which has determined to set aside £10,000 a year for the next five years for the carrying out of patient and systematic investigations into the scientific details affecting their own business, and for promoting the education of their younger employees. In embarking on the latter project the firm is anticipating the compulsory scheme of part-time schools which forms a section of the Bill recently introduced into the House of Commons by the Minister of Education, for it proposes to establish a works school in which part-time instruction will be given during working-hours. Pupils showing outstanding ability will be encouraged

to prosecute their studies more thoroughly; and in approved cases opportunity will be afforded for securing whole-time education at a technical college or a university. It is sincerely to be hoped that this attempt to benefit both the business and the workers will be abundantly successful, and that the splendid example thus set will be largely followed in other branches of industry.

THE NUTRITIVE VALUE OF MUSHROOMS.

Because analysis shows that mushrooms contain a relatively large proportion of nitrogenous compounds, it has commonly been assumed that they form a highly nutritious article of diet. *The Journal of the Board of Agriculture*, however, points out that this by no means follows. To be of value as a foodstuff, the nitrogen must be present in the form of protein, the valuable flesh-forming constituent of such foods as lean meat, fish, beans, peas, cheese, &c. Now in mushrooms a considerable part of the nitrogen present is not in the form of protein at all; moreover, of the protein which they do contain only a portion can be digested, and thus become available for the nutrition of the body. As compared with other vegetable food-substances, mushrooms contain no more protein than do cabbages or potatoes, and in total nutritive value they are far inferior to these on account of the much smaller quantity of carbohydrates which they contain. At the same time, they are not entirely without value. They are useful for flavouring purposes, and they afford a pleasant change of diet; but if the body is to be adequately sustained, it is necessary that more nutritious foods should be eaten along with them. From the food point of view, purchased mushrooms are not usually worth the money paid for them; but when they can be gathered or obtained very cheaply, they may serve a useful purpose in giving an agreeable variety to the menu.

A NEW SOURCE OF POTASH FOR FERTILISING PURPOSES.

The lack of potash fertilisers is by no means the least of the difficulties with which the farmer has had to contend since the outbreak of war. During the previous thirty years the whole world had learned to look upon the extensive deposits occurring at Stassfurt in Germany as its one source of supply, and British imports had steadily increased until in 1913 they amounted to 22,000 tons. The sudden cessation of these imports, while inevitable, has been a serious handicap to the farmer in his efforts to increase the nation's supply of food. Attempts have been made to remedy the deficiency of potash by the use of seaweed, the burning of hedge-trimmings, and in other ways, but these expedients are by no means sufficient for the needs of the situation. Fortunately, however, as is pointed out by Mr Harold T. Cranfield, agricultural chemist to the Midland Agricultural College, in a recent number of *The Journal of the Board of Agriculture*, we have in our own land an important source of supply which has hitherto been neglected. The gases driven off from iron blast-furnaces and the dust which accumulates in their flues contain an appreciable percentage of potash, and Mr Cranfield estimates that if this storehouse is properly investigated and controlled, it may in the future satisfy at least half, and possibly three-quarters, of our agricultural needs. The matter has been taken up by the Potash Production branch of the Ministry of Munitions, which is calling for returns as to the rate of production and the stocks of flue-dust which the blast-furnaces have in hand.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A MANSE GARDEN.

In shade of moss-grown, lichen'd wall,
Bright columbine and foxgloves tall
  Lift pink and purple heads;
The lily of the valley sweet
Twines snowy bells around their feet,
  And o'er them fragrance sheds.

A wealth of tulips, white and red;
Of perfumed thyme, a purple bed
  Where bees hum all the day;
Of clove-pinks sweet, a border white;
While poppies, in the glad sunlight,
  Flaunt scarlet pennons gay.

And in my cherished garden fair,
Her perfumed beauty everywhere,
  Is summer's Queen of Flowers.
Sweet roses, crimson, white, and red,
Smile forth from many a garden bed,
  And ramble o'er my bowers.

Below my garden, all day long,
A streamlet croons its endless song,
  As down the glen it flows;
Upon its banks, so fresh and green,
Are dancing blue-bells, meadow queen,
  Gay broom, and pink wild rose.

A shelt'ring wall, beyond the stream,
Like drowsy giants the mountains dream,
  Their summits in the skies.
My heart's delight, this scene so sweet,
Hills, stream, and garden, cool retreat,
  My earthly Paradise!

B. DUNBAR DEY.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

'THEIR HEARTS' DESIRE.'

By ISABEL SMITH, Author of *Vain Threads*, *The Romance of Mutby Workhouse*, &c.

CHAPTER I.

'NOW, Aunt Naarah, my friend Mr Twitty has got your will all ready, and it only needs the signature. If you will just sign here, please;' and Mr Herbert Knowles (Lawyer Knowles, as he was called in the Essex town of Crabtree, where he practised) pointed invitingly to the sheet of thick foolscap which lay on the table of a dingy office in Lincoln's Inn Fields.

He was a man of early middle age, clean-shaven, with small, keen eyes and a sallow complexion. He served on several committees in his own town, and carried round the bag at church on collection Sundays.

'Just here, auntie,' he added persuasively, as his client made no attempt to comply.

Miss Naarah Knowles, a grim, gaunt woman, with her scanty gray hair dragged off her high forehead in such a deliberately unbecoming fashion as to suggest the principle of the Jewish matron's wig, sat bolt-upright on a faded leather chair, the hunted, despairing expression of a captured animal in her prominent eyes. It was a dreadful moment for her, and she felt as if she had been urged to sign her own death-warrant. All her life—that is, after the one brief romance of her youth was ended—money had been her absorbing interest.

Money—how to keep every penny possible, even at the price of half-starving herself; how to increase it by safe yet profitable investment (always under the guidance of her devoted nephew Herbert)—that is what Aunt Naarah lived for; and—now—to realise that she was to will it away—that one day. She was roused from these sombre meditations by the voice of Mr Twitty, who, as his friend was interested in Miss Naarah's will, had drawn it up for her, so that there should be no chance of its ever being judicially set aside.

'Perhaps Miss Knowles would like to read it through again first,' he said in tones as dry as the numerous parchments reposing in dusty bundles on the office shelves. He handed her the document as he spoke, and Auntie Naarah withdrew her gaze from a row of deed-boxes, and took the fatal document.

It was short, as short as legal prolixity could make it, and it bequeathed all her worldly possessions (with the exception of a legacy to her faithful servant, Jean M'Intyre) in equal portions to her nephew, Herbert Knowles, solicitor, and her three nieces, Ellen, Priscilla, and Mary Knowles, spinsters. There it was, inscribed with terrible clearness, the future disposal of her property. Tears of self-pity came to her eyes.

'And now,' said Mr Twitty, 'please sign.'

He replaced the will on the table, and gave Miss Naarah a pen.

Herbert, surreptitiously biting his nails by the fireplace, watched the proceeding anxiously. Suppose even now his aunt should refuse to sign it! The old proverb of 'a horse being brought to the water' came into his mind.

However, Aunt Naarah, who, after so much patient effort and persuasion, had been prevailed upon to make her will, now completed the business by duly signing it. At that moment, Mr Twitty pressing a button, a clerk appeared with such promptitude that he might have been waiting outside the door, and they both added their signatures.

'There it is, Miss Knowles,' said Mr Twitty lightly. 'All in order. Signed by the testatrix as her will in the presence of us present at the same time who in her presence and in the presence of each other have hereunto subscribed our names as witnesses,' he added, quoting the final attestation clause.

'That will do,' said Miss Naarah curtly. She felt she had borne enough, and did not want any more of her last will and testament, which was forthwith handed to the clerk to be stowed away in an underground cellar with hundreds of other like documents, some of which had been there for half-a-century, and never been claimed.

'You will feel it a relief to your mind, Aunt Naarah,' said Lawyer Knowles. It certainly was a relief to *his*.

'Not much of a business after all, was it?' chimed in Mr Twitty. 'Wills? Why, since the war began we've hardly done anything else but make 'em. Men going out to the front, you know.'

But Aunt Naarah had no thought beyond her own affairs.

 [*All Rights Reserved.*]

'I wish, Herbert'—she turned fretfully to her nephew, who had picked up his hat and was anxious to get away—'I wish you had let me leave Jean the hundred pounds I meant to.'

'Oh, my dear aunt, that, I think, would have been excessive for a person in her station of life. Half that amount I consider ample, generous. But'—Herbert looked at his watch—'we are trespassing on Mr Twitty's time.—You have an appointment, I believe, Twitty.—Come, aunt; I will see you to your cab.' Regrets, he felt, were dangerous. The sooner he got her out of the lawyer's office the better. He breathed more freely when they were downstairs and once again in the bustling city street.

'And now I think the best thing we can do will be to go and get some lunch before you go to the station,' he said. 'You are determined to go back to-day?'

'I should hope so,' Miss Naarah snorted. 'I should be sorry to stay the night in this dirty, noisy London. Why, I shouldn't sleep a wink.'

Lawyer Knowles sympathetically agreed. He chatted away on different subjects till they came to a quiet restaurant which he knew.

'Now you must have a good lunch, Auntie Naarah, as my guest,' he said, studying the menu. 'And, waiter, bring a half-bottle of Moet & Chandon,' he added, feeling that this was an occasion which warranted a little extravagance, seeing how comfortably his own and his sisters' future was assured.

Auntie Naarah almost gasped at the order. She was accustomed to nothing but water on her own table. Indeed, when rare visitors came to a meal at her house, they were always asked if they would take water or (if they were not abstainers they hoped the alternative would be something stronger) *hot* water.

However, she sipped the champagne much after the manner in which a chicken drinks, her cheeks and her long nose, with its inward-turning tip—sign of an inquisitive disposition—reddening in the process.

The wine cheered her, loosening her tongue. 'I hear that Edward Strachan has joined Lord Kitchener's Army,' she observed presently.

'Young Strachan?' Lawyer Knowles's keen little eyes hardened. 'A good thing, too,' he added. 'The discipline and regular life will knock the nonsense out of him. That, I think, is the benefit of a big war. It rakes in all the riff-raff, and sweeps them off.'

'You would hardly call Edward Strachan riff-raff, Herbert,' remonstrated his aunt.

'Well, perhaps that is not quite the correct term,' amended Herbert promptly. 'The ne'er-do-wells, spendthrifts, those who think of nothing but pleasure—the army is all right for such.'

'Some of the finest gentlemen that ever breathed have been in the army,' retorted Auntie Naarah. Her nephew began to think the wine would make her quarrelsome. 'I am sure this young man's father, Major Strachan, was one.' Her face glowed a more vivid crimson as she uttered this tribute to the departed soldier.

'Oh, Major Strachan, I dare say,' said Lawyer Knowles quickly. 'But—well, his son, from what I hear, is quite a different type. Gambles—bets on horses—never sticks to his job more than a few months. "Everything by turns, and nothing long,"' he quoted disparagingly.

Auntie Naarah drained her glass with a prolonged sip. Then she shook her head, which might mean anything.

'A young man,' continued her nephew skilfully, 'whom it would be a sin to help, and indeed a folly; something like trying to fill a sieve with water.' He reflected that though his aunt had made her will so satisfactorily, there was nothing to hinder her giving money away in her lifetime.

Aunt Naarah nodded. 'Don't you let me lose my train,' she said irrelevantly.

Lawyer Knowles looked at his watch, and beckoned to the waiter.

'That would not do,' he said briskly. 'And I must be getting back to Crabtree.'

Outside the restaurant he took a taxi; it was a day of extravagances, and in a few minutes they were at Waterloo, and Auntie Naarah was safely in a third-class compartment of a slow train which stopped at Tussocks, the village where she lived.

'Good-bye, Herbert. I am obliged for your kind attention,' she said, giving her nephew a peck on the cheek. 'My love to the girls, and I hope one of them will come and stay with me as soon as possible. I think, under the circumstances,' she concluded meaningly, 'the least they can do is for one of them to be always with me. I'm not getting younger, and I need cheerful companionship. Don't forget.'

Herbert, a little doubtfully, knowing his sisters' averseness to burying themselves at Tussocks, promised to give them the message.

. . . . . .

Two men talking at the corner of Crabtree High Street as Herbert passed on his way home that evening paused a moment in their conversation.

'There goes Lawyer Knowles,' said one to the other. 'Looks rare and pleased with himself, don't he?'

'Done a good stroke of business likely,' was the reply. 'He's a cute one, he is. You'd have to get up very early in the morning to get the better of him.'

His companion laughed, taking his pipe out of his mouth. 'You're right,' he said. 'Ah, well, lawyers are a deep lot at the best!'

'"The devil's own," don't they call 'em?'

'And not far out either, I'll stake my bottom dollar,' said his friend forcibly.

Meanwhile Lawyer Knowles had reached his

own front-door and inserted his latch-key. He lived in one of those ultra-respectable-looking red brick houses which are to be found in all country towns. It stood flush with the pavement, and its long, narrow windows were screened from the vulgar gaze by wire blinds which gave those inside the rooms the advantage of looking out without being seen. The edge of the pavement in front of the house was guarded by short posts supporting iron chains, and by reason of this relic of the past the lawyer's abode was called 'The Chain House.'

In the comfortable low-pitched dining-room the cloth was laid for the evening meal, as it was modestly called, and the three Misses Knowles were seated round the fire with knitting—or, rather, one was knitting, while another held a skein of wool on her hands, and the third wound it. They might have been the three Fates spinning human destinies; and, indeed, they were at that moment concerned with their brother's future. He had lately employed a girl typist in his office. She seemed a harmless, quiet little thing; but, as they agreed, one never knew what designs she might have. It is true, they thought the same of every woman of Herbert's acquaintance, but in this girl's confidential capacity they felt there were particular dangers.

Their brother's key sounded in the door, and, a little guiltily, they all sprang to attention.

'Herbert!' they cried in chorus; and Ellen, the eldest and most practical, pressed the bell, a signal for the servant to dish up. Mary moved Herbert's slippers a little closer to the fire, and Priscilla, who rather adopted kittenish ways, ran to meet her brother.

'Well, Bertie, is it a *fait accompli?*' she cried vivaciously, 'or has Auntie Naarah jibbed at the last minute?'

Herbert shook his head non-committally. With his natural caution, strengthened by his legal training, he seldom, if ever, answered a question directly.

'Let me get my boots off and have something to eat before you put me under cross-examination,' he said, bustling up to the hearth. But his cheerful air reassured them. The sisters exchanged smiling glances.

The maid brought in hot dishes, and the next minute they sat down to one of Ellen's economical hashes, where there was very little meat and a good deal of seasoned hot water, and sippets of toast.

Herbert was allowed to satisfy his hunger. Then Priscilla the irrepressible turned to him eagerly. 'Did you manage all right?' she asked.

Herbert nodded. 'There has been no hitch,' he replied. 'But it was a great business for Auntie Naarah. She had worked herself up so over the affair, she seemed almost to feel as if she were *giving* her money away. However, it's done. I'm glad I managed to persuade her (in this I had Twitty's co-operation) to delete a few uncalled-for legacies. The minister, I found, she had put down for one hundred pounds simply because he was a good man and poor.' He laughed. 'As I pointed out to Auntie Naarah, people ought not to expect to be paid for being good, and most parsons are poor—they get used to it, like the eels.'

'Oh Herbert!' They all laughed in rather a shocked way.

'Well, it's true, isn't it?' went on their brother. 'And then Jean's legacy I halved.'

'I'm glad, Herbert,' cried Mary. 'Jean is a detestable woman. She would like to boss the whole show.'

'Mary! Mary!' reproved Ellen, who, although only the senior of the others by four or five years, had never lost a sort of elder sister authority over them.

'So she is,' retorted the chidden Mary. 'I am sure when we stay at Auntie Naarah's she seems to resent the slightest interference, and, indeed, to treat one as an interloper.'

'Oh, by the way,' said Herbert as soon as the pudding course had been cleared and they were nibbling cheese and biscuits, 'that reminds me—Auntie Naarah is wishful for one of you to go and stay with her now. She put it pretty plainly that, considering her property is left to you all, it is your duty to be with her in turns, in perpetuity.'

There was a dismayed chorus: 'Oh Herbert!'

'Fact,' said Lawyer Knowles comfortably, since *he* had not to go, companionship to a fidgety and querulous old maid being one of the thankless tasks which do not fall to his sex's share; 'and really, you know, girls, I think auntie has reason.'

'Well, it's not my turn,' said Ellen; 'I went last.'

'And I can't go because of the Red Cross concert,' said Priscilla triumphantly. 'There's a heap to do in arranging that, and I have all the accompaniments to play.'

'Then that leaves it to Mary,' said Herbert calmly.

Mary looked decidedly sulky. It was rather a family failing. The Knowles family did not blaze out into sudden fury, which burnt up evil humours in a wholesome purifying flame, leaving the mental atmosphere sweeter afterwards. They said 'catty' things to one another and sulked. Sometimes for days two of the sisters would be 'not on speaking terms.' Rather an awkward situation, seeing they were all shut up in the same house, with nothing particular to occupy them. On these occasions the two at war addressed all their remarks to the neutral sister.

'I can never get on with Auntie Naarah,' said Mary.

'You mustn't be all angles, Mary,' said her brother judicially. 'I grant you, poor auntie is

rather a trial, but there it is; and'—encouragingly—'as the old hymn says—doesn't it?—"Though painful at present, 'twill cease before long"—Auntie Naarah can't last for ever.'

This, however, seeing that at present Auntie Naarah was sound in wind and limb, was but poor consolation.

'Neither shall we,' rejoined Mary moodily.

'It is impossible for *me* to go,' said Ellen, 'for it is my turn to preside at the mothers' meetings; and, besides, there is the autumn house-cleaning.' She looked round the table as if to say, 'Here I have a good case. None of you can manage these things so well as I can.'

'The only way is to put a good face on it,' said Herbert.

'That's all very well,' sulked Mary. Then suddenly her heavy countenance lightened. 'I can't go,' she cried emphatically. 'I've just remembered Stella Cooper is coming to stay next week on her long-promised visit; and if I were not here she wouldn't enjoy it a bit!'

'Thank you, Mary,' returned her sisters.

'Well, it's the truth. Stella is my schoolfellow, isn't she?'

'Then it means none of us can go,' said Ellen tartly.

Herbert looked protestingly. Women, or *ladies*, as he invariably called them, would fight, he knew, but it was tiresome that they should turn awkward at this crisis.

'One of you must!' he said with an air of authority which dismayed them.

And then Mary had a brilliant inspiration. 'What about your typist, Miss Brooke? Could you spare her just for Stella's visit? I'd go then. You could get a temporary one, couldn't you?'

'Oh, really, I don't know.' Herbert objected to the tables being turned on him. 'It would be very awkward,' he said.

But the sisters, remembering the conversation before he came in that evening, exchanged meaning glances. Mary's suggestion seemed to them the very thing. Mary was about to urge it forcibly, but Ellen, who had lived long enough to realise that the awkward male objects to being bossed, and can best be managed by cajolery, interposed hastily.

'I know it is awkward, dear Herbert,' she said soothingly. 'But if you could manage the week or two Stella is here, I know a nice person at the Y.W.C.A. who would be glad to take Miss Brooke's place *pro tem.*, very quick and capable,' she added.

Herbert grunted. 'I will think it over,' he conceded grudgingly.

(*Continued on page 787.*)

'ICH DIEN.'

By G. R. Glasgow.

IT is a pity it is German, but there it is—a royal motto, and not a badge of slavery; very easily translated into plain English—'I serve.'

There are alarmist rumours abroad—almost as persistent as were those of the Phantom Army—as to the position of women after the war, and the attitude towards domestic service that they mean to adopt. A book has been published under the pseudonym, 'An Old Servant,' which has been scornfully repudiated by the merry maids of the present, who resent the implication of service, and announce, in eager letters to the papers, that for the future they will smart under no such stigma, but intend to work for only so many hours a day, and have the evenings to themselves. Like the servers in shops, they will sleep out.

But I do not think that the general public need feel very much alarmed. The lure of domestic life is inbred in many women, and to them the coming and going caused by restricted hours of work would be tiring and distracting. They are of the large majority who, having begun a job, like to see it through, and who would, in their secret hearts, rather reserve to themselves the right to say, 'This is not my work,' than lie under the yoke of any trades union. In every rank of life there are the born home-makers, the natural organisers, the peaceful, and the orderly, who flourish in an atmosphere of homely content, and who are not always on the look-out for grievances. They are of those who take a pride in their work; to whom the family they serve with a beneficent tyranny is always exceptional, and the house of their allegiance a second home. To these the idea of a six-hours day would be ridiculous and repellent. If you had to do your daily task, and then move on and move out, leaving its completion to the afternoon shift, it would, to many minds, add a new terror to life, and make what was meant to be a time of recreation a restless and recurring nightmare! For, to people of the domestic type, satisfactory work, deftly and efficiently done, is an end and aim in itself, and they take as great a pride in the home machinery of which they are the *hub* as a soldier does in the care of his rifle.

I think I am right in saying that every woman would keep a servant if she could afford it, and it is those who best know what *they* would expect from a servant who best understand what a mistress is entitled to ask of *them*, and who also realise that, though there are certain services which cannot be bought with

money, there are a great many which are certainly included in wages, and which it is dishonest not to offer to the last farthing's worth. I am talking of quite ordinary households, small and big. In the case of the smaller, the atmosphere is generally friendly and homely; kindness is offered and accepted; loyalty to 'the family' is very usual; the mistress knows the work, and expects it to be more or less faithfully done; there is order and intelligence in the division of labour, and in its acceptance. There is affection, and very often love, on both sides; and in an earlier generation the servant often lived and served and died in the same family.

No one expects, or really wants, that now. The facilities of travel have given a larger horizon to the young of every class, and they want to see more of the world; whilst the mistress is rather relieved not to have the care and responsibility of aging dependants who have outgrown their activity, just when she herself wants the young and active and cheerful to do for her the work she has hitherto enjoyed doing for herself.

In larger establishments there must always be less scope for individual care and friendship, and more need for rules and regulations; but, on the other hand, there is an extra degree of liberty and comfort, and a wider society—perhaps too much comfort and luxury to foster initiative and independence, except in strong characters that are not inclined to take their colour from their surroundings. The work is too clearly defined to allow of overlapping, and though it is not in the bond, the manner of work and its distribution does very nearly approach the modern idea of a so-many-hours day and so-many-hours off-time. Sometimes one wonders what a housemaid gives a husband for dinner, or how a parlourmaid manages to bring up her children; and one feels that the ideal butler who marries the cook has very much the best of the bargain. One somehow feels that good cooking is a very secure foundation! Servants have always one tremendous advantage in life. If they find a crumpled rose-leaf in their bed, they can give notice next morning, with the full and calming consciousness that they need never be a day out of a situation, but can sweep off in a taxi to their next place, leaving a distracted household behind. Each new place is only a new adventure.

One of the lessons learnt in the war has been learnt by V.A.D. ladies in the pantry and at housework. They have gone out valiantly, unpaid and in many cases overworked, and learnt efficiency in various departments, through grinding toil and under adverse conditions. They know quite thoroughly how much a mere woman should be asked to do in the way of house-work, and under what conditions she works best and most willingly; they realise *why* mops are better than scrubbing-brushes, and have learnt the use and misuse of a cap! But they also know what amount of work they ought to expect from a trained and efficient servant, well paid and well fed, and it will not be so easy to hoodwink them in the future as it has been in the past.

I knew one servant who gave the devoted love and service of more than sixty years to four generations of the same family. She had too much self-respect to call herself by any name that she considered 'new-fangled.' 'I *am* a servant, love,' she said, and that ended the matter. After that no one in the family dared allude to her as a 'maid'! She never neglected or forgot her own family ties and loves and duties; but, as years passed, and they slipped from her one by one, the children and grandchildren, and even the great-grandchildren, of the house took their places naturally in her affections, till she counted them as descendants of her own, and, like the Scotswoman she was, wove them into a clan. Their sorrows and their joys, their triumphs and their defeats, were always her own; and when she was torn between love and truth, as one so often is in this perplexing world, if she could not conscientiously say to one of her children, 'You are very beautiful,' she could at least say, 'You are very lady-like, love.'

She met her children at the gate of birth, and received them with ever-open, ever-welcoming arms. Sometimes, with reluctant but never rebellious love, she stood by another open gate, and watched them out of sight. Death had no terrors for her, and always, willingly, she would have bartered her life for theirs; but it is not given to all of us to die for those we love. After the storms and calms of a chequered life, she sailed at last into a fair haven, and her epitaph covers all her service: 'Love is the fulfilling of the law.'

So, when one comes to think it over, perhaps there is something of humility in the modern maid who refuses to be called a servant. Such service is not *bought;* it is given generously, with open hands, and, as the French say, '*Donner, c'est quelquefois semer.*' It is a faint reflection of One who said once, long ago, 'I am among you as He that serveth.'

No, I do not think we need trouble much about our future service. There will always be a certain number of women, young as well as elderly, who appreciate settled conditions, and home life, and intelligent supervision—who like a port in a storm, and don't care to have their little craft left on the high seas for fortune to bring in; and there will always be just and conscientious mistresses to recognise and appreciate efficiency in service. And I also think there will always be a good number of ordinary human beings who would rather be called an *old servant* than an *old maid!*

THE AGENCY AT SOLLER.

By W. Victor Cook, Author of *Anton of the Alps, A Wilderness Wooing*, &c.

THE shadows cast by the lantern moved to and fro to the swing of the vessel as Donald Bruce sat in the tiny cabin of the Spanish fishing-boat, poring over the message which he and his companion had been ordered to hand in at the telegraph-office at Barcelona.

Donald Bruce was the confidential clerk to the well-known wine firm of M'Ilroy, M'Ilroy, and M'Allister, of London and of various ports of Spain. He was neither in khaki nor in blue, but he was engaged in doing his 'bit' (with the full approval of his employers) in the manner which seemed to him most in accord with his particular opportunities. His proceedings, it should be added, were strictly unofficial. Donald Bruce's companion was the tall and bony old Catalan smuggler who was notorious along the coasts of Spain under the name of El Pajarillo, or 'the Little Bird.' The Little Bird, who had lost a brother in a torpedoed trading-steamer, was pursuing a vendetta in his own particular fashion against the nation which he persisted in regarding as his brother's murderers.

By virtue of an understanding between the two gentlemen mentioned, every time a German submarine was disappointed of a cargo of oil and other necessaries through the foresight and private information of El Pajarillo, a sum of five thousand pesetas transferred itself from the coffers of Messrs M'Ilroy, M'Ilroy, and M'Allister to the possession of the Little Bird. To explain how Donald Bruce and El Pajarillo came to be rocking at midnight on the Mediterranean, it should be said that exactly an hour before this tale begins they had kept an appointment with a U-boat which ought to have been kept by a certain compatriot of the Little Bird's. By means of an adroitly conveyed hint to that gentleman that British destroyers had got wind of his intentions, they had succeeded in post-poning his trip; and at the same time, with a really brazen effrontery, the Little Bird had earned the gratitude of the U-boat's commander by imparting to him a romantic story of how, at the last moment, his expected supplies had been seized by the Spanish customs, and by warning him confidentially that the neighbour-hood of Valencia was for the time being most unhealthy for his craft. In return for this kind action, the U-boat's commander had entrusted to El Pajarillo the message which Bruce (dressed like a Catalan fisherman, and wearing a piratical-looking Robespierre cap) was at that moment puzzling over.

It was written in fair Castilian on a page torn from a note-book. Being translated, it read: 'Frankenfest, Soller. Our representative will honour himself by calling on you on Saturday about one o'clock to inspect your stock with view to important purchases. Retnu & Co.'

Bruce came out on deck, and went to where the lean figure of the Little Bird sprawled at the tiller. 'Pajarillo *mio*,' said he, 'how long will it take us to make port?'

'With this head-wind, señor, six hours at the least.'

The Scot repeated to him the message he had just read. 'Do you know a firm of the name of Retnu?'

'*Hombre!* What a name! I never heard of it before.'

'I thought not. Suppose we spell it back-wards. We get *unter*, which is Boche for "under," Little Bird. The message means, I take it, that at one o'clock on Saturday Señor Underwater and his friends will try to get from this Frankenfest fellow at Soller a cargo of stores such as we have just stopped him from getting at Valencia.'

'Clearly,' agreed the Little Bird.

'It is a head-wind for the mainland, but it is a fair wind for the Balearics, is it not?'

'Very true, señor.'

'If we could contrive to put a spoke in the wheel of this Frankenfest, it would be another five thousand pesetas in your pocket, Pajarillo.'

'Under the terms of our agreement, that would be so,' said the Catalan. 'But I would beg you to observe, Señor Bruce, that it is a long way from here to Soller. It would take us three days and nights of sailing if the wind holds fair. And we are not provisioned for so long a journey.'

'We have enough to drink,' said the Scot; 'and there are fish in the sea.'

'But there is also the German submarine in the sea. Suppose our fine captain sights us going east, whereas he told us to go west? In that case it will be the fish which will get us, and not we the fish, Señor Bruce.'

'Very true,' said Bruce. 'And yet, Pajarillo, five thousand pesetas'——

'Señor, do not misunderstand me. I am only indicating that difficulties exist. The cause is a good cause; and a good cause, supported by five thousand pesetas, will always command the respectful consideration of Pablo el Pajarillo. Mind the boom, señor—I am going about.'

The Little Bird pushed the tiller down as he spoke, and a minute later the boat, her big lateen sail filling before the favouring breeze, was heading due east to where the horizon was already paling for the dawn.

The boat was an ancient craft, but seaworthy enough, and the westerly wind followed them loyally for a couple of days and nights, during

which they took alternate tricks at the tiller. They caught little fish, being anxious to get on their way without delay, and by the evening of the second day they were both pretty sharp-set.

'I could make a fine verse about a plate of soup,' said the smuggler, who had a queer addiction to the making of poetry without any provocation.

'How far do you reckon it to Mallorca?' asked the Scot, as they sat smoking while the sun went down. Fortunately they had plenty of tobacco.

'Fifty miles.'

'The distance from London to Brighton,' muttered Bruce. 'They serve a good meal on the week-end Pullman. Suppose the wind drops, Little Bird?'

'Then we will fish.'

'I could eat a whale,' said Bruce. He took a look round the waste of deep-blue sea, and suddenly stood up. 'Look, Pajarillo! There is a steamer yonder to the eastward. If we shift a point or two she will pass within hail. Perhaps she will give us a few loaves.'

The Catalan shrugged. 'More likely she would take us for a decoy, and show us a pair of heels. *Madre de Dios!* what is that?'

An awful detonation came across the sea. Where the steamer had been, three or four miles away, a dense black cloud, shot through with crimson fire, rose from the sea against the paling eastern sky. It lifted slowly, and showed the steamer still there, but with one mast instead of two, and belching smoke and flame.

'Torpedoed!' shouted Bruce. 'Quick, Pajarillo—to the rescue!'

'I think we are like to want rescue ourselves if we go that way,' said the Spaniard grimly. 'But it shows you read the telegram aright.'

Without more ado he shifted the helm, and they sailed towards the burning vessel.

Bruce was watching her intently. 'She won't last till we reach her,' he groaned. 'God! Look at that!'

As a diving porpoise throws up his tail, so the stricken steamer suddenly threw up her dismasted stern and plunged bodily beneath the waves. A great cloud of mingled smoke and steam hung for a few moments above the place of her disappearing, and then the sea rolled cold and empty in the dusk.

No, not quite empty. Straining their eyes, they perceived a tiny black spot. 'A boat!' said the smuggler, gray-faced in the fading light. 'Yah! If I had that sea-murderer's throat in my two hands!'

The black spot grew slowly clearer as they sailed towards it. Of the murderers there was no sign. By-and-by they reached the boat, and lowered sail for the rescue.

Half-a-dozen nerve-shattered men were in the boat, one with his leg broken; three women; a child of four with a crushed arm; and two dead bodies singed with fire. These were all that were left of a ship's company of threescore. They had not an ounce of food or a drop to drink among them.

The two adventurers helped the poor creatures on to the fishing-boat, and towing the ship's boat, made sail again for the Balearics. The ship was an Italian vessel, coming from Naples to Valencia. There had been no warning. They had not even seen their murderers.

On through the starry night sailed the Spanish craft, the westerly wind still filling her sails, and the sea sparkling phosphorescent in her wake.

At midnight Bruce was at the tiller, steering a course which the Little Bird had set him by the stars. Suddenly a blinding light enveloped the little vessel. Several of the shipwrecked Italians sat up on the deck where they had been stretched, their faces white in the dazzling ray. As swiftly and silently as it had flashed on them, the light vanished. For a few minutes they held their course. Then came a swishing sound close astern. A low black shape raced up alongside, churning the water white with her railway speed ere her engines slowed, and through a megaphone a hoarse voice challenged in French, and ordered them to heave to.

Pajarillo the smuggler emerged from the cabin, where he had been nursing the injured child, and lowered sail; while Bruce pulled in the boat towing astern, and went aboard the destroyer to tell his story. He came back with a lieutenant, a surgeon, and a case of stores.

Before the two officers returned to their ship they shook hands with extreme cordiality both with the young Scot and his companion, and the lieutenant said some things which made Bruce glad of the darkness to cover his blushes. The lieutenant had approved the fishing-vessel's programme, but had pointed out that this was Thursday night, and that there was no time to lose. '*Bonne chance!*' said he. 'We also shall try to be at the rendezvous. You may not see us, but you may hear us if we have good hunting. *Après la guerre*, Little Bird, you shall fly to visit me in Paris.'

Again the sea churned white as the black shape sped away into the night, and the smuggler hoisted sail again for the islands. The breeze held steady through the night, but lost its force at dawn. There was a haze over the sea as the sun came up, but El Pajarillo, shading tired eyes with his wrinkled brown hands, said he saw the mountains of Mallorca. Sure enough, another hour's sailing brought them well in sight of land.

El Pajarillo called the mate of the Italian steamer, who was among the rescued, and—Bruce interpreting—asked if he wished to avenge the loss of his ship and men. The flash of the eye and the fierce gleam of teeth between the black moustache and beard were answer enough.

'I am going to steal your boat, *amigo mio*, but I am going to leave you my little ship. Sail her into Palma yonder. Our Mallorquins are hospitable. Tell them how the cursed Germans sank your ship. It will do you no harm to hint that they came up from behind a deserted Spanish fishing-boat—this boat of mine—and that you who survive were able to get on board and make for Mallorca. It is giving the murdering Jonahs more credit than they are entitled to, but my friend and I, *por Dios*, will set the balance right for you if we can. Above all, let none of you breathe a word of the French warship. So shall your dead be avenged. Do you swear it?'

His right hand on his heart, his left outstretched to the blue sky, the Italian vowed compliance. Then, with the tears running down his face, he kissed his rescuer on both cheeks ere the Little Bird climbed down with Bruce into the smaller boat.

This, too, had a small mast and sail, and before midday El Pajarillo, who knew the rocky island coasts like the palm of his hand, brought her to land at a lonely spot not too far from their destination.

Then, through the hot, vine-clad hills, the two adventurers made their way to Soller. They came to that pleasant valley about sundown, and as they went down towards the village they fell in with a goat-herd driving in his flock for the evening milking. With this youth the Little Bird opened conversation, and confided, among other things of less account, that his name was Juan de Roca, a sailor from Valencia. Now Juan de Roca, as Bruce very well remembered, was the name of the man whose efforts to supply the German U-boat with its needed stores they twain had, only three nights ago, frustrated by a notable piece of bluff. For the Little Bird calmly to appropriate his luckless countryman's name and address struck the Scot as a very neat piece of impudence.

Having regaled the admiring goat-herd with several fantastic tales such as the sailors of all nations are addicted to telling, El Pajarillo asked him casually, 'And do you happen to know if there is still in Soller a fellow named Frankenfest, a German?'

'Why,' said the boy, 'it is he who keeps the store at the corner of our street.'

'In that case, little friend of mine, it will be easy for you to earn five pesetas.'

The lad's dark eyes gleamed.

'God helping you,' said the smuggler, 'you might, as a sharp lad, make ten. The point is this. My friend and I have to get back to Palma with the least possible delay. You have only to take this message'—here the Little Bird produced the scrap of paper the German captain had given him—'and deliver it into Señor Frankenfest's own hands. His own hands, understand; not his wife's, or anybody else's in the world.'

'I understand, Señor de Roca.'

'Very well. Here is five pesetas. Can you read?'

'No.'

'No matter. Having delivered the paper, you will ask Señor Frankenfest for another five pesetas, though you will not be so great a fool as to tell him you have already received any. Probably he will offer you less, but he will certainly ask you from whom you had the message. It is then that you will use your wits, little one, and tell him no more till you have the money in your hand. See?'

'Perfectly, Señor de Roca,' grinned the boy.

'Then, *adelante!* We will part here. In case you would like to know what is in the paper, I will tell you, since you seem a sharp lad, that it informs Señor Frankenfest that a client intends calling on him to-morrow on important business. So now you know as much as I do. *Adios!*'

As soon as the goat-herd had disappeared with his charges round a bend of the road, El Pajarillo, instead of setting out for Palma, sat down by a hedge of flowering cactus and calmly lit a cigarette. 'It is about one o'clock on Saturday,' said he between his puffs, 'that the precious representative of this precious under-water villain will do himself the honour to call on Señor Frankenfest to make his important purchases,' he observed. 'The question is, *amigo mio*, which one o'clock?'

'I should say one hour after midnight, Little Bird.'

The smuggler nodded. 'From now till one in the morning you and I must watch this Frankenfest as a cat watches a mouse. Something tells me we shall spend a busy night, Señor Bruce.'

'The busier the better, Little Bird,' smiled the Scot.

They smoked a cigarette each, and went on quietly to the village. It was quite dark when they reached the *plaza;* but in Soller, as in many another village of that Spain which some think so backward, there is a sufficient service of electric light, and in the glow of a lamp over Frankenfest's store they had the satisfaction of seeing from a little distance their goat-herd in altercation with a stout man in the doorway. After a few minutes the lad departed, putting something in his pocket.

'That is a sharp lad,' said Bruce. 'Do you suppose the German suspects anything?'

'Why should he?' the Little Bird demanded. 'He is an agent for this submarine fellow, and he has his employer's signature. What more does the villain want?'

It was a little after nine. As they stood smoking and watching the store from the convenient shadow of a fig-tree, a civil guard approached. They engaged him in conversation, explaining that they had missed the last train

back to Palma by the little island railway, and inquiring as to a cheap *posada* in which they might pass the night. Both still wore the fisherman's dress in which they had embarked from Valencia.

Suddenly Bruce noticed the stout figure emerge from the store and walk away down the road at a smart pace. The Little Bird did not seem to have observed the fact, being apparently entirely engrossed in discussing the comparative merit of two houses which the guard had mentioned. In vain Bruce sought to catch his comrade's eye, and his impatience increased each moment as the German became gradually lost to view in the darkness. Only then did the old smuggler seem reluctantly to make up his mind, and with what seemed a needless profusion of thanks, and the deferential offer of a cigarette to the guard, he took a polite leave, and the two friends started very deliberately down the long street.

'Pajarillo, we shall lose our man! He went down the road while you were arguing with the guard,' said Bruce the moment they were out of earshot.

'Not so fast, my friend,' chuckled the old *contrabandista*. 'You are a good Spaniard for most purposes, but you have not learned that in this country one must hasten slowly, and not omit the little ceremonies of life. Now I must go into the *posada* and arrange for our night's lodging, in case our friend the guard should take it into his head to look in for us. I shall explain that we have a call to make before supper.'

'But meantime our man has disappeared.'

'We shall find him. Look you, Señor Bruce, while I am in the inn you will follow this German. There is no turning from this road till you get near the sea. You will sight him before he can turn aside; and you will follow him. Whenever you come to a turning, you will drop a bit of paper at the entrance of the road he has taken. He will go eventually to the sea—we know that—and when you have tracked him to the end of his journey, you will wait for me. In a quarter of an hour I will be with you.' He glanced behind. 'It is safe now—you can run.'

Bruce ran in the direction the German had taken, his feet, on which he wore the rope *alpargatas* of the Spanish peasant, making no sound. Very soon he sighted his quarry walking stolidly towards the sea. But instead of going straight down to the tiny rock-encircled port where the fishermen of Soller moor their boats, the German presently turned from the main road and followed a track which led up on to the cliffs, away from the town. Bruce dropped his guiding paper, and as they left the lights behind, drew nearer to his man.

For a couple of miles the German walked along a rough byroad, which became little more than a mule-track; then he struck off the track altogether, and made straight across a terraced vineyard on the hillside in the direction of the Mediterranean. It was so dark that Bruce had little hope of El Pajarillo observing any guiding signs; but, in conformity with his instructions, he scattered several pieces of paper at the edge of the mule-track, and then laid a thin straight line of them in the direction taken by the German.

Suddenly the cliff dropped away at his feet. He had come to a steep cleft running inland from the sea for several hundred yards. The secret agent had disappeared down the rugged face of the cleft. Searching about in the darkness, which the faint light of the rising moon was beginning to make less dense, the Scot found a practicable descent, and with infinite caution began to go down. He reached the foot of the cliff and the sea-beach with less difficulty than he had anticipated, and found himself on a tiny stretch of white sand. Of his man there was for the moment no sign.

Bruce crouched still and listened. There was no sound but the sighing of the little waves along the rocky shore. He realised that to leave the shadow of the cliff would be to risk detection. For what seemed a long time he kept silent in the shelter of the cliff. The moonlight strengthened gradually, and at length Bruce crept to the margin of the shadow, and held his watch in the light to see the time. It was past eleven.

He was creeping back to the cliff-side, when the firm grasp of a hand on his arm made him start violently. Next moment, with a profound astonishment, he recognised his Catalan companion. A whisper came in his ear: '*Por Dios*, Señor Bruce, we shall have good hunting to-night! Do you know the caves of Manacor?'

'No.'

'They are on the other side of Mallorca—great stalactite caverns that go far under the shore. Every Mallorquin knows of them, but few know that there is also such a cave within an hour of Soller. This Frankenfest is clever! Never mind. Set a thief to catch a thief, and an old smuggler to catch a secret agent. Now listen to me. We have nothing more to do but to wait here in the shadow till this fellow's confederates come ashore. Then we must do what we can to preserve the neutrality of Spain, and earn our five thousand pesetas. The cave is a little way up the gully yonder. A signal flashed in the gully can only be seen from the sea. Do you watch the gully, and I will watch the water.'

They watched steadily for half-an-hour.

Suddenly the glare of an electric torch shone down the gully so powerfully that the two men crouched low against the bottom of the cliff. The beam was shut off. Within a few seconds there was a red light visible far to seaward, which vanished almost immediately. Then three

short flashes from the gully were answered by three red flashes from the water, and darkness fell again.

'This bit of sand is the only landing-place for miles,' muttered the smuggler.

Another half-hour of waiting passed. Then above the faint plash of the wavelets they caught the low, rhythmic sound of oars working in muffled rowlocks. A boat, all painted white even to the oars, with sailors dressed also in white, appeared as if suddenly on the sea close to the shore.

The Little Bird gave a low chuckle. "By night all cats are gray," he quoted. 'But cats in a white fur show least in a faint light against the sea. Oh, these fellows are no fools, Señor Bruce.'

The white boat grounded on the white sand, and as she did so the stout figure of Frankenfest emerged from the gully. He shook hands with the officer of the boat, which contained half-a-dozen men. The whole party, with the exception of one, immediately walked up the beach and entered the gully.

'*Hombre!*' muttered the Catalan. 'We could not have arranged it better ourselves. Can you run?'

'I used to run for my college a few years back,' said the Scot. 'Shall we rush that fellow in the boat?'

'Precisely. It is five hundred yards from the cave, and a roughish path. But I warn you, Señor Bruce, they may shoot.'

'They may miss,' said the Scot.

'Bravo! Can you pull an oar?'

'Pretty well.'

'*Bueno!* See! the boatman is looking seawards. When they are right into the gully, we will run like the wind for that boat. The first there will deal with the man, and the other will seize the oars, and pull for the point of the bluff yonder. It is only a few hundred yards, and then we shall be out of range round the corner. *Coraje!* Are you ready?'

'Ready!'

'Then go!'

Like two dogs loosed on a hare the companions raced forward across the narrow stretch of sand. The younger man was leading by half-a-dozen yards when they reached the boat, and not till he sprang over the gunwale did the German sailor in the stern become aware of their presence. He turned with a wild shout, but before he could put hand to weapon Bruce was on him, knocking him backward over the thwart with a lightning blow between the eyes. The Scot fell on top of his man as the boat, already three parts in the water, was shoved off by the lusty arms of the old smuggler, who tumbled, dripping, aboard, and in a moment had seized the oars and was thrusting seawards with swift, strong strokes.

'Get down low, and take the tiller!' cried the Catalan, though he himself stood fearlessly in his gaunt height, working the oars.

Bruce was obeying, when the stunned German, recovering from his knock-down blow, sat up. '*Kamerad!*' he gasped.

'*Kamerads* all ashore!' retorted the Scot dourly, and without more ado he tipped the man bodily over the side into the sea.

Urged by the smuggler's nervy arms, the boat was making progress towards the bluff. Out of the corner of his eye Bruce saw the crew come running to the water's edge. A revolver cracked, and a white splinter flew from one of the oars. The revolver cracked again, and Bruce felt his left arm, holding the tiller, go numb. He shifted to his right.

'Faster! Faster, Pajarillo!' he cried.

More shots followed, flying wide, and the Catalan's breath came hard as he leaned to and fro to his work.

Far out to sea a shaft of light swung round the horizon.

Donald Bruce was feeling horribly faint. He pulled himself together. He saw the German seamen run along the shore, and heard the revolver-shots cracking again. But out to sea he saw the shaft of light fasten on a dark object lying low in the water. A moment later a dull, angry boom thundered over the sea. Another, and another. A livid sheet of flame, red and green and yellow, shot upward from the end of the beam. Then the sea swallowed the flame, and the beam was gone.

'Good hunting, by the lord, Pajarillo!' he cried, and rolled senseless across the tiller.

When he came to himself a man in a blue uniform, with gold braid on it, was watching him with an agreeable expression. Bruce recognised the surgeon of the French destroyer.

'Monsieur,' said the surgeon, 'I have here some excellent bouillon.'

'Where is El Paj—— Where is my friend?' said Bruce.

'Your friend is taking supper with our commander, who has opened a bottle of the best, but unfortunately cannot speak Spanish. Permit me to say that you nearly lost your arm. How many Boches are there ashore yonder?'

'Seven, with the officer.'

'It was fortunate for them that you took their boat,' said the surgeon grimly.

'And their ship?' asked Bruce.

'*Là bas!*' said the surgeon, pointing through the floor. 'We have just sent a wireless to the *capitania general* at Palma, informing the authorities, with our compliments, that a band of German sailors are waiting at Soller to be interned.'

A few days later the confidential clerk to M'Ilroy, M'Ilroy, and M'Allister came out of the partners' private office. He was immaculately dressed, but his left arm was in a sling. Beside him, smoking a *puro* of the best, walked

the brown-faced old *contrabandista* called the Little Bird. The Little Bird was putting a wad of notes carefully inside his red Robespierre cap.

'Ten thousand pesetas—not a bad week's work, *mi Pajarillo?*' smiled Bruce as he shook hands.

'Excellent, señor. I confess that this business interests me. Between you and me, I have made up my mind to accept the offer of your honourable principals in there to continue in this line for a time. I have been a spendthrift fellow, but if I could make up twenty thousand pesetas to provide for my family—I have a large family, Señor Bruce—I should face the future with a better heart. Permit me to say that I am proud to be associated with a man of business who is also a poet, like yourself.'

'Life is full of poetry, if one views it from the proper angle,' said Bruce sententiously.

'I shall endeavour to compose a few verses on our week's work, señor,' said the Catalan with perfect gravity. 'You, I venture to hope, will do the same. And as soon as I discover another suitable subject for a composition, I shall communicate with you without delay.'

'The sooner the better, Little Bird,' said Bruce.

SNAKES IN INDIA.

By SHELLAND BRADLEY, Author of *Adventures of an A.D.C.*, *An American Girl in India*, &c.

PEOPLE who have never been in India, and who believe that residents out here go in hourly dread of snakes, are as far from the truth as the globe-trotter who, never setting eyes on a snake throughout a cold weather tour along the beaten track, jumps to the conclusion that snakes are mostly a myth. The average Englishman in India, apart from the forest official and others whose work brings them into close contact with the jungle, may live in many an Indian district for months without so much as seeing or even hearing of a snake. Living for the most part in houses well raised above ground-level on brick or stone plinths, and set in the midst of gardens or compounds kept clear of jungle, it is rarely that a European is bitten by a snake. On the other hand, some districts are particularly snaky, and it is a common occurrence, especially in the rains when they are washed out of their hiding-places, for snakes to be found in one's garden, or more rarely at close quarters in the house itself. Thatched roofs, especially if old and dilapidated, provide them with most desirable quarters, and in some of the dak bungalows in out-of-the-way places where they are seldom used snakes congregate in numbers. It is not conducive to that unruffled frame of mind so necessary to the real enjoyment of a meal to have a snake drop unexpectedly from the roof on to the centre of the dining-table, and to know that another may follow at any moment. Neither is it altogether calculated to encourage one to linger in one's bath suddenly to spot a krait dangling uncertainly in the thatch ceiling overhead. One is also inclined to resent being taken at a disadvantage when a Russell's viper, one of the most deadly of all the tribe, drops out of the sleeve of one's dressing-gown as one goes to put it on in the morning. It is something of a shock to the strongest nerves to step suddenly upon a snake and to feel that you have been bitten, even though you do discover later on, some time after you have given yourself up for dead, that the snake had luckily bitten you right on your biggest and toughest corn, through which the poison could not penetrate. Yet all these things have been known to happen, most of them many times.

The Indian unfortunately is by no means so immune from snake-bite as the European, and every year snakes lay a heavy toll on human life among the poorer classes. The enormous areas of waste and jungle lands that remain in most Indian districts provide ample breeding-grounds, and the Indian ryot, living often in mud-walled, thatched-roof huts, round which the rankest vegetation is allowed to grow unchecked, falls a frequent prey to snake-bite. Last year in one district in Bengal alone 555 cases of deaths from snake-bite were recorded, 4510 being recorded for the whole province; and though, as one old official report that I came across recently explained, 'mortality from snake-bite doubtless covers a multitude of sins,' being a convenient fiction to account for the death of an undesirable relative or neighbour, the great majority of reported cases are doubtless true.

Amongst this same file of correspondence I found an interesting account of efforts made by Government to exterminate poisonous snakes in days gone by. Apart from the point of view of snakes, it is interesting as showing the watchful care of a paternal Government and the varied duties expected of a district magistrate. In 1858 the magistrate of a certain district drew the attention of Government to the heavy mortality from snake-bite, and asked permission to offer a reward of four annas for every snake brought in, dead or alive. Government sanctioned the proposal, but with the proviso that, in order to prevent fraud, the district magistrate should himself see the snakes' heads cut off and the reward paid. Within a few months 7846 snakes had been brought in, involving an expenditure of 1961 rupees 8 annas. This a careful Government seemed to consider too great

a price to pay for the extermination of reptiles, and the reward was promptly reduced to two annas. But it was soon seen to be a case of economy overreaching itself, the magistrate somewhat sarcastically reporting that 'there were few persons in his district willing to risk their lives to bring in a live snake for two annas.' By 1861 the number of snakes brought in had dwindled to eight, involving an expenditure of only one rupee for the whole year, and Government, if its efforts were not to be rendered futile, was forced to raise the reward again to four annas. The result was astonishing. The district magistrate who had strongly urged the increased reward reported on 14th July 1862, with evident satisfaction at the success of his efforts, that forty-seven snakes had been brought in on one day, and seventy on another. Only seven days later, however, the magistrate was plainly a trifle overcome by his own success. 'Ninety-seven snakes,' he wrote, 'were brought in on Saturday, and 118 to-day,' and the duty of superintending their decapitation had become so burdensome that he applied to Government for permission to depute some other officer to perform the task. Attending 118 executions a day was materially encroaching on his more onerous duties. But a careful Government, doubtless a little alarmed again at the expense involved, refused this seemingly reasonable request. No eye but the magistrate's own could be trusted to see that the snakes were alive when brought in, and were properly beheaded, so that they might not be produced again to claim the reward. Those months of the year 1862 were decidedly bad times for snakes. From 29th May to 14th October no fewer than 18,423 snakes were reported to have been brought in, making an average of over 100 snakes a day; while from 15th October to 7th December the number increased to 26,029, giving an average of 463½ a day. These figures, when reported, at once put a watchful Government on the alert. How was it to be accounted for that more snakes were being caught in the cold weather, when snakes are supposed to disappear, than during the rains, which is pre-eminently the snaky season of the year? The magistrate was asked to submit an explanation of this surprising circumstance without delay. The much-harassed magistrate, seeking for a reason, ascribed the increase to 'the increased expertness of the snake-catchers, and the larger number of persons who had abandoned their occupations and taken to this comparatively lucrative mode of obtaining a livelihood.' This explanation, however, Government did not consider wholly satisfactory, expressing grave doubts as to whether all the snakes paid for had really been poisonous ones; to which the magistrate rejoined with some warmth that he had exercised the greatest possible discrimination, and that 40,000 rupees would not have paid for all the snakes brought before him had the non-poisonous ones not been rigorously excluded.

In spite of the heavy mortality they occasion, it is astonishing with what superstitious reverence snakes, especially cobras, are regarded in many parts of India. So far from killing the snakes that take refuge in their houses, many of the poorer and more ignorant people afford them shelter and food, apparently fearless of consequences. Others, though not going the length of showing them hospitality, will carefully catch them, and taking them out to the jungle, let them loose again. The cobra figures, always as an object of respect, in many an Indian legend and folk tale. The Nagbansis, one of the many races that people the primitive land of Chota-Nagpur, connect the cobra with the origin of their race. Pundarika Nag, the great serpent, so they relate, transformed himself into human shape and won the hand of Parbati, the daughter of a high-caste Brahmin of Benares. But devoted as the couple were, there was one thing that detracted from the happiness of the bride. Pundarika's assumption of the human form was perfect, save for one thing. The double tongue of the serpent he was unable to disguise, and his wife discovering it, with true wifely curiosity, demanded to know the reason of this strange phenomenon. Much as she protested her love for him, Pundarika feared that he would lose her respect if the truth were known, and with deep insight into the feminine mind, he took her on a pilgrimage to the shrine of Jugernath at Puri by the sea to divert her thoughts. All went well so long as the novelty of the road and the attractions of the holy place lasted; but on the return journey Parbati's curiosity returned, and Pundarika, goaded by her importunity, at last told her the truth. But no sooner had he told her than shame at the disclosure overcame him, and he jumped into a lake close by and disappeared, never to return again in human form. Parbati was grief-stricken at this unanticipated result of her curiosity, and forsaking her new-born child, she threw herself, in a paroxysm of grief, into the lake into which her husband's body had disappeared. The unfortunate infant thus deserted was not left long alone. A Brahmin passing by, carrying his idol, the image of the sun, and stopping to drink by the side of the lake, was startled to see the child lying on the bank with a great hooded snake on guard over it. Terrified at the apparition, the Brahmin turned to run away, stooping as he did so to pick up his idol. To his surprise, he was unable to lift it from the ground, so heavy had it suddenly become. As he hesitated, overcome with fear, the snake spoke, announcing itself as Pundarika Nag, who had returned to guard his deserted offspring. Relating his story to the Brahmin, he confided the infant to his care, prophesying that the child would one day become the Raja of the country in which they

then were, and directing that he should always be known as the snake-crowned Raja. It is from this child that the Nagbansi family claim descent, and they are said to wear their turbans so wound round their heads as to present the appearance of a snake with the head protruding in front. The crest of the family is a cobra with a human face under its expanded hood. Though the serpent in the legend represents the Devil, to be able to claim relationship with him is considered a very ancient and honourable connection.

Not long since the Zoological Gardens were in need of a fresh supply of snakes, and I promised to do my best to procure some for them. A list of those especially required was sent to me, ranging from the non-poisonous *betachra* (the tree-snake) and the *dhamin* (the rat-snake), for which four annas only were offered, to the deadly *sankhamuti* (the krait) and the *chandrabora* (the Russell's viper), which were valued at one rupee; but I was given a sort of roving commission to collect as many snakes as could be obtained. I rather wondered as I read the letter whether the authorities at the Zoo remembered that my district was something over three thousand square miles in extent, and I luckily refrained from letting the demand for snakes be issued over the whole of it. Fearing that my experience might be somewhat like that of my predecessor, who had been so overwhelmed by the supply of snakes that his offers of reward had produced, I sent out only to a few selected localities, notifying by beat of drum that snakes brought in to me on a certain date about a month hence would be paid for at a fixed rate. I also wrote to three of the leading zamindars of the district, asking if they could provide any from their estates. Two replied, promising a supply, but the third was doubtful. 'As there is no such man within my zamindary as can catch the living snake,' he wrote, 'I think it will be difficult for me to supply specimens of varieties of snakes in time. However, I will try to look after a man who can catch the living snake, and to supply in time some sorts of snakes.'

In the press of many other matters, I had quite lost count of the appointed day, and was astonished one morning, on going into my veranda, to find the compound invaded by a large crowd, squatting on its heels and guarding innumerable little baskets grouped around it. The snake-catchers had arrived, my chaprasi informed me. There were already some fifty or sixty of them, and new recruits continued to add to the number. My appearance on the scene was the signal for a hasty advance, and a clamorous desire to exhibit their dangerous trophies. My little head-clerk, who arrived on the scene with the office file concerning them under his arm, and a bag of money in his hand wherewith to pay for them, viewed the situation with obvious apprehensions. 'Sir,' he said, looking at me solemnly, 'I beg to be excused, but I have no acquaintance with the habits of snakes. I fear much there will be difficulty in controlling so many of such poisonous character.'

'It will be your duty,' I replied, regarding him with the same solemnity, and irresistibly led to imitate his manner, 'personally to examine each snake, compare it with the description in the list, and pay for it accordingly on the spot.'

For a moment he looked at me reproachfully, then with a resigned, 'As your honour pleases,' turned nervously to his unaccustomed task.

After that it seemed to be a case of snakes everywhere. Restraining the impatience of the snake-catchers to exhibit their specimens, we seated them on the ground at considerable distances apart, and warily I and my little head-clerk went amongst them to inspect what they had brought. A few of them had come in quite long distances with only one snake of the value of four annas; but most of them were the proud possessors of several, and some eventually went away with what to them was considerable wealth. About half the snakes were cobras, but of these the variety seemed infinite, varying in colour from the darkest olive or black, with a wonderful purple iridescence, to a pale chocolate, fawn, or yellow. Various as they appeared, however, the snake-catchers divided them only into two classes—those with spectacle-like marks on the hood, which were known as *gokhuras*, and those without, called *keutias*. One, a splendid specimen some five feet long, was a glorious reddish-brown, shading near the hood into a brilliant orange. The Russell's vipers, smaller, but no less deadly, were a light chocolate-brown, with three series of large, black, white-edged rings down the back. To these the slender, brilliant green tree-snakes formed a striking contrast.

The snake-catchers were full of information. Cobras and Russell's vipers, it appears, can bite one another with impunity, but almost every other snake succumbs to the bite of either of them. A fowl bitten by a Russell's viper is said to die in thirty-five seconds, a dog in from seven minutes to several hours, a cat (in spite of her nine lives) in fifty-seven minutes, and a horse in eleven and a half hours. The most astonishing piece of information given me was that the hooded snakes were all females and poisonous, while the males were all hoodless and innocuous. I am bound to add, however, that an expert on snakes has since informed me that much of the information given to me with such confidence by those snake-catchers must not be wholly relied upon.

The skilful manner in which the men handled the snakes was marvellous. In spite of the openly expressed fears of my little head-clerk and my own secret misgivings, they seemed to have them under perfect control. Though the

poison had doubtless been extracted from most of them, they hissed and struck with their venomous-looking fangs as the men cleverly caught and held them, proudly displaying their size and beauty. All were carefully paid for and listed in my presence; but unfortunately other duties called me away, and I was not present to see them packed up in the boxes specially made to receive them. Later in the day the head-clerk told me, with an obvious sigh of relief, that they had all been packed and despatched. It was only then I learned that the boxes prepared had run short, and that seventy-four snakes had, therefore, been packed in the last two boxes. When I remembered the size of the boxes, my sympathies for the first time went out to those unfortunate snakes. The Black Hole of Calcutta must have been nothing to it. I upbraided my little head-clerk, but his desire to have those poisonous snakes safely boxed and despatched and off his hands seemed to have extinguished any humanitarian instinct he may have had. 'Sir, it was necessary to dispose of them,' the much-worried little man gravely replied to my expostulations; 'the snake-catchers had been paid, and being desirous of going away, even threatened to let loose their snakes if I did not take delivery.' Yet how they got so many into those two small boxes I cannot imagine. I feel that the end of this snake story ought to be that when the box arrived at the Zoo only one very large fat snake was found inside. But truth compels a less picturesque though almost as disastrous an ending. Only twelve of those unhappy snakes had survived the journey.

HUMOURS OF THE INDIAN MUTINY.

By the Rev. JOHN LENDRUM.

THE Indian Mutiny is linked in our minds with so much that is dark and tragic that to associate with it anything like humour or fun may appear almost an outrage. The facts of life, however, are not nearly so proper as some people would make them. The tragic and the humorous, the grim and the ridiculous, get mixed together at times in the strangest of ways; and, in particular, wherever the British soldier goes he shows himself not only splendidly brave in action, but irrepressibly cheerful. He is always cool enough to have time for his little joke. So it has been in the present war against Germany, and so it was also in the days of the Indian Mutiny. As we read the deathless story, we are at times like to weep; yet at other times we break into a smile, and sometimes even burst into boisterous laughter.

The British soldier, it would appear, is never overwhelmed by the seriousness of war, but preserves always a sort of nonchalant detachment. For one thing, he has always leisure for the making and giving of nicknames. In the present campaign he has suffered much from the huge German shells; yet, on account of the foul smoke and smell they give out as they explode, he dubs them 'Black Marias,' or 'Jack Johnsons,' or 'coal-boxes.' So, during Outram's heroic defence of the Alum Bagh, near Lucknow, a heavy gun in the enemy's front battery was known among our men as 'Nancy Dawson;' and again, when Sir Hugh Rose invested Jhansi, one of the enemy's guns was nicknamed 'Whistling Dick,' the reason annexed being that while with other guns there was time to duck beneath the sand-bags, with this gun the puff of smoke was scarcely seen when the shot came whistling overhead.

Nor was it only the guns that got nicknames. Some way down the slope of the Ridge towards Delhi city stood an old Hindu temple, which, as the scene of much hard fighting, had to have some handy name; and, hearing the natives call it *swami-ghur* or *swami-khana*—that is, 'god-house'—our men promptly named it 'the Sammy House.' Why should they bother with an outlandish native name when a good English one with a dash of humorous contempt in it was to hand? Again, in the turret of a high native house that almost overlooked the Residency compound at Lucknow there was a party of snipers. One of these, an African eunuch, used his double-barrelled rifle with such skill that he was known among our men as 'Bob the Nailer;' he nailed every one he aimed at. And the same good humour amid the engines of death appears in the following. At the beginning of the siege of the Lucknow Residency the rebels were so short of ammunition that they hurled against our posts great stones or logs of wood bound with iron. As one of these logs came swinging through the air our men would cry out with a laugh, 'Here comes a barrel of beer at last!'

As this last tale suggests, our people during the Mutiny were often hard put to it for food and drink. In the entrenchment at Cawnpore horse-flesh became a delicacy, so that our riflemen were more anxious to bring down a horse than to shoot its rider. Yet Mowbray Thomson, one of the few survivors of the Cawnpore massacre, could write thus cheerily—afterwards at least: 'Our hungry disgust had well-nigh sunk into despair when an old knacker came into range. . . . He was brought down by a shot like lightning, and hewn up. . . . The head and some mysteries of the body we stewed into soup, and liberally sent to fair friends in the entrenchment, without designating its nature, or without being required to satisfy any scruples upon that head.'

Then, too, as we have learned again in the present war, our British soldiers cannot get on without tobacco. At Lucknow, when the tobacco gave out, they took to smoking any sort of likely leaf they could find, just as in Flanders the other day some of our men were smoking tea. When Greathed's column reached Agra after a forced march, the British in his force were so burnt by the sun as to be hardly distinguishable from natives. 'The Queen's 8th,' writes one who was present, 'passed within three yards of us. "These dreadful-looking fellows must be Afghans," said a lady to me, as they slowly and wearily marched by. I did not discover they were Englishmen till I saw a short clay pipe in the mouth of nearly the last man.'

Sir James Outram, it is said, used to get very irate on occasion; but after letting out at any one, especially a young officer, he was never comfortable until he had made it up by some kind word or deed, often by the offer of a cheroot—a gift of value in those days. His holster, it is said, was stuffed with cigars instead of a revolver, and he gave them away freely, being also a hard smoker himself.

Nor was tobacco the only thing that ran short. At Cawnpore the ladies gave up their stockings to be filled with shot—'a species of cartridge never heard of before;' and on one occasion at least a bit of notepaper was hard to find. One of a few Europeans who, fleeing from the rebels, had found refuge in a cowshed, got a promise from one of the herdsmen to carry a letter to his wife at Naini Tal. He had only a small scrap of paper—'half the flyleaf of Brydges on the 119th Psalm,' and the stump of a lead-pencil. When the note was written he dipped it in milk, and set it out to dry in the sun. In an instant a crow pounced upon it and carried it off. 'I, of course, thought it was gone for ever, and felt heart-broken with vexation, as I had no more paper, or any means or hope of getting any, on which to write another note.' However, two natives followed the crow, and after an hour's chase saw the bird drop the paper, and brought it back uninjured. And, one is glad to learn, the letter duly reached its destination.

Soon after the outbreak of the Mutiny, when the first regiment of kilted Highlanders arrived in Calcutta, the natives are said to have declared that the British were so short of men that they had been forced to send their women. From the closing days of the Mutiny there comes another gibe at the kilt. One day, near Cawnpore, the troops under Sir Colin Campbell had to ford a river, and the men stopped to take off their shoes and stockings and trousers. 'What are you stopping for there?' a soldier cried out from behind. 'Don't you see I am taking off my breeches to cross the river?' came the reply. 'Bedad!' exclaimed the other, 'I knew the General would never stop till he had made Highlanders of us all.' At another point, fifty men of the 71st Highland Light Infantry were taken seventy miles in thirty hours on camels. The Highlanders did not like the action of their steeds, and their kilts proved so awkward for riding, and left them so sore, that after a halt they refused to remount, and had to be told sharply that if they did not mount the camels they would be left behind and lose their heads to the rebels.

The British soldier is not only a first-rate fighting man, but so greedy for fighting that he can never have enough. Before Delhi there were more than thirty fights within twelve weeks; yet one of our men could write: 'It appears quite strange to have had no fighting for five full days, and our fellows will begin to think they are badly used.' The Goorkhas, too—who, by the way, were with us and not against us in the Mutiny—were as keen as the Europeans. When word came in that the enemy was at hand, they were 'so delighted at the chance of getting a fight that they threw somersaults and cut capers.' When it got out that there was to be a battle the next day, our men in hospital declared they would not be kept in from it, and begged their comrades not to tell they were sick. Even when severely wounded, they would not give in. At Delhi especially their spirit was magnificent; and, stricken to death, a soldier would tell his officer he would soon be up again and ready for a brush with the enemy. At the taking of a fort near Calpee, a soldier who went under the assumed name of Whirlpool received no fewer than nineteen wounds. 'Take care, lads,' he said as they put him into the *dhooly*, 'and don't shake my head, or else it will come off.' For a previous exploit he was awarded the Victoria Cross; and he must have been of the right stuff, for he not only received nineteen wounds, but recovered from them. There were others who could joke even over their punishments. General Hope Grant was very strict in the matter of looting, and having one day caught some men in the very act of robbing a house, he had them tied up forthwith and flogged. Thereafter, whenever the men saw him coming, they would say one to another, 'Now, boys, take care of your backs; here is the provost-marshal coming.'

One of the heroes of the Lucknow garrison was Private Cuney, of the band. Accompanied by a sepoy who adored him, he crept into a battery of the enemy and spiked the guns. On his return he was confined in the guardroom for leaving his post without orders; but whenever there was fighting to be done he had to be let out, and when wounded he would leave his bed to join in a sortie. Another Lucknow hero was Captain Fulton, of the Engineers, who greatly distinguished himself in counteracting the mining operations of the rebels. One day, having detected a mine the enemy had driven a certain distance, he ran a short counter-mine to meet it, and then sat patiently, revolver in hand, waiting for the unconscious enemy to break

through. Some one looking for him asked a sergeant if he were in the mine. 'Yes, sir,' was the reply; 'there he has been for the last two hours like a terrier at a rat-hole, and not likely to leave it all the day.' Another day he found the enemy mining quite near his post; so, putting his head over the wall, he called out in Hindustani a trifle of abuse, and '*Bhago! bhago!*' ('Fly! fly!'); and at once there was such a scuffle and scurrying that he could not help laughing. A like ruse was used with similar success at Cawnpore. One night, the enemy threatening a general assault that would have overwhelmed our little band, Captain Moore and Lieutenant Delafosse went out into the open, and in a loud voice Moore gave the word of command, 'No. 1 to the front!' Completely taken in, and thinking we were to attack in force, the enemy at once rose and retreated to safer cover.

A very picturesque figure in the story of the Mutiny is Colonel Neill, of the Madras Fusiliers, who, from their fierceness, were known as Neill's Lambs. When his men were being entrained at Howrah, the stationmaster threatened to start the train whether they were all aboard or not; whereupon Neill put him in the charge of a sergeant's guard; and when other officials proved insolent, he laid hold of the engine-driver and the stoker, and placed a guard over them until all his men were safely in the train. Another hero, who also, like Neill, fell in the Mutiny, was Captain William Peel, R.N., whose men and guns from H.M.S. *Shannon* proved of the greatest service. He was everywhere spoken of for his coolness in action. He went into action, some one said, as unconcerned as if he had been going to an evening-party, and while working his guns he was always whistling or telling an anecdote.

Among the volunteers in the Lucknow garrison, clerks chiefly, was a stout, middle-aged Eurasian, who one day asked his officer, 'What are we to do, sir, if we are charged by elephants?' Without a smile, the officer replied, 'Whether able to keep off such huge animals or not, Government expects each individual to make the attempt.' Another Eurasian was in great anxiety how to present arms when his post was visited by an officer. 'Never mind, sir,' said another civilian volunteer, Signor Barsotelli; 'make a *leetle* noise; who is to see in the dark?' This Italian—there was a Frenchman also in the garrison—helped much not only by his bravery, but by his gaiety. Called out suddenly one night from a sound sleep, he exclaimed, 'I think these grand officers do this for their own amusement.' Yet the next moment, we are told, there he stood, a musket in one hand, a double-barrelled rifle in the other; at his side a huge cavalry sword, and pendent over his breast a huge ammunition-pouch—a comic figure perhaps, yet fearless and determined.

Of Sir Colin Campbell, afterwards Lord Clyde, there are many memorable tales. 'When he grows very indignant,' writes Lady Canning, who met him in Calcutta, 'he pulls off his little cap and scratches his head violently, leaving his hair standing bolt-upright.' During some sharp fighting on the Kala Nuddee, the Irishmen of the 53rd, hearing they were to be relieved by the Highlanders of the 93rd, charged without orders. A little drummer-boy who had perched himself on a mound and sounded the advance, asked why he had dared to act without orders, replied, 'Please, sir, I was afraid the men would lick me if I didn't.' Furious at the daring breach of discipline, Sir Colin rode up to the 53rd and pitched into it handsomely. But the wild Irishmen, whenever he began to speak, shouted as loud as they could, 'Three cheers for the Commander-in-Chief, boys!' until at last he was forced to go away laughing.

Another good story with a bit of boisterous fun in it comes to us from the annals of the defence at Lucknow Residency. After the unhappy check at Chinhut, Sir Henry Lawrence decided to hold only the Residency, and gave orders that the Muchee Bhawan, an old fort in the city, which was to have been maintained as a separate position, should be evacuated and blown up. At midnight the troops marched out, and half-an-hour later the air was rent by a tremendous explosion. One man, however, was missing. When the roll was called he was lying drunk in some out-of-the-way corner, and could not be found. When the magazine exploded he was blown into the air, but, returning to earth unhurt, went off to sleep again. In the morning, to his horror, he found himself alone amid a mass of ruins. But finding a pair of bullocks and an ammunition-cart, he appeared with these at the gate of the Residency. 'Arrah, by ——! open yer gates,' he cried out. And the guards, we read, let him in, convulsed with laughter.

Such are some of the humours of the Indian Mutiny; and perhaps the recounting of them may help to keep us cheerful during the present distresses. It need only be added that nearly all the stories told above are to be found in Forrest's *History*, and have thus the great merit of being true.

SNARES.

Delicate threads of pearly gray,
Laden with dew at dawn of day;
Gossamer web of filmy lace—
Woven with skill and wondrous grace
Beautiful maze—but flies—beware!
Danger lurks in this dainty snare.

Plausible words of subtle charm,
Giving no hint of latent harm.
Temptations veiled in witching guise
Reveal—too late—their specious lies.
Unwary folks—take heed—beware!
Danger lurks in each cunning snare.

A CAVALRY RECONNAISSANCE.

By A Scottish Officer.

'THERE is a show on to-morrow,' announced the O.C. 'The division are going to demonstrate in front of B——. We shall start at two in the morning, and I shall issue detailed orders, of course; but meantime take note that corps signal squadron will lay a cable to temporary divisional headquarters, which will be twelve miles from here, and we will lay cables from there to brigades, and likewise keep in touch with the latter by visual signalling; and, Mr Mess Pip, a cup of tea just before we start would be very comforting, would it not?'

So, after reveille at twelve-thirty, followed by 'Turn out and saddle up' at 1 A.M., a party of mounted signallers, with half-a-dozen six-horse and eight-horse wagons, move quietly off in the moonlight across the rolling downs of Palestine, the last wagon paying out the telephone cable which is to be the link with headquarters in the rear.

Two miles from camp we enter a broad gully which leads to one of the *wadi* crossings, and dip gradually down to the stream, the banks, seamed and scored by many a torrential rainstorm, rising above us in fantastic shapes. The stream is now, however, only rippling gently over its stony bed, with its trickle of water expanding here and there into a semi-stagnant pool, in which innumerable frogs croak. Then we strike another gully on the far side, and, after a mile of twisting and turning through many tributary *wadis* and cross *wadis*, we once more reach the level grassy plain, and halt a while for a breathing-space.

We cannot, in fact, move on farther just yet, until the brigades that are also to take part in this reconnaissance precede us, for we are now beyond the outpost line. But far away on either side and behind us we hear the tinkle of innumerable hoofs as the iron heels strike the stones of the river-bed, the clank and jingle of steel from bit and stirrup, and the soft 'pad' of a multitude of horsemen advancing towards us over the grass in close formation.

'Who are you?' calls a voice in the darkness. Quickly comes the answer from the officer in command of the signal-party; and then the reply, 'Right! We are going through you.' For some minutes there is much dust, while shadowy mounted forms appear on all sides; after that, stillness.

'Stand to your horses! Mount!' and we follow up the brigade in front of us, and ere long become aware of a faint gray light in the east, and of that sensation of freshness in the air which comes with the dawn in Palestine. Pale gray soon turns into a dim yellow; then yellow changes and flushes into red. First the man immediately in front of you as you ride becomes visible, then more files, and by-and-by the head of the column stretching out before you. Last of all there appear on the left, a quarter of a mile away, a brigade advancing in column of troops, and beyond these again another brigade in a different formation—mounted troops in front, mounted troops away to the right, and more mounted troops far away on our left flank. Here at least there is room and to spare and ample breathing-space for all the cavalry in the war to manœuvre and fight it out, as the mounted men-at-arms and the Crusader knights, their great progenitors, did of old on these same Syrian plains.

Mile after mile extends the march, the going perfect over these grassy and gently rising uplands stretching to seemingly illimitable distances, to which even the wide and far-famed pastures of Meath and Kildare seem but diminutive enclosures. Here our route lies by a mud-built, deserted farm-house surrounded by a cactus-hedge, enclosing also within it perchance a patch of watermelons, cool, delicious, and thirst-quenching, which, when they can be found and appropriated, give to the thirsty soldier in the Promised Land the drink of the gods as compared with the heavily chlorinated water with which he has too often to moisten his parched lips and throat in the heat of an Eastern summer. There, by a clump of shady trees, are broken pottery and scattered remnants of black goats'-hair cloth, from which their tents are made, that mark the site of a former Bedouin encampment; while before long we are crossing some ancient camel-track, along which for ages there only passed the long, slow-moving caravan of the unchanging East.

The sun has now risen over the hills of Judea; but, the sky being still cloudy, the air even yet retains the coolness of the Syrian night, and we

 [*All Rights Reserved.*]

are, moreover, moving on to higher ground. By this time so many drums of signal cable have been paid out that we know that we cannot be far from the rendezvous. Another half-mile and two tracks cross. The officer in command has a look at his map. 'Yes, this is the place.' Then comes the order, 'Dismount and hand over horses to number fours.' Out of the limbered wagon come the little shelter tent for the telephone-men, the telephone instruments, the helios, and all the apparatus, in fact, of the signal service, invaluable for campaigning and reconnaissance-work in a wide-spaced and sparsely inhabited land like this.

Down on the ground goes the officer with his map and compass. 'The —— Brigade are on a bearing of 70 degrees,' 'The —— Brigade are on a bearing of 125 degrees,' and so on, and away go the cable-wagons on the indicated bearings, trailing the telephone cables as they go. Just as the helios begin to twinkle on the far ridges the divisional commander and staff arrive on motor-cars, having followed an ancient camel-track winding over plain and tableland, while from a circling aeroplane overhead there flutters down a beribboned packet containing a message. Such are the arts and artifices of modern war!

But suddenly comes a far-away *bang!* followed by a low whine; a column of black smoke shoots up among a group of led horses just in front of us (some of whom stampede at once), and our ears are smitten by the terrific *crump!* of a high-explosive shell. The Turks have discovered that something is afoot, and, not knowing what it may be, are searching the ridges and hollows with high explosives and shrapnel. The —— Brigade are now in touch with us by telephone, so that wagon must have got quickly out to them; and then comes the first message: 'We are shutting off our helios, as they are drawing the enemy's fire.' The shelling increases, and various groups of led horses move out of range. Divisional headquarters also receive considerable attention, and have to move farther back, while the machine-guns of the Turks splutter on our front and flanks. We have now clearly uncovered the Turkish position in this part of their long front, stretching from the sea beyond Gaza into the desert. Gradually, however, the Turkish fire diminishes, for they appear to think that, after all, it is not the real thing yet, and that no attack in force is intended to-day, whatever may come later.

Quite melted away now are the clouds which kept the air so cool in the early morning, and by eleven o'clock the whole country is shimmering in the fierce blaze of the sun of June in Palestine. One would indeed give anything for shade and sleep, but there is no shade to be found, while sleep is still a far-off luxury. In the approaching noontide heat the distant hills are wrapped in a mantle of blue haze, while from the enemy lines comes now only the *bang!* of an occasional gun, for the Turkish gunners too are evidently made somnolent by the lassitude of the meridian hour. The heat would, in truth, be unbearable but for the fresh breeze that sweeps in from the sea, even although the latter is some twenty miles away. We cannot move homeward just yet, however, for the special purpose of this reconnaissance is still incomplete in some of its details. There is an opportunity, therefore, to ride quickly to the far ridge and look from it at the ancient city of the seven wells in the dim distance, and to scan through a glass the mouth of the valley which leads to Hebron and Jerusalem.

But shortly after the sun has passed the meridian come the orders to retire, and out go the wagons again to roll up the telephone cables; helios twinkle a final message, gear is packed away, and horses are hitched in for the return march. Yet the Turks must of necessity speed the parting guest, so shells begin to fall once more, and rifle and machine-guns to babble; while from the Turkish lines come out several regiments of cavalry to 'shepherd' our rearguard, for some part of the way at least, across the wide plain which is the 'No Man's Land' on this flank. Still, previous encounters with our mounted troops have made their valour discreet, and they do not risk pressing us too hard on this occasion.

Back again we move over the many miles of rolling grass-lands. 'It looks like a two-sheep-to-the-acre country,' say the Australian troopers; for, although it is three months since we have had any rain, the grass is nevertheless still fresh and green, thanks to the heavy dews at night. Once more in the moonlight we descend into the *wadi*, and up again over the plain. From the Turkish trenches on the distant right-front flash the green points of fire of several Verey lights. 'Stage fright,' says some one, 'for they think that our show to-day no doubt means an infantry attack to-night.'

Camp is made once more, after a stretch of eighteen hours in the saddle, just as the shadow of an eclipse passes over the moon. 'Why was this eclipse not advised in route orders?' grumbles the O.C. 'Last night, for instance, it might have been very awkward;' and then, to the officer left in charge of the camp, 'Have you anything to report?'

'Nothing sir, except that a white cat sprang into my tent a few minutes ago, and is still there.'

'We will calculate to-morrow,' replies the O.C., 'the significance of the conjunctive appearance of a white cat and an eclipse of the moon, if some one can supply a table of demonological values. Personally I should say that an eclipse in Ramadān indicated local and prospective hell for the Turks. Is grub ready?'

The appearance of the white cat has never

been satisfactorily explained. No one knew how it had arrived, or whether it was still lurking in a corner of the camp-commandant's tent, or had disappeared as mysteriously as it came. Perhaps it may have been a reincarnation in the same form of one of those members of the great feline family which had been embalmed thousands of years ago by some ancient Egyptian princess, and had wandered far from the tombs of Beni Hassan into the Holy Land, in the Moslem feast of Ramadān, in search of adventure, and of new experiences of life in a very modern world! And this might even be the 'Night of Decree' or of 'Power,' when communications between Heaven and the World are particularly to be expected, and when, according to the Koran, many signs, miracles, and wonders may take place. Who can tell?

An hour later the actual eclipse was over, but the moon had turned to a blood-red; many wearied and thirsty soldiers were at length able to seek rest and refreshment in sleep; while a great peace had fallen upon the camp in the Syrian plain, broken only by the tramp of sentries, and the champ or the occasional neighing of horses in the lines. And now, from the blue vault of heaven above us, 'the Syrian stars look down.'

'THEIR HEARTS' DESIRE.'

CHAPTER II.

MEANWHILE Auntie Naarah had also reached her destination. It had been a long journey, with its frequent stoppages, but she had hardly noticed its tediousness.

Seated in a corner of the compartment, her back to the engine, as she had always been brought up to sit, Auntie Naarah, oblivious of her fellow-passengers, let her thoughts go back to the romance of her youth, when Edward Strachan's father, a young subaltern, had loved and wooed her.

More vividly than she remembered the happenings of yesterday did she recall the fleeting days of promise too soon to be nipped in the bud by the chill frost of parental disapproval. They had met at a country house, where both were on a visit, and had fallen in love at first sight. The lonely woman, hard-featured, whom none of her fellow-passengers would probably have credited with ever having had a lover, saw herself once again a fair young girl, modest, retiring, as girls of the early Victorian era were trained to be. She saw him—Edward Strachan—the handsome, dare-devil lieutenant with whom she had wandered hand-in-hand along the yew-hedged walks of the old-world garden.

She heard him speak her name—'Naarah'—saying that he loved its quaintness, and poor Auntie Naarah, who had been so called by a Puritan father and mother because the name had a Biblical sound and signified 'handmaid,' which subservient position was right and fitting for women in the eyes of all the Churches, felt that she too would like it. She loved it still more after her lover went to India. It sounded an Indian name to her then. A dusky Indian maid might have borne it, she thought. Those few days of Auntie Naarah's memorable visit, which passed with the swiftness of a weaver's shuttle, were all the time she and her lover had together.

After Naarah's return, Lieutenant Strachan had come boldly to her parents' home to ask sanction for their engagement. Had it been given, he intended to ask further that they might be married before he left with his regiment for India in a few weeks. But the permission was never granted.

Naarah's parents belonged to a dour and narrow-minded sect of the Church, and to them the mere fact of young Strachan being in the army was a sufficient ban to the union. The army for them stood for idleness, extravagance, and everything that was undesirable. None of their kin on either side had ever had anything to do with it. The old lines,

> The scarlet coats, the scarlet coats,
> They are a graceless set,

barely expressed the case to their minds. They were of the considerable class (surviving to-day in the form of conscientious objectors) which, while desirous of its property and lives being protected by the Services, yet illogically disapproved of the army and navy. It was wicked to fight; at the same time, it was only right that civilians and their possessions should be securely guarded from an invading enemy. But when Edward Strachan tried to make Naarah's parents see the inconsistency of such reasoning, they turned and rent him.

No child of theirs should marry a godless soldier! In vain Naarah wept and implored; in vain her lover brought all his powers of argument and persuasion to influence them. They were deaf to entreaty and remonstrance. They would rather, they told the young man plainly, see their daughter dead than married to him—a man who lived by the sword!

And so it ended. The lovers were ruthlessly parted; they were even forbidden to correspond. The episode was to be considered finished. Lieutenant Strachan sailed for India, where, after a couple of years, he married, his wife dying at the birth of the son, on whose shortcomings Lawyer Knowles had held forth to his aunt that afternoon. Later on, having distin-

guished himself in the Afghan campaign, Edward Strachan, then Major Strachan, died in the Punjab.

Naarah never saw him again. She, under the autocratic sway of mid-Victorian parents, settled down to the dreary shut-in life which was the lot of ordinary middle-class girls at that time. She grew hard and bitter. Small wonder, seeing how her life and nature had been thwarted. But her parents were quite satisfied with their judgment. It was better for Naarah to be an old maid than to have married as she had wished. They left her well off when they died, and money henceforth became Auntie Naarah's god.

She never saw her lover again, but she saw his son.

Major Strachan had told his boy, if ever he had the chance, to look up a Miss Naarah Knowles (somehow he felt sure she could never have married any one else), and Fate made their meeting extraordinarily easy. As it happened, the young man had relatives who had come to live in the town near which Auntie Naarah's lonely house was situated, and whenever he went to visit his kin he used to try to come over to see the woman whom his father's old letters, tied with ribbon and smelling of dead roses, had told him how he had loved.

Auntie Naarah awoke from her day-dreams with a start when the train crawled into Tussocks Station that afternoon. It was drizzling outside, but she set off bravely to trudge the mile and a half to her home.

In due time she arrived at the garden gate. It hung on one hinge, because repairs cost money, and Auntie Naarah never spent a halfpenny if she could help it. She passed through into the garden, past its straggling shrubs and bushes—never cut and trimmed for the same reason—and rang at her front-door. Jean, a middle-aged servant, who had put up with her mistress's irritating ways for a number of years, opened to her.

'You've got back?' she said. 'And there's a visitor to see you.' She threw open the parlour door as she spoke, and there, pacing up and down the room in the faint light of a half-turned-up, evil-smelling oil-lamp, stood what looked for the moment to Auntie Naarah's blinking eyes—the vision of her dead lover, Major Strachan!

It was his son.

'Well, Miss Knowles,' he cried, coming forward to meet her in his hearty, impulsive manner, 'I've just come to say good-bye. I'm going *out* the day after to-morrow.'

Auntie Naarah shook hands; then, walking across to the table, turned up the lamp. The young man in his khaki stood revealed. A fine, well-set-up fellow, good to look upon with his fair, open countenance and fearless blue eyes.

Auntie Naarah nodded two or three times, which might have signified her approval. 'Bring tea,' she said curtly to Jean, who waited for orders. 'So you've enlisted?' she added.

'Yes, and been hard at it for the last three months. Never knew what work was before,' said Edward Strachan with a laugh. 'Now I think there's no limit to my endurance.'

'Humph! Well, you couldn't have done better.' A gleam of softness came into Auntie Naarah's eyes. 'Try to be as good a man and a soldier as your father, and you'll do.'

'I'll try to,' he answered softly.

At tea Auntie Naarah gave him a brief homily. He must do his best; and she hoped—she quite hoped—that the discipline of the army, so necessary to a young man, and the hard work, would do Edward a great deal of good; and that when the war ended he would either remain in the army or settle down to some business at which he could stick.

'There must be no more chopping and changing about, Edward, because this, that, and the other doesn't suit,' she said; 'you must work.'

Edward agreed. 'Probably I shall stick to my new job,' he said.

Auntie Naarah passed him a plate of stale cake, which was cut up into 'ladies' fingers,' and only came out on the rare afternoons when a visitor was present.

'I have done a momentous thing to-day,' she said solemnly.

'Indeed!' The young man, trying to make two mouthfuls of his cake, looked up, surprised.

'Yes. I have made and signed my will,' was the weighty response.

'I suppose that's a good thing,' remarked Edward. He did not know quite what was the correct thing to say under such circumstances. Personally he had no need to make a will before he went out, as he had nothing to leave. His shilling a day and a trifle in the P.O. was all his worldly store.

'And,' went on Auntie Naarah, fixing him with a stony stare, 'I have left *all* my property to my nephew and nieces—the children of my late brother, George Knowles.'

'Quite right, I should say,' replied Edward cheerfully.

Money was nothing to him, he not belonging exactly to the vast clan who are 'wiser in their generation than the children of light.' He lived almost as carelessly and without thought for the future as the birds of the air. If he had made a little money, it might be by backing a lucky horse, he spent it freely and generously. If he had in turn to live frugally and abjure pleasures, he took it all philosophically as in the day's work.

Soon after he bade his adieus; and Auntie Naarah, putting out the lamp, sat in silence over the smouldering ashes on the hearth till bed-time, living again, in *memory*, the one paradise out of which, as Richter says truly, we cannot be driven.

A day or two after, in reply to a letter to her nieces, which was rather in the nature of a royal command, asking one of them to come and make a lengthy stay, she received the following reply:

'The Chain House,
'Crabtree, *November '15.*

'Dear Auntie Naarah,—Thank you so much for your kind invitation, which one of us would have been very pleased to accept' (Auntie Naarah snorted), 'but unfortunately just now we are *all* engaged, so shall not be able to enjoy the pleasure of your company just yet. It is very tiresome how things happen like this. However, as you make a point of one coming as soon as possible, we have ventured to send a substitute.

'Miss Brooke is a very nice, quiet girl. She has been in Edward's employ as a typist, but he is quite willing to spare her for a little while till Mary (whose privilege it is to visit you next) is at liberty. She is engaged with an old schoolfellow. I think you will like Miss Brooke, and we have tried to instil into her your requirements.

'Mary will look forward to coming a little later.

'We are all very busy just now working for others, and all our spare time is spent in knitting for soldiers.

'We were so glad to hear a pretty good report of you the other day from Herbert. With love from us all,—Your affectionate niece,

'Ellen Knowles.'

Auntie Naarah read the letter through twice, a red spot of indignation burning on her high cheek-bones. '*Too busy! Working for others!* What about me?' she muttered angrily. 'I suppose they could knit socks here as well as at Crabtree. Humph!' She snorted again. 'Send me a type-writing minx! What do I want with her? A strange girl, who would eat like a horse, I expect! I never heard of such a thing! Never!'

With trembling fingers she was about to tear up the offending letter and throw it on the fire, but her habitual carefulness came to the rescue, and she proceeded to fold and tear it in lengths for 'pipe-lighters' to save matches.

A few minutes later Jean, who had tramped in to Tussocks to do some marketing, and who had called at the post-office on her way home, brought in her mistress's frugal tea.

'Have you got the spare room ready as I ordered, Jean?' asked Auntie Naarah quickly.

'Yes, ma'am. It's all ready. I've had the warming-pan in the bed, and put away the best crockery, getting the odd service out. If one of your nieces was to come this very moment, she could just step up.'

'They're not coming,' said Auntie Naarah portentously.

'Not coming?' Jean looked aghast.

'No; they're engaged.'

'What! all of them?'

'Each one, as it appears.'

Jean sniffed. 'Well, we can do without them,' she said, adding, 'I don't know as they aren't like the old turnpikes, as my uncle used to say—"more missed than wanted."'

'But what do you think, Jean?' went on her mistress excitedly. 'They're actually sending some one in their stead—a young girl out of an office.'

Jean made the noise with her tongue against the roof of her mouth which is supposed to express surprised disapproval. 'Well, if that isn't the limit, Miss Naarah! Send a stranger to their own kith and kin!'

Auntie Naarah nodded. 'But I won't have it,' she said. 'I will not put up with such interference. My house is my castle, I suppose.'

'One would think so,' said Jean.

'And I am going to write at once, or directly I have had my tea, to forbid my nieces sending such a girl. That will surprise them.'

'I reckon that will put the lid on,' said Jean with a grim smile. And then they both started and looked at each other in dismay as wheels sounded in the road outside, and some vehicle drew up at the gate.

'Whatever—who can that be?' exclaimed Auntie Naarah.

Steps came up the path; the door-bell rang. Jean flew to answer it, and a cabman stepped over the threshold and put down a small portmanteau. Then Jean became aware of a slight, girlish figure standing behind him.

'Thank you,' said a sweet, low voice. 'I think this is right.'

The cabman pocketed his fare, and went briskly back to his horse, and Jean cried, 'Stop! What does this mean?' She stared at the visitor, who, looking somewhat surprised, had followed her luggage into the hall.

'I—I've come from the Misses Knowles at Crabtree,' said the girl, adding anxiously, 'Am I not expected?'

For answer Jean flung into the parlour, where her mistress was standing a few paces from the half-open door. 'She's come, ma'am,' she gasped.

'I—I never heard of such a thing in my life!' replied Auntie Naarah.

She glared at the doorway. The uninvited guest stood half-revealed in the opening. Then, summoning her courage, she came into the room. 'I am Eva Brooke,' she said timidly. 'Your nieces sent me. I understood they had written, and that you would expect me this afternoon.'

'You understood quite wrong. My nieces wrote, certainly, but I've only just read the letter, and I was about to write and tell them I would not receive you.'

The girl flinched before the fierce gaze and

manner of the infuriated Auntie Naarah. 'I can go back,' she faltered.

'Go back! How are you going to find your way back to the station in the dark? Absurd!' snapped Auntie Naarah. 'You'll have to stay the night at any rate. It is most *provoking*.'

'I didn't want to come,' Eva protested. 'But Mr Knowles gave me no choice. If I had refused I should probably have lost my job in his office, and—and—I have my living to get.'

'I dare say; I dare say.'

Jean came to her mistress's elbow. 'It isn't her fault, as I can see,' she said in a stage-whisper. 'Hadn't you better give her some tea? I'll bring another cup and plate.'

Aunt Naarah grudgingly assented. 'I dare say you'll be glad of some, now you are here,' she said ungraciously, adding, 'We live very plainly and frugally—no luxuries or dainties.'

'I am used to living plainly,' answered Eva. She might have appended to that statement that upon the salary Lawyer Knowles paid her it would have been impossible to do anything else.

Jean came bustling in with a small tray on which (quite unnecessarily, her mistress thought) she had put a plate of cake fingers which had been brought out for Edward Strachan. 'The spare room is all ready,' she murmured reassuringly to the unexpected visitor.

Jean liked the look of the girl, and inwardly decided that she would be an improvement on the Misses Knowles. Certainly Eva Brooke was fair to look upon, with her clear, pale complexion, smooth dark hair, and soft gray eyes shadowed by black lashes.

Jean hoped she would stay. The Hermitage, as it was fitly called, was a dull enough place; a little young life might enliven it somewhat. When she showed the stranger to her room Jean took the opportunity of giving her a few hints as to her behaviour to Miss Naarah.

'She's difficult. No gainsaying that,' said Jean. 'But I believe she's got a heart somewhere. Just you humour her a bit; and don't argue, whatever you do. Miss Mary Knowles, she tries that on when she stays here, and they pretty nearly come to blows.'

'Poor old lady! it must be very lonely for her here,' said Eva compassionately. She glanced at the funereally hung four-post bedstead, and wished herself back at her Crabtree lodgings.

'It is that,' acquiesced Jean. 'But Miss Naarah, she never was one to make friends.'

Eva thought that first evening would never end. Auntie Naarah showed her resentment at the intrusion by a stony silence; but after supper—a Barmecide feast, brought in from motives of economy close on the heels of tea—she relaxed a little.

Could Miss Brooke play cribbage?

Miss Brooke could. She had been well drilled by her invalid father at that curiously arithmetical game. The board was got out accordingly, and they played for some time. Auntie Naarah found her new companion was much quicker at counting than her nieces. Also, she did not forget to take for 'his nob' or 'his heels,' an omission which Auntie Naarah always felt very irritating.

Next morning, when Eva Brooke tentatively made an inquiry about trains, Auntie Naarah replied that there was no hurry; she had better wait till the morrow. And when the morrow came it was the same.

'Do you know, Jean, I'm half-inclined to let the young lady stay on a while,' she said.

'Why not?' returned Jean. 'She seems a kindly body, and gives no trouble; and as for her keep, she doesn't eat more than a canary.'

Auntie Naarah's miserly soul had noticed the visitor's small appetite with approval. Perhaps, if the truth were known, this had been the determining point in her favour. Anyhow, it ended in Eva Brooke's staying on for the present.

In accordance with her promise to Lawyer Knowles before she started, Eva wrote a brief summary of the state of affairs. Miss Naarah was pretty well, and she herself seemed to be giving satisfaction. Auntie Naarah did not trouble to write to her nieces; they had taken too much upon themselves, and must be made aware of the fact. Auntie Naarah would teach her legatees to dictate to her!

(*Continued on page 804.*)

'THE CURSE OF SCOTLAND.'

By Charles Menmuir, M.A.

THIS term, applied to the 'nine of diamonds,' has been in vogue in Scotland for upwards of two centuries at least, but, despite the efforts of many writers who have endeavoured to trace its origin, the subject has never been fully treated within even the limits of a magazine article. Any reader desirous of acquiring some knowledge of this phrase, as a sort of nickname for the playing-card, will find that he has at present no small amount of hunting up to do in rather out-of-the-way sources. The present writer, having been faced with this trouble, began at last to jot down the various references to the subject which he happened to come across. In stringing these together here, however, he does not presume either to have arrived at a definite explanation of how the term arose, or even to have tabulated all the many suggestions that have

appeared from the various pens more or less busy with this great 'Card Controversy' during the past hundred and fifty years. His purpose has been the humbler one of giving a résumé of what has been written on the question, and of placing on record the most important of the many elucidations of it that have been put forward at one time or another for a gullible public to swallow.

At the outset it may be appropriate to remark that this point of dispute about a playing-card may claim the distinction of having a precedent in support of it; for a writer of Elizabethan times makes a reference to the same kind of squabbling about a similar point in his day. The book which contains his statement is now very rare, bearing the catchy and alliterative title of *The Pennyless Parliament of Thread-bare Poets.* Its author appears almost to have foreseen the attempts of a later age to deal with such a matter, and indeed he seems to encourage such efforts, inasmuch as he gravely informs us that 'it shall be lawful for coney-catchers to fall together by the ears about the four Knaves of Cards which of them may claim superiority.'

The most widely accepted explanation of the phrase, 'the curse of Scotland,' is the one linked to the name of that Duke of Cumberland whose memory was rendered infamous throughout Scotland by his cruelty after Culloden. According to tradition, he wrote upon the back of the 'nine of diamonds' his order for the massacre that followed the battle. To bolster up this story, several points have been made much of. Its supporters, for instance, have attached great weight to the fact that Cumberland was an inveterate gambler, and generally carried a pack of cards in his pocket. What more natural, then, according to their line of argument, than that he should have used one of them in writing his order? Some have even gone the length of suggesting that the actual card is still in existence. In *Notes and Queries* (8th series, vol. iii. page 416), Father Oswald, O.S.B., wrote as follows: 'I am told on good authority that the identical card is preserved at Slains Castle, Aberdeenshire, the seat of Lord Errol.' This was replied to effectively in a later volume of the same magazine by W. Cooke, F.S.A., who stated that 'my friend, Captain Webbe, who married a sister of the present Lord Errol, has most kindly made a search for this card, and he writes to me: "The only card I can find among the Kilmarnock papers is the *eight* of diamonds; it has a short letter written on the back of it from the Duke of Hamilton to the Countess of Yarmouth, expressing regret at his not having been able to call upon her. There is no other card; nor has my wife ever heard of there having been another in existence here."'

Another writer, also favouring the Cumberland story, pointed out in the same magazine that this use of playing-cards for writing notes upon was not at all unusual in those days. 'To use,' he says, 'playing-cards for notes was certainly not an uncommon practice. I have now before me two notes of a serious character, and on matters of business, written in 1767, one of them (by a right reverend prelate) on the back of an ace of hearts, and the other on that of a three of spades.' Some might be inclined to regard this as making Cumberland's supposed use of the card more likely; but it is very significant that no one has ever made any endeavour to give us the exact words of this brutal order, and, further, even those who believed that he wrote it were by no means unanimous, for some of them maintained that what was written was really the Duke's first account of his victory. This variation secured particular favour in the eyes of those who favoured Cumberland, as it served the double purpose of whitewashing the Duke and of still admitting the connection between his name and the card, if only as a sample of his enemies' malice. This account is also mentioned in *Notes and Queries.* 'Cumberland was known to be a gambler and fond of cards, and is said often to have carried a pack in his pocket, and the first account of his victory at Culloden is said to have been written on the field upon the back of the nine of diamonds.'

Another suggestion has also been put forward that it was the other side who were the guilty ones. The following, which is again quoted from *Notes and Queries,* is the most detailed account of this explanation that has so far appeared: 'There certainly seems to be something wanting explanation with regard to the circumstance connected with the battle of Culloden and the supposed order of the Duke of Cumberland not to give quarter, which was said to be written on the nine of diamonds. Now, on the morning when the Lord Kilmarnock was beheaded, Lord Balmerino sent a message to him desiring an interview, at which Lord Balmerino asked Lord Boyd "if he knew of any order being made before the battle of Culloden for giving no quarter to the Duke's army," at the same time declaring "that he himself knew nothing of any such order." Lord Kilmarnock replied that he knew nothing of any such order, but that since the battle of Culloden he had been informed that there was some order to that effect, signed George Murray, and that it fell into the hands of the Duke immediately after the battle. Lord Boyd, up to his last moments, denied any knowledge of the message or command alluded to, and said "that he would not knowingly have acted under such an order, because he looked upon it as unmilitary and beneath the character of a soldier." Here then, on the one hand, it is asserted the Duke sent an order to give no quarter to the Jacobites; and, on the other, we have the same charge made against the latter in respect to the Royalists.'

Although for long this hypothetical connection of the card with the battle of Culloden was firmly believed in and most generally accepted, it is interesting to notice that it was precisely the one most easily ruled out of court, because evidence exists in black and white that the name 'Curse of Scotland' was applied to the card before ever Culloden was fought. Until quite recently the earliest printed record of the phrase was that contained in Dr Houston's Memoirs of his own lifetime (1747). On page 92 of that edition the author, in describing the state of parties in Scotland shortly after the rebellion of 1715, wrote that Lord Justice Ormistone, who had been very zealous in suppressing the rebels, 'became universally hated in Scotland, where they called him the Curse of Scotland; and when the ladies were at cards playing the nine of diamonds (commonly called the Curse of Scotland), they called it the Justice Clerk.'

In the Oxford *English Dictionary*, however, a still earlier quotation is given from the *British Apollo*, a magazine which was first published in 1708. In the third volume (for 1710) occurs the following: 'The nine of diamonds is called the Curse of Scotland.' The present writer became aware of this quite accidentally, for he had been content with what Dr Murray had given by way of quotation under the heading 'curse.' Under this various references are given, with the Houston one as the earliest. Naturally any one would suppose that this would be the most that the dictionary could do for us, and consequently there would be no inducement to prolong the search through its pages. Turn, however, to the word 'diamond,' and there you find the earlier allusion from the *British Apollo*. The omission of this under the word 'curse' is possibly due to the fact that it was not known to the editor until after the portion containing the word 'curse' was printed. None the less is the omission to be regretted, for 'curse' is undoubtedly the fit and proper word for the quotation to appear under, although there is nothing to be said against it also being placed under 'diamond.' Shortly after stumbling across this fact, I chanced to notice also that this same point had been commented upon by a writer in *Notes and Queries*.

Another interesting proof that Cumberland had nothing to do with the card was brought forward some few years ago by a Mr Hawkens, who owned a print of which he wrote these remarks: 'Cumberland's connection with the nine of diamonds cannot be true, for I have in my possession a print entitled "Briton's Association against the Pope's Bulls." In it the Young Pretender is represented attempting to lead across the Tweed a herd of bulls laden with curses, excommunications, indulgences, &c. On the ground before them lies the nine of diamonds. The print is dated Oct. 21, 1745, some months previous to the battle of Culloden.'

Before proceeding to a statement of the other guesses at the origin of the term, it may be worth while alluding to an instance somewhat analogous to the above. In various parts of Ireland, especially in Kilkenny county, the six of hearts is known as 'Grace's Card.' The explanation usually given of this is that a gentleman called Grace, on being asked, with promises of royal favour, to help William III., gave this answer to an emissary of Schomberg's who had been sent to him: 'Tell your master I despise his offer, and that honour and conscience are dearer to a gentleman than all the wealth and titles a prince can bestow.' According to the tale, this reply was written on the back of a card with the six of hearts upon it.

The next attempt at solving the problem with which we now deal is probably the one that has had most backing; and, as regards the weight of authority supporting it, it seems to have the strongest claim to be considered the most feasible one that has yet been put forward. It is stated well and concisely in the following terms in *Chambers's Encyclopædia*: 'Perhaps the least worthless of the many explanations offered is that it involves a reference to the detestation entertained in Scotland towards John Dalrymple, first Earl of Stair, on account of his activity in promoting the Union, and especially for his share in the Massacre of Glencoe. His heraldic bearings, "Or, on a saltire azure, nine lozenges in the field," bore a fanciful resemblance to the nine of diamonds.'

The Oxford *English Dictionary*, while pointing out that the origin of the phrase 'curse of Scotland' is doubtful, considers the Dalrymple explanation the best of a bad lot. Dr Murray cautiously terms it 'a not unlikely suggestion.' In doing so he follows in the wake of Annandale's *Imperial Dictionary*, which, after enumerating most of the usual explanations, holds that the 'Stair' theory is most probably the true one. The *Century Dictionary* also quotes this explanation, and adds, somewhat vaguely: 'Other explanations have been proposed.'

The heraldic proof seems to have been rather popular, for at least two other names are given as claimants to the doubtful privilege of being the cause of the first sinister use of the term. The first of these was Colonel Packer, of whom a writer in the *Gentleman's Magazine* for 1786 states: 'The common expression made use of at cards refers to the arms of Packer, namely, Gules, a cross of lozenges, and that Colonel Packer was one of the persons on the scaffold when Charles I. was beheaded, and the same soldier afterwards commanded in Scotland.' When he was there he acted with so great severity that he became detested, and the evil taint attached to his name was supposed to have caused it to be linked with the nine of diamonds, because of the suggestion derived from his coat of arms.

In a similar manner a Scotch M.P., named Campbell, had his name dragged into the question. In a scarce volume entitled *Chronology, or the Historian's Companion* (4th edition, London, 1826), occurs the following: 'Diamonds, nine of, called the Curse of Scotland, from a Scotch member of Parliament, part of whose family arms is the nine of diamonds, voting for the introduction of the malt-tax into Scotland.' This personage was apparently Daniel Campbell of Shawfield, who was member for Glasgow in the early part of the eighteenth century. His house was destroyed by a mob in 1727 because he was suspected of 'having given Government the information on the habits and statistics of Scotland necessary for the preparation of the malt-tax, as well as having exposed a system of evasion of duties in the Scots tobacco trade.' Unfortunately for the feasibility of this theory of his connection with the playing-card, it must be added that his coat of arms cannot be said to suggest the nine of diamonds, even in the remotest degree.

Another set of explanations seeks to derive the phrase from certain card games. Brewer, in his *Dictionary of Phrase and Fable*, says that the two most plausible suggestions are: '(1) The nine of diamonds in the game of "Pope Joan" is called the Pope, the Antichrist of the Scotch Reformers. (2) In the game of "comette," introduced by Queen Mary, it is the great winning card, and the game was the curse of Scotland because it was the ruin of so many families.' The first of these suggestions was once stated in the *Gentleman's Magazine* in the following syllogistic form, and was evidently intended to be the final word on the matter: 'The Curse of Scotland must be something which that nation hate and detest; but the Scots hold in the utmost detestation the Pope; at the game of Pope Joan, the Nine of Diamonds is Pope; therefore the Nine of Diamonds is the Curse of Scotland. Q.E.D.'

It certainly seems a natural source to seek for the origin in some card game or other, but this does not in itself imply that the use of the phrase arose in this manner. In the case of 'comète,' for example, it can be shown that this game clearly had nothing to do with the question. In a French book of 1739, called *Académie universelle des Jeux*, the game is described as having been played with two whole packs, the first to contain all the red cards, the other the black, each pack thus formed to be used alternately, the nine of diamonds being the red comète, and the nine of clubs the black. According to this, there would be two comètes, both equally liable to be the curse of Scotland. This theory, therefore, fails to account for the particular suit—diamonds; and, as it stands, either clubs or diamonds would have an equal right to be the curse of Scotland.

Grose, the antiquary, in his *Tour through Scotland* (1789), turned to Scottish history for an answer to this card conundrum, and maintained that 'diamonds . . . imply royalty, and every ninth king of Scotland has been observed for many ages to be a tyrant and a curse to the country.' Brewer, in referring to this, made the sarcastic comment that it was a pity Grose did not give the names of these kings. Singer, in his book, *Researches into the History of Playing Cards*, also gives the same explanation. In writing of various cards that have got nicknames, he tells us: 'The Queen of Clubs is called in Northamptonshire "Queen Bess," because the queen, history says, was of a swarthy complexion; the four of spades, "Ned Stokes," but why I know not; the nine of diamonds, the "Curse of Scotland," because every ninth monarch of that nation was a bad king to his subjects. I have been told by old people that this card was so called long before the rebellion of 1745.' Unhappily, Grose's historical knowledge was not always above reproach, for in another of his books, called *Lexicon Balatronicum: a Dictionary of Buckish Slang, University Wit, and Pickpocket Eloquence*, he confuses Argyle with Dalrymple, and states the explanation connected with the name of the latter as follows: 'Others say it is from its similarity to the arms of Argyle, the Duke of Argyle having been very instrumental in bringing about the Union, which, by some Scotch patriots, has been considered as detrimental to their country.'

At least two other explanations connect the crown of Scotland with the nine of diamonds. One of these fanciful tales informs us that in the turbulent times of Mary Queen of Scots a daring fellow named George Campbell attempted to steal the crown out of Edinburgh Castle. He failed in this, but succeeded in stealing nine jewels out of it. As a consequence a heavy tax was put on the people to replace these gems. The writer of this wonderful concoction then proceeded to clinch his story by adding that he perfectly recollected in the early half of last century that the card was often called 'George Campbell' in the Highlands of Scotland.

A variant upon the above occurs in a volume printed about 1770, and called the *Oracle, or Resolver of Questions*. Amongst the questions which it attempts to 'resolve' is this vexed one of the 'Curse of Scotland.' The author proceeds with question and answer in these terms:

'*Q.* Pray, why is the Nine of Diamonds called the Curse of Scotland?

'*A.* Because the Crown of Scotland had but nine diamonds in it, and they were never able to get a tenth.'

Chatto, the author of a work called *Facts and Speculations on the Origin and History of Playing Cards*, actually accepted this ridiculous statement as the genuine one, and wrote of it that it was perhaps as near the truth as any of the others.

Another explanation that has been put forward is that the word 'curse' is a corrupted form of 'cross,' and from this the attempt has been made to link the card to the St Andrew's Cross by reading the phrase 'curse of Scotland' as if it were originally the 'Cross of Scotland.' This transposition of the letter does, as a matter of fact, occur occasionally in Scots speech, as, for example, 'grass' is frequently spoken of as 'girse;' but even if the feasibility of this change be admitted, there still remains to be accounted for the idea of evil associated with the card. One would rather have expected an exactly opposite meaning if the Cross of Scotland had any connection with the matter at all.

Whichever of the clues is the genuine one, it is at any rate fairly safe to assume that the card must have been named after some object of public detestation. As regards this point, more than one of the above explanations would fit, but certainly not this relationship with the Cross of St Andrew. The Oxford *English Dictionary* expressly states that 'curse' and 'cross' are quite distinct. 'Of connection with cross which has been suggested there is no trace.' It may be noted here, also, that the difficulty of arriving at a conclusion about the phrase is increased by the fact that the derivation of 'curse' (Late O.E. *curs*) is of unknown origin, and 'no word of similar form and sense is known in Teutonic, Romanic, or Celtic.'

The *Century Dictionary* records that the word 'curse' has been also supposed to originate in a particular use of an early form of the word 'cross,' as in making the sign of the cross in exorcism. It requires, however, a considerable stretch of imagination to trace a resemblance in the nine pips on the card to either the St Andrew's Cross or the cross used as a sign for protection from evil. In reality, the 'five' in a pack would be nearer the thing, and even then the special suit of diamonds is not accounted for, as any of the other suits would be equally applicable.

It is interesting to note that several other cards have also been given nicknames. Mention has already been made in this article of the six of hearts being termed 'Grace's Card' in Ireland. In Northumberland the four of hearts at whist is sometimes called 'Hob Collingwood,' and it is regarded by many players as an unlucky card. The four of clubs has also a bad reputation among sailors, who usually speak of it as the 'devil's bedpost.' According to a writer in the *Gentleman's Magazine* for 1791, the queen of clubs is known in Northamptonshire as 'Queen Bess;' and the four of the same suit is termed 'Ned Stokes.' It is a somewhat remarkable fact that the 'four' of these different suits should be thus singled out for special notice. No explanation, so far as I am aware, has ever been given of this.

Some years ago Dr Murray, the editor-in-chief of the monumental Oxford *English Dictionary*, made inquiry through the columns of *Notes and Queries* for information regarding the phrase 'Curse of Scotland,' and in doing so he made the statement that he had not then any ground for thinking that the phrase was of Scottish origin. One would hardly have expected that the learned doctor would have been so sceptical as to the birthplace of the term, more especially as he was himself a Scotsman. Later on, however, when dealing with it in the dictionary, he admitted that there is practically no doubt but that it did hail from Scotland, and it is surely significant that all the elucidations so far brought forward have been of Scottish birth. They may, one and all, be erroneous, for absolute proof of the truth of any of them seems now past praying for, but they have this at least in common, that they are all of Scottish origin.

I got recently on the track of what I imagined was to turn out an English connection with the nine of diamonds, but unfortunately I drew blank when the chase was followed up. As the incident, however, deals with a playing-card, it may not be out of place to record it here. In *Notes and Queries*, 9th series, vol. v. page 493, a query was inserted as follows, but no answer, so far as I am aware, was given to it at the time: 'The nine of diamonds carved on a pulpit. Can any one of your readers suggest a reason for it being carved on a pulpit in Spofforth Church, Yorkshire? (Eboracum).'

Through the courtesy of Mr Fred Mitchell, architect and surveyor, Leeds, with whom I got into touch over this point, I have been put into possession of an item of more than passing interest with regard to this pulpit carving. When I wrote to Mr Mitchell, soliciting his help towards a solution, he informed me that a carving of this character did exist, but that it certainly was not in Spofforth Church. In a further communication from the same gentleman he expressed himself in these terms: 'I am inclined to the opinion that the mention of Spofforth is an error; it should have been Sprotborough, a village a few miles west of Doncaster. I have looked up my notes of this church, as promised, and find: "Fine late oak pulpit, apparently contemporary —very curious carving on door, a pack of cards, a jug, and a dice-box, said to represent gambling, drinking, and roguery."'

Not content with giving me this enlightenment, Mr Mitchell took steps to verify his previous communication, and, with the co-operation of his brother, he laid me under still further indebtedness by forwarding to me a drawing of the door-panel, showing the jug, dice-box, and a pack of cards, on the top one of which is represented the six of diamonds.

My gratitude for the above information did not, however, prevent me from being somewhat disappointed that this six of diamonds did not

happen to be the nine of diamonds. I had to console myself with the fact that all I have come across in connection with the 'Curse of Scotland' has been confined to Scottish sources; whilst I had also to admit that the origin of the phrase still remains an open question, even although its nationality be beyond a doubt.

'DICKY' DOYLE AND HIS ILLUSTRATIONS.

By E. Beresford Chancellor, M.A.

IF you examine that series of comic, yet essentially accurate, delineations of London life which Richard Doyle contributed to *Punch* and the *Cornhill* midway in the last century, under the titles of 'Manners and Customs of ye Englyshe' and 'Bird's-Eye Views of Society,' you will be transported to a world which seems, in all outward semblance, as far removed from our present state of society as that of the Plantagenets. The former series appeared in 1849, the latter in 1864, and in those fifteen years dress and habits altered perhaps less than during any other similar period during the reign of Victoria. If you take the fifteen preceding years, you will find that then the dress and manners and customs of the English went through a very obvious change. In the matter of ladies' clothes this change was marked enough, but hardly so much so as in those of the men, in whose habiliments the trousers, originally introduced by Brummell, became the rule, and not, as before, the rather rare and, as then regarded, *outré* exception. The top-hat, too, more or less in its present form, was the invariable concomitant of the smartly dressed man, and the peg-top trousers had largely taken the place of the previously strapped variety, and might, indeed, frequently be seen composed of a plaid material such as Lord Brougham wore in his later days. Similarly, during the fifteen years succeeding 1864, a no less drastic change took place in clothes: the trousers were no longer peg-topped; the top-hat (that constantly changing item of attire) had altered in a variety of ways; the frock-coat had come in, and the stock had gone out (you won't find an umbrella in Doyle's 1864 series, but you will come across many stocks). The varieties of changes in ladies' dress are too complicated for the mere man to enumerate or describe, but the disappearance of the crinoline, the advent of shoulder-of-mutton sleeves (to name but these), produced a far different appearance between, say, the belle of 1864 and her of 1879 than between one of 1849 and one of 1864.

Perhaps the best way to show how greatly 1849 differed from 1917 will be to take some of Doyle's pictures of that period, and point out the strange and wonderful things to be found in them.

The first represents an 'At Home,' the feature of which is the polka. Who dances the polka to-day? It survived its contemporaries, the schottische, the mazourka, and the redowa, all of which we stole from Poland, but is now more or less definitely *en retraite*. The gibus had not then become general, and men brought their ordinary top-hats (they almost slept in them, one would think) into full drawing-room, although one or two of the former variety are to be seen. The ladies' head-dresses range from the simple *à la grecque* convention to the terrible turban worn by the matron, who clung to this Oriental and, to the philosopher, significant covering. Old gentlemen wore fobs and stocks, young gentlemen wonderful ties made up into gigantic bows; and only the military were adorned with moustaches (a beard was then a rarity), as may be seen in the picture showing Hyde Park, where coaches with their two footmen standing behind jostle cabriolets such as Lord Tom Noddy called for on a famous occasion, and such as Mr Montague Tigg was accustomed to drive.

No. 4 of the series shows us St James's Street on a drawing-room day, and although the topographer might well question the accuracy of the architectural drawing, we at least have the famous bow-window of White's in all its critical glory, and the gate of the Palace in the distance. Most of us have seen those survivals of past magnificence, the state-coaches, on similar occasions in our own time, so that their presence in Doyle's picture does not seem so archaic as some of its features—policemen in top-hats, for instance.

In 'Tea and a Little Musyck,' as No. 6 is entitled, we have a scene we should have to travel far to discover to-day—especially as here the majority of the audience is composed of young bucks gorgeous in elaborate neckties, with low-cut waistcoats, very prominent jewellery, and the inevitable top-hat carried into the music-room.

The representation called 'Ye Commons Resolved into a Commyttee of ye Whole House'—not the present Gothic structure, but its insignificant predecessor—is interesting, because one can identify some of the protagonists. Sir Robert Peel is addressing the House in his characteristic attitude. Mr Disraeli is sitting close by, with his abundant locks showing beneath his back-tilted top-hat. Lord John Russell (Premier) and Lord Palmerston (with his hat over his eyes—he was then Foreign Secretary) and the large form of Mr Roebuck may be distinguished on the other side of the Treasury table.

The next picture shows the furore created by Jenny Lind, who gave her great series of concerts in 1847–48, and the inability to hear whom threw half fashionable London into despair. Here we have a well-dressed crowd fighting and struggling to obtain admission into the principal entrance of Her Majesty's, for all the world as if it was a mob at the pit or gallery doors on a first night.

Exeter Hall is now no more, but in the days of yore it was a great place for meetings, and Doyle shows us 'A Christian Gentleman Denouncynge ye Pope' during the anti-papal campaign which raged at this time, and which led (through *Punch's* attitude on the subject) to Doyle (who was a Roman Catholic) severing his connection with the periodical.

The picture of the Royal Academy represents the yearly exhibition of that body in Trafalgar Square, whither it had removed from Somerset House in 1838, and which it left for Burlington House in 1869.

Although the Derby as represented by Doyle is familiar to most of us — even if the dresses worn then, and the means of transit, have altered out of all recognition, the picture which follows is as strange almost as Tyburn Tree or the Stocks. It is 'A Prospect of Greenwich Fair,' and the once famous Richardson's Show is in full swing; there are notices of the giant and the inevitable fat lady; a tragedy and a pantomime may be seen for threepence; and in another part a gentleman armed with enormous boxing-gloves invites all and sundry to come and learn the noble art of self-defence; what time the showman bawls out an insinuating programme, and musicians in wonderful hats do their best to drown his oratory.

The picture of the House of Lords during a hearing of appeals is interesting as showing Lord Brougham, almost the only peer present, seated, deep in thought, with crossed legs clothed in the plaid which has been noticed as a favourite habiliment of that remarkable man.

The dominating feature of these wonderful little pictures in miniature is the top-hat. In 'Society Enjoyinge Itselfe at a Soyrée,' it is there carried in the hand. In 'A View of Mr Lorde hys Cryket-Grounde,' most of the players wear it (what a different Lords to the one we know!—although the site is the same). It fills the picture in the view of a flower-show at Chiswick Gardens; at a shareholders' meeting where railway dividends are announced at a minimum (the railway boom was then producing the usual results of booms) only the very excited members of the meeting are cooling their heads by temporarily discarding their beloved covering; men wear it at a Thames regatta, when they are going on apparently lengthy railway journeys, at the cider cellars (where do they drink cider in cellars to-day?), even when they are fishing from punts off Richmond, where, by-the-by, we see the old 'Star and Garter,' so recently demolished, on the adjacent hill.

In those days men used to dine off Whitebait at Blackwall, as here we have them probably at 'The Brunswick' (Lovegrove's tavern) or 'The Artichoke,' both once noted houses for the delicacy.

In No. 27 in the series we are introduced to the Chamber of Horrors at Madame Tussaud's. This was when the exhibition was at the Baker Street Bazaar, which it left for its present palatial home only in 1884. The names and effigies of some celebrated murderers are given; and we see Edward Oxford, who shot at Queen Victoria in Constitution Hill on June 10, 1840; James Greenacre, who murdered Mrs Brown, and was hanged on May 2, 1837; Rush, Daniel Good, Thom, and other malefactors.

Some of these little pictures, crowded with life and character, instinct with wit and humour, as they are, yet seem to us to-day to recall a period as remote for all practical purposes as the Middle Ages. For instance, the 'Prospect of an Election' (No. 31), with its hustings, its vociferous member, its motley crowd, its ferocious partisan, carries us back to Eatanswill —and Eatanswill is now, except in Dickens's vivid prose and Phiz's no less vivid pencil, at the back of beyond. Look, too, at plate 34, where a comic actor (is it Charles Mathews? I think so) is amusing a crowded house innocent of stalls—the pit filling the ground-floor of the auditorium from the back up to the orchestra! The Zoological Gardens as shown in the next picture is the same, yet not the same, as we know it. The bear-pit and the cages where the king of beasts sits magnificent are now but a small item in the greatly enlarged place. Nor do we to-day see much of the once regular concomitants of Guy Fawkes's Day, as represented in plate 37, where one of the squares—from the statue and the mounted cleric, I imagine St James's Square, where William III. in stone and the Bishop of London's house still exist, to be intended—where one of the squares, I say, is filled with processions of boys carrying the one-time distinctive effigy.

In some of Doyle's pictures are introduced the portraits of famous contemporaries. Thus in No. 30, where we are shown 'Ye Farmer's Friend Impressynge on ye Agrycultural Interest that it is Ruined,' we have Mr Disraeli on his feet, apparently horrifying his auditory by his prognostications. Disraeli had become leader of the Conservative party in 1847, a year after the Repeal of the Corn Laws, it will be remembered. Again, at a 'Promenade Concert' (No. 40), the once famous figure of M. Jullien is seen conducting the orchestra; while Lord Brougham

in the House of Lords and Sir Robert Peel addressing the Commons have already been noted.

In this series of pictorial comments (so to term them) on current events, as well as in the later 'Bird's-Eye Views of Society,' which are practically all concerned with the social life of the period, we have 'in little' a record of the manners and customs of an altogether different day from our own. Modes of dress and modes of thought, amusements, and social habits of all kinds have undergone such a drastic revolution that in looking at these pictures of our forebears we are relegated to a wholly alien kind of society, and can but connect the two, here and there, by the presence of some landmark or some rare surviving observance common to both.

Perhaps one of the most marked differences, especially noticeable now, is the change in the garb of the military, the busbies and red uniforms of the Grenadier Guards then giving that touch of colour to an otherwise rather gray London, which to-day has given place to the khaki which mixes all kinds of regiments in one common ochre tint.

Richard Doyle, who was responsible for these illustrations of a past time, was born in September 1824, in London, and was the son of that John Doyle whose political caricatures over the signature of H. B. were at once the delight and the terror of politicians and statesmen. In his fifteenth year (so precocious was he) young Richard published his illustrations of the famous Eglinton Tournament; and another example of his early cleverness exists in his manuscript journal, now in the British Museum, which in its accompanying illustrations exhibits wonderfully fresh and inventive genius in a youth, for such he was when he wrote it. He first contributed to *Punch* in 1841, and two years later became one of its regular staff—the present well-known cover of that periodical being his work. His 'Manners and Customs of ye Englyshe' first appeared in *Punch* in 1849, with annotations by Perceval Leigh, who wrote under the pseudonym of 'Mr Pips.' The 'Bird's-Eye Views of Society' came out in the *Cornhill* while that magazine was under Thackeray's direction. In 1850, owing to a difference with *Punch* over the Roman Catholic question, on which that journal took a very pronounced anti-papal line, Doyle, who, as I have said before, was a Roman Catholic, severed his connection with it. Much book-illustration was subsequently undertaken by him, and his graceful and quaint designs may be seen in *The Newcomes* and *Rebecca and Rowena*, in *The Scouring of the White Horse*, in *The Battle of Life*, in *The Bon Gaultier Ballads*, and in *The King of the Golden River*. Later he took to water-colour work. In December 1883, while lunching at the Athenæum, he had an apoplectic stroke, from which he never recovered. Mr Austin Dobson once wrote of him: 'In Oberon's court he would at once have been appointed sergeant-painter.' He could have no better or more illuminating epitaph!

A CANADIAN FRONTIER TOWN.

By Fred A. Talbot.

IT was a blazing-hot August day. We had been paddling listlessly since a heavy lunch which had just been negotiated, and the heat of old Sol was not conducive to hard work. We were drifting round a bluff on the Fraser River, when suddenly the Indian in the bow of the crazy dug-out yelled, 'There's Fort George!'

The words acted like magic. It was more than six weeks since we had last been in the hubbub of civilisation, and that was at Edmonton. But as we had toiled along the lonely trail we had heard much about Fort George. Every prospector and traveller we had met had been full to overflowing about the boom in the new town, and the Indians during our six-days' canoe journey of three hundred and fifty miles down the Fraser had talked of little else. Though hot, tired, and lazy, we pulled at the paddles, to cover the last mile in record time, as if just setting out.

It was not long before we were pulling across the broad stretch of clear green water where the Nechaco joins the Fraser, and shot under the high, overhanging bank on which is perched the Indian reservation. The Indians gazed at us stolidly, their features relaxing into a broad smile when one of our Indian crew sang out some exclamation in incomprehensible Cree. A little later we ran into the bank with a smart jerk, just opposite the Hudson Bay fort, from which the town derives its name, and which for over a century had been a lonely outpost in the wilderness, an oasis to the white traveller, but which now was being absorbed rapidly in a maze of civilisation's bonds.

Tents were quickly pitched, and a general clear-up indulged in to remove the traces of the last six days' experiences on the river. Then I sallied forth to explore the town. There were bustle and excitement on every side. At this time, now some years ago, the town was only four months old; but in that short period much had been done, for in Canada months are as years in the Old World. The town had been planned in the usual American manner with streets running

at right angles to one another, and there was that characteristic uniformity in width.

Fort George came into existence with a rush. It is difficult for one who has never been through the country to realise how isolated the spot was, how inaccessible, and what the pioneers had to experience in order to be in 'on the ground-floor,' as they call it. The site is at the confluence of the Fraser and Nechaco rivers, two of the most important waterways in the interior of British Columbia. Placing one leg of a compass in the town, one could at the time draw with the other a circle of three hundred miles radius, and then not strike the nearest railway.

Seeing that the spot was so remote and so difficult to gain, it seemed a somewhat mad idea to establish a town there, and one wondered what its future would be. But there was method in the pioneers' madness. The Grand Trunk Pacific Railway was then being driven right through the country, and the pioneers found that Fort George was to be the point where the Nechaco and Fraser rivers would be crossed at one and the same time. Then, again, they knew the country like a book, even though it was closed to commerce and civilisation. They knew that every mountain range ran in such and such a direction, and that the passes by which these clumps could be threaded all converged to one point, and that was Fort George; that the trade routes to the interior followed those passes; that all the provisions for certain udson Bay posts were supplied over a wide circle from the pivoting fort at the confluence of the two rivers; and that if the Grand Trunk Pacific Railway wished to enter Vancouver, it would have to spread out from Fort George to do so. All this and more was known to these hardy frontiersmen, and there and then they decided that Fort George must blossom into a great town and become an important railway centre, and that some day it would be the focus of a large railway network, ramifying to all corners of British Columbia.

The rush to the site of the new town has never been equalled since the discovery of gold in the Klondike and the mad stampede that then ensued. These frontiersmen and others anxious to buy land came up by rail as far as Ashcroft. Thence they went over the two hundred and twenty miles long Cariboo Road as best they could. Some walked, others rode, while every kind of conveyance that could be brought into service was utilised. It was a motley throng that pressed along that track, winding up and down, in and out, and suffering the tortures of thirst as they toiled over the terrible alkali desert thirty miles in width, on which not a drop of water could be obtained. The road brought them to Soda Creek, where it ended. Before them was the turbulent Fraser running Pacificwards at from six to eight miles per hour. There was no trail for the next one hundred and fifty miles passable to vehicles. The river was the obvious means of communication, and they had to get up this as best they could. The Indians at the Fort George reservation welcomed the invasion with open arms; it was a harvest to them, and they charged outrageous prices for any assistance they rendered.

It must also be remembered that all the participants in the rush had to bring their own necessities with them, such as tents and provisions, for prices were at famine-level in Fort George. When they reached the site of the town, they pitched their tents and squatted down, awaiting the auction sale. In due course the lots were put up, and spirited bidding ensued for the choicest positions.

After the sale there was another wild rush to get buildings up and to commence business. This was for a store, that for a barber, another for a baker, these here and there for land offices, a restaurant, and so on. Two banks came in, and ran up buildings with timber walls and canvas roofs, the managers sleeping on the premises with their loaded rifles beside them. Building had scarcely commenced before the irrepressible newspaper man appeared on the scene, and rapidly housed his type and pedal printing-machine, so that simultaneously with the laying of the foundations of the first timber buildings the initial issue of the local newspaper appeared. Down on the river-bank a sawmill sprang into existence, and soon the screeching circular saw was whizzing round, ripping into lumber the logs sent down the river.

Then a small steamboat appeared on the river, maintaining communication between Fort George and Soda Creek, the head of the Cariboo Road. It drove a thriving trade, until one day the captain mistook his course and knocked a hole in the bottom of his little craft in the ill-famed cañon. For a month Fort George was as completely cut off from the outside world as if it were at the North Pole. The luckless inhabitants were placed in a tight corner. Butter was exhausted, flour soared to a prohibitive figure, milk was unobtainable, tea and coffee became luxuries, and sugar was as scarce as snow in summer. Every day the unfortunate marooned inhabitants anxiously awaited the repair of the boat and its arrival with provisions. Many, unable to stand privation, hurried away, and those who remained went on short rations to tide them over the famine.

But the inhabitants were resolved not to be caught napping in that way again. Down on the river-bank a shipyard was rigged up, and soon tools were being vigorously plied in the building of the hull of a larger river steamboat, the machinery for which was coming up from the railway as fast as possible. Amid much jubilation, the hull was successfully launched, the machinery installed, and the *Bx*, as the craft was called, proved herself one of the finest little boats ever seen on an inland waterway.

I was sauntering along Main Street, taking in the general features of the city, when I was suddenly accosted with 'Looking for a job, stranger?'

I turned, and saw a tanned, husky frontiersman, with a hammer in one hand and a saw in the other.

'Not much. What do you think?'

'Thought as perhaps you was. I can give you a good one. Come on; I'll give you six dollars a day and your board.'

Twenty-five shillings a day, and unskilled labour at that! I thought the man must be hard up for labour if he was willing to pay such a wage.

'Honour bright! What! isn't it enough?' he went on, observing my silence. 'Well, make it seven dollars.'

I shook my head negatively. I was thinking of the thousands working for less a week in Britain than this man was offering me for a day. 'I don't want any work,' I explained; 'I'm just looking round.'

'Gee! I don't know what I'll do. Can't get a man anywhere;' and he expectorated vehemently. 'Look here; I wish you would come and give me a hand. I'll willingly pay you for any assistance you can give. I'll do the rough, hard part of it; only, I must have some one to help me. It's a double-handed job. Come on, that's a good fellow!'

But I was proof against his pleading. I wandered a little farther down the street, and ran into a prosperous-looking young fellow. With frontier bonhomie, we were soon conversing as if lifelong friends. I broached the labour question, and related my experience of a few seconds before.

'I guess he'll have to do it himself. Why, here it is difficult to get a man for love or money. I have purchased a large estate up the river, and want to erect a summer home. I asked an English carpenter if he would undertake the job. Yes, he was agreeable. What would I pay him? Eight and a half dollars—roughly, thirty-five shillings—a day (what he was already receiving) and his board. No; he refused. Wouldn't go under fifty shillings a day and his board. That summer home of mine is still in the clouds, and will stay there until I can get labour cheaper.'

On all sides it was the same story. If you wanted a job done you had to do it yourself; you couldn't get a man, no matter what you would pay. Money was as cheap as dirt; these frontiersmen put no value on it. Nothing was less than 'two bits'—that is, a shilling. Smaller coins had no purchasing-power. In fact, in these frontier towns every effort is made to establish the dollar as the unit, in order that all negotiations may be effected in bills or paper money, so that coins may be dispensed with, as in the Canadian currency paper money begins with the dollar, the silver coin of this value being detested on account of its size and bulk, while the lesser coins were disliked as being small. The bill is far easier to carry. So every inducement to spend a dollar at least is held out. An article is priced sixty cents, or two for a dollar. You may not particularly want the second article, but by spending the dollar you save twenty cents; or another commodity may be thirty-five cents, or three for a dollar; and so on.

Down the street the gambling-saloon was in full swing. Its owner was a Chinaman, and he was making money faster than any one in the place. Poker, black-jack, and other games of chance were the rage, and Johnny always played, and invariably won. In games of bluff the Chinaman is the most inscrutable opponent one can have. He sits as stolid as a statue; not a muscle of his face moves to betray his hand, and he generally wears his opponents out. Everything is fair and above-board; but, as one habitué told me, 'you might just as well play with a brick wall as with old Johnny.'

Fort George at the time of my visit certainly could not be described as a poor man's town. The cost of carriage from Ashcroft, three hundred and fifty miles away, was in the neighbourhood of forty pounds a ton, and accordingly provisions were high. Bacon was one-and-eightpence per pound, butter three shillings, meat tenpence, flour sevenpence halfpenny, condensed milk a shilling a tin, jam eighteenpence a pound, tinned fruits half-a-crown a two-pound tin, bread a shilling a two-pound loaf, while eggs were difficult to get at four shillings a dozen. Yet one could procure at a certain restaurant an excellent meal for two shillings, comprising soup, fish, meat, vegetables, sweets, cheese, and tea or coffee. This restaurant was run by two enterprising young ladies, formerly waitresses in a similar establishment at Quesnel, one hundred and fifty miles to the south, who had come up in the first rush, and undertaken to minister to the wants of 'Little Mary,' and, what was more, had found the undertaking highly remunerative.

One feature conspicuously absent in Fort George was the saloon. It was, or passed as, a 'dry town,' to quote the nickname for a community which has no liquor license. At the time of my visit, however, a thriving trade was prosecuted in the illicit sale of alcohol, and I experienced no great difficulty in securing a bottle of a well-known brand of 'Scotch,' though it cost me twelve-and-sixpence. The 'driver of the blind pig,' as the illicit vender of liquor is styled, was at that time making hay while the sun shone; but shortly afterwards the sun went behind a cloud, for an emissary of the law suddenly appeared on the scene, and raided the 'pen,' rounding up the driver and his wares. These were confiscated, while the owner was awarded a year's imprisonment,

with the alternative of leaving the country in a fortnight.

Life in a town such as this might seem devoid of any legitimate amusement, especially as every one is infected with the desire to 'get on' with business; but such is not the case. An impromptu ball was inaugurated in our honour on the floor of the poolroom, but postponed, as the internal mechanism of the musical box which was to perform the office of orchestra had given out. By the next evening the defects had been remedied, and the fun was fast and furious while it lasted, the half-dozen ladies resident in the town, attended by their husbands, contributing to the general gaiety. Though the floor was not of a mirror-like description, and was a mass of knots, dents, and inequalities, accidents only served to enhance the general liveliness. For three and a half hours Terpsichore reigned supreme, and then at midnight the younger members of the party kept up the hilarity on the plank-walk outside until the first signs of dawn appeared in the east.

Once a week on the average a general 'mafficking' took place. Then the whole town indulged in a frolic. Just why, no one knew; only to keep things going, was the explanation. At any rate, there was a general rag, and something suffered. Every one took it in good part, however, and any damage that was caused was usually put right. Dominion Day was generally the event which called for extreme rioting. It would put any Independence Day celebration on the southern side of the border to blush. It was not fired by alcoholism, as alcohol was unobtainable except in limited quantities, certainly not large enough to inflame boisterous spirits. But every one let himself go, until sheer exhaustion compelled retreat to bed; though that was not, as a rule, before the early hours of the morning. It is characteristic of these frontiersmen that, although they lead a steady, hard-working existence, and are as stolid as Indians, the desire to let themselves go now and again cannot be quelled.

Although the town was only four months old, and the railway was over three hundred miles away, many an old-timer pioneer bemoaned the approach of civilisation. These hardy men dislike connection with the outside world. So long as a place is inaccessible, and hardship has to be experienced to get there, they are in their glory. More than one expressed his intention of 'moving on and starting another town somewhere.' Evidences of civilising influences, bringing commerce in their wake, were apparent on every side, to their intense disgust. First the river was taken over by the steamboat, and there was no further need to make an exciting and adventurous canoe trip down the river to reach Soda Creek; then motor-cars were hurtling up and down the Cariboo Road, doing in ten hours with comfort what formerly occupied two or three days with discomfort; so that Vancouver was only three or four days' journey distant instead of a week or more. Again, the telephone had crept in, and the news of what was going on in the world at large was flashed to this little community. True, there was no electric light, trams, saloons, theatres, or other incidentals of a modern city; but the old dogs didn't like it. The tougher element were packing up their traps for a farther trek. 'The worst of it is,' muttered one old pioneer with a mournful shake of his head, 'this is the last piece of frontier country on the North American continent, and when this is opened up, what are we going to do?'

To these venturesome spirits the outlook was certainly black from their point of view. Without doubt, the frontiersman is rapidly dying out, as his spheres of activity are being narrowed down by the march of civilisation. They cannot go to the Klondike, for that is as open as Switzerland; Hudson Bay Territory is as much developed as the west of Ireland. There is only Ungava and Labrador left for them, and even these two provinces are not so completely closed as was New British Columbia some years ago. Many of these hardy fellows are extremely wealthy, but their restless spirit will not let them settle down; the idea of passing their last days in comfort and ease in a city is as repulsive to them as is work to the tramp. The last frontier is, indeed, rapidly disappearing, and with it a fine race of men who have done much for the opening up of Canada, for in their wake there always follow the farmer, prospector, and capitalist, as surely as night follows day.

EGYPT.

SPIRIT of Egypt! still I hear thy voice
Calling across the bar of countless years
Of toil and serfdom, 'neath the conqueror's yoke
Of pain and tears.

Thou art but sleeping; thou canst never die;
Ever shall live thy thoughts, thy work, thy fame.
All nations' sages through all time shall still
Echo thy name.

'Who drinks Nile water must return;' not so
The power of rivers of the past, save thine,
Where, hid from prying eyes, still sits
Isis divine.

Thou goddess Sphinx, between whose mighty paws
Thy queen, great Cleopatra, wooed her love,
Thou knowest all: art truth: thou daughter born
Of gods above.

Enough for man once to have seen the sun,
Thy sun, O Egypt, sink behind the pile
Of Cheops; and the first star rise
Above the Nile.

The wrongs that desecrating hands have done
Forgive: nay, 'tis too much to ask; and yet
Thy sacred lotus-flower consume, and so,
Egypt, forget.

'SPECIAL SERVICE.'

THE STORY OF THE MOTOR-BOAT PATROLS.

By JOHN S. MARGERISON, Author of *The Sure Shield*, &c.

HAD he been born eighty years ago he would have been a Corinthian, and have found the adventure for which his soul craved in tooling along a dusty highway in a chaise and four, or financing—and maybe taking part in—those fistic contests of the old-time Prize Ring. However, as he first saw the light of day in the year of Queen Victoria's Jubilee, and did not find adventure until he had attained years of more or less discretion, he discovered his twin-soul in the motor-car.

He was a bright young fellow, and had circumstances compelled him to work for his daily bread and butter, would have risen to supreme command of any motor-shop in rather less than no time. His ear was one of those uncanny microphones which could detect in an instant defects from the sound of a running engine; he could tell you whether the timing-chain was a little slack, or whether the carburettor was merely choked. And, what was more, he took just as great delight in stripping down the mechanism and adjusting that timing-chain or clearing that carburettor as he did in going 'all out' along a particularly inviting piece of highway. With it all, he possessed the sympathy of touch and the subconscious knowledge of the right thing to do in an instantaneous emergency which are the gifts alone of the born driver.

As was only to be expected, when marine motoring began to attract the interest of the more adventurous youth on this side of the Atlantic, he plunged into the aquatic sport with all the fervour of an enthusiast, and rapidly became super-efficient in the handling of racing-hydroplanes and all their kindred craft.

Fortunate as regards financial resources, he was able to put into practical shape the manifold ideas which came to him from time to time; and the result of his many improvements on his own racing-boat was that he began to carry off, at the periodical regattas for petrol-driven craft, more pots, shields, and trophies than he could find room for on his sideboard; more pendants than the halyards on his boat's small mast could accommodate at one time.

Then came war.

'I'm going into this,' he said. 'I've got an idea that the navy will be able to use me and my boat; surely there's some way in which my peculiar knowledge of marine motoring can be utilised in the national service. Besides, look at the sport there'll be on the water—racing will be tame in comparison.'

Accordingly, he made certain representations to the powers that were—and the results of these representations were many and varied. The first was a commission as a temporary lieutenant in the Royal Naval Volunteer Reserve for himself and a diminutive White Ensign for his boat. Then came a tiny three-pounder semi-automatic gun and a few boxes of ammunition. This weapon he mounted on the half-deck of his craft forward, and balanced the effect by erecting a brass-jacketed, efficient-looking Maxim aft between the well and the sternpost. A miniature but powerful searchlight completed the boat's outfit; and a few tins of high explosive, with percussion-detonators ready for fitting, were added for certain specific purposes. His brother—who, incidentally, had turned his own boat over completely to the Admiralty—came as his second in command, and four men who had attended the racing-hydroplane in more peaceful times became able seamen in the Volunteer Reserve 'for the duration,' and for the love of the thing.

Thus equipped, the boat put out one gray morning for a certain spot on the east coast 'for disposal.' Her commander wondered largely what 'disposal' meant; an unsentimental commodore informed him that, initially, it meant acting as tender to a certain ship, which, in her turn, was a tender for submarines. The boat which had once made hay of all competition by reason of her speed, now found that speed and the facility with which she could be handled of exceeding value in taking mails to certain grateful submarines, and in bringing back the manifold letters they had found time to write. Then, when the mother-ship required fresh provisions, it was the racing motor-boat which fetched them. This was all very well for a time; then her commander began to grumble.

'I joined to fight,' he said; 'not to be an errand-boy.'

 [*All Rights Reserved.*]

'Your services can be best utilised, *at present*, in the work you are doing,' said Authority.

The young lieutenant bowed to the mandate, and gleaned an infinitesimal amount of hope from that 'at present.'

November came—the November of that first terrible winter—and the motor-boat got a change in her work. She was detached to run messages between two great battle-fleets, both of which, in certain convenient harbours, awaited alike the coming of the German Fleet and '*Der Tag*.' The lieutenant made some friends among the regular officers, it is true, and this went a long way to compensate him for those dreary days and nights when the motor-boat slashed through gray, icy seas; when the pitiless rain and sleet came down in sheets, drenching through everything; when oilskins chafed great calluses on wrist and throat; when life became almost unbearable.

Indeed, I think it would have become utterly so but for one little episode which came to break the monotony during the end of that winter. It was one of Von Tirpitz's submarines—sent out in that long-dead initial 'iron blockade'—which provided it by attacking a herring-boat, whose chief duty at the moment was the fishing up of mines. The herring-boat had nothing but rifles for armament; the submarine was making great play with a six-pounder, and rapidly reducing the fisherman's upper works to matchwood and splinters, when our motor-boat came silently and swiftly on the scene.

An overshot round from the three-pounder was the first sign of her presence, and the submarine turned to deal with this new and even more puny antagonist before finishing off her first opponent. But before she could get time to train her gun properly, the motor-boat was literally at her throat.

With the audacity which had carried through many a forlorn hope in racing days, the lieutenant let her rip, stem dead on to the submarine, while the three-pounder in the sea-washed bows put in double tides. Right close in to almost point-blank range, presenting a small and hard-to-hit target to the submarine, the little craft sped; and then, after a lateral spraying of tiny three-pounder shell—each of which did its part in the manufacture of a neat open-work pattern in the submarine's hull—she turned and fled, leaving that U-boat to go down faster and farther than her designers had ever calculated upon.

'Now, that's something like service,' said the lieutenant. 'Nothing like a bit of a scrap to encourage one in this everlasting errand-boy job.'

But Authority sat up and took notice when he made his modest report. When it was compared with that sent in by the herring-boat, Authority decided that the motor-boat could be better employed; so they appointed her to 'detached service'—which means exactly service as requisite or at commander's discretion. The motor-boat began to enjoy herself. She cropped up in all sorts of places. Lonely trawlers, punching up and down their ten-mile beats on the edge of their snared grounds, smelt her occasionally, and were grateful in their own dour fashion for the news she brought. Drifters, garnering enemy mines in the home waters, told her of suspicious happenings, which she immediately went to investigate. It was on one such occasion that she found a submarine in difficulties; a submarine which laughed at her insistent demand for immediate surrender, but which soon changed her tune when the Maxim swept every man from her whaleback, and the lieutenant's ready automatic made good practice on every head that showed above her conning-tower top. And, just to make sure, the three-pounder made a colander of the conning-tower, so that the U-boat had the option of diving and filling—thus drowning all hands—or surrendering unconditionally. It took her three hours to make up her mind to do the latter, and for that space of time the tiny cockle-shell motor-boat danced around her, ready and eager to deal with any and every emergency.

It was a great triumph for the young lieutenant when a tug came and took that submarine in tow; and later on he had the pleasure of seeing her, under a differ nt ensign, performing most efficient service with a flotilla.

Rusty tramps, nosing their canny way up Channel, met him occasionally, and were grateful for the lead which he gave them through the mine-field paths. Passengers on gigantic ocean liners speculated whether the tiny boat would sink and fill before she had piloted them to a safe anchorage, and all admired the grit and devotion to duty shown by these erstwhile racing-men.

Flanders called next—called insistently—and, lo and behold! our motor-boat blossomed into a full-sized canal monitor; and by the way her crew talked, you'd have fancied she was capable of beating the High Seas Fleet single-handed. She one day engaged in a long-range duel with a field-battery, and put two of its guns out of action; and that same evening she put a termination to the career of an enemy supply-train, to say nothing of destroying a couple of motor-lorries in a convoy. An inquisitive Taube, which swept low in the sky the better to see what the little spitfire might be, received a dose of lead from the Maxim that transported her pilot to hotter regions, and the Taube nose-dived into the canal, and was later retrieved as a spoil of war.

Then appeared defects. The rack and strain of the first year of warfare began to tell on motors and hull; spare parts ran short. A visit to a dockyard was imperative; and, for a full month, these half-dozen silent, bronzed, salt-

stained men of the sea 'enjoyed the blessings of the land and the fruits of their labours.'

For a full year they had dreamed of a bed that didn't kick and leap with every wave-motion; of a freshly cooked meal that didn't come out of a can; of clean, white sheets instead of soaked sleeping-bags; of Turkish baths, and stalls at the 'best thing in town.' Realisation came too swiftly; once these things had been sampled, there was born in their blood the old restlessness, and a full week before their time they were back in that dockyard, trying to hustle workers here, lending a hand there, with the result that the motor-boat put to sea three clear days to the good. She had achieved the impossible; she had hurried the dockyard!

'Why do we want to get back?' echoed the lieutenant when they asked the reason for his energetic pushfulness. 'Well, I don't know. It's a rotten life. Look at these hands. They used to be soft and white; now a coal-miner would be disgusted by their horniness. Look at this chafe on my neck; that comes of wearing a sodden oilskin when the spray comes over the bows in bucketfuls. We usually wear dry clothes for just so long as it takes the sea to soak through a change of raiment, and, as a rule, when at sea we have to bale like demons to keep the dear old hooker from filling and foundering. But, man alive! we like it—like it even better than those fair days when we sliced through the Roads at Cowes for silver cups and shields and trophies and bits of coloured bunting half the world would give their ears to sport; like it better than all the games we ever knew. War's the greatest game of all!'

'Your boat draws only a few feet of water,' said Authority, once more waking up to the lieutenant's existence. 'Go over to the Belgian coast and see what you can find there in the way of mines; also, if you should happen to see an occasional submarine—well, you know how to deal with her.'

The motor-boat said 'Thank you' very nicely, and disappeared once more. The 'pack' who hunt the *unterseeboote* gave her enthusiastic welcome; their commodore gave her a station and a few intricate devices for bringing home her quarry. Also, so that a crew should not be bored in the intervals between 'kills,' she was provided with one of those jolly little one-boat drags whereby enemy mines can be fished up from the depths and the gun-layer be allowed good practice in sinking them—from a safe distance.

Once there came a submarine, which broke surface after she had seen the motor-boat, and whose big four-inch gun talked most rudely to the smaller craft. The motor-boat spat back and ran—ran with the submarine lumbering after her, throttling down her motors so as to keep just out of range, and all the while drawing that U-boat farther and farther into the meshes of a gigantic net set for the trapping of such as she. And, after the destroyers had closed in and captured the U-boat, it was the little hydroplane which was given the job of escorting her home to a certain place on the east coast, where the navy has established a base for dealing with enemy craft which come intact to these shores.

It was rather fortunate that she should get home that day, for several big Zeppelins tried that same night to demonstrate what 'frightfulness' really was, having chosen certain highly important cities as their objective. But the east coast defences were ready and waiting for them, and also for the flotilla of submarines they had brought with them for some nefarious purpose or other. So when, just after midnight, our motor-boat became embroiled with two enemy submarines, which would insist upon rising, firing, and then suddenly dipping, her lieutenant suddenly bethought himself of a new scheme he had worked out a few days before—a scheme in which the jolly little one-boat drag and the tins of high explosive with percussion-detonators played a big part. He put the scheme into effect, and it worked. I can't tell you what it is—the Censor won't let me—but the enemy lost five submarines in that enterprise, three of which the young, bright lieutenant claimed; and the Admiralty have since adopted and improved upon the device in the eternal submarine hunt. The inventor refused to add a few letters to his name as a reward.

'D.S.C., be hanged!' he said when they mooted the subject. 'If there'd been no war there'd have been no invention. I don't want bally rewards for playing the game.'

At other times attached seaplanes would tell the motor-boat that submarines lurked in her vicinity. Then, by means of her own, the motor-boat would locate them. She became a shadow; where the *unterseeboten* went, she followed, and she had a nice way of tenaciously sticking to their tails till they came up to breathe, when—on the principle of hitting first and asking questions afterwards—she would present them with a grand collection of three-pounder shells, most of which found their billets, and raised joy in Admiralty hearts when her reports were sent in.

But, notwithstanding the marked success which has attended his strenuous efforts, notwithstanding the thanks and gratitude a good-natured navy pours upon him and his fellow motor-boaters, the young lieutenant has never got rid of that tremendous feeling of awe engendered by the work of the Grand Fleet around him; has never quite lived down that unconscious pride in the useful and important jobs the Motor-Boat Patrol are called upon to do.

'The end?' he queried when once asked a certain question. 'The end's inevitable; it's just got to be the end of war for ever and ever.

The future 's as bright and rosy to-day as it ever was; Fritz is nearly sitting up and wagging his tail like a begging dog. Rewards?'

He broke off, and pointed to a small photograph on the wall of his room ashore. It showed a battered submarine in tow of a tug which had once been a pleasure-steamer, and hoisted above the black-crossed Eagle Ensign was the Meteor Flag of the Sea Empire.

'Rewards?' he repeated. 'Those pots and things there I got in fair and strenuous contest.' His arm swept in a vague gesture the silver-decorated sideboard. 'Look here, my boy; if it came to a choice which of all my trophies I should keep, you could take all the cups and shields and shove 'em in the crucible; you could rip the pendants up for paper-making; but that photo is the picture of the first submarine I ever succeeded in capturing, and when my call comes, it shall be buried with me. No, it 's not swank. It 's just the feeling that war is the greatest game of all; that the best reward a man can have is to know he did his little bit when his country had need of him.'

THEIR HEARTS' DESIRE.

CHAPTER III.

'YOU girls made a mistake,' said Lawyer Knowles one morning at breakfast—'I thought so at the time, and I said so, I believe—a great mistake; and now I hope you will realise it.'

He put on his pince-nez and read again a letter from Auntie Naarah written to him, but evidently in answer to one from Mary, in which she had stated that, her old schoolfellow having left, she was quite at liberty to pay her long-looked-forward-to visit to The Hermitage. It ran as follows:

'THE HERMITAGE,
'TUSSOCKS.

'MY DEAR NEPHEW,—Mary need not trouble. At present I am quite comfortable with the young woman you sent me. I find her very quiet and biddable.

'The weather is very bad, and I am not feeling as well as I should like. But what can one expect at my age with so much rain and cold winds? This house is very damp in the autumn. Jean, too, has got a troublesome cough.—Believe me, your affectionate aunt,

'NAARAH KNOWLES.'

Ellen peeped inquiringly round the coffee-urn. 'What is wrong, dear Herbert?' she asked a little anxiously.

'And where did we make a mistake?' put in Priscilla pertly.

'If you meant about Miss Brooke, Herbert,' said Mary, 'I think we managed very well.'

'You *think!*' cried Herbert witheringly.

They had all thought so—all the girls, that is. Certainly Herbert had not seemed to appreciate being robbed of his typist. But then his reluctance had only made the sisters feel more convinced of the wisdom of their suggestion. If he *had* any leanings towards her, it was such a good idea to get her away; and once she was out of the office and the estimable substitute from the Y.W.C.A. in her place, what was to prevent the arrangement, so far as the exchange of typists was concerned, from being permanent?

'Read this,' said Herbert shortly. He passed the letter to Ellen as the eldest. 'Read it out,' he added.

Ellen complied. There was a momentary dismayed silence as she finished.

'Auntie Naarah certainly seems hurt,' said Ellen.

'I don't wonder,' retorted her brother. 'Just after I had taken so much pains and trouble about her will, too. It is very annoying.'

'Oh, well, she 's *made* it, Herbert,' said Priscilla comfortingly.

'Yes; but there 's nothing to hinder her altering it or making another,' said Lawyer Knowles crossly.

'Still, dear Herbert, I hardly think that likely,' said Ellen. 'And it upset her so to do this, didn't it?'

'It upset her—yes,' agreed Herbert moodily; but he thought with some uneasiness of the French proverb, '*Ce n'est que le premier pas qui coûte.*' It would probably not upset Auntie Naarah so much a second time.

'"Quiet and biddable,"' quoted Priscilla dissatisfiedly. 'Miss Brooke is a sly little thing, no doubt. And now Auntie Naarah isn't very well, she 'll try her hardest to worm herself still more into her good graces.—*You* ought to have gone, Mary,' she concluded, turning to her sister.

'Why couldn't you go?' retorted Mary. 'You know I had Stella coming.'

'I think, too, Mary, you ought to have gone,' said Ellen.

'Oh, of course, it was my fault,' snapped Mary.

'That fact is proved,' said Herbert coldly. 'It was a most unwise proceeding altogether.' He meditated a moment, then said, shuffling his letters and papers together, 'The only thing I can think of is for me to run down to Tussocks and bring Miss Brooke back.'

'My dear Herbert!' cried Ellen.

'Give me the time-table, Priscilla.' He looked at his watch. 'I could go to the office, and get off by the 12.30 to London. It 's

awkward.' He ran his eye quickly over the time-table, 'And there's no train back till the 6.20 this evening from Tussocks. I sha'n't get back till late.'

Visions of the inadvisability of Herbert's travelling alone with his typist at such an unhallowed hour as it would be before they could arrive at Crabtree filled all the sisters' minds simultaneously. It was altogether a most awkward situation. If Herbert fetched Miss Brooke back, she would return to his office forthwith, and then that danger—the ever-lurking danger, to their minds—of Herbert's falling in love, and so unsuitably, would be to the fore again.

Their fears, as it happened, were quite unnecessary. Herbert was too cold-blooded, too wrapped up in himself, ever to fall in love; and as he was comfortably off, and had great expectations, he would naturally, if ever he did bring himself to marry, choose some one who had money.

Yet, if Miss Brooke stayed on at The Hermitage indefinitely, there was the other greater danger that she might, as Priscilla suggested, worm her way into Auntie Naarah's testamentary favour. It was a case of Scylla and Charybdis. But to their minds one thing was certain—it would not do, even if Miss Brooke was to be recalled, for Herbert to fetch her. Suppose any of their friends saw them together, any of the Crabtree people, what would they think? At the best, they would say that Herbert was engaged to his typist.

'I don't think, dear Herbert,' said Ellen, 'that it would do for you to go. It would—well—perhaps it would look rather funny.'

Herbert's sallow complexion got a dull red. 'Look funny?' he repeated. But, like his sisters, he thought a good deal of those fetishes of the weak—what people would think, and how it would look.

'Why shouldn't Mary go?' said Priscilla. 'She would have been going on her visit if it hadn't been for this, and Miss Brooke could come back by herself.'

'Capital, Priss!' cried Ellen. She felt that her sister was a Daniel come to judgment. 'The very thing. Mary must go.'

Mary looked as if she did not relish the idea.

'Of course, *I* must be the scapegoat,' she said.

Herbert, however, seemed loath to give up his own suggestion. But in the end, as is usually the case in a man's own house, his womenkind triumphed. Few men have the courage to brave feminine opinion (under their own roof, at any rate)—unfortunately for the characters of both.

Mary was to go. And a very cross Mary went to pack her things forthwith, while a very much injured Herbert strode off to his office. The other two sisters alternately bemoaned their attempts to play the *deus ex machina*, and assured themselves that it would be all right.

'Far better for Mary to see Auntie Naarah,' they said. 'So much more satisfactory than writing.' They sent Mary off primed with adjurations to keep her temper, and to express penitence for having unwittingly annoyed Auntie Naarah.

'It will be all right,' said Ellen placidly, as Mary's train steamed out of the station. 'And I have just been thinking we might get Miss Brooke a post as typist at the V.A.D. Hospital. I believe I heard another one was wanted.'

. . . . . .

The inmates of The Chain House were wrapped in slumber that night when they were roused by a loud and persistent knocking and ringing at the front-door. Hastily attiring themselves, the whole family hurried downstairs, and the front-door being opened, Mary, tired, almost distraught, staggered into the hall.

There was a chorus of 'Mary! Whatever has happened? Why have you come back?'

Mary dropped her portmanteau with a thud on the linoleum-covered floor.

'I couldn't get a fly,' she almost cried. 'It was too late.' She felt overwhelmed with having been out in the dark streets alone at night!

'But—but what about Auntie Naarah? Hasn't she forgiven you?' cried Ellen.

'For Heaven's sake, speak, Mary!' said Priscilla, almost pushing her sister into the dining-room.

'She's about knocked up,' said Herbert. 'Get her a glass of wine, Pris.' Then, as Mary, sipping the wine, revived somewhat, 'Now, take your time; tell us quietly,' he said in his most judicial tones. 'Why did you come back to-night?'

'Because Auntie Naarah was gone,' sobbed Mary.

'Gone!' For an instant Lawyer Knowles's heart leapt exultingly. Gone! Dead—before she could play any monkey tricks with her will! 'Do you mean *dead?*' he asked, trying to speak concernedly.

Mary shook her head. 'No; gone away. When I got to Tussocks, and drove to The Hermitage, I found the garden gate padlocked and the house all shut up. The cabman got over the fence, but the place was shuttered and barred, and there was no sign of life.'

She dabbed her eyes.

'Mary, you must eat this,' interposed Priscilla, coming in with some bread and meat; 'then you'll feel better.—Won't she, Herbert? Jam? No, I don't think Mary wants jam.—Do you, dear?'

'I didn't say, "*Jam*,"' retorted Herbert fiercely, adding, 'Auntie Naarah has clean bolted.'

'And Miss Brooke with her,' said Ellen.

Priscilla gave a gasp of dismay; she could not speak.

'Didn't you make inquiries?' said Herbert to

the returned traveller. 'You've got a tongue. Didn't you use it? *Where* has Auntie Naarah gone?'

'I don't know,' replied Mary, almost choking over a piece of bread, after her long fast. 'I asked at the station and at the general shop, but they could only tell me they'd all gone away. No one knew where. She took tickets for London.'

The grotesque-looking trio, in their unbecoming deshabille, exchanged dismayed glances. Auntie Naarah taking a journey, which was always an ordeal for her unless she had some pressing reason! It was inexplicable!

'You may depend,' said Priscilla sagely, 'that Miss Brooke is at the bottom of it. She is a designing girl, I believe.'

'She is nothing of the sort,' said Herbert staunchly.

When will women realise that the surest way to enlist a man's sympathies for a woman is to speak against her?

'Well, there is nothing to be done to-night,' said Ellen.

'I'll telephone to Twitty in the morning,' said her brother; 'though I don't apprehend Auntie Naarah will have called there. However, we have no need to be uneasy,' he added. 'Auntie Naarah has Miss Brooke with her, if not Jean.'

'Yes,' sniffed Priscilla.

'They may all be murdered,' said Ellen ominously.

'Well, of course, in that case there is nothing we can do,' replied Herbert.

The morning, though it gave no solution to the astonishing disappearance of Auntie Naarah, at least moderated her kinsfolk's anxiety. She had not been to Lincoln's Inn Fields, which was the great thing. They could only wait now.

The solution came in a day or two in a letter from Miss Brooke for Auntie Naarah, written from a boarding-house at Torquay. It dwelt, rather tantalisingly, on the delightful change from Tussocks, the balmy air and sunshine, and the enjoyment of the Winter Gardens and such-like entertainments. Entertainments! When Auntie Naarah would never spend a penny on such extravagance! They were very comfortable, lived plainly but well, and the company, including a minister whom Auntie Naarah seemed to enjoy chatting with, was very pleasant.

At the end of Eva Brooke's epistle was a post-script in Auntie Naarah's mean, niggling calligraphy, which stated that she would probably be staying a week or two at Torquay; but on her return to The Hermitage she would be glad to see Mary, her other nieces following in due course, as she felt she had, under the circumstances, a right to their society.

'There, see what you have missed, Mary,' said Priscilla. 'Torquay this weather—delightful!—concerts—cheerful society.'

There was no need to enlarge on the advantages her sister had missed. Mary was bitterly disappointed. However, she declared that if she had gone to Tussocks, Auntie Naarah would never have gone to Torquay. It was all Miss Brooke's doing.

'Well,' said Herbert, who looked rather disquieted, 'Miss Brooke will soon be back in my office, out of harm's way.'

'But, dear Herbert,' protested Ellen, 'I hoped—that is, I thought that nice girl from the Y.W.C.A. might take her place.'

'*Girl!* She's an old fool,' growled Herbert. 'Can't spell even, and cries if I speak about her shortcomings. No. It's been very awkward for me without Miss Brooke, and it is a great pity Mary ever suggested her going.'

The two elder sisters agreed, and in consequence Mary was obliged to be an unwilling disciple of the Trappist monks in the matter of silence for the next few days, for, there being no neutral, she could not hold communication as usual on these occasions.

. . . . . .

Meanwhile at Torquay the two ladies whose movements had caused so much uneasiness were having a good time. Auntie Naarah had chosen a boarding-house in the least expensive situation, but even then she felt a pang when she thought of the double expense of her companion and herself. Still, it was the first time for untold years that she had been away. If it had not been that Jean had shown signs of being knocked up, and declared she must have a holiday, however, it is doubtful whether her mistress would have left home. But Jean gone would mean expense and annoyance with charwomen, and Auntie Naarah did not feel equal to that.

As for Eva Brooke, Torquay, even with the leaven of Auntie Naarah's fidgety presence, was an agreeable change after her nephew's office, and it was made more interesting for her by the numbers of wounded soldiers there. She could not resist the temptation of buying cigarettes for them, though it required a great screwing up of courage before she dared offer them. However, after the first two or three times it became easier, and the poor fellows were most of them so grateful.

Auntie Naarah was rather horrified at first by a proceeding that in her young days would have been considered unmaidenly in the extreme. But if she had a soft spot in her hard nature it was towards soldiers, and she contented herself with merely chiding Miss Brooke's extravagance. 'You spend all your money on tobacco,' she observed disapprovingly one day when Eva had been distributing largely, 'and it's *waste*—gone in a few moments; and what is there to show for it?'

'Still, it gives the poor fellows enjoyment while it lasts,' replied Eva, 'and I don't grudge my last penny to do that.'

'Oh, that 's talking nonsense,' was the crushing reply.

'Think what they have done for us, Miss Knowles,' retorted Eva warmly. 'Risked their lives, endured untold hardships, come back halt and maimed. Why, there 's nothing too good for them!' she added vehemently.

'Oh, well, of course, one feels grateful,' said Auntie Naarah.

One of the 'permanent' inmates of the cheap boarding-house used to visit at the Red Cross hospital. She asked Auntie Naarah's permission to take Eva with her once. It was given, and Eva returned full of her visit.

'The poor fellows!' she cried with tears in her eyes. 'Such long rows of beds—and some of the boys looking so ill—and all so patient. Oh, Miss Knowles! it makes one realise a little what an awful thing war is.'

Auntie Naarah nodded, and the lady visitor asked if *she* would not go next day.

Auntie Naarah shook her head. She did not think that her nerves could stand it. However, after all, she was persuaded, and went. It was a sight she never forgot. All her natural life she had been centred on herself and her own health, her money, and how to save it. But somehow, as she walked on tiptoe down the long ward, past the one or two bad cases where the beds were screened from the public gaze, watched by so many pairs of eyes—eyes that had a look in them which told of what the owners had gone through—the eyes of men who had faced death, seen their comrades killed beside them, been through HELL—she felt that nothing else mattered.

The lady who was conducting them halted presently. 'I should like you to speak to my special favourite,' she whispered. 'Such a nice boy.'

Auntie Naarah nodded. She felt she would be glad to get away from the sight of pain and sickness, away from the atmosphere of disinfectants, but she would go through with it.

'Now,' said the cicerone, stopping at a bed where a young soldier was sitting up, turning over the pages of a magazine with his left hand, 'I've brought a new friend to see you this afternoon.'

The young man looked up with a bright smile, which suddenly changed to one of surprised recognition. '*Miss Knowles!*' he cried.

Auntie Naarah stood as if she had been turned to stone, staring at the occupant of the bed, speechless, hardly believing the evidence of her eyes.

'Do you know Miss Knowles?' asked Eva, surprised.

'I should think so,' was the quick response.

'Edward Strachan!' gasped Auntie Naarah. 'You here!'

A sister who was passing looked at the gaunt woman, and pointed to a chair. 'Won't you sit down?' she said.

Auntie Naarah subsided weakly into a chair by the bed. '*You* here!' she repeated.

'Yes. I was wounded almost as soon as I got out,' replied Edward Strachan cheerfully; 'but I 'm much better, and going to be allowed out in the grounds to-morrow.'

'But—but'—Auntie Naarah's distressed gaze was fixed on an empty sleeve—'you 've lost your arm.'

'Yes. Rotten luck, wasn't it? But I've got another,' was the cheery reply.

'Your *right* arm,' continued Auntie Naarah.

'Yes—but I've come back,' said Edward Strachan meaningly, and his smile faded as he thought of some of his comrades who would never come back.

'How are you going to get your living with only one arm?' queried Auntie Naarah, the unwonted tears trickling down her long nose.

'I shall learn to use the other, Miss Knowles,' said the young man. 'I shall manage all right. Don't you worry about me.'

'I think perhaps Miss Knowles had better come away now,' said the lady who was responsible for her visit; 'she seems rather upset.'

'Oh, don't hurry,' said Edward; but he looked at Eva as he spoke.

Auntie Naarah wiped her eyes. 'You never told me you were wounded, Edward,' she said half-reproachfully.

Edward explained that he had sent a card from the hospital, but he didn't want to worry her before. He should be all right soon.

Soon after the visitors t ok their departure, Edward promising to return the call on the first opportunity.

'I am afraid it was rather a shock to you, Miss Knowles,' said the lady, giving Auntie Naarah her arm as they walked away from the hospital.

'It was. The young man's father was a dear friend of mine,' replied Auntie Naarah.

'Ah!' murmured her new friend sympathetically. 'He is a fine fellow,' she added warmly.

Edward Strachan was soon to be seen walking along the sea-front or sitting in shelters, sometimes alone, sometimes with a companion from the hospital.

Auntie Naarah and Eva Brooke were sure to see him in their walks, and more than once he had tea with them at a café. Once he had the temerity to share the formal tea in the stuffy drawing-room of the boarding-house, an object of keen interest and sympathy from the many elderly ladies there. But his most cherished moments were when he happened to meet Eva *without* Auntie Naarah innocently making the unwanted 'third wheel of the cart.'

(*Continued on page 820.*)

SOLDIER-LIFE IN GRÆCO-ROMAN EGYPT.

By Rev. Professor GEORGE MILLIGAN, D.D.

SOME years ago I strung together and contributed to this *Journal* for 1909 a budget of old papyrus letters recovered from the rubbish-heaps of ancient Egypt, with the view of illustrating the new light thrown upon the ordinary life of the people in the centuries immediately preceding and succeeding the beginning of the Christian era. Amongst these, two soldiers' letters were included. The first was from the young recruit Apion, who had gone on foreign service, and who wrote from Rome to inform his father of his safe arrival after a stormy passage, and of the good time he was having on the three gold pieces which he had received from the emperor as military pay. The second was from the same soldier at a later date, and was addressed to his sister, his father apparently having died in the interval. Various pieces of family news were narrated, from which it appeared that Apion was now a married man, and greetings were sent from his 'life's partner' Aufidia, his two daughters Elpis and Fortunata, and his little son Maximus, whose birthday was about to be celebrated. Both letters were simple, frank, human letters, just the kind of letters we are accustomed to receive from the front to-day. And it may, therefore, be of interest to cite a few additional examples, one or two of which have been deciphered and published quite recently, and to do so purely on account of their human interest, and without any effort to learn from them any particulars of the military situation in Egypt in either Ptolemaic or Roman times.

Before, however, turning to these letters, a few documents of a more general character may be referred to.

Thus, from the town of Oxyrhynchus, at the beginning of the second century after Christ, we have a communication in Latin addressed by one prefect to another, announcing that six recruits had been 'approved,' or, as we would say, 'passed' for service in his cohort. Their names and ages are fully detailed, along with the mention of any distinguishing bodily marks or signs they possessed, exactly as is done to-day in the personal descriptions appended to our passports. Here the six men are: 'C. Veturius Gemellus, aged 21, without description; C. Longius Priscus, aged 22; description, a mark on his left eyebrow; C. Julius Maximus, aged 25, without description; [·] Lucius Secundus, aged 20, without description; C. Julius Saturninus aged 23; description, a mark on his left hand; M. Antonius Valens, aged 22; description, a mark on the right side of his forehead.'

That 'exemption' from active military service was given then, as now, on adequate medical grounds is shown by the following certificate from the same district:

'Copy of a release dated and signed in the twelfth year of Tiberius Claudius Cæsar Augustus Germanicus Imperator, Pharmouthi 29. Release from service was granted by Gn. Vergilius Capito, Prefect of Upper and Lower Egypt, to Tryphon, son of Dionysius, weaver, suffering from cataract and shortness of sight, of the metropolis of Oxyrhynchus. Examination was made in Alexandria.'

The year referred to is the year A.D. 52, and the reference to Upper and Lower Egypt may also be noted as recalling the double crown of the Pharaohs.

With this exemption-certificate may be compared the 'honourable release,' inscribed this time not in a papyrus letter, but on a wooden tablet, which was accorded to a veteran on the completion of his military service.

Another document of a considerably later date deals with a complaint raised by certain recruits that they had not 'received the sum agreed upon with them.' And elsewhere the sum payable to recruits is described as an allowance for food and clothing; while there is also evidence that, after the expenses for these had been deducted from the soldiers' stipends, any surplus was added to their deposits in the military 'bank.' To what extent these deposits were obligatory or only customary is not clear.

Requisitions both of supplies and of money for military purposes are by no means uncommon, and may easily have led to much extortion. Of this we have a trace in an official report of the fourth century announcing 'for the information' of the prefect certain demands made by officers who are named—Zoïlus, the adjutant, being credited with '20 rugs of 6 cubits,' supplied to him by the local rug-merchant, and Tauriscus, a member of the bodyguard, who had come to collect 'corn and barley' receiving in addition '80 solidi of gold.'

That, too, private soldiers in Egypt were as apt as in Palestine in the days of John the Baptist to 'make wrongful exactions' and not to 'be content with their wages' is shown by the very vehemence of the denial of a village scribe in an almost contemporary document, dated in A.D. 37:

'I swear by Tiberius Cæsar Novus Augustus Imperator, son of the deified Jupiter Liberator Augustus, that I know of no one in the village aforesaid from whom extortions have been made by the soldier . . . or his agents. If I swear truly, may it be well with me; but if falsely, the reverse.'

Very curious, too, is the account, dating this

time from the middle of the third century before Christ, of the drastic steps taken by certain householders to avoid having officials—there is no express mention of soldiers—billeted upon them. It was found amongst the Flinders Petrie papyri, deciphered with such skill by Professor Mahaffy, and in his translation runs as follows:

'Mem. to Aphthonetos the strategus, from Andronikos. We find in Crocodilopolis that [the occupiers?] of the houses formerly billeted in have taken down the upper story at the owner's instigation, and in like manner have built up the doors of the houses [and] set the altars against them; but this they have done to avoid being billeted on. If then you approve, since we are short of billets, write to Agenor to compel the owners of the houses to remove the altars to the most convenient and conspicuous place on the houses, and to build them up better than the previous ones, in order that we may have room to give to the overseers of the works who have just arrived.'

The exact meaning to be attached to some of the expressions used is not very clear, but so much at least seems certain, as the editor points out, that it was the privilege of the Crown to billet any of its officials who came on public service in certain houses of the town, perhaps only houses with two stories and two doors; and that their occupiers, to evade this liability, had gone the length of taking down the upper story, and blocking up a door by setting into it an altar or shrine. They must, accordingly, be compelled to remove the altars to more convenient situations on the roofs of the houses, and thus leave the lower stories free for billeting purposes.

Passing from these more general documents to letters written by soldiers themselves, we may begin with one, again written in Latin, which was intended to serve as a letter of recommendation or introduction, and incidentally throws light upon the happy relations subsisting between different ranks in the Roman army during the second century. It has been translated as follows by Drs Grenfell and Hunt in the first volume of their *Oxyrhynchus Papyri:*

'To Julius Domitius, military tribune of the legion, from Aurelius Archelaus, his *beneficiarius*, greeting. I have previously recommended to you my friend Theon, and now I beg once more, sir, that you will regard him as if he were myself. He is indeed a man worthy of your affection. He left friends, property, and business, and followed me, and he has throughout secured my comfort. I ask you therefore to grant him admittance to your house; he will be able to relate to you all that we have done. Whatever he tells you about me you may take as a fact . . .'

Attention has been drawn to the echoes of Biblical, and especially New Testament, phraseology which the letter contains. And in consequence it has been conjectured that the writer, Archelaus, may himself have been a Christian, and that, when he speaks of his friend Theon's having 'left friends, property, and business, and followed' him, he was borrowing directly from the words of St Peter in Matthew xix. 27. But, as Professor Deissmann has pointed out, it is not likely that any Christian believer would take words so hallowed to him by their associations and apply them to an ordinary human friendship. And the probability is that we have here simply one of the 'stock' phrases of recommendatory letters, which in the Gospels acquired deeper spiritual meaning.

Our next letter is of a very different character, and for unblushing begging would be difficult to beat. It is addressed by a soldier to his mother, in the hope of arousing her pity and assistance, after apparently he had failed with his father.

'To my dearest mother, heartiest greeting. Above all I pray that you may be in health along with all the members of your household. Please, as soon as you have received this letter, send me 200 drachmas. When Gemellus, my brother, arrived, I had only 20 staters, and now I have not one, because I have bought a chariot with a team of mules, and have spent all my money upon it. I am writing that you may know the state of the case. Will you send me a woollen robe and a rain-cloak . . . and a pair of bandages and a pair of leather garments, and oil, and a basin, as you said to me, and a pair of bolsters, and . . .? Further, mother, send me my monthly stock of provisions as quickly as possible. You said to me, when I was visiting you, "Before you enter the garrison, I am going to send one of your brothers." But you have sent nothing to me, and thus let me depart having nothing. You did not say, "He has nothing—no money or anything else;" but you let me depart like a dog. And my father, when he came, did not give me anything—an obolus or a rain-cloak or anything at all. The result is that all are laughing at me. "His father is a soldier," they say, "but he has given him nothing." My father said, "When I return home, I will send you everything." He has sent me nothing. Why? Valerius's mother sent him a pair of girdles and a pitcher of oil, and a basket of slices of meat and . . . and 200 drachmas. I beseech you, therefore, mother, send to me. Do not leave me thus. I have gone and borrowed money from a fellow-soldier and from my adjutant, and my brother Gemellus sent me a letter and breeches. Know that I am grieved because I have not gone near my brother, and he is grieved because I have not gone near him. He sent a letter blaming me because I had gone to another district. I am writing this that you may know, mother. It will be good if when you have received my letter you send to me quickly. Know that my brother Gemellus

[sent me] a letter and departed. I greet all of you at home. I greet Apollinarius and Valerius and Geminus. I greet all who love us.'

Such letters, let us hope, were rare. And it is certainly pleasant to turn from the 'Give, give,' there displayed to the satisfied and generous tone of another letter, also addressed by a soldier to his mother. It comes from Oxyrhynchus, and appears in the last volume of the *Oxyrhynchus Papyri*, published for the Græco-Roman Branch of the Egypt Exploration Fund by those unwearied workers Drs Grenfell and Hunt. Their translation runs thus:

'Theonas to Tetheus his lady mother, many greetings. I would have you know that the reason why I have been such a long time without sending you a letter is that I am in camp, and not that I am ill; so do not grieve about me. I was much grieved to hear that you had heard about me, for I was not seriously ill; and I blame the person who told you. Do not trouble to send me anything. I received the presents from Heraclides. Dionytas my brother brought me the present, and I received your letter. I give thanks to [the gods] . . . continually, . . .'

And then, lest he should not have made himself clear, the unselfish lad adds a postscript in the left-hand margin of his papyrus sheet at right angles to the rest of the letter:

'Do not burden yourself to send me anything.'

From another new collection, published in Berlin in the spring of last year, and showing, therefore, that a certain amount of literary activity was still going on there, another letter may be selected. It belongs to the first half of the third century after Christ, and the soldier's correspondent this time is his sister.

'Athenodorus sends heartiest greetings to his sister Selbina. Above all I pray that you may be in health, and I make my prayer on your behalf to the gods of this foreign land. I wish you to know that I am engaged in the Arsinoite and Heracleopolite districts and in other districts along with Areius the decurion. He belongs to Tmetn[i] in the Lycopolite district. His cattle are with you in Antinous, and he is about to visit us. Question the wife of Horion, my fellow-soldier, and seek out . . . , in order that you may let me know regarding them. I am sending by the hand of my fellow-soldier Dioscurus, who belongs to Diopolites, who is being commissioned along with us for work in the Government office, and is engaged at Hermopolis, 30 denaria, that is 120 drachmas. On receiving them let me know that you have received them "as soon as water has flowed into the channel [of your empty bag]." I shall always write you and incur outlays on your behalf. Show yourself accommodating until such time as I shall meet you. Let Lucias work and live on his pay. Do you also pay heed to the opportunity. Let not Lucias be idle but work. Spread out the other cloak for bleaching [?] and sell it, and also the remaining three, in case I shall be backward to sending to you. Sell . . . if you find one. Do not fail to let me know if you have received the 30 denaria. I send many greetings to Antonia. Take care of yourself until I come. Let my mother know that Sirtti held an entertainment for me. I am giving her a woolly garment belonging to Herieus, and on his account I have not sent it to you. I have not given him money. I greet Lucias and the wife of Paulinus with her children. Do not neglect to let me know regarding your health. Do not be anxious about me. Tittus, the cavalry man, is serving along with us. The brass articles which I sent you by the hand of Sirt' the sailor are his. Give them therefore to his wife along with the brazen pint-measure. I have received only one letter from you. Tell the priestess of the shrine of the Hermonthites, that I am sending my letters there, since she is well known. Let me know therefore whether you have instructed her, so that I may send my letters there. Send me to the Government office a letter under the address of Memnon. Memnon will send it on to me. I send greetings to the landlord along with his children. I pray that you may be well.'

It cannot be said that the contents of this discursive letter are in themselves of particular moment, and yet their variety, taken along with the constant repetitions and the abrupt passing from one subject to another, is thoroughly characteristic of the unpractised letter-writer of that or of any generation. Apart, too, from this, the letter has a special interest for the New Testament student, owing to its use of many colloquial words and phrases with which he has become familiar in the Letters or Epistles of the New Testament—further proof, if proof be needed, that the book intended for the people was written in a tongue the people could understand. Into this it is impossible to enter here, but one point may be noted. The foregoing letter has been compared in its general setting and structure to St Paul's Letter to Philemon, and so may lead us to the last letter that can be cited, in which the circumstances of the Pauline writing are reproduced with a strange likeness.

The letter forms part of the military correspondence of a Roman military officer, Abinnæus, who resided at Dionysias, to the south of Lake Mœris, about the middle of the fourth century, and is written by a village priest, Kaor, with whom a runaway soldier had taken refuge, as Onesimus had taken refuge with St Paul. Moved by the same spirit as the Apostle, the priest states that he is sending this man back to his duties, and in doing so prays that the man may be pardoned 'just this once.'

'To my master and beloved brother Abinnæus the Præpositus, Kaor, Papa of Hermopolis, sends greetings. I salute your children much. I wish

you to know, lord, with regard to the soldier Paulus, with regard to his flight, pardon him just this once, since I am not at leisure to come to you this very day. And again, if he does not desist, he will come into your hands still another time. I pray for your health for many years, my lord brother.'

Unfortunately we have no means of knowing in this case, any more than in the case of Onesimus, whether the appeal was successful.

GEORGE TINWORTH.

By WALTER A. MURSELL.

IT is probable that the name of George Tinworth is not known to the majority of people. It is likely that the announcement of his death in 1914 roused no interest or emotion; but it carried me back a period of nearly thirty years, when, as a lad, I was taken to see Doulton's famous pottery-works at Lambeth. I have the vaguest recollection of the many things I saw—a confused picture of glistening clay, whirling wheels, jars and pots of all sorts and shapes and sizes, men in soiled aprons and with grimy hands, girls sitting in a quiet room painting in a quite wonderful way flowers and leaves and animals upon the well-known art pottery or Doulton ware which at one time had so wide a popularity.

But the picture that remains vivid in my memory to-day is of a large room at the very top of the great factory, in which a small, bearded man moved softly about, and gazed at the intruder with a mildly troubled eye, as if deprecating the invasion of his quiet seclusion. This was George Tinworth, worker in terra-cotta, moulder of life-size figures, maker of statues, shaper of wonderful panels, creator of things grotesque and beautiful, dreamer of dreams. Here he had lived and worked almost from boyhood. The Doultons had found a man of genius, and they wisely gave him freedom to shape his own fancies and to follow his own bent; and Tinworth turned that vast room into a place of wonder.

Often have I sat at Kennington Oval, with the green shaven turf outspread before me, speckled with flannelled figures in the middle distance; and while a ball was being retrieved from a far boundary, or during a lull in the great game, my eye has rested on the tall ornamental chimney of Doulton's Pottery, visible in the haze in company with 'the towers of talk at Westminster,' a mile away; and I have thought of that retiring genius working in his big, rambling room under the tiles, heedless of the roaring world of London down below him, caring neither for cricket nor for the prattle of politicians, but dreaming in clay, making poetry and pottery at the same time.

It was wonderful to witness the ease with which he manipulated the plastic stuff in his caressing fingers. He would take up a lump of clay from a table, and, with a quiet smile and a twinkle in his eye, proceed to show the curious and amazed visitor 'how it was done.' A roll with the dexterous fingers, and it became a small pedestal; a few swift squeezes and pinches on another shapeless lump, and a statue was placed upon the base. A pull here and a dab there, and the whole thing was changed into a cat making her morning toilet. Another twist or two, and there was a grinning gamin or a sailor dancing a hornpipe. Another pat and pinch, and the figure became an apostle. I saw Abraham grow under my very eyes. It was like a conjuring trick. It was not merely the figure that he gave you, but a face with a real expression upon it. It was most fascinating to watch him, and if you expressed surprise and pleasure he would be as embarrassed as a girl. For George Tinworth was an anomaly in these latter days—a genius who declined to pose in the limelight; a man, also, of high ideals and humble, child-like heart; an artist, too, who was never satisfied with what he had done, but was always hoping that he would do better next time, for ever striving, for ever pressing on to the summit of his ideal for the only prize an artist cares about—perfection.

Tinworth lived entirely for his work. Though he had genius, he never presumed upon it, but toiled year after year with a most ardent enthusiasm and an untiring industry. He was never satisfied, was always altering and improving. A day was not wasted if in it he could give his figure or statue the touch that would make it breathe. When he was conceiving and executing one of his great terra-cotta panels, crowded with life-size figures, which by-and-by would appear in some public hall or lend an added dignity to a cathedral, he was completely absorbed in his work, toiling daily at his task with a religious intensity.

The secret of Tinworth's greatness, like the secret of all really great men, went back into his character. He was a deeply religious man, brought up on the Bible, whose pages he brooded over perpetually, and whose pictures and figures lived in his mind. He was a devout and simple Christian, but so shy that when he presented himself for membership in a Baptist church in London, he was so flustered and confused with the questions and forms, and so entirely unable to give any verbal expression to his faith, that he gave up any attempt at seeking membership in a church, though he remained a faithful church-goer to the end of his days. It was the

church that was the chief loser, not its stammering and timid disciple.

All his greatest subjects were Biblical in character. He loved his Bible. It appealed to him by its depth and beauty, its wonder and suggestion, and it stimulated his genius as nothing else did. Something within him awoke at its call and responded with a devout alacrity to its quickening. He loved a large canvas and a dramatic moment. Hence he chose such themes for his panels as Christ and the Children, The Entry into Jerusalem, The Release of Barabbas, and The Raising of Lazarus. All these were on a big scale, every figure life-size, and all crowded with detail. He seized the inner meaning of an incident, so that its hidden lesson was conveyed to the spectator by the pose or the grouping or the expression of countenance of the various persons in the drama. Some of these expressions were particularly striking. He brought out the inward difference between Jesus and Barabbas in a marvellous way by his delineation of the two faces—the one calm, beautiful, serene, resigned, with a pure and manly strength; the other gross, grinning, evil, with recklessness, scorn, violence, and sensuality in every line of it.

Tinworth had a sardonic humour about him, too, which he sometimes used with great effect, and which came out very vividly even in some of his religious productions. One would not suppose that there was any scope for humour in the incident of The Raising of Lazarus. But Tinworth saw it, and managed it quite legitimately, on the basis of a clear Biblical suggestion. I remember it particularly, because this happened to be the very panel he was at work upon when I paid a visit to his studio so long ago. He had modelled one of the crowd of unbelieving Jews at the grave's mouth holding a handkerchief to his nose, in anticipation of the stone being rolled back! A grim touch, but a touch of nature that makes the whole world kin. The eye for dramatic effect is shown in the statues that Tinworth executed of Charles Haddon Spurgeon, the great Baptist preacher, and Charles Bradlaugh, the famous and doughty champion of Freethought. In the statue of Spurgeon, the great pulpit orator is represented with arm uplifted and finger pointing heavenward; in the Bradlaugh statue the burly demagogue is depicted with the hand making a fierce gesture earthwards, or possibly to some spot lower than the earth! From which it will be seen that if Tinworth had his prejudices, he had also the courage of his convictions. The kindliest man may sometimes attribute a repudiation of orthodoxy to a flaw in character, and the strain of strong and gentle piety in Tinworth would scarcely find a point of contact with an iconoclast like Bradlaugh.

George Tinworth's work is done. He has enriched the world with many a striking and beautiful product of his art; they may be seen in quiet minster and in stately cathedral for years to come. But the more enduring part of him is invisible—the genius that dreamed over the Bible, the spirit that drank daily at the full springs of God, uttering itself in a life of simplicity, industry, and faithfulness that made him the friend of many.

SAVED BY A PUFF-ADDER.

By G. H. Furse Deane.

MOST people have justly such a loathing for poisonous reptiles that it seems hardly credible that one of the most venomous and repulsive-looking of snakes should have been the means of saving a man's life. But it sometimes happens that bad men and savage animals are forced by the irony of Nature to take a part in the theatre of life for which they seem utterly unfitted.

In this case the man and the snake were thrown together by one of those unaccountable *coups de théâtre* which Nature takes a grim pleasure in staging. It was Christmas Eve, 1901—the last year of the great Anglo-Boer war. I was sitting in my tent in Clanwilliam, which lies about a hundred miles north-north-east of Capetown. Clanwilliam, though it bears a British name, and has a fair sprinkling of British descendants, is an old-fashioned, Dutch-built town, consisting merely of one long street of detached country-houses lying along the left bank of the Jan Dissels River.

One of my new chums was a conductor of transport-wagons, named Morgan. Morgan was a licensed Government land-surveyor, and before the outbreak of the war, which swept thousands of men out of their peaceful vocations into the ranks of the belligerent forces, he had been living in Southern Rhodesia. He had joined one of the columns, had been besieged in Mafeking, had got an attack of malaria, had been sent down to the base hospital at Capetown, and after recovery had again joined the military as a conductor of transport-wagons. He had been all over South Africa, not only in the towns, but in the remote back-veld; knew Dutch as well as English; and, though somewhat quiet and reserved in manner, was an excellent conversationalist.

On that particular evening there was a smoking-concert at the sergeants' tent a few yards farther up the road, and Morgan happened to come in; and, after staying there half-an-hour, he strolled down to my tent.

I brought camp-stools, and we both sat outside. Men whom we knew passed and repassed, and among them was a group of Australian officers who held commissions in the different volunteer regiments that garrisoned the town. One of them, Lieutenant Davids, wore a black shade over his left eye. At my invitation they sat down and chatted, and they all partook, except Davids, of some particularly good whisky, which I had obtained by special favour from one of the officers of the South Staffordshire regiment.

'Davids has sworn off,' said the others, laughing. 'He was out on patrol the day before yesterday, and in Pakhuis Pass he met a dragon, or some other fabulous monster, and this creature squirted some poison into his eye.'

'Well, tell us the whole yarn,' said I.

'I was out on patrol duty,' said Davids, 'towards Pakhuis Pass, the day before yesterday, with three native troopers. We had nearly reached the top of the pass, when a long black snake crossed the road leisurely. I was riding a few yards ahead of my men, and at once charged into him, and got in a good smack with my stock-whip. He backed up against a big rock, and showed fight, rearing up and flattening his head. My horse was rather skittish, so I got off. I caught him another good crack with the whip, and then he elongated his neck like a pea-blower, and before I could get in a *coup de grâce* he squirted his venom slap into my left eye. Jeerusalem, boys! vitriol and nitrate of silver are soothing and unctuous compared to that liquid hell-fire. My lance-corporal, who had shouted a warning to me to be careful, told me to put on a little pipe-oil [nicotine], and this relieved it somewhat. Just look here!' and he removed the shade, and we could see that the whole of the eye was swollen and inflamed as though from an attack of the worst kind of ophthalmia.

'But how is it we've never seen this particular species of snake?' asked one of the other Australians.

'Because it's not found all over Cape Colony. You won't find it in the southern districts, or anywhere in the Eastern Province, but only in this middle chain of mountains; and it's not found on the other side of the great inland chain,' said I.

After a few minutes' chat they went on to the smoking-concert, and left Morgan and myself alone.

'It's quite evident that none of those Corn-Stalks believe altogether Davids's story,' I observed.

'The belief of most men is as limited as their mental horizon,' said Morgan. Then he produced his tobacco-pouch, and handed it to me with the words, 'You've noticed this particular pouch, haven't you?'

'Yes,' said I; 'it's an iguana-skin, isn't it?'

'No,' said Morgan gravely; 'it's the skin of a puff-adder, and'—he spoke with gravity—'paradoxical though it may seem to you, this particular puff-adder was the means of saving my life.'

'Saving your life!' said I. 'That must be an occurrence worth relating.'

'Well, if you care to listen, I'll tell you the whole story. This thing happened on Christmas Eve, 1896. I had been busy doing some private survey-work in Southern Rhodesia. I had a mixed gang of men, one of whom was a quondam Kafir witch-doctor, who possessed a considerable knowledge of herbal medicines, and who was credited by his fellow-workers with supernatural powers. He was named Umbande, but I always called him Johnson. He spoke English as well as Cape Dutch. We had knocked off work the afternoon before, and as I had received an invitation to spend Christmas with a friend named Graham, I gave the men four days' holidays, intending to return two days after Christmas.

'I had never been to Graham's farm before, and there was no road thither from our camp; but, as the veld was pretty open, and he had given me a few landmarks to steer by, I was not at all afraid I should lose my way. The walk of thirty miles through such country as that was a mere trifle to a South African land-surveyor. As horse-sickness had been prevalent in this part during the winter, I had not a single trek or riding animal with me.

'That evening, before turning in, I strolled down to where the men were camped. They always made their bivouac a few yards away from my fire. On the present occasion they were all squatted in a semicircle round old Johnson, who was throwing his dice, evidently telling somebody's fortune. These dice are composed of the knuckle-bones of a goat, and are known among the Dutch as *dobbel-steentjes*. On the farms one often sees children playing with them. They call them their *dol-ossen*, and place them in rows, with a toy wagon behind, like a long team of oxen. When I came up and stood behind him, he looked up into my face with a troubled expression. He had a very open face, and a good prominent forehead, and without his cap, as I had often thought, he would have posed well for a model bronze Socrates. Then he swept up the dice with a quick motion of his hand, and put them back in his bag.

'"Whose fortune have you been telling?" said I.

'"You believe in them, master?" said he.

'"Believe in them! How can I believe in them? They are merely children's playthings," replied I.

'"Children's playthings!" he said slowly; and he repeated these words two or three times, looking up at me steadfastly with the many-wrinkled brow of trouble or perplexity.

'"Throw them out again," said I; and he did so, though with considerable reluctance.

'Then I arranged them as I had seen Dutch farm-children place them, in a long double row,

like a span of oxen. When I had placed them all in position, and was looking at them and at old Johnson alternately, memory, with one of those lightning-like back-strokes of hers, which are so inexplicable and yet so illuminating, lit up a scene of the past. I was in what is called in Cape parlance the *onder-veld*, in the district of Fraserburg.'

'Oh, I know that part of the country well,' said I. 'I was there when Hertzog and Brand's columns came down from the Free State to get horses.'

'I had been surveying on a farm some fifty miles north-west of Williston, and had been staying off and on with a Mr Dantje Roux, a very kindly, intelligent old fellow.'

'I knew him well,' said I. 'His sheep were nearly all wiped out by the drought of '96, and then he started a small country shop.'

'Did he ever tell you about one of his children having died of snake-bite?'

'Oh yes,' replied I. 'I think it was on a Sunday, when I was visiting there, that he told me the whole story with that minuteness of circumstantial detail in which the old-fashioned Boer indulges.'

How it happened was briefly in this way. A puff-adder had come near the house, had been seen by one of the grown-up people, attacked with a stick, and left for dead. The child had seen it, and began playing with it. The snake had revived sufficiently to bite the child. The little one had been put to bed, and had been doctored with such simple remedies as the household medicine-chest could provide, and seemed to be progressing well. On the fourth day, when the father came up to the little boy's bed, the patient raised himself to a sitting posture, and, with a sudden convulsion, fell back dead.

'Well,' continued Morgan, 'a day before this, the boy was playing in the yard with these knuckle-bones, or *dol-ossen*, as he called them, and he was shouting out their names and urging them on with that realism of action which is the birthright of childhood. When I came there again he was a corpse. And now, as I looked at the old Kafir's African dice, the whole scene was reconstructed again.

'When I said "Good-night" Johnson promised to rouse me early, and bring me a cup of coffee.

'I am a sound sleeper, but I always wake at four o'clock, and when I got up that morning old Johnson had just started his fire. I dressed myself quickly, and made up a few necessaries, such as a spare shirt, brush and comb, &c., into a light roll to fasten with straps behind the shoulders. Then I slung my Martini carbine over this, and put a few cartridges in my pocket. There was not, I thought, any likelihood of my meeting dangerous animals, but as I had to cross a big vlei, or dry swamp, I might pick up a buck —one of the smaller kinds—which would be a welcome addition to Mrs Graham's larder.

'I did some very good walking during the early part of that day, and it was not too hot to be pleasant. My idea was to keep walking till about eleven o'clock, then find some shade, and take a good siesta, then start again about 3 P.M.

'In Cape Colony, especially in the Western Province, you can tramp for hours without finding a tree which will afford shade enough at noon for a person to lie under; but here there were plenty of trees, and every here and there patches of brushwood. As for food, I had some sandwiches with me, and a golden-syrup tin to make coffee in. Resting under a tree for about ten minutes, at eight o'clock I took a light breakfast of sandwiches and water.

'My course was pretty plain. I was to keep steadily to the north-west, with a kopje having two tops, shaped like two inverted funnels, as my beacon. This kopje was approximately two-thirds of the whole distance from my base-camp to Graham's farm. A mile or two beyond the kopje I should strike the vlei, which was some two miles wide, running north to south. In this vlei I should find a wagon-road going to the farm, but in those days in Rhodesia wagon-roads were mostly rough tracks which had been ridden through the veld, not made.

'I was in the pink of condition, for a land-surveyor's life in South Africa, when he takes to the back-veld, is one of the healthiest in the world. I passed above the kopje a little after eleven o'clock, and as it was now getting pretty hot, I determined to make my lunch, have a good smoke, and then take a siesta. I found a good tree which would give shade for at least a couple of hours, made a plain but hearty meal, and then, after a few draws at my pipe, lay down for a nap. My walk, coupled, no doubt, with the holiday feeling of well-deserved leisure, acted so soothingly on my nerves that I slept until three o'clock, and it was close upon four o'clock before I had partaken of coffee and was again under way. It was now pleasant and cool, and I reckoned I could easily do the remaining ten miles in the three and a half hours which elapsed before sundown. After about half-an-hour's brisk walking I struck the vlei, which was from two to three miles wide, and I kept going up it, hoping to strike the wagon-road which I thought crossed from one side to the other. As a matter of fact, this road had been formed only some three months before, and had been used for "riding" poles and firewood. It did not cross the vlei right through, but only came about half-way, and then made a wide circular bend back into its original course.

'For about an hour I held on my course on the hither side of the vlei, chiefly because the going was easier, but also because I thought that, as this vlei, which was really only a wide river-channel, had a low, sloping bank on either side, the wheel-tracks of a wagon would leave a

deeper spoor as the animals pulled out. Then I tried the vlei itself, which I crossed about half-way.

'As there was now only about an hour before sundown, the possibility arose in my mind that I should have to spend the night in the veld. But before I prepared my camping-place I was determined to make one final effort to locate the farm. I ascended the farther low bank, and climbed a tree, and from my elevated perch I gazed carefully all round in hopes of catching sight of some tell-tale wreath of smoke or other sign of human occupation; but all in vain. Then I got down and walked back to the water. I cannot say that I felt at all nervous at the prospect of having to sleep in the veld. Just alongside the stream I caught sight of a *grijsbok*, which was standing broadside on. I dropped him in his tracks with a Martini bullet behind the shoulder, and then set to work cleaning him. This accomplished, I lit a fire, toasted the buck's liver over the coals with a forked stick, and enjoyed a good supper. Then, fastening the animal's feet together with a spare *riempje* [rawhide strap], I slung him up on to a branch of a wide-spreading tree, under which I intended bivouacking. My rifle, too, I fastened on to the same branch, outside the buck, taking the precaution to load it again. Then I cleared a place on the sand for my shakedown, and, after a final pipe before turning in, I was soon sound asleep.

'In those days I was an excellent sleeper, and was never troubled with bad dreams or anything approaching nightmare. So it was all the more inexplicable when I woke some time after midnight with a vague sense of clammy oppression on the left side of my chest. It took me some seconds to realise what was the cause of this; and then, as I was now fully awake, the horror of the dreadful visitation dawned clearly on me. A large, fat, loathsome puff-adder was reclining on my chest, the whole of its coils covering a space very little bigger than an ordinary dinner-plate, and with its evil-looking, flat head resting close under my short beard. It seemed to be fast asleep, and was purring like a cat. I was at first so horrified that I could not formulate any plan of action. Then it occurred to me that if I could seize it suddenly by the tail, I could hurl it from me. But my knowledge of South African snakes warned me that the puff-adder bites backwards; though it is quite a mistake to suppose that when its long, sickle-like fangs are cleared for action it cannot bite an object in front of it. Again and again, when a youngster, on the Cape flats, I have teased a puff-adder with a whip, and have seen that when once it is thoroughly on the defensive, it can snap in front as well as behind. And in the present case the snake lay with only a tiny portion of its tail exposed—certainly not enough to grasp at. Then I thought of catching hold of it behind the head, as I had often seen my foreman do. But I remembered that he never caught a snake without first treading on it. I must not omit to mention at this stage that the moon was shining brightly, and I could carefully note the slightest movement on the part of the snake. I lifted my arm slowly to see if I could make a grab at it, but, whether it was through my heart beating at double-quick time or through some palpable vibration of my body which it was impossible to control, the loathsome creature seemed to arouse from its placid slumbers and transfix me with its Gorgon eye; and I realised that I must feign an attitude of perfect torpor.

'Naturally, all these thoughts did not pass through my mind at once. They were only evolved slowly, with alternating periods of hope and fear.

'No doubt it was this balancing and counterbalancing of the forces on my side and those arrayed against me which saved my reason and prevented my hair from turning white. My heart, too, shared the abnormal excitement of my mind, for it was at one time quite regular in its pulsations, and at another it was thumping like a locomotive engine on a heavy up-grade. One thing I knew I must do, and that was to keep rigorously awake; for if I fell asleep again, and woke with a sudden start, I ran the risk of being bitten.

'But a more terrible ordeal was awaiting me, and one which called into requisition all the powers of that *mens æqua in arduis* beyond the limit which the Roman poet could ever have imagined. It must have been fully an hour after I woke, and between two and three o'clock in the morning—as I could ascertain roughly by the position of the moon—when I saw what appeared to be two dim lights which appeared to be moving together about two feet above the ground. First I saw them on my left, and then a few minutes after on my right. They burned with a soft, phosphorescent glow, which was very weird and elusive. After they had travelled slowly more than once across my limited field of vision, I came to the conclusion that they must be caused by the eyes of some night-prowling animal, such as a hyæna or a Cape hunting-dog. I did not know for certain whether the eyes of these animals emitted any glow at night. Then it occurred to me that it might be a leopard or a panther. As to its being a lion, that was quite outside my reckoning. Whatever predatory animal it might be, it had probably been attracted by the smell of the buck which I had cleaned, and when it found the entrails, would in all likelihood make a good meal of them, and then retire without molesting me.

'When I next saw these twin-lights they seemed to me much nearer. There was a little open glade some twenty yards to the left, and I

kept my eyes fixed steadily on this. You can imagine my amazement, therefore, when, a few minutes after this, there stepped out of the shadows into the light a lion—not the lean, loafing, decrepit, man-eater type, but a well-set, thick-maned animal with lowered head, like a bloodhound on the spoor, and eerily glowing eyes. Strange to say, my unwelcome visitor, the puff-adder, also saw the lion, and was actively on the *qui vive*, raising its head and flickering its tongue.

'The lion stepped across the clearing, but did not advance directly towards me. He was evidently attracted by the buck which hung on one side of me, and he was puzzled, or, it may be, even scared, by the rifle hanging on the other. He was adopting, too, an old stratagem of a wary antagonist by going round and round his objective in ever-narrowing circles. When he came again into view within the open space, he was not more than ten yards off. Then he sat down with his head raised, for all the world like a tame mastiff, and his tail slowly whisking from side to side, and regarded me intently. He got up in a dignified manner, and came a little nearer, always with a sidelong, half-circular motion, and nosing the ground carefully. Evidently he thought I was asleep, and was waiting to annex the buck, but was not satisfied until he could ascertain this by actual personal observation. He quartered his ground as methodically as the best pointer, and was now alongside me. At first, when I saw him sitting taking stock of me, I thought I would stake all on one grand *coup*, grab the snake and hurl it from me at the lion, then leap to my feet with an ear-piercing war-whoop, and get hold of my rifle. But the threatening attitude of the snake, which seemed to be eager for a fray with any third comer, made this altogether too risky a proceeding for such a novice at snake-handling as myself. All I could do was to petrify myself into a state of perfect torpor, and await results.

'The lion was snuffing at my clothes, and seemed to be puzzled at my rucksack, which I was using as a pillow. And then he saw the snake, and he gave a low snort of surprise or disgust. The puff-adder drew its head on one side like a catapult, and struck him on the nose. The lion at once retreated a pace or two, snorting loudly, then came up again, and gave a dab with his paw in the direction of the snake. The puff-adder meanwhile seemed to have swollen itself out to twice its normal size, and struck now with such force at the lion's snout that it rolled completely off my body. The lion again retreated, this time a pace or two farther.

'Now I was free, and rolling on the off-side away from the snake, I sprang to my feet and gave a blood-curdling scream. Whether the lion was confounded at this novel mode of warfare, or at the sudden intervention of a second antagonist, I cannot say; but he bolted at once with one or two gigantic bounds, not even looking behind. As to the puff-adder, its head was slightly torn by the lion's claws, and, though I felt some compunction at despatching it, I deemed it best not to harbour such an uncanny visitor.

'The less said of my mental state during the last few minutes the better, but I can remember very vividly repeating the rules for Latin genders which I had learned when a boy in the public-school primer. The rest of my story is soon told. I put in the time before dawn in skinning the snake.

'When it got light I struck back along the vlei, and found cattle-tracks leading to some kraal, and I reached Graham's shack in time for breakfast. Everything was done by both Graham and his wife to make compensation for the horrible Christmas Eve I had spent. On the day following Christmas we went after the lion, and followed his spoor for a couple of miles. Then we turned back, for, as Graham put it sententiously, "He's heading straight for the Zambesi."

'When I got back to my boys at our base-camp I told them all my adventures. Old Johnson listened to my narrative with the keenest interest, and when I had concluded he said solemnly, "Master, I knew that you would meet some great danger, but the dice showed me that you would pass through it safely."

'To my somewhat curtly-put question, "Then why didn't you tell me of it before I left?" he replied, with the same serious look on his face, "But you would never have believed it, master, for you said that the bones were only children's playthings."

'It was he, incidentally, that made the pouch for me. None of the other Kafirs would touch it on any account.

'I have found myself again and again faced with these two unanswerable questions: could old Johnson have possessed some occult power of divining by means of these bones? or was it merely the black charlatan's desire to exalt himself in the estimation of the white man?'

LOVE'S AFTERMATH.

You come to me from out the long dead years
What time I wander in the realms of sleep,
And with angelic touch you dry my tears,
And softly whisper that 'tis vain to weep—
That all the loves of old, if true and pure,
Are garnered up to one day gladly bloom
Where hopes are realised, and joys endure
Unmenaced by the shadow of the tomb.
With this sweet message comforting my soul,
I take my place amid earth's striving throng,
And with eyes firmly fixed on that far goal
Attune my heart for its unuttered song,
Assured that I, when freed from mortal clod,
Shall meet you in the Paradise of God.

THE HEART OF THINGS.

By Henry Leach.

London, Yesterday.

THE glamour of history is such that most of us, upon reading of the great events of bygone days, epochs in the life of mankind, as we regard them, have reflected upon the peculiar privilege granted to the people of such times in having been born into them, and upon the strange sense of importance, no doubt, and the thrills of existence that they must have enjoyed. It may be an empty reflection, for, after all, every age has its work to do, and does it, for the development of the great scheme of humanity; and in the long-run, though the cataclysms of war appear to make the greatest impression on mind and circumstance, a fairly steady age average may be maintained. But it is certain, anyhow, that it is a whim of the mind to regard epochs of the past as those in which life seemed to sparkle most, and to think of the fine thing it must have been to live in such days. To have been in Egypt under the second Rameses! Would it not have been something to have been one of the humble workers engaged in the building of the temple of Thebes; or to have been a Roman in the great days when Cæsar brought the captives home, and there were processions of purple and gold through the Eternal City, which, for feelings of exultation that they kindled, have hardly been bettered in the centuries since? Nearly every boy at some time has lingered over the fancy that it must have been a wonderful thing to be a Roman and have a share in such an age as when the legions leaped upon the shores of Britain or when Horatius kept the bridge in Rome. The past, as we view it from afar, is never prosaic; history and legend work such a refining process upon the general mass of fact and incident that from the measure of a whole world and a full century they will extract one ingot, and labour upon it and polish it until it is a beautiful gem that glitters before our eyes for ever. Yet really in those times there was much of what we would call dull according to modern standards. A humble citizen of Rome, even in its greatest days, might carry on his life with no greater exhilaration or better means of edification than a Lancashire cotton operative enjoys to-day. Probably the advantage would be all with our cotton-worker. In the great days of Rome the general course of life and action was not just what it may appear to have been from a Shakespearian play. Looking back in our own history, most of us see as the most glowing chapter that of the Elizabethan period, when England was quivering to the great expansion upon which she was then entering. Drake and Raleigh, and the colour that seemed to glisten upon everything and make of life something between a ballad and a fairy-tale—it must have been a privilege to live in those times when the imagination strained across the seas. Again, when the first Europeans, and particularly the first people from our own islands, struggled in the throes of the early colonisation in North America, what a draught of life they had! As we have said, most of us, in looking back in time, have somehow felt, even if the thought has not always been clearly expressed to ourselves, that those who have slept for centuries since had privileges in life, being chosen for the mighty periods. Perhaps, in spite of the maintenance of that average of which we have spoken, a certain special dullness crept into our collective existence in late Victorian times—it is said so—and that may account for some of the envy that has arisen; and yet how should that be so when steam and electricity and all the wonders of science were developing every day and changing the manner of life? But sometimes we find ourselves in the midst of great events, the greatest, and then indeed it may appear to be a miracle of the ages that, seeing that there has been some sort of civilisation for thousands and thousands of years, a certain event charged with the utmost consequence should occur, and you or I should be individually associated with it; that we should have been born at the particular time to ensure our participation in it, and not fifty thousand years before, or even in the seventeenth or eighteenth century among the ancestors of whom we still hear. What an extraordinary chance it seems that, of all the generations, fate made its cast upon our unexpectant selves! It is, of course, not extraordinary; but do not mind that now.

* * *

It has been said that of all the *mots historiques*, that which most excites the fancy and is capable of most constant personal application is the saying attributed to the doge of

 [*All Rights Reserved.*]

Genoa (not of Venice) when, at the beginning of 1685, he went to Versailles to offer the compliments of his republic to Louis XIV., the court of Louis Quatorze being something to see and to think about. Upon returning to his own city he was asked what it might be that had astonished him most at Versailles, and he answered, according to the story that is given us in France, '*C'est de m'y voir.*' Nothing had excited his wonderment so much as the simple thought that there, amid that most impressive scene at Versailles, he, the doge of Genoa, as far removed in thought and circumstance from such things as he could possibly be, should find himself implanted. To find himself a part of such a scene was a greater wonder than the scene itself. The oddity, and yet the special human waywardness, of such reflections does not come upon us at once; but it is there. It was much the same with many persons in the early stages of the present appalling world conflict. They saw life and the whole fabric of civilisation heave up and tremble; they were told and believed that this was the most gigantic happening, the most fateful event, that had ever occurred since humanity came into being; that the future of the whole human race, the general path and tendency of civilisation, were to be determined by it. Hence we, you and I, who chance to be living in this particular one of the many generations of civilised life that are known to have existed, have been chosen as the instruments of this marvellous and enormously important process, and to see all the wondrous events that occur, and to be part of them. Search among the recollections of your own thoughts for a year or two, and you will almost inevitably discover that at one time or another you were inclined to marvel at the strange chance that had pitchforked you into this arena —whether you rejoiced at it or not. That this cataclysm should occur at all is certainly remarkable, but then we know that history deals in sensations; what is strange to us, as it was to the doge of Genoa, finding himself of all others at Versailles, is that we of all others should belong to it and be a part of it. In time the drama, the reeking tragedy, the fiery process of world adjustment will be completed, and we shall pass away. What of a hundred or two hundred years hence, when they who then walk the earth—if there be any then who do not fly—may notice our tombstones, if they will be so kind, as they pass through the village churchyards? Will they wonder also upon our fortune in having lived at such a time, and will they glory in our victory? Or will they be doubtful upon many things, and have eclipsed our sensation with something greater and more terrible?

* * *

By this fourth winter, though love of country and of right, and the great determination that glows in the honest heart, are not less than they were, but more, it comes to pass that emotions are exhausted, the senses somewhat dulled by the fast sequence of shattering events, and while new impressions are difficult to make upon us, we think perhaps somewhat less of the immensity of current happenings than we did at first. Amid so much madness and confusion people have reflected that for over three years the most tremendous of our explosives and other horrors, the yielding of tens of thousands of lives, the full aggregate of sacrifice and enduring and suffering—none of these has made the very slightest difference to the workings of Nature. In that way they may seem not to have mattered to any one save man alone, and it is wondered what account, if any, is taken of them by the Highest Power. One who becomes a little morbid under the effect of such considerations may inquire as to what the attitude of posterity to this affair is likely to be, for at the beginning—more so than now, it seems—we took posterity very much into our thoughts. It is not now less the fact that we labour heavily and suffer for posterity; but the intensity of our labour is such that we do not concern ourselves with these sentiments as a year or two ago. Splendid as we may have been, there is, however, sometimes an uneasy feeling on the part of those of the morbid way that posterity, duly thanking us and feeling grateful, even if regretting that we overlooked something that may cause trouble later, will have a large eye for certain notorious faults in our organisation and administration. But beyond this, thinking of the farther posterity to which the last faint eddying rings made by the splash of this tremendous missile of war into the placid pool of life will hardly seem to extend, this person of troubled thought, not content that verily the day's evil is sufficient thereunto, conjures up the prospect that away in the ages ahead, farther in front, perhaps, than we are of the early adventurers in neolithic times, our great event, this most awful thing of the world and its history, and all our tremendous sacrifice and the crowning achievement of it, may not even be remembered! They may not know of it. They may have other troubles to think about without rummaging among faint records of prehistoric periods to confirm doubtful theories of tribal wars when civilisation was so young that even radium—as they may put it—had only just come in. Some of us may start a little at the thought that this war, the period in which we have the privilege of living, may be forgotten! But we must bear in mind the old way of time, unflattering though it be. M. Anatole France achieves in one of his short stories the most remarkable effect of its kind that is contained in literature. He takes a great event in the long-past history of the world, one that we all know of, one that has affected most of our lives most profoundly, and he nominates one of the chief actors in that tremendous affair,

and finds him only a few years later, in his old age, resting in retirement, and entertaining himself at a bathing-resort, where he exchanges reminiscences with an old associate. The latter reminds him of the event, and asks him if he does not remember. He considers for a moment, and then says he cannot recall it; he has forgotten. Without further indicating the details of this short sketch, we may say that the effect upon the reader of the suggestion of the very possibility of forgetfulness in the circumstances is tremendous, shaking. Some such emotion, a little gentler perhaps, may arise at the thought that an ultra-distant posterity, tracing its own origins back and back until, for want of records, it halts at some point which is yet perhaps a hundred centuries on from that in which now we live, may not know of us and what we bore. These parts of the earth may have become cold, and the region of the southern pole, warmed and made pleasant, may have been long established as the centre of life and industry. And some day a hardened traveller comes home there after remarkable explorations amid the icy, silent regions of old Europa, and among the specimens he brings are some bits of metal which suggest to the mind of this imaginative person a theory, that about the twentieth century there may have been a struggle of some kind between the people of those parts, or, if not, that they indulged in strange sports and recreations. This explorer will naturally read a paper on the subject to the scientific societies; but the members will smile sadly, and reflect that the hardships borne by this splendid fellow have weakened his mind. They will not believe him.

* * *

If we need not fear that our war will not be remembered, this possibility, in the way it has been put, may at least serve to counteract our idea of the wonderful consequence of ourselves. A true sense of proportion may be assisted, and it may be realised that, great and overwhelming as is the war, all the armies of the world could not make a single blade of corn to grow without the assistance of Nature, to which it is such a trifle. So much for our 'power' and the instruments we use; let us not confuse the merely human with what is more than human. But the truth is that man himself in the fourth winter of war is insensibly acquiring the true sense of proportion, and in his own slight considerations is adjusting the war to its proper place in regard to the eternal. Man is, after all, a marvellously adaptable creature with a fine reserve of sense. If he wonders unduly to-day, and is excited accordingly, the truth dawns upon him by the morrow, and he goes his way without another thought. The war is still a big thing to him because he knows it is big, that it is the biggest thing of its kind the world has had—in numbers, carnage, and so forth; but he knows there have been wars in the past which have probably influenced the destiny of human life quite as much. Even if he were disposed to think less of the war, he could not; a careful Government turns the screw upon him a little more at every minute. The phlegmatic way in which man, and above all, we may say, the Briton, pursues this war in the fourth winter makes a marvellous study in simple, quiet persistency. So adaptable are these human beings, such their capacity for accommodating themselves to circumstances, that some of them may reflect sometimes that, in spite of it all, things, so far as they can see, are not greatly different. They have forgotten so much, you see. Though a thousand things have happened, each one of which might have caused consternation in the placid days, they are all taken as customary now, and as of long establishment. Consider the railway travelling arrangements, the licensed houses, the food and drink restrictions of every kind, the registration of persons, the severe taxation, the revolution in prices of most things and the scarcity of many. See what a vast change has swept over our Governmental system. Think of the Defence of the Realm Act and how much our political and civil liberties have been curtailed. And there is the darkness of the streets and the sense of creepiness under starlit skies. The other night, at the opera, we were watching with delight that lovely work of Mozart and Beaumarchais, *The Marriage of Figaro*, excellently given; and presently, beyond the high ceiling, through the walls, back from everywhere and round us there came dimly, but nearer and nearer, the sound of guns. Now and again there was an uneasy rustle in the seats, but not more than that. People pretended not to know. And another night, after some hour or two's firing over our London, as between the enemy and ourselves—mostly ourselves by way of barrage, as we call it—the 'All clear' was given, and then, what was the first thing that happened afterwards? Why, all the urchins —and some who were bigger than that—turned into the thoroughfares, and in the very dim light they scraped their feet along the surface of the streets, and poked about with their fingers in the gutters, looking and feeling for bits of shrapnel for mementoes! And the strange thing is that the dog life of the town, having itself understood that queer business was afoot, and entering thoroughly into this lighter aspect of the affair, scratched and smelled and poked about in the gutters in a veritable frenzy of search for shrapnel, and intermittently howled with the excitement of the quest. This we saw in Piccadilly. It is nothing; nothing is anything. But how different are the times, and how adaptable the people who live in them!

* * *

Surely some changes have been wrought. Are men the same? When the blast of war began, all in confusion laid charges to them-

selves, and in their distress and their resolve urged that it was for the good of all, and that they all had erred and the lives of all were needing cleansing. The war would do it, so they said. Time has modified some of those reflections of the early days of war. All that rises from this conflict is not pure and good; there are things that are better for the soul than war. Men are chastened, and they have many sorrows now. In that surely they have gathered a new strength. In other ways men are changed. They are more careful, silent, discreet. The great Napoleon said as a maxim that in war-time you should keep your eye upon your neighbour. All the people are doing that. If real loves and real friendships have drawn closer, there are wider separations elsewhere. Looking around, man sees a frightful materialism in the ascendant, and he sees nations turned to insincerity and opportunism. He sees states, governments, regarded formerly as being of undoubted honour because they had seemed to be the concentrated essence of the best of their people, the models, the examples, the judges, the committee verily of life and death—sees and hears them committing every kind of dishonour, and particularly hears them lying from day to day and hour to hour upon every fact and circumstance, changing the form of their own thought between its leaving their minds and reaching their lips, and sending it out in falsehood, until it appears too difficult or impossible for them ever to speak the truth. If these be the states, the rulers, the governments, the highest examples, what then shall be the individual? Wherein shall he find the code for his own conduct? Alas! If these governments be foreign and enemy to us, nevertheless our faith in some human institutions is shaken. From a great disillusion the man of the time falls down to no despondency. He sees idols and old ideals totter; but he reconstructs. In this exigency he shows not mere adaptability, but a marvellous persistency. From the first dawn of life it has been a struggle upwards, and now, after a spell of rest, the struggle is fiercest. Man is scratching on. He is more silent, and he is thinking more. Some vague thoughts, such as those of the accident that has put him in this struggling time, and of the relation between war and the things of great eternity, come up in his mind. And again when his liberties are lessened, and his friends have gone, and the night is dark, and he feels alone. Then there are all the lies and the other falsities of great governments; the judges are condemned, and the standards are in the gutter. More than ever he is alone, in thought and feeling and direction. He, every one, feels inevitably and certainly in these days one great thing, and that is that now his strength, all of it, for the present and the future, his hope and his guidance, must come from within. He must be a moral and spiritual guide to himself. So he turns with a wild, hungry eagerness to elementary philosophy as never before. Slowly simple truths are presented to him as never before; wonderful and good they seem to be. He thinks far more. . . . That is the greatest thing the war has done till now, the greatest any war could ever do. It has made a world of careless men to think. They are thinking now.

THEIR HEARTS' DESIRE.

CHAPTER IV.

A FORTNIGHT passed, and Auntie Naarah was still at Torquay. Her nephew and nieces began to think about the expense of such a protracted stay; they had always rather encouraged her meanness, being content on their visits to The Hermitage to go on short rations, knowing that every penny thus saved would go to swell their ultimate portion.

That Miss Brooke was at the bottom of it the 'girls' all felt convinced. Even Herbert had misgivings. He felt himself in a delicate position. It was advisable that Miss Brooke should return to her work at his office. On the other hand, her recall might offend Auntie Naarah.

However, a glaring instance of incompetency on the part of the Y.W.C.A. substitute decided the question of Miss Brooke's absence. Herbert wrote a diplomatic note to his aunt, saying he would be glad to know when she could spare his secretary, and that one of his sisters would be ready to relieve her at a moment's notice. In reply, Miss Knowles said that she was sorry to have inconvenienced her nephew, that Miss Brooke was returning forthwith, but that the writer hoped she would be coming before long to Tussocks, as 'she was a very ingenuous, kind-hearted girl,' and nothing would suit Auntie Naarah better than to engage her as a companion.

This announcement created considerable dismay at The Chain House. Ellen declared that that must never be; Priscilla said that she had foretold just what would happen; and Mary, feeling somehow the cause of such a state of affairs, said valiantly that Herbert need not let her go. To which Herbert sullenly replied that he was not a slave-owner, and had no power to retain Miss Brooke's services against her will.

Miss Brooke looked very fresh and blooming when she once again took her place before the typewriter in Lawyer Knowles's office, one

window of which looked sheer on the narrow little river which flowed through the town of Crabtree. Her employer asked a few questions about his aunt, and was surprised to hear that she had been to concerts and once or twice to the 'Pictures.' It was all so unlike Auntie Naarah as to suggest undue influence at work.

Lawyer Knowles was suspicious by nature, and when, coming suddenly into Miss Brooke's domain one morning, he surprised her with a happy smile on her lips while hurriedly slipping a letter into her pocket, he began to think her designs on Auntie Naarah were flourishing.

'Have you heard from Torquay since you left?' he asked with apparent carelessness. Rather injuredly he added, 'We have had no letter from my aunt for some few days.'

'Miss Knowles has been ill,' replied his secretary.

'Ill? Why were we not told?' cried Herbert sharply.

'Miss Knowles was taken suddenly ill; it is believed she ate something which poisoned her,' said Eva Brooke. 'One or two other people in the hotel had the same symptoms, but more slightly.'

'Poisoned!' Herbert looked concerned. 'And is my aunt still there, and is she better? Just what does she say?' he asked irritably.

'My information does not come from Miss Knowles,' said Eva; and surely he was mistaken, but Lawyer Knowles fancied there was a gleam as of mischief in her dark eyes.

'Not from my aunt? Some one in the hotel, then?' he persisted. The Knowleses were an inquisitive family, and were never above asking questions to find out what they wanted.

Eva Brooke shook her head. Then, colouring, she said boldly, 'My letter is from Mr Edward Strachan.'

Lawyer Knowles almost gasped. 'Edward Strachan!' he repeated blankly. 'What is he doing at Torquay? I thought—I quite thought' (he almost said 'hoped')—'that that undesirable young man was out at the front.'

His tone unconsciously suggested that he would not have cared had Edward Strachan stopped a bullet.

'Mr Strachan is home wounded,' said Eva Brooke, and her eyes flashed.

Unfortunately Lawyer Knowles was too perturbed to notice it.

'Wounded! Dear me! Not dangerously, I suppose?'

'He has lost his right arm,' said Eva proudly.

'Well—very sad, of course. But he was a lazy, extravagant fellow before he enlisted. I am afraid he never did any useful work with his right arm.'

'He is a brave man, at any rate,' cried Eva; and her employer turned in surprise at the challenging emotional tone of her voice.

'Oh, I don't doubt that,' he replied leniently. 'But that attribute unfortunately does not always belong to a worthy character. However, the young man's shortcomings have nothing to do with us, so far as I am aware.'

'On the contrary, Mr Edward Strachan's good name has a great deal to do with me, Mr Knowles,' said Eva Brooke vehemently, 'seeing that I am engaged to marry him.'

'Marry him!' Lawyer Knowles was staggered. 'My dear Miss Brooke, I can hardly congratulate you. I fear—I very much fear—he will never (now less than ever, owing to his infirmity) be likely to earn an honest living.'

'If not, I must work for both,' said Miss Brooke; 'and I may take this opportunity to say that I am looking out for more remunerative work. At my present salary it is hard enough for *one* to live.'

Lawyer Knowles frowned. 'You won't find it so easy,' he said with grim satisfaction, conscious of the inadequate wages generally paid to women workers.

Eva only smiled confidently. With Edward's love she felt strong to face an adverse world, to wrest favours from close-fisted fortune. The girl's happiness had beautified her; she looked younger, more blooming and desirable altogether.

She was too good, much too good, to be thrown away on a thriftless fellow like Edward Strachan. Forgetting the errand which had brought him, Lawyer Knowles retreated to his own sanctum in a very bad temper. For so curiously is man compounded that the mere fact of a woman being out of his reach immediately increases her value in his eyes 100 per cent.

He had never thought of marrying Eva Brooke himself, in spite of his sisters' misgivings on the subject. He had no idea of marrying a portionless bride; but he liked Eva, and somehow he felt hurt at the idea of her being engaged to some one else. It was illogical, of course; but then even shrewd lawyers are sometimes illogical where women are concerned.

When he went home Herbert told his sisters about Auntie Naarah's indisposition, and of Edward Strachan's being at Torquay, but he did not mention the engagement. Feeling annoyed about it himself, he would not give his sisters the satisfaction he knew it would evoke on his own account.

However, Auntie Naarah, sending a note in very shaky handwriting on her return to Tussocks a day or two later, gave the surprising news in a postscript. 'Poor Edward Strachan, who has lost an arm in his country's service, is in hospital at Torquay, and I understand that he and Miss Brooke intend making a match of it. I suppose they think they can live on love.'

. . . . . .

When Mary paid her deferred visit to The Hermitage she found Auntie Naarah in bed with a chill. The return from balmy air and sun-

shine to the gray skies and perpetual damp of Tussocks had taken effect on her frame, weakened by her short but severe attack while away. In her feverish state Auntie Naarah's mind wandered, and even when she was once more about again she sometimes seemed dazed, and her memory, never good of late years, grew rapidly worse. Still, her mind was clear and unaltered on one point—that is, having Eva Brooke as a permanent companion. And this, together with the knowledge that Edward Strachan would soon be visiting his relatives in the neighbourhood, gave The Chain House contingent furiously to think.

Mary wrote frequent reports of the invalid, who appeared to be giving considerable trouble. On two or three occasions, Mary said, she had got up and dressed in the middle of the night, once putting on her outdoor attire with the intention of walking in to Tussocks to the bank.

As a result of this information, Knowles, who had brought his legal mind to bear upon the case, himself paid a visit to The Hermitage, taking Ellen, as being more experienced, with him to relieve her younger sister. Auntie Naarah stared blankly at the pair of them when they were shown into her parlour, where every breath of fresh air was rigorously excluded, red sandbags, which had been in vogue in the days of her youth, stretching their snake-like lengths on the top of the window-sashes.

Mary looked quite wan and enervated by her fortnight's stay, the close atmosphere even more than Auntie Naarah's fidgety ways having evidently told on her.

'Really, it is almost insupportable,' she confided to Ellen, 'and auntie is so irritable. I sometimes think she'll wear us all out before we get the chance of seeing a farthing of her money.'

'Well, Ellen has come to take a hand now,' said Herbert consolingly. Then he went over to Auntie Naarah, crouching in a big chair over a handful of coals in the grate, which was all she allowed herself.

'And how do you feel to-day, aunt?' he said solicitously.

'I am not at all well,' was the reply. 'But what are you doing here? I wasn't aware that I had sent for you.'

'I came to see how you were getting on, auntie,' replied Herbert in rather crestfallen tones.

'Perhaps Mary wrote for you.' A gleam of cunning came into Auntie Naarah's faded eyes. 'She writes a great deal. Waste of ink, I call it, now when everything is so dear.'

'No, auntie, indeed I did not,' began Mary, anxious to justify herself; but Herbert put up his fingers silencingly. 'It's no good taking any notice of what she says,' he replied *sotto voce;* and then, as Auntie Naarah turned to her nephew with the repeated question, 'What are you doing here?' he added, 'Poor thing! you see how it is.'

'Yes, that's what I say,' said Mary in an excited whisper. 'Auntie is—is—going off her head, don't you think?'

But Lawyer Knowles never committed himself to a statement if he could help it. He only shrugged his narrow shoulders as Auntie Naarah, peering suspiciously at them both, asked what they were 'jabbering about.'

'We only want to help you, dear auntie,' put in Ellen.

'I don't want your help,' was the ungrateful rejoinder. 'I don't want any of you; so you can take your ugly face off, Ellen, as soon as you like.'

Ellen grew a dull red. It is humiliating to have one's personal appearance depreciated, even if the depreciator's mind seems temporarily unhinged.

Herbert again shook his head with a soothing air. 'Poor auntie! She will never be quite herself again, I fear.'

'Wouldn't it be as well if you could see her doctor?' Ellen, drawing her brother apart, presently suggested.

'Just what I intend doing, and that is why I am staying till to-morrow.' He objected to being given a lead.

Auntie Naarah's medical attendant was a young man and a bachelor, which perhaps accounted for his large and increasing practice. He very seldom had occasion to visit The Hermitage, and with so many more interesting patients to see, he did not care to waste much time with a cantankerous old maid.

Herbert approached him with a very serious air about Auntie Naarah's condition.

'Oh, she's better; she's got over the bronchial attack better than any one could have expected; but then she's tough, Mr Knowles. Another bout would do for her, though, I shouldn't wonder.'

'Humph!' Herbert looked concerned. 'But it was about her *mind*, Dr Banks, I particularly wished to see you,' he said. 'To me her mind seems failing. And she has turned so suddenly against my sisters and me, which in itself is, I believe, a sign of such a state.'

'Sick people often take dislikes of that sort,' said the doctor carelessly.

'And I suppose my sister told you of Miss Knowles dressing in the night and coming down. Really, you know, doctor, she might set the house alight.'

'Take her candle away, then,' replied the doctor shortly.

'I understand my sister did that,' said Herbert, 'and Miss Knowles nearly fell downstairs in consequence.'

After a little conversation, and Herbert's adducing several instances of Auntie Naarah's

peculiarities, the doctor allowed that it might be true that her mind was failing.

Knowles was one who believed in striking while the iron was hot, and on his return to Crabtree he called on his friend Mr Twitty in Lincoln's Inn.

'You do a lot of work for companies,' he said. 'I wish, Twitty, you could find a good post for a lady typist who has been in my employ. She is really worth more than I can give her.'

Twitty promised to do his best, and Herbert hurried home to be in time for a missionary sermon which a colonial bishop was preaching at his church.

Meanwhile Ellen, acting on her brother's instructions, kept a watchful eye on Auntie Naarah, and when the doctor was paying his farewell visit she asked his opinion about getting a resident nurse for her aunt. 'My brother suggested it when he was here,' went on Ellen. 'He said a nice nurse used to mental cases, who would be kind but firm, would be a great comfort.'

The doctor looked rather surprised. He didn't think Miss Knowles was bad enough for that, he said. But when Ellen, with all her family's obstinacy, pointed out how unfair it was to Jean to leave her alone with her mistress in such a trying state of health, and that her nieces felt unequal to the strain, he began to waver. For one reason, the doctor was in a hurry, and thought the quickest method of getting away was to say he would think it over.

'I am sure you could find some one suitable, doctor,' said Ellen with her most bewitching smile.

The doctor said he would see what he could do.

When Herbert went down to The Hermitage again after a very brief interval, he found a stern-faced woman mounting guard over his aunt. The unfortunate lady, who had always gloried in her independence, was now never for a moment left alone night or day, the 'nurse' sleeping in a box-like little room leading out of her patient's.

Lawyer Knowles congratulated himself on his wisdom. 'Things marched,' he felt.

But when Ellen and he were alone the former remonstrated.

'It's all very well, Herbert,' she said; 'but think of the expense! I've beaten the woman down, but her salary means something out of Auntie Naarah's income; and, besides, there's her keep. Jean says she will have the best of everything.'

Herbert gave a sphinx-like smile. 'Granted, Ellen,' he replied, 'that there is some expense connected with the new arrangement; but had we left auntie alone, who could have said what would have happened? There was nothing to prevent her making a new will any day.'

'No, of course not, dear Herbert,' replied his dutiful sister. 'But though any will Auntie Naarah might make now would be set aside, she being of unsound mind, what is there to hinder her *giving* her money away?'

There was a half-triumphant glance in Ellen's eyes, as if she thought she had propounded a poser.

'Sh-sh!' said Knowles cautiously. 'Don't put things so baldly, Ellen; one never knows who's within earshot. And as for the contingency you mention, I have thought of that, and am making arrangements accordingly. I am proposing to bring Twitty down in a day or two, and I think he will see that Auntie Naarah is not fit to have control of her money. With a little judicious persuasion, I have no doubt that I can get auntie to create a power of attorney for Twitty to sign her cheques. You leave it to me, please, Ellen.'

'I might have guessed you would think of something, dear Herbert,' responded Ellen with a glow of gratification.

Then she went into the parlour, where Auntie Naarah was sitting with a picture-book on her lap.

'Well, auntie, how are you feeling now?' she chirped.

Poor Auntie Naarah, whose dull eyes had the pathetic, wondering expression of a dumb animal under suffering, looked up. 'What is that woman doing here?' she asked slowly, pointing to her nurse.

'She is here to help you, dear auntie,' said Ellen cheeringly.

Jean was indignant at the installation of the 'keeper,' as she styled the strange woman.

'Miss Knowles would be all right if she was let alone,' she cried. 'I don't see, Miss Ellen, what all of you's little game is; but I know you've got some maggot in your heads.'

'You may be quite sure, Jean, my brother and all of us are only acting for your mistress's good,' said Ellen.

Jean sniffed. 'Say *your own*, Miss Ellen, and you'll be nearer the mark,' Jean retorted candidly. 'You'll have every penny she's got. Miss Knowles has told me so herself often. But if you want to hurry her out of the world, pretending she's off her head won't help it.'

'Do you know, Jean, you are being very rude,' cried Ellen.

'I say what I think,' said Jean, 'and it would be better if other folks would do the same. That nurse, she's as cunning as she's high. I pity my poor mistress never being out of her sight when she no more needs a keeper than I do.'

'When you speak to me like that I am not at all sure you don't need one,' replied Ellen with dignity. However, not to let Jean think she bore any malice, Ellen asked Jean, when she came in from chapel that very evening, what the text was, and Jean, with some meaning, Ellen fancied, replied promptly, 'He gave them

their hearts' desire, Miss Ellen, but He sent leanness into their soul.'

. . . . . .

Eva Brooke, who was now in London at the good post the obliging Mr Twitty had provided, received a letter from her *fiancé* one day which gave a deplorable account of Auntie Naarah.

'Poor old lady!' wrote Edward. 'I should hardly have known her when I dropped in at The Hermitage the other day to see her; she seems reduced to a state of mental and bodily helplessness—can't call her soul her own, I should think. It made me feel quite bad to see her. I can't bear to see a dumb animal ill-treated; and this was worse, somehow. When I was going poor Miss Knowles put her hand into her pocket. She looked sadly at me as she said, "I'm sorry, Edward; I should have liked to give you a little present, just to buy you some tobacco" (she used to give me a quid or two now and then, you know, Eva), "but I have no money now. My nephew's friend Mr Twitty, a lawyer, signs all my cheques. I haven't even a shilling in my purse," she said; and the pitiful way she looked at me—it made my blood boil, I can tell you. I only wish you could be with the poor old girl, darling; you would make her happy; and she is not a bad sort really. I can never forget that my father loved her.'

. . . . . .

The end came to Auntie Naarah's cheerless existence quite unexpectedly. Perhaps the feeling that she had no interest or authority or anything to give her a grip on life had something to do with it. Anyhow, when the spring came she escaped from the never-ending surveillance of her keeper and her relatives.

And one sunny afternoon all the Knowles clan were gathered in The Hermitage parlour, where, following an old-fashioned custom, Mr Twitty was preparing to read the will he had made. And then, as Lawyer Knowles and his sisters, in their deep mourning, sat round the room trying to look as if they were broken-hearted at having just attended poor Auntie Naarah's funeral, a taxi dashed up to the door, and three strange men alighted, one of whom was in ministerial attire.

Jean went to answer the door, and the next minute had shown them straight into the parlour, amid the astonished protesting glances of the assembled group.

'Excuse the interruption,' said the first-comer, a keen, middle-aged man, who held a long envelope in his hand. 'But I have only just seen the announcement of Miss Knowles's death, and I have hastened from Scotland to be present at her funeral, as it was her desire that I should be. I conclude, however,' looking round, 'that I am too late for that.'

Lawyer Knowles bowed. 'This is a family gathering,' he said, 'and this gentleman,' pointing to Mr Twitty, 'is about to read my late aunt's will.'

'Then I am in time,' said the stranger. 'I am a solicitor practising at Torquay'—and he handed Herbert his card, on which was inscribed, 'Mr George Cotton, Solicitor, Torquay'—'and I was sent for by the deceased lady to see her at the Minerva Boarding-House, Green Street, on the 6th November last. The Reverend Nehemiah Watkins'—he indicated the minister—'was present by the testatrix's request on that occasion.'

As he spoke he drew forth a document from the envelope. 'This is the will I made there and then for Miss Knowles,' proceeded Mr Cotton. 'She had been taken dangerously ill, and thought she would not recover. Mr Watkins and my clerk here, John Horning'—he nodded in the direction of the third man, who stood modestly apart—'were witnesses to the same.'

'But—but—this is absurd,' cried Herbert. He had turned a yellowish white, while the 'girls' stared, open-mouthed, dismay written on their countenances; Jean, whom they were all too concerned to notice, standing just inside the door, a look of exultant expectancy on her face.

'It is all in order, my dear sir,' said Mr Cotton. 'Your will is pre-dated by two months. Miss Knowles, it appears, had been thinking over the disposal of her affairs, and was evidently not satisfied. Therefore she made this new will, which I should like to read now.'

He did. In slow, sonorous syllables the Torquay lawyer proceeded: '"This is the last will and testament of me, Naarah Knowles, spinster, of The Hermitage, Tussocks, Surrey. I revoke all wills and testamentary dispositions heretofore made by me, and declare this to be my last will. I appoint the Reverend Nehemiah Watkins and Mr George Cotton my sole executors.

'"I bequeath one hundred pounds each to my nephew, Herbert Knowles, solicitor, and to my nieces Ellen, Priscilla, and Mary Knowles; as they are already comfortably off, they are not in need of a fortune. To my faithful servant Jean M'Inly I bequeath one hundred pounds free of duty.

'"I bequeath one hundred pounds to the B.R.C.S., and I appoint Private Edward Strachan, 56th Battalion of the Middlesex Regiment, son of the late Major Edward Strachan of Grey's Court, Chelsea, my residuary legatee, hoping that the responsibility of this wealth will be a comfort to him in his maimed condition, and that he will realise the great trust committed to him.

'"In witness whereof I have to this my will set my hand this 6th day of November 1915."'

'It is preposterous!' cried Herbert, springing up. 'Miss Knowles must have been off her head when she made that new will. She was for some months before she died.'

'But perfectly sane while she was at Minerva

House,' put in the minister, who had not yet spoken. 'I had many an argument and talk with poor Miss Knowles, and the doctor who was called in to attend her can bear out my statement.'

'My aunt has had to have a mental nurse for some time,' said Herbert furiously.

'That is of no consequence, my dear sir,' replied Mr Cotton. 'As you know, the testatrix was of sound mind when she made this will; that is all we have to consider. I sympathise with you in your disappointment if, as I gather, this last will is less in your favour. But it must stand.'

'I shall appeal!—Twitty, we must appeal!' cried Herbert.

Mr Twitty shook his head gloomily. 'I am afraid we have no case, Knowles,' he replied in low tones.

The 'girls' seemed dumbfounded by the overwhelming and unexpected disappointment, a veritable bolt from the blue.

Priscilla was the first to recover her speech. '*Residuary legatee*,' she said. 'What does that mean, Herbert?'

'Mean! It means in this instance that that scapegrace Edward Strachan will become possessed of about thirty-five thousand pounds,' replied Herbert, white with rage.

'And The Hermitage,' put in Mr Twitty, 'with the furniture, plate, books, &c.'

'In fact, everything that is not specified in the legacies already mentioned,' said Mr Cotton.

'Well, money is not everything,' remarked the minister, with a laudable attempt to pour oil on the troubled waters.

'There has been undue influence,' cried Herbert. 'I am sure we can prove that.' He turned to Mr Twitty, who again could only shake his head regretfully.

'Not at all,' Mr George Cotton replied quietly. 'Miss Knowles had a perfect right to will her money as she chose'—he picked up the fateful document from the table—'as in the words which she dictated at the end of her will, but which I believe I omitted to read just now: "Is it not lawful for me to do what I will with my own?"'

THE END.

THE MINISTRY OF MUNITIONS AT WORK.

By Luke Harruney.

SOME time ago Mr Lloyd George, in an address to the staff of the Ministry of Munitions, described the first meeting of the Ministry. It took place, he said, in a room barely furnished with a table and five chairs, and one of the important points under discussion was how to obtain a carpet for the room from the Office of Works! Not quite three years have elapsed since then—no very great space of time in a human life—yet how remote those days seem to be already to workers with the Ministry! Huge buildings have been taken over on all sides, until, octopus-like, the Ministry has extended its tentacles all over London. Most Londoners are aware that practically the whole of Northumberland Avenue has become one immense Government office, and that the giant hotels and clubs in the neighbourhood have been swallowed up one by one; but few realise that, not content with this, the ramifications of the Ministry extend east and west even in London. And all over England factories and filling-stations have sprung up to an extent that has profoundly affected the national life. The tale of how all this came to pass will have to be told after the war, and it will be worth the telling, if only because many of the results have come to stay.

At the present juncture, however, it will be more interesting to give some details of the work now going on in our midst. It would be no ordinary room nowadays that could contain even the 'heads' of departments and sections of the Ministry. In July 1915 the staff of the Ministry numbered no fewer than 8761 persons of all ranks. At the time of writing it amounts to nearly 40,000. And over and above all these, there are 8000 persons at work in America. Let not the reader think, when he sees these figures, that an undue proportion of men has been withdrawn from military service, for a year ago women made up 28 per cent. of the total, and nowadays they account for 61 per cent., and are actually 29,000 in number. Men over military age or otherwise unfit for military service largely account for the 11,000 remaining in this country.

Very similar are the figures for our greatest arsenal, Woolwich. Here the staff numbered 10,866 in August 1914. Now it numbers 73,571, and the women employees have increased from 125 to nearly 25,000. After this, we may hope to hear fewer gibes at the expense of the 'weaker sex.' And the work that this staff is carrying out is enormous. Not only is the Ministry (with other new 'ministries' and departments) engaged in putting into practice an experiment in State Socialism on the largest scale, but it is also organising and developing old industries that had languished, while bringing into existence entirely new ones. Many of these had previously been entirely in the hands of the foreigner, or were undreamt of before the war. Take glass, for an example. Of the

optical supplies sold in these islands before the war only 10 per cent. were of British origin, and the very processes for the manufacture of certain kinds of glass were practically unknown. All the formulæ necessary have now been worked out in actual practice, and we can supply not only ourselves but also our Allies with every article needed. Recently German boastings about potash have appeared in the newspapers. German chemists have plumed themselves on the fact that before the war they furnished the bulk of the supplies of this material—so important in agriculture and the arts—and have announced that after the war they will supply the world. Well, Great Britain has chemists also, as the Germans are beginning to find out, to their cost; and—honour to whom honour is due—Mr Kenneth Chance, with others connected with the Ministry of Munitions, has devised an entirely new process for the manufacture of potash, by which the German plans are already defeated. In addition to this, Dr Addison says that the new programme for fertilisers to be produced in Britain includes over a million tons of superphosphate, nearly half a million tons of basic slag, and a quarter of a million tons of sulphate of ammonia.

Nor does all this by any means exhaust the list of side results—of matters which are not primarily essential for the supply of munitions, but which have attained a lasting increase owing to the waste and wear and tear in the production of more necessary war material. Many waste products have also been utilised. It is safe to assert that the most vital of all chemical reagents in the production of high explosives is sulphuric acid, or oil of vitriol, as it is vulgarly called. Before the war sulphuric acid was largely used in the industries of peace, and nitre-cake, one of the by-products brought into prominence owing to the unprecedented output of explosives, was a waste material, very often treated as refuse. But nitre-cake contains nearly 30 per cent. of sulphuric acid, so that many manufacturers, previously in the habit of using the pure acid, have now found (partly under compulsion, it must be admitted) that nitre-cake can be used for many of the purposes for which the acid itself was used. When the war is over many firms will continue to use nitre-cake, and thus reduce their expenses and turn out cheaper material. Every one has heard that horse-chestnuts, also, are valuable. The Director of Propellants will be glad to tell collectors where to send them.

It may be asked why the Ministry needs so large a staff as 40,000 persons, and what they all are doing. In the first place, the correspondence of the various departments is enormous. Every conceivable subject under the sun is dealt with, from guns and chemicals down to the provision of police for the factories, and even the menus of the workers' meals. A letter may arrive, addressed to no one in particular, and when it has been opened and read, and the particular department and section to which it appertains has thus been ascertained, it is at once sent to the proper officer. All the correspondence has to be filed and referenced, by dockets, if necessary, and copies of the replies kept. When thousands of letters are involved (a daily occurrence), even this is no slight task. So each section has its registry, and each department its main registry—a sort of post-office controlling letters and telegrams and the mass of official correspondence carried on by means of 'minutes' and 'files' between departments and the other branches of the Government service. Many of these last are curious, and even at times confusing, owing to the rapid growth of the different branches and the invariable practice of designating them by initials instead of writing the full address in words. Thus, Mr 'X' of His Majesty's Office of Works will be addressed on a 'minute' or 'file' as 'Mr X, H.M.O.W.' Without further ado, in this instance, everybody will know what is meant. But, given a new ministry or section, the puzzled clerk will often be put to much trouble in order to find out what is meant. Take, for example, the 'Oils and Fats' section. Here the official initials, 'M.F.O.F.S.,' rather suggest a practical joke than 'Ministry of Food, Oils and Fats Section.'

Forms, too, now being sown broadcast all over the country, to the exasperation of those ordered to fill them up, are a constant source of derision to the comic papers. Yet a little reflection should convince any one that they are absolutely necessary if control is to be maintained over the output of this or that article. The plainest questions have often to be repeated, even a simple direction to sign a form and give the deponent's name and address being frequently ignored; so that a wearied official is left with nothing but a post-mark on an envelope to guide him as to who it is that is answering his questions. And when the examiner of these forms has to go through hundreds of them day by day and tabulate the results, this is no joke. In addition to all this, factories have continually to be visited, and controlled establishments supervised, so that a large number of travelling inspectors are necessary.

Guns are now being turned out to an unheard-of extent. The number of machine-guns now made has increased twenty times, so Dr Addison tells us. The output of sulphuric acid has increased to fifteen times the quantity before the war, and it costs less to make. And as regards steel, whereas our output before the war was about 7,000,000 tons a year, it is now nearly 10,000,000, and is increasing rapidly. Steel plates now cost half the price paid in America. One and a half million steel helmets were turned out for our Tommies during the last six months,

and 17,963 tons of them have been sent abroad. Of the shell components sent us from the United States, the U-boats have only succeeded in accounting for 5·9 per cent.

Zinc deserves mention. As the French say, the Germans had successfully 'accaparated' the Australian output of spelter before the war, and only one-third of the zinc used in Great Britain was the product of the Empire. Zinc is now completely under our own control, and Australia has swept away the German hand for ever.

Notwithstanding increased wages, economies have been effected in all directions. Our shell-filling factories alone employ about 100,000 hands, and fill about 85 per cent. of our shells, at a reduced cost of nearly 40 per cent. The magnitude of the operations necessary for filling shells can be gauged by the fact that every million round of 18-pounder shells requires 183,000,000 separate gauging operations. Thus the work of inspection is gigantic. Trinitrotoluol, or T.N.T., the turn-out of which is controlled by the oldest department of the Ministry, the Department of Explosives Supply (D.E.S.), is now produced in such quantities that if the old rate of cost before the war had been maintained £7,000,000 a year would now have to be paid for it. But, thanks to the improved plant and methods, necessitating a capital outlay of only one and a half million pounds sterling, the total cost now amounts to just half that sum. T.N.T. now costs 8½d. a pound instead of 1s. 9d. By March 1915 the total of the pre-war output of high explosives had been increased twenty-eight times. Nowadays it is quite four times the amount it had attained even a year later than this—in March 1916.

More than 6000 new inventions have been reported on, and special rewards have been granted to the employees in sixty-five cases.

In conclusion, it may safely be added that when the war ends, the work begun by the Ministry will in many respects be found to be of lasting value, even in times of peace.

A GERMAN DESERTER.

THE poor devil of an Alsatian had swum the Rhine at daybreak, and landed safe, but exhausted, on the friendly soil of Argovie. A German patrol had put out in a boat from the Baden shore a minute too late; as the result of which, Fritz just managed to reach the asylum of neutral waters, his pursuers daunted by the incriminating presence of Swiss sentries, but for which eye-witnesses they would have shot their countryman on neutral soil with no more compunction than they had shown in the case of a Russian fugitive a fortnight earlier. For the Russian, death could have had no sting, because he and his had for months been tortured, the favourite punishment for the slightest disaffection being to string these unfortunates up to trees by the wrists!

Desertions across the Swiss frontier, whether by swimming the broad and rapid Rhine or by crawling, under cover of darkness, across the neutral zone, increased to such a degree during the third summer of the war that the German military authorities had continually to devise new baits to lure the repentant and unwary back to the fold. These efforts failed, if only because the fugitives knew their former masters too well to trust them. In vain were successive proclamations to deserters, each more tempting than the last, posted along the frontier. First, the offender was given seven days in which to report to his regiment, and was promised no worse punishment than a few months in prison. Could they but have counted on such a penalty, thousands would first have deserted, and then have given themselves up, so as to get out of the inferno of the dreaded *Trommelfeuer*, which shatters their nerves more effectually than all else; but well they knew that the real reward of repentance would be immediate transfer to the front trenches, so they stayed on the safe side of the border. The next proclamation, issued early in June, went yet further, for it extended the period of absence without leave to six weeks, and promised that bygones should be bygones. That also, as Fritz confided to me in the intervals of conveying Gruyère cheese to his mouth on the point of his rusty clasp-knife, seemed too good to be true, and those who had won free of the Kaiser's jurisdiction knew where they were well off.

He had never had much heart for the war, though at the first call to the colours he had left his little home in Hüningen, within sight of Bâle's factory-stacks, and had shouldered his rifle with the best. That was in September 1914, and since then he had been moved from West to East and back again, had fought in the Ypres salient and in the Russian marshes, had faced Australians and Cossacks (and did not know which of them had given him a clearer foretaste of hell), had been rushed from one pandemonium to the other, had thrice changed his battalion and four times his regiment, two of his earlier companies having been wiped out. As he evidently was not meant to be killed in battle, he had had enough of it, and cleared out.

He never had his heart in the business. He was an Alsatian, though he spoke German. He hated the pigs of Prussians, and prayed that the French might soon drive them out of Alsace. And now he was exiled from the home he could

look on from the streets of Little Bâle. His wife and children could not come to him. Ah, well! the war would not last for ever, and the pigs were going to have too many troubles of their own soon to give any thought to him! Why all these desertions?

Look you, some deserted for one thing, some for another. Most of those who crossed into Switzerland had their families in that land before the war. They regretted, too late, the patriotic impulse that had made them follow the drum across the Rhine. Others, more sensible and less sensitive, had known where they were well off. Switzerland was full just now, for numbers of young and able-bodied Germans had hurriedly got across the frontier in those feverish July days when war, though a moral certainty from Metz to Königsberg, had not yet been declared.

Many deserted because they could no longer stand the strain or the insufficient food. For days together they got no bread. When they did get it, it was mouldy. The troops in garrison complained that all the food went to the men at the front; but those who hungered in the trenches were quite aware that most of it was eaten by the greedy brutes in the garrisons.

Pay? Oh yes, he got pay—nominally, fifty-five pfennige a day, but more often he did field-work on the lower Landsturm scale of only thirty-three. Even this he was advised to pay into War Loan! *Advised!* No; there was no compulsion, but a bad mark was made against all who refused.

His wife's separation allowance? Great! For herself and five little ones, ranging from ten to three, twenty-eight marks a fortnight, or about thirteen shillings and eightpence a week! At the present prices of food, this would just have housed and fed the wife alone. Now, of course, it would stop; but he was a skilled mechanic, and he would, within a week, be sending her better money.

How did he think the war was going? Oh, who could tell? It was pretty much of a stand-still. Certainly no one believed any more in the march on Calais, and Paris was as safe as Munich. But, at the present rate of advance, it would take even the English, devils though they were, about five years to reach the Rhine. Probably both sides would get tired of it at last and come to terms. That would be the best way. It was a beastly business, and only those could wish to prolong it who had neither been in it themselves nor had their dear ones in the trenches. Anyway, he hoped France might get back her provinces. That, said this German-tongued Alsatian, was what Alsace and Lorraine wanted, whatever the newspapers might say. That, for him, was the whole business of the war. Belgium? Servia? No affair of his. But an Alsace freed from the Prussian heel—there was a dream for one's declining years!

And so, with a little offering, I took leave of my ragged runaway compelled by the irony of fate to bear arms for a land he hated against an enemy for whose victory he prayed in his heart.

THE MONTH: SCIENCE AND ARTS.

THE COMMUNAL KITCHEN.

THE need for public kitchens where munition-workers can obtain ready-cooked food at reasonable prices must be patent to all who are conversant with the conditions under which many mothers with young children are helping us to defeat the Hun. These women have no time to cook food for the midday meal, a fact which has been quickly grasped by that most progressive of public bodies, the Hammersmith Borough Council. A large central kitchen has recently been opened at the Council's public baths, and supplies cooked food by two motor-vans to a number of distributing centres situated in the districts most thickly populated with women workers. Two thousand meals a day can be served from each distributing centre, and the number of customers is rapidly increasing. The menu is varied from day to day, a weekly list being distributed, so that customers can choose what they require before going to fetch it—an arrangement which saves much time when the meals are served out. Prices are very low, as is shown by the following selection from one week's menus: soup, 1d.; mutton-pie, 3d.; meat rissoles, 2d.; steak and kidney pudding, 3d.; salmon cutlets, 2d.; potatoes, 1d.; college pudding, 1d.; jam-roll, 1d. In spite of these prices, the Council expects to make enough profit gradually to wipe out the initial outlay, amounting to nearly two thousand pounds. The central kitchen contains eight steam-heated boilers, each capable of boiling eighty gallons of soup in half-an-hour, with six gas-boilers as a reserve. Baking is provided for by four steam-ovens, two gas-ovens, and a pastry-oven with a capacity of seventy pies every twenty minutes. The equipment also includes an electric mincing-machine which can deal with one hundred and fifty pounds of meat in six minutes, while fruits and vegetables are cut up at still higher speeds.

A SOURCE OF GERMAN POISON-GASES.

German chemists have proved themselves so ingenious in providing artificial substitutes for natural substances that it comes rather as a surprise to hear that they use the seeds of

a Central American plant, the sabadilla, to produce some of the noxious gases employed in warfare. With this object in view they are said to have bought up the whole available supply before war broke out. Even the dust from these seeds is so irritating to the throat, nose, and eyes that the labourers, when harvesting the plants, are compelled to wear masks. Sabadilla-seeds contain a poisonous alkaloid, veratrine, used as an ointment for rheumatic and neuralgic pains. The dried ripe seeds were formerly official in the British pharmacopœia, but are now little used. Absorbed into the blood in medicinal doses, they act on the muscles and depress the heart, circulation, and body temperature. They have been employed in acute febrile diseases in strong, healthy persons.

LONG-DISTANCE FLIGHT.

The Italians were the first people to employ aeroplanes in warfare, while in other directions they have always shown a pronounced inventive faculty. It is not altogether surprising, therefore, that an Italian aeroplane should hold the world's record for a long-distance flight. In this connection it may be remembered that Captain Laureati's recent flight from Turin to London without a stop, although given so much publicity, did not establish a record, the distance, six hundred and fifty-six miles, having been considerably exceeded by the French aviator Lieutenant Marchal, who flew eight hundred miles across Germany, and very nearly succeeded in landing within the Russian lines. Captain Laureati, nevertheless, holds the world's record by virtue of a previous non-stop flight from Turin to Naples and back, when the distance covered was nine hundred and fifty miles. In his recent trip from Turin to Hounslow a strong north-westerly wind was encountered throughout the whole journey, which goes far toward making this performance equal the previous record achievement for distance. The flight was completed in seven hours twenty-two and a half minutes, involving a speed of eighty-nine miles an hour—a remarkably good speed against the wind for the type of machine flown. A mechanic accompanied Captain Laureati, and two machine-guns were carried. Many people have asked why, if these long-distance flights are possible, we do not go farther afield on our bombing raids into the enemy's country. It must be remembered, however, that the distance that can be flown without alighting depends upon the load carried; hence, with an effective number of heavy bombs on board, an aeroplane is very much handicapped as regards mileage.

SUBMARINE AS OYSTER-DREDGER.

The usefulness of the submarine by no means ends with the sinking of hostile vessels in warfare, and Mr Simon Lake, the well-known inventor, has recently been experimenting with a submersible boat for picking up oysters from the bed of the sea. This vessel, which is illustrated and described in the *Popular Science Monthly*, is somewhat similar in design to the fighting submarine. One important difference, however, is that when the boat is submerged the oil-engine is enabled to work by means of long pipes reaching above the surface, one to supply the necessary air, one to carry off the exhaust gases. A much larger pipe, also reaching to the surface, contains a ladder whereby the crew may enter and leave the vessel when at the bottom of the sea, and has a platform at the top for a look-out man. This pipe terminates in an observation chamber in the middle of the boat, from which the sea-bed can be examined. At each side of this chamber are the oyster-holds, into which the oysters are drawn by suction on the principle of the vacuum-cleaner. On good ground this strange oyster-dredger is said to be capable of sucking up five thousand bushels of oysters in an hour. A propeller is provided which can be worked by the engine that operates the vacuum-pumps and other machinery.

MOUNTAIN-SIDE CARVED INTO A MONUMENT.

We have long been accustomed to look to America for the greatest achievements of the world in certain directions, and this attitude has often been justified, at any rate so far as sheer size is concerned. One of the most recent examples of this nature is the carving of a mountain into a colossal monument to commemorate the part taken by the Confederate side in the American Civil War. Stone Mountain, near Atlanta, is particularly adapted to this project, which is now being carried out by the well-known American sculptor, Mr Gutzon Borglum. The adopted design shows an army moving across the face of the mountain, and in its midst will appear all the well-known Confederate leaders. According to the sculptor, as quoted in the New York *Evening Post*, 'the carving will be in full relief whenever it is necessary to so carve it to give the appearance of complete relief. Otherwise the work will be carved in simple relief, and frequently even only drawn with a chisel into the great wall. We have learned that our mounted men, horse and rider, must be from hat to fetlock at least fifty feet to produce the proper effect.' Mr Borglum goes on to describe how the work will be carried out from a horizontal track just above the top of the design, upon which will run trucks carrying electric elevators. The carvers will work in the cars of the latter, which are eighteen feet square and capable of ranging downwards four hundred feet. Automatic tools driven by electric motors are to be used by the carvers, who will work in squads of four. Each group of three or four squads will be under the direction of an artist, and three to five of such groups are to work con-

tinuously until the design is completed. The carving, when finished, will be eight hundred feet in height.

LIGHT PRODUCED BY INSECTS AND FISH.

The extraordinary efficiency of the light given by certain insects and fishes has hitherto been the despair of the electrician, who can only transform a paltry 15 per cent. of electrical energy into light, the remainder being dissipated in the form of heat, whereas the firefly produces light practically without any heat at all. Again, several fishes, notably certain species very numerous in Japanese waters, give out light which is not only very great in volume for the energy involved, but which also has a power of penetration through sea-water unapproached by any artificial light at present known. The substance that produces this light has now been discovered by Professors Ulric Dahlgren, Edwin Conklin, and Edmund N. Harvey of the Biological Department of Princeton University; and, according to Dr W. H. Ballon, quoted in *Popular Science Siftings*, this substance can be secured in sufficient quantities for commercial purposes from the Japanese fish already referred to, while it can also be made synthetically. The latter resort is, however, unnecessary at present, as the natural sources of supply are large enough to meet any probable demands for some time to come. According to Professor Harvey, this luminous substance can be kept in sealed vacuum tubes indefinitely, and when exposed to oxygen and water it gives a bluish phosphorescent light.

THE ELECTRIC PROBE.

Science has been indefatigable during the course of the present war in devising improved methods of treating men wounded in the fray. In this connection a distinct advance has recently been made in the construction of the electric probe and in the method of using it. In the older form of this instrument the probe through which the wires were led was inserted into the wound, and on coming in contact with any metallic body produced sounds which were carried to the ears through hearing-discs similar to those used by telephone-operators. But in this form of telephone-probe the sounds were apt to be mingled with others, and thus its usefulness was strictly limited. In the newer instrument, however, this difficulty is obviated. Both the metal probe and the contact wire are connected with a very delicate galvanometer, which by its movements indicates the passing of even a feeble current of electricity. The wire having been placed in contact with the tissues at the edge of the wound, search is made for the metal substance with the probe. As the same metal is used for both the probe and the contact wire, as soon as the former touches a piece of metal of a different kind an electric current is set up which deflects the needle of the galvanometer. The amount of deflection is to some extent an indication of the size of the foreign body, the needle being moved by even the tiniest speck of metal, and violently agitated by a piece the size of a bullet. It is expected that the improved instrument will be a valuable supplement to the X-ray apparatus in the speedy location of bullets and fragments of shrapnel, and thus be the means not only of alleviating pain, but also of preventing the development of dangerous complications.

WATER-POWER IN FRANCE.

The increased price of coal owing to the war, together with the scant prospect of any substantial reduction after peace has been brought about, has accentuated the attention given of late years to natural sources of power. More especially is this the case in countries possessing no coal at all or in which the supply is unequal to the demand. Some interesting figures relating to the water-power available in France were given recently in *La Nature*, from which it appears that over nine million horse-power is obtainable from French rivers for one hundred and eighty days in the year. Corresponding figures for other European countries show that France is especially favoured in this respect, her water-power resources being considerably larger than those of Norway, Sweden, or Italy, or in fact of any other country, excepting perhaps Russia, for which no statistics are given. It is also interesting to note that although Germany's available water resources only amount to about one and a half million horse-power per annum, she has utilised 31 per cent. of them, whereas only 10 per cent. of French water-power is yet developed.

DISINFECTING FLUID.

The Annual Report of the Medical Officer of Health for the Metropolitan Borough of Poplar for the year 1916 contains some interesting references to the manufacture and use of electrolytic disinfecting fluid, which is made by the electricity department. During the year in question some fifty-three thousand five hundred and eighty gallons of this fluid were produced and distributed to various municipal undertakings and to the general public. Since the plant for making the fluid was installed, eleven years ago, four hundred and forty-five thousand five hundred and sixty-nine gallons have been produced, at a cost of about one-halfpenny a gallon.

LARGEST TELESCOPE IN THE WORLD.

America will shortly be in possession of the largest telescope in the world, if indeed the instrument is not already completed. According to *Nature*, 'The history of this great telescope dates from 1906, when Mr John D. Hooker, of Los Angeles, presented the sum of forty-five thousand dollars to the Carnegie Institution for

the purchase of a glass disc and to meet other expenses incident to the construction of a one-hundred-inch mirror for a reflecting telescope of fifty feet focal length.' A further gift from Mr Carnegie has provided for the mounting of the telescope in a suitable observatory. Far and away the most difficult piece of work in connection with such an instrument is the construction of the mirror, which consists of a glass disc accurately ground and polished, and covered with a thin film of silver. The casting of the disc was entrusted to the French Plate-Glass Company of St Gobain, and the number of failures produced before a satisfactory mirror was cast shows how difficult was this part of the work. Owing to many defects the first disc was rejected on delivery in California, where special buildings had been erected for grinding and polishing the face to the necessary curve. After being cast, such discs have to be kept in an oven at a high temperature for a long period, and the second and third castings broke during this process, which is known as annealing. Eventually a flawless disc was produced, and the grinding operation was begun. The face was first ground to a spherical curve, which was afterwards modified to a paraboloid, the latter operation taking about a year. Some idea of the exactness needed may be gathered from the fact that the difference between these two curves at the centre of the mirror was only one-thousandth of an inch. The mirror measures about one hundred and two inches in diameter, is nearly thirteen inches thick at the edge, and weighs over four tons. Mirrors for telescopes are silvered on the face, not on the back, as for the ordinary looking-glass. The silver coating is almost infinitesimal in thickness, and is deposited by a chemical process which in this case occupied fifteen minutes. Although the middle of the mirror was only one and a quarter inches deep below the edge, no less than thirty-five gallons of distilled water were required to fill the depression. The silvering operation used up thirty-two ounces of silver nitrate, one hundred and fifty gallons of distilled water, and certain chemicals.

MOUNTING OF THE GREAT TELESCOPE.

Very great care was taken to pack the mirror securely for its journey to the summit of Mount Wilson, six thousand feet above sea-level. The silvered face was covered with a layer of cotton-wool, and the mirror was subsequently crated on edge and mounted upon a motor-truck. Widening of the mountain-track for the upper half of the journey had to be resorted to for the transport of the mirror, other large parts for the mounting of the telescope, and materials for the building of the observatory. Owing to anonymous threats, armed guards accompanied the mirror in its journey up the mountain, this precaution being taken not only on account of the loss which would have resulted had the mirror been broken, but also because of the impossibility of replacing it under war conditions. The mounting for the instrument is naturally on a colossal scale, and the enormous weight is relieved by two huge drum-shaped floats which revolve in mercury-baths when the pointing of the telescope is altered in direction. As must be known to many of our readers, large telescopes have to be slowly moved from east to west to make up for the motion of the earth round its axis. This movement is effected by a clock, of such proportions for the instrument in question as to require a weight of two tons (four thousand four hundred and eighty pounds) to work it. Of course, such a weight could not be wound up by hand, and a powerful electric motor is provided for this purpose. It is of the utmost importance to mount a large telescope on an absolutely firm foundation. In this case the concrete pier supporting the mounting, which rests on the solid rock, measures twenty feet by forty-five feet at the ground-level, and it rises thirty-three feet. At the top is a circular concrete slab, eleven inches thick and fifty-four feet in diameter, the overhanging parts being supported by massive ferro-concrete brackets. Round the edge of this slab is a metal wall eight feet high, which reaches up to the floor of the observatory, where a water-seal renders the joint air-tight without making any actual contact that would transmit vibrations. The foundation pier is hollow, and has three floors, which are used for various purposes. Covering the observatory is the usual dome, in this instance one hundred feet in diameter, and built with an inner and an outer shell, the better to protect the telescope from changes of temperature. A slot from the zenith to the edge of the dome, which can be moved round, allows the telescope to be pointed to any part of the heavens. No less than thirty-five electric motors are required to give the necessary movements to the telescope and dome.

COMPLETION OF THE TRANS-AUSTRALIAN RAILWAY.

The recently completed line between Kalgoorlie, on the Western Australian goldfield, and Port Augusta, at the head of Spencer Gulf, in South Australia, forms the last link in the great chain of railways uniting the eastern and western coasts of the Australian Commonwealth. The new section, the construction of which was begun in the year 1912, is about 1050 miles long. At Kalgoorlie it joins up with the line, some 350 miles in length, which connects that city with Perth and Fremantle. It is anticipated that in the immediate future the traveller will be able to leave the incoming mail-steamer at Fremantle, and, journeying by luxuriously appointed fast train *viâ* Perth, Kalgoorlie, Port Augusta, and Adelaide, reach Melbourne in the course of about sixty hours. Thence, if he so desires, he may continue his journey by rail to

Sydney, Brisbane, and the towns of central Queensland.

PREDICTIONS AND PROPHECIES RELATING TO THE KAISER.

The article in the October issue of *Chambers's Journal* on 'Predictions and Prophecies relating to the Kaiser, Germany, and Austria' has been widely read, and has aroused much curiosity on the part of many readers, who have written to the editor for further information. The questions usually asked have been, who is Mr R. C. Wyndham, and what is his authority for the prophecies of Johannes the Monk? In reply to the first question, Mr R. C. Wyndham is well known in the Roman literary world, and has been resident in Rome for over twenty years. His address is 23 Via Silvio Spaventa, Rome. He was for a considerable time associate editor of *The Roman Mail*, an English newspaper published in Rome, but discontinued during the war, and was the first Roman correspondent to the Paris edition of the *New York Herald*. *Vaticinium Lehninenses*, mentioned in the article, was written in the year 1240, by Hermann, an anchorite of Brandenburg. The manuscript was presented in 1450 to the library of Magonza, and was printed in a publication entitled *Prussia Instructed, Hermann Redivivus*, reprinted several times between 1725 and 1873, the last time by Desclée of Lille in 1891. Napoleon I. declared the prophecy contained things 'superior to mortal intelligence.' Mr Wyndham's authority for the prophecies of Johannes the Monk is that of Signor Giuseppe Ciuffa, the well-known Italian writer, author of *La Guerra Europeo e le Profezia* ('The European War and Prophecy'), published by Descles & Co., Piazza Graziolo, Rome. Letters sent to Signor Ciuffa at this address will reach him, and Mr Wyndham is convinced that satisfactory replies can be given to all inquirers.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

INCHCOLM.

GRAY stones of an olden day!
Time has fashioned your slow decay.
Time has wrought, and its glamour clings,
For ye hold imprisoned the whisperings
Of dim, cloistered, forgotten things.

And still ye echo the seabirds' call,
Gray stones in a gray wall!
And hearken still, as ye did at birth,
To the wind's lament and the wind's mirth,
And the low croon of the troubled Firth.

Gray days and a gray year!
Such the tale of our sojourn here.
But ever within the walls of chance
The ghosts of a happier season dance,
And memory laughs at circumstance.

W. CLARK.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Volume VII. of the Seventh Series of CHAMBERS'S JOURNAL *is now completed, price* 10*s*. 6*d*. *net.*
A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.
A cloth case for binding the whole of the numbers for 1917 *is also ready.*
Annual subscription, including postage to any address, either at home or abroad, 11*s*. 4*d*.

The January Part of CHAMBERS'S JOURNAL (published about 21st December) will contain the opening chapters of a story of striking freshness and powerful interest,

ENTITLED

THE FORESTER'S GIRL,

By Mrs W. F. IRVINE BELL,

Author of 'John Pardon's Choice,' 'Ole Cam'ron,' &c.

Also 'The Mariner's Return,' by 'Taffrail,' and other exceptionally attractive stories, together with a host of entertaining and informing articles on subjects of world-wide interest.

END OF THE SEVENTH VOLUME.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

CHRISTMAS 1917.

THE LADY OF THE PINES.

By ALFRED COLBECK,

Author of *Wheal Catherine of Trencrom*, &c.

CHAPTER I.

SIDNEY BENTHAM, thin, pale, weary, sat meditating in his bachelor's quarters overlooking a mid-London park, with a distant glimpse of the Thames. As the butler cleared away the remnants of the dinner Sidney watched him. His bald head, his clean-shaven face, his speckless linen, the neat bunching of his white tie were all familiar; so were his quiet and rather slow movements and the clockwork-like exactness and efficiency with which everything was done.

'Poppleton,' said he, 'how long have you been with me?'

'Nine years, sir; and seventeen with your father.'

'Seventeen and nine are twenty-six. Have you ever had a holiday?'

'Two, sir, in your father's time.'

'In my father's time! I had the impression that one was due—from me, Poppleton. So I've decided to give you a holiday.'

'Yes, sir. When, if I may ask, and for how long?'

'When? To-morrow, perhaps, or next week—as soon as I can arrange it. And for how long? Say six months, or twelve, or eighteen—I really don't know, Poppleton—until I want you again.'

'Six, or twelve, or eighteen,' repeated Poppleton, as much surprised as ever he permitted himself to be. 'But, sir, you'll want me before half of the six are gone.'

'I may. Have you any relatives?'

'One sister, sir, in Derbyshire.'

'Would she take you in?'

'For three months, sir? She would be very pleased to.'

'I mentioned six, Poppleton, or twelve, or eighteen. Would she take you in for eighteen?'

'I think so, sir,' answered Poppleton dubiously.

'Mind, it's a holiday, Poppleton. I don't want any one else to snap you up.' Remembering his age, Poppleton knew there was little fear of that. 'Your salary will be paid by my solicitor, Mr Angold—you understand?—monthly, as you receive it now, only by cheque.'

'Yes, sir.'

'And five pounds a month to your sister.'

Poppleton's dubiousness vanished. 'It is very generous of you, sir.'

'Not at all, Poppleton. It's a mere matter of business, and the advantage is with me. I shall leave the flat. One of those accommodating firms that deal in second-hand furniture—better than new, as they are accustomed to advertise—will clear everything out, lock, stock, and barrel, after we have gone.'

'I to Derbyshire, sir; but you—where will you go, sir? Shall I hear from you?'

'I don't think so, Poppleton. Still, you can get at me, if you wish, if there is any real need for it, through my solicitor.'

'You haven't passed the doctor, sir?'

'No! Worse luck! He refuses to have me at any price—says I shall spend my time in the hospital. They have more than enough of my sort already.' And he made a wry face, and bit viciously at the end of a cigar which he ought not to have indulged in. Biting it was a sign of vexation. He usually cut his cigars neatly. His vexation continued. He ejected the badly severed end just as viciously, and added, 'He's right.'

'I'm sorry, sir.'

'Thank you, Poppleton,' Bentham replied, after a pause, and with a swift glance at his servant's sympathetic face. During the pause he had conquered a rush of resentment. Pity, even the kindly pity of his servant, hurt him. 'I shall not require anything more;' and he dismissed him.

Bitter thoughts assailed Bentham. He was very lonely. All his friends, or nearly all, were in the army, officers mostly, some at the front, others in training. Two or three of them had enlisted as ordinary privates. He admired these. His own doctor had told him plainly that he was not fit. The army doctor, after the briefest examination, had shaken his head, and said, 'It's all very well, Bentham. You've pluck enough. But you haven't stamina. We want men as hard as nails for this business, or men we can hammer into hardness; and you—well, you'd soften, and melt away. It's not your fault. I'm sorry.'

And Poppleton, knowing him better, shared the opinion of the doctor, and echoed the doctor's final words.

But Bentham felt that he must do something. He must not be quite out of it. He had formulated a plan. Poppleton's holiday was a part of it. He would fit in the other parts, and prepare to carry it out, on the morrow.

'In a moment, Bentham,' said the solicitor, slipping a rubber band over a batch of papers, and swinging his pivoted chair round to place them in a pigeon-hole of his private desk. 'Now!' and he swung back again. 'I'm glad to see you;' and his quick gray eyes scrutinised the attenuated face of his client as he held out a plump and well-groomed hand. He was old enough to be his client's father.

Sidney explained succinctly what he wished the solicitor to do for Poppleton.

'For eighteen months?' repeated the solicitor, pencilling down the instructions.

'More or less,' said Sidney.

'That's indefinite,' remarked the solicitor.

'I desire it to be,' said Sidney. 'About myself'——

'Yes?' and the questioning affirmative dropped into the pause.

'This is quite confidential, a secret to all but you, Angold.'

'I can keep a secret,' smiled the solicitor, anticipating something utterly different from what his client had in mind.

'You know where I get my income from?'

'The greater part of it—yes: from the Ryeburn Collieries.'

'I have never been to Ryeburn. But I intend to go, not as Sidney Bentham, but as Ben Sidney; and not as a shareholder, but as an applicant for work.'

'In the pits?' remonstrated the solicitor. 'The work'll kill you. If that's your wish, you'd better try the trenches—far better.'

'Perhaps. But, you see, the "far better" cannot be without formalities—medical examinations and what not; and there are hospitals to consider, and their upkeep, and the possible claim to a pension. So my way to the trenches is barred. It isn't barred to the pits.'

'But—Bentham—underground! You'd never stand it. It's a mad idea.'

'I shall try for something on the surface. My purpose is to release a healthier man than I am—to do his work that he may do my fighting. I shall not put it like that. But that will be my purpose primarily. A secondary purpose will be served. I shall get to know the conditions out of which my income springs; and I jolly well ought. Don't you think so?'

'Not in that way. It's a mad idea,' repeated the solicitor.

'Well, there's method in my madness, anyhow. You'll see to Poppleton. I'll see to myself.'

'Shall I remit you any fixed allowance?'

'Goodness!—no! I shall be a workman.'

'If you're hard up?'

'I'll write you.'

'Without delay, Bentham—without delay. You're not strong. And I'm concerned for you, as the son of your father, who was my oldest and dearest friend. I fear—— But there! you've a will of your own; and you're your own master.'

'Until I become a workman.'

'Become! You cannot become. You may try to play the part—comedy, I hope, and not tragedy. Be careful! And may your man, the man you release, fight like a hero.'

CHAPTER II.

THREE days later a stranger entered Ryeburn, carrying a battered portmanteau. He was warmly clad in a mixture of rough tweed. Round his neck was a linen collar of rather conspicuous whiteness, set off by a faded blue tie. This plain attire was a marked contrast to that of the colliers returning from the pits.

They were collarless, leather belts buckled about them to keep up their soiled moleskins and corduroys, vests open, revealing flannel shirts of coarsest textures. Bottle-necks were protruding from their pockets. Square tin food-boxes were swinging listlessly in their knotted and grimy hands. The contrast was intensified by the stranger's gait; for most of the pitmen, powerfully built, drooped sideways and seemed almost misshapen, and their legs, slightly bowed, shambled rather than walked.

'That's a bit heavy for thee, my lad,' said one of the colliers, as the stranger dropped the bag and looked about him. 'Let me tak' ho'd 'n it!' and he passed his food-box into the other hand. 'Theear!' and considering the ease with which he lifted it, the portmanteau might have been empty. 'Ar' t' goin' far?'

'Only as far as where I can get a decent lodging.'

'Lodgin's are scarce. There's seven pubs, but no lodgin's. We don't cater for visitors. Ryeburn's hard to beat for healthiness, but it isn't a spaw exactly. There's too much coil abaht. What says tha to comin' wi' me and axin' Sarah? She'll tell tha if any decent body i' Ryeburn can put thee up.'

'Thanks!' said the stranger, falling into step with him.

'It's nowt,' returned the collier, alluding to the portmanteau. 'Has t' ever been i' Ryeburn afore?'

'Never.'

'It's an airy place. We get some rare winds here. There's pines at t' back on 't, higher up, and they say 'at t' smell o' t' pines is good for folk;' and he glanced inquisitively at the stranger. 'Ryeburn's noan to be sneezed at.'

But the stranger was not communicative. Relieved of the weight of his portmanteau, he breathed more easily, and, without undue strain, he kept up to his helper's shambling pace. Beneath the coal-dust, he saw that the collier's face was shrewd and kindly, and seamed with many lines. The shock of hair escaping from beneath his soft cap was iron-gray. His closely cropped beard was grayer still. He judged him to be a man well over sixty.

'Here we are!' said the collier, stopping at an old cottage at the top of the village; and, pushing the door open, he called, 'S-a-a-r-a-h!' in musical tones.

Sarah, a buxom woman near his own age, appeared, and stared at the stranger. Her husband tersely explained why he had brought him.

'Come in,' she urged.—'Put t' bag dahn, Daniel. We'll talk abaht t' lodgin's ovver t' dinner.—Come in. And what may yo'r name be, mister?'

'Ben Sidney,' replied the stranger.

'Which is it to be—Sidney or Ben?' she asked.

'Ben,' he replied promptly.

'It's more homely,' she assented.—'Nah, Daniel, tak' t' top off o' that coil-dust, and we'll begin. Ben'll relish his meyt more if he faces a man o' natural colour. Not but what he'd do wi' a touch more red.'

Ben acknowledged the wished-for improvement with a winsome smile. He was passing into a new experience under a new name.

As Angold had told him, however, it was only a play. He might try to hide himself under the tweed mixtures, to pass himself off as the needy proprietor of a battered bag, to answer as naturally as he was able to the homely name Ben; but he could not conceal his attenuated hands, his thin, pale face, the delicate handling of the clumsy cutlery, the inadequateness of an appetite that should have been sharpened by Sarah's tempting viands, the refined manners that were habitual to him, the undiluted English, so unlike the idioms of the Ryeburn countryside. He was puzzled somewhat by the Doric of Daniel and Sarah, and obliged to answer monosyllabically, and not always to the point, preferring this to attempts at elucidation by hesitating inquiries. He made a mistake, too, by putting his hand in his pocket after the meal and placing half-a-crown on the table.

'What's that for?' asked Sarah sharply.

'I must pay for my dinner,' he replied.

'Put it back—put it back,' she expostulated. 'Do you want to insult us?' and her comely face flushed with anger.

He flushed also, realising his mistake, and meekly obeyed her.

'As if we couldn't thole a meal's meyt!' she exclaimed indignantly. Then, her anger subsiding, 'It's too late nah for you to go traypsin' abaht Ryeburn after lodgin's. You'd better stay here to-neet, at ony rate.'

'But can you conveniently accommodate me, Mrs Bradley?'

'I can let you have a flock bed, and cleean sheets, and warm blankets, and a room all to yoursen.'

'That would suit me splendidly,' said he; 'only, you must allow me'—— and he paused, remembering his mistake.

'Only what?'

'Don't be offended, Mrs Bradley! You must allow me to pay.'

'Two o' t' lads are sowjers, you see,' explained Mrs Bradley, ignoring the question of pay, 'and it's their bed 'at's empty. We've another lad, t' pick o' t' bunch, 'at's mad to go. He'll be in sooin. Phil's a clever lad, and can talk your talk, or as near as matters nowt. You'll get on wi' Phil.—Willn't he, Daniel?'

'He should do,' answered Daniel, who had risen from the table, and was passing into a back-kitchen to complete his ablutions.

But when Phil came, a tall lad of nineteen, with his mother's amiable features, he was shy

with the stranger. He eyed him inquisitively. He could not place him. Speaking to his father and mother he lapsed into a partial Doric; but speaking to Ben he used the English of the county school, where, because of his aptness to learn, he had attended longer than most lads, and still assisted the master at the evening classes. But Ben's intonation was not his. It increased his shyness. Ben tried to set him at ease, overdid it perhaps, and failed. When Phil excused himself, pleading an evening engagement, and left early, they were both relieved.

Ben stayed on at Daniel Bradley's. No other lodgings offered or were sought for; and he and Mrs Bradley had come to an arrangement which satisfied the pride of both. Ben was a problem to the collier and his wife, and a greater problem still to Phil. He spent the first fortnight mainly among the pines; and the fresh breezes that sang through them, and the aromatic odours inhaled with every breath, strengthened him. A ruddy tan began to spread over his face, and the back of his neck began to burn brown. Daniel suggested that he was a gentleman 'baht brass or nearly,' invalided, and in search of health, and that he would probably stay a month. Sarah was doubtful. Her tentative invitations to the stranger to confide in her had not been responded to. 'He's as cloise as a cockle,' said she—'and as soft,' she added, as a charitable modification, lest her husband should think she referred to the shell only. Phil, who had overcome his shyness, and who had taken quite a liking to Ben, simply awaited developments.

But Phil's time was short. He had heard his country's call. Men were needed. His elder brothers had gone. Why should not he go? The manager at the colliery said he was indispensable. Phil had to do with the time-keeping, the wage-sheets, the insurances, the checking of accounts, and other clerkly work, intricate perhaps, and only efficiently done by close familiarity and training; but surely, he argued, some one else could do it, under the tuition of Bryce, the secretary and cashier.

'Women do it at the banks and in many of the business offices,' said he.

'Ours is different,' objected the manager. 'It isn't ordinary book-keeping. You have to go below sometimes. We couldn't send a woman down the shaft. And what could a woman do with a crowd of rough colliers? Be content, Phil! We must have the coal—that's an essential; and you can serve your country where you are.'

But Phil was not content. He felt that he could serve his country better by enlisting. His mother desired, quite naturally, having parted with two, to retain her youngest. His father was reticent, unwilling to influence him either way. 'Pleease thysen!' said he. Phil, with his increasing confidence in Ben, consulted him.

'What would *you* do?'

'You see what I'm doing,' returned Ben bitterly.

'But if you were in my place, with my work, as strong as I am?'

'I should go.'

'Of course. And I ought to. It's not my look-out—it's the manager's—to provide for the vacancy.'

'Could I fill it?' ventured Ben.

'You?' and Phil regarded him in a new light. 'What sort of a penman are you?'

'My writing's legible,' answered Ben. 'It's not quite copperplate, but people can read it.'

'Do you know anything about percentages, and insurances, and contracts?'

'No,' replied Ben honestly. 'But I could learn.'

'I go underground sometimes. The galleries are low in places, and at the face the ventilation isn't perfect. The men, too, are not your sort. Still'—— And Phil fixed his eyes upon him, as if to appraise his fitness for the position. There were questions he could not ask him. He concluded, 'Will you see the manager?'

'Gladly. And I'll work under you for a month without wages, and try to get into the run of it. If I don't suit I can withdraw.'

'Will you propose that?' asked Phil eagerly.

'Yes.'

They saw the manager. Phil introduced him, and Ben explained his offer.

The manager, impressed by the manner in which the explanation was given, and the bearing of the man, said straight out and brusquely, 'Who are you?'

'Phil told you I was Ben Sidney,' he replied, suppressing his resentment. His cheeks burned, however, and a dangerous light flashed into his eyes.

'Have you any references? The position is a responsible one.'

'I could furnish several, I dare say, in a few days, if you require them.'

'One would do.'

'You shall have it.'

'And in the meanwhile'——

'I could help Phil,' interposed Ben; and the manager, scrutinising him, assented.

Five days later, schooling his face to gravity and summoning all his powers of self-control, Ben handed to the manager the written name and address of his single reference. The manager glanced at it and started slightly. Mr Angold was the solicitor for the company which controlled the whole group of pits.

'Is it quite satisfactory?' asked Ben.

'I will write him,' answered the manager.

'Thank you,' said Ben. 'You will let me know if it isn't?'

The manager nodded, and Ben retired, drawing the door to silently. When he was safely beyond it, and free from observation, his features relaxed into a slow smile.

'Well, I'm blest!' exclaimed the manager in a low tone, afterwards indulging in a somewhat rare reverie.

CHAPTER III.

HE had good reason later to congratulate himself on his blessedness.

As Phil's substitute Ben was doing his work well. Phil had followed a prescribed routine. Ben did more than that; he showed an intelligent interest in many matters outside the range of his own duties; he studied the map of the mines; he obtained a clear idea not only of the underground workings, but, where the pits were contiguous, of their connections with, and relations to, each other. Mining itself, as a scientific occupation—levels and roofs, faults and dips and strata, the lie of the land, the pull on the surface, haulage, lighting, ventilation, machinery—appealed to him, and engaged his thoughts. Not that he said much. He was unassuming, and scrupulously attentive to the work he had to do. But his knowledge, or, rather, his grasp of other work, leaked out, and the manager heard of it; and sometimes, to satisfy himself, to discover, too, who the man was, he put it to the proof. The solicitor's reply had been very brief and not illuminative. He had simply said that Ben was trustworthy, and he had advised the manager to engage him.

The manager knew that Ben was not what he pretended to be. The way he carried himself, a flashing gleam in his eyes, an occasional inflection in the tones of his voice, gave the manager the impression that he had seen him before or met some one very like him. The impression was fleeting. He was only acting the workman; but what did it matter, after all, so long as the work was efficiently done?

Phil had left in the autumn. The winter passed, and spring came, and with it the awakening of a lovely countryside. It was a joy to Ben. He made no companions. He spent his leisure in the fields and woods.

In time, as Ben Sidney, and a clerk, he appeared before the local military tribunal, was medically examined, and placed in Class C3. The manager was satisfied. There would be no need to appeal for the retention of his services. He might be able to keep him, possibly without appeal, to the very end of the war.

The increasing pressure of the war greatly restricted the supply of timber. Props were scarce and very dear. But the pits must have them. Cautiously, with the lapse of the months, the manager had become more intimate with Ben, and one day he mentioned to him the difficulty he was in.

'We've had the props from Norway,' said he, 'but now we cannot get them.'

'Why not try nearer home?' suggested Ben.

'We shall have to. But we shall have to buy the standing trees; and that's new to us. An expert might tell us what a wood is worth; but the employment of an expert would add to the cost, and it's a heavy price already.'

'Dare you trust me, Mr Seldon?'

'What! to appraise the value of a wood?'

'Yes, based on its adaptability to your purpose.'

'Ben, where did you learn such phrases? They're not a working man's. No man here would have put it like that. I shouldn't myself.'

Ben's colour came. 'That's not the question. Dare you trust me?'

'I dare,' replied the manager. 'We'll have a look to-morrow at the small plantation on the farther side of the hill; not the one at the top, the one beyond, a couple of miles away.'

Ben was pleased, for sentimental reasons, that the manager had not fixed upon the one at the top. He had been there often, and three times, once in the late autumn and twice recently, he had come across a young lady sketching there. She was unknown to him. He had made no inquiries about her. When he had seen her, seated in one of the glades, and transferring to her canvas, idealised perhaps, a panel-like picture of the distant country framed by the columnar trees, he had turned aside. He would no more have dreamt of obtruding upon her than if the glade had been a private studio. She was very fair. The contour of her stooping form had not been lost upon him. He associated her with the crown of the hill. He thought of her as the Lady of the Pines.

They had to cross the crest to reach the plantation on the farther slope. A path, diverging from the road, led across a couple of fields and entered one of the glades. Just within it, and unseen until they were nearly upon her because of the sharpness of the declivity, was the artist, palette in hand, and busy with her brush. The golden light of the westering sun glinted between the blown locks of her wayward brown hair. She had heard their footsteps and voices before they came within view, and, at their nearer approach, she calmly levelled her clear gray eyes upon them.

The manager raised his hat. Ben lifted his cap out of courtesy.

'It's a fine afternoon, Miss de Lisle,' said the manager.

'Lovely,' said she, bending to wash one of her brushes.

'May we'—— and the manager indicated the canvas.

'With pleasure;' and she smiled radiantly.

'It's not much to look at—a mere wash as yet, with just a touch of sky.'

The manager was now standing beside her. Ben moved behind him. He glanced at the canvas. The first underlying tints were washed in, as she had said, and the sky was an experiment. The splashes of vivid orange across the violet-blue were so conspicuous as to produce a bizarre effect. Ben was more interested in the artist than in the picture. Unseen, he could take in the poise of her head, the delicacy of her fingers, the lissome slimness of her bending form, a picture finer and more alluring than the fields, light strewn, and framed between the straight trunks of the red-brown pines.

'Is the squire at home?' asked the manager.

'Yes, Mr Seldon. Do you wish to see him?'

'In a day or two—probably,' he added as an after-thought, the certainty depending upon Ben's valuation of the wood. 'Good-afternoon!'

She inclined her head by way of adieu, and continued her sketching; indeed, she had never paused, but painted on, chatting, unperturbed by their presence. She had not spoken a word to Ben; she had scarcely glanced at him; and Seldon had not thought fit to introduce him. He was only a workman; or if not—and Seldon suspected not—he must take the consequences of playing a workman's rôle.

They passed through the wood and emerged into the open. The land dipped into a wide valley. Across the valley, midway up the slope of the opposite hill, Brockwell Manor, the home of the De Lisles, was set back among the trees, its long low façade of yellow freestone warmly illuminated by the sinking sun. The windows flashed like mirrors. Below was the plantation. A trout-stream ran along its nearer margin and parted it from the lush meadows. The trees, well grown, followed the curves of the stream upward into a hollow of the hills, and a few, like scouts, straggled out as far as the windy summit.

'Will he sell?' asked Ben, after a long silence, as they dropped together down the hill.

'Who? The squire?' responded Seldon. 'I don't know. We can try him.'

'It would spoil the valley,' said Ben, 'and deprive him of an excellent covert. Is he a sportsman?'

'Yes. But what of that? We must have props.'

'It remains with him to decide. If the plantation were mine'——

'Well?'

'I should think twice about it.'

'So will he—three times. Still, if he's patriotic—and he is—he'll see that coal just now is much more important than game. Oh yes, he's patriotic. He's offered the Manor to the War Office as a hospital, or a convalescent home, or something of that sort; and any wounded chap would have jolly good reasons to thank his lucky stars if he got in there.'

Ben silently agreed with him.

They viewed the plantation. Ben ran his appraising eyes over it, and noted the closeness and average girth of the trees. Crossing the stream, they paced the lower line of the plantation, then returned and walked up the hollow, the stream dwindling, and then disappearing within the wood, until at last they came out among the stragglers on the summit.

'It's worth buying,' observed the manager.

'At a certain figure—yes,' returned Ben. 'What is the present market price for props such as you require—cut into lengths, I mean, and delivered at the pits?'

The manager told him.

'And, if the squire sells, he'll probably want you to provide your own fellers, and to do your own haulage. H'm!' For several minutes he stood quite still, absorbed in an intricate calculation. Then he mentioned the sum. 'You couldn't afford to pay much more than that—a trifle maybe—and you ought not to pay less.'

'Ought not to pay less! It's a business transaction.'

'And business should be fair.'

'It's always fair to buy at the lowest price possible.'

'You're the manager;' and Ben shrugged his shoulders.

'I am,' acknowledged Seldon, with a curious glance at him, followed by a quiet laugh, 'and I must look after the interests of the company. But you're not a—yes, you are. Excuse me! You're an admirable clerk, and something more—a competent valuer of standing timber.'

'Not quarrelling, gentlemen, I hope?' a voice interposed; and they turned to find the squire approaching. Their voices, in the stillness, had carried farther than they thought. He had come through the wood. His wrinkled, ruddy face wore a pleasant expression. His quick gray eyes were sparkling with suppressed merriment. Except for an observable trimness in his attire, he might easily have been taken for one of his own gamekeepers.

'Far from that, squire,' said Seldon, shaking hands with him. 'I and my'——

'Yes?' and the squire turned to Ben.

The manager was amused. He had paused slightly, and the squire had popped in his interrogative. He resumed, smiling, 'I and my clerk were discussing business.'

'Oh! your—clerk.' The squire put up an eyeglass and stared at Ben coolly, but not offensively, and ended by saying, 'I'm glad to meet your clerk;' and he proffered his hand.

Ben, secretly annoyed at Seldon, but openly pleased with the squire, clasped his hand instantly. For another long moment the squire stared at him; then, as he raised his eyebrow, the monocle fell with a click.

'Discussing business, were you?' said the

squire. 'I had the idea that that was mostly done in offices by managers and—clerks. I may be intruding; and so I wish you good-day;' and he raised his hat to both.

'No, squire—no!' disclaimed Seldon. 'We're the intruders. This is your land; and the business concerns you.'

'Indeed!' and the squire turned again. 'How does it concern me?'

'We're in want of timber.'

'And you wish to buy? Is that it?'

'Yes. We've been looking over the plantation. Would you entertain an offer for it?'

'For the timber? As it is? What do you want it for? Props?' The questions came swiftly, like a series of revolver-shots, and were quite a contrast to his rather slow preceding remarks.

'Yes,' said the manager. 'We cannot get props from Norway. The war's playing havoc with the timber trade.'

'And with many another,' returned the squire. 'But not with the profits of your company, Seldon. Coal's going up, props or no props; and the men are kept at it, with bigger wages, and a war bonus. The men earn all they get, but I wish you could persuade them to make a better use of their money. I'm glad they're kept at it. My game's safer. But—the drinking! What fools they are! So you want to buy the wood? I'll think about it.'

'And you'll write me, squire?'

'No! Send your—clerk—Mr'——

'Sidney.'

'Send Mr Sidney, your clerk, up to the Manor on Monday, and I'll give him my decision. Let me know through him what price you can go to. And,' a trifle sarcastically, 'when you fix the price, Seldon, remember that I'm not obliged to sell, nor, except for the special circumstances, disposed to sell. And now, gentlemen, good-day!'

CHAPTER IV.

ON Monday, late in the afternoon, Ben called at the Manor. He had completed his day's work at the colliery. Notwithstanding the demand for coal, and the higher wages, and the war bonus, many of the colliers kept 'Saint Monday.' They refused to work on that day. Some of them failed to appear on the Tuesday. 'Much would have more.' It was generally the middle of the week before the company could reckon upon its full complement of men. Ben's tasks were always lightest on the day of the colliers' uncanonised saint.

The squire received him in the library.

'You've come about the wood?' he began. 'Well, Sidney'——

The name dropped out so pat that Sidney was taken aback. Only his closest friends had so addressed him. It was his home name, the name of his boyhood, familiar on his mother's lips, and frequently used by his father too, when both were living. The squire's use of it gave him a perceptible shock.

In an instant, and on the impulse, he interposed: 'Ben—that is what Seldon calls me, squire, and all the Ryeburn people.'

'I prefer Sidney,' said the squire, wrinkling up his face—'that is, if you have no objection. Seldon said Sidney; and in transactions of this kind the surname seems to me to be the more appropriate.' He spoke dryly.

'If you prefer it,' returned Ben, a trifle pale. 'Yes, I've come about the wood. Have you decided to let us have it?'

'I was going to ask, when you interrupted me, what price Seldon had authorised you to offer. It depends partly upon that.'

Ben named the sum.

The squire concealed his surprise, and said, 'Was that amount arrived at by a valuation?'

'Yes.'

'Whose?'

'Mine.'

'Yours? My preference for Sidney is justified. The surname is certainly the more appropriate. You may be Ben to Seldon; you are Sidney to me.' The dryness had disappeared from the squire's tone. He was speaking cordially. And yet Ben could not quite follow the movements of his mind. 'I took the trouble myself, Sidney,' the squire went on, 'to have the plantation valued, with the result—a remarkable coincidence—that the amount is yours exactly.'

'By a professional valuer?'

'By a professional valuer. And I infer from this remarkable coincidence that you are not a clerk.'

'What, then?' and Ben was betrayed into a smile. 'A professional valuer?'

'No, Sidney. Believe me, I'm not so dense as to draw that conclusion. You must have inside knowledge of the value of standing timber. The question is, how did you get it? And the answer is, from those before you. You couldn't grow the wood in your own lifetime; you're young yet; but your father, or his father, or the father before him, with excellent foresight, planted, as did mine; and the wood, with the inside knowledge of its worth, came to you through them. Is my inference correct?'

Ben was fairly caught, and said, laughing, 'You've got me.'

'So Sidney's the name between equals—not Ben.'

'I agree.'

'And you'll stay to dinner?'

'I cannot agree to that;' and Sidney glanced at his tweeds.

'Why? Because you cannot dress for it? I can fix you up—not with my own; they wouldn't

fit you—with Jack's. He's tall and slim, like you, but as tough as pin-wire. He's at the front, in those abominable trenches, and'——

'I wish I were.'

'Oh! that's it?' and the squire looked at him with a touch of commiseration, noticing the longing in his face, and aware of the longing in his tone. 'You'll stay—as a favour, Sidney?'

'Well, if you put it like that'——

'I do. Besides'—and there was a twinkle in his eye—'we haven't settled yet about the sale of the wood. We must leave it over. It wouldn't interest Phyllis, or, if it did interest her, you would find her against you. On artistic grounds she would oppose the sale of the wood. Props wouldn't appeal to her.'

'Not if they were linked with patriotism?' put in Sidney.

'Perhaps,' mused the squire. 'You would bring in another factor then that might possibly balance the artistic. Still, as a matter of policy, I would advise you to defer the discussion until after dinner.'

Sidney had clean forgotten Miss de Lisle. How would the squire account for the sudden invitation to dinner? He would have to introduce him—under what name? It was useless to keep up his masquerade as a quasi-clerk in the presence of the squire. Was it worth while to begin it with Miss de Lisle? He had a secret wish to meet the Lady of the Pines on equal terms. He would risk it, and trust to the squire to pull him through.

He felt more like himself in Jack's borrowed plumes than in his own well-worn tweeds—more like himself than he had felt since his arrival in Ryeburn. He had entered his own world again. As the drawing-room door opened, the squire, pleased at his transformation, came forward to meet him, and turned with him towards his daughter.

'Phyllis, this is Mr Sidney.—My daughter, Miss de Lisle.'

She acknowledged the introduction, and glanced at him keenly, critically, but without the slightest recollection of having seen him before. The transformation was complete. Her father had simply told her that there would be a guest for dinner, a gentleman who had called to see him about the plantation in Brockwell Hollow. She had asked no questions; but she had expected some one nearer her father's age.

At the dinner-table mutual opportunities presented themselves of closer observation and acquaintance. They sat opposite each other. She was indeed very fair. Her filmy evening-dress, silvery, with a tinge of azure, enhanced her fairness, and confirmed Sidney's first impression when he had caught sight of her among the pines. Her clear gray eyes shone lamp-like in the delicate oval of her face. The frankness of her gaze pleased him—a gaze without a shadow. Her hair was brushed back in open waves and caught up in a mass behind her shapely head. The colour of it reminded him of the sunlit bark of the pines.

The conversation turned upon the acceptance of the Manor by the War Office as a centre for convalescents. A small medical staff had been appointed, and a few nurses; for it was intended to send men who still needed attention, men recovering from surgical operations more or less severe.

'And Phyllis,' remarked the squire proudly, 'is to superintend the domestic arrangements, to see to the creature comforts of all our guests.'

'And fill up my time nursing,' added Phyllis.

'If you have any time to fill up, Miss de Lisle,' returned Sidney. 'Your time will be fully occupied, I fancy, with the domestic arrangements. It will be no light task to cater for them all.'

'My experience at the camp will help me,' responded Phyllis. 'Have you seen the camp, Mr Sidney?'

'Only from a distance,' he replied. 'What experience have you had there?'

'I have taken my share in the work of the canteen,' said Phyllis, 'and got to know the tastes of the men.'

'But you are to have men here back from the firing-line—men who have been in the thick of it, and suffered; and their tastes may change.'

'While they are suffering, Mr Sidney; but we are to have them afterwards. And their tastes will revive.'

'So they will, Phyllis,' said the squire. 'A reviving taste is a sign of convalescence.'

'They are to be guests?' questioned Sidney.

'What else?' demanded the squire. 'We shall treat them like a happy house-party.'

'And so,' commented Sidney, 'they will be both favoured and fortunate.'

Then they spoke of the training-camp, half-a-dozen miles away, and Miss de Lisle entertained them with incidents connected with the canteen, and the gathering of the men for their sing-songs. Her only regret in relation to the new work at the Manor was that she would have to relinquish her visits to the training-camp, where, in the 'hut' provided by her father, she had contributed in many ways to the healthy recreation and enjoyment of the men.

When she retired the squire said abruptly, 'You'll fell the trees and move them?'

'Of course,' replied Sidney.

'Then that's settled,' returned the squire.

'At the price I named?' queried Sidney.

'Certainly. I cannot haggle,' said the squire. 'I'm not used to it. The valuations agree, so the price must be right. They're independent valuations. You don't know my man?'

'I don't,' assented Sidney. 'But he knows his business.'

'And you?' The colour crept into Sidney's face. 'You needn't answer,' the squire went

on. 'And now that that's done with, will you come into the library and have a smoke with me; or shall we rejoin Phyllis?'

'I'll forgo the smoke, squire, if you don't mind.'

'Or defer it. Will you stay the night?'

'I must get back—thank you! Mrs Bradley will be wondering already what has become of me.'

'Mrs Bradley?'

'Of the cottage where I lodge—a miner's wife. And I'm due at the office at six-thirty in the morning.'

'Self-discipline, Sidney!'

'And self-imposed. It's worth it. The fellow I've released is at the front, and he's doing well—better than I could do. I think of him as my substitute, to salve my conscience partly, and partly to outmanœuvre those over-scrupulous doctors who wouldn't dare to pass me. I'm relegated now to Class C3,' making the confession with a wry smile.

'Who is he?' asked the squire, after a reflective pause.

'My substitute? Mrs Bradley's youngest. She's three, and they're all there.'

'A generous contribution;' and the squire, aware of a sudden moisture, began to blink his eyes. 'I honour Mrs Bradley,' said he huskily, 'and her husband too. We're giving the best we have, rich and poor alike. God help us! We ought to win.'

'We shall.'

'With God's help,' repeated the squire, 'we shall.'

Phyllis was a little surprised when they rejoined her so speedily.

'Will you play for us, Phyllis?' asked her father.

'With pleasure,' she replied, placing her needlework on one side, and moving towards the piano. She fingered it softly, an improvisation that did not interfere with the talk, and merged itself presently into a well-known air.

'That's the sort,' remarked her father approvingly.

'And not this;' and from the well-known air she drifted into a classical sonata. When she had finished, she said, 'Your taste needs cultivating, dad.'

'I am past it, my dear.'

The drawing-room door was ajar. In a lull of the music they heard the thrill of the electric bell. The outer door opened. A wave of cool air rushed into the room.

'Is Ben here?' asked a rough voice.

'Ben?' queried the butler, in suppressed amazement.

'Excuse me,' said Sidney, hastening into the hall.

Phyllis, more amazed than the butler, rose and walked across the room, seeking, open-eyed, an explanation in her father's face. Nor was her amazement lessened when she saw that he was quietly smiling.

'I say, mayster, where's Ben? This chap's lost his wits,' said the voice.

'Daniel!'

Silence followed, then an exclamation, accompanied by a resounding slap. 'Well, I never! Has' tha fun' new lodgin's and ta'en up wi' t' squire?'

'No, Daniel. I was coming home.'

'And time, too. It's nearin' midneet.'

'I'm sorry, Daniel. I'll be ready in a few minutes. Were you uneasy about me?'

'Sarah's uneasy.'

'I ought to have thought about the time.'

'Or dropped a hint 'at t' squire might keep tha; then it wo'dn't 'a' mattered. I'll wait.—How do, squire?' for, as Sidney disappeared, the squire came into view.

'You must forgive us for keeping him, Daniel.'

'It's nowt. You've a reight to keep him, and he's a reight to stay; but Sarah—my wife, squire—were upset a bit, and fearful 'at some'at had happened him.'

'It's greatly to her credit, Daniel, that she's so concerned about her lodger.'

'Ben's more 'n a lodger, squire. Sarah thinks as much abaht him as if he were one o' t' family.'

'He needs motherly care.'

'You're reight theear, squire—and motherly, that's Sarah.'

'And yet I hear that all her sons have gone.'

'Ay! All t' three;' and Daniel's face sobered. 'Phil's t' youngest. He went t' last. God bring him back! If owt happens to Phil, it'll break her heart. And you've one theear, squire,' he ventured sympathetically.

'My only lad.'

CHAPTER V.

WHEN the squire returned to the drawing-room Phyllis faced him with a puzzled look in her eyes. 'Who is he, dad? What is he to Mr Sidney? Why has he come for him? I cannot understand it.'

'First, my dear, lest I forget, Sidney wished me to express his regrets to you for so abrupt a departure.'

'But the man who came for him,' urged Phyllis, a little impatiently—'who is he?'

'Daniel Bradley, a miner, who works at the Ryeburn pits. Sidney lodges with him. That is the only connection between them, I believe, except'——

'Except what?'

'Sidney told me that he had taken the place of Bradley's youngest son. He was a clerk at

the collieries. He enlisted some time ago, released, I think, by Sidney's offer to fill his place.'

'Then is Mr Sidney a clerk?'

'He 's acting as a clerk.'

'Acting? He 's a clever actor.' She felt that she had been taken in, and she very naturally resented it.

'You 're mistaken, Phyllis. He 's not a clever actor.'

'But, dad, a clerk! And see how he carried himself off here.'

'Which proves my statement, Phyllis. He carried himself off here as he really is—a gentleman. He 's acting as a clerk, and not cleverly; still, efficiently, I believe, so as to satisfy the manager. Your point of view is inverted.'

'Oh!' exclaimed Phyllis dubiously. 'Why did that man fetch him?'

'Because his wife was concerned about him. It is late, my dear, and she expected him back hours ago. It is my fault mainly. I pressed him to stay.'

'Knowing he was a clerk?'

'Knowing he was a gentleman.'

'You should have told me before, dad.'

'Perhaps I ought to have told you. But there was very little time, my dear. And, besides, I thought it didn't matter. Does it?'

'It might have made it easier for me,' responded Phyllis. 'I should have understood better when—when—Mr Bradley came. It puzzled me. Did Mr Sidney call about the wood?'

'On behalf of the colliery company.'

'And not on his own behalf? My impression was that he had called to consult you about the preservation of the game. And you can see now, dad, that that was absurd. It put me in rather a false position. The colliery company, you say?'

'Yes. They want to buy the wood.'

'To buy it! Why, pray?'

'For pit-props.'

'Dad!' incredulously.

'Sidney made me an offer for it.'

'A useless offer, of course. You 'll not sell.'

'I have sold.'

'Dad!' reproachfully.

'It 's like this, Phyllis. The timber is needed. There 's no foreign timber coming in. We must have coal. It cannot be got without props. And the wood is specially suitable for props. I told Sidney you would object. To cut the wood down would utterly spoil the artistic beauty of the Hollow. He countered the objection by connecting props with patriotism.'

'Patriotism?'

'Yes. Rather a curious connection, Phyllis, brought about by the war. We must sacrifice the artistic beauty of the Hollow to the exigencies of the war.'

Phyllis was quiet for a time, musing; and at last she said, 'What about the money, dad?'

'It 's yours, my dear.'

'To provide for our guests;' and her face brightened as she lifted it to his to give and receive a grateful kiss.

Ben and Daniel arrived home about midnight. Sarah was listening, ill at ease that Ben should be out so late, and a little fearful lest Daniel should return without him. When she heard their footsteps she flung the door open, and encountered Daniel's laughing face.

'Here we are,' said he.

'Then he wor at t' Manor?' queried Sarah.

'Ay,' returned Daniel laconically, and with an intonation which implied that he had something more to say.

Turning to Ben, she said, 'I 'm all on pins and needles. There 's two letters, a blue 'n for us and a white 'n for you. Has Daniel mentioned 'em?'

'No,' answered Ben eagerly. 'Where are they?'

She opened a canister which she had taken down from the high self, and drew them out. 'T' white 'n first,' said she. 'That 's yours. We 'll wait.'

'If you 'll allow me, Mrs Bradley, I 'll read the other one first.'

'Hearken to him, Daniel!—Well, read t' blue 'n if you 've a mind to; but'——

He had taken advantage instantly of the permission, and suddenly jumped up, holding out both hands. 'Congratulations, Mrs Bradley,' said he.

'Whatever for?' and, mechanically, she stretched out her hand to grip his.

'And to you, Daniel.' The collier gripped his other hand. He beamed upon them both. 'Phil has won the D.C.M. Why don't you cheer? Hurrah!'

'Is he mad, Daniel?' asked Mrs Bradley, concerned.

'It 's abaht Phil if he is, and he wants to smittle us,' responded Daniel.—'What mun we shaht hurrah for? T' naybors 'll hear us, and we s' wakken 'em up.'

'Then they 'll cheer.'

'For Phil?'

'Certainly. He 's won the D.C.M.'

'What 's that?' asked Mrs Bradley with bated breath.

'The Distinguished Conduct Medal.'

'O-o-o-o-h!' she exclaimed.

Daniel was very quiet.

'Owt else?' inquired Mrs Bradley.

'Yes. He 's wounded, and he 's been taken back to the base. But he 's won the D.C.M.'

'I don't feel much like cheerin',' said Mrs Bradley. 'Where 's he hurt?'

'A lame leg and a disabled arm—that 's all,' answered Ben. 'He 'll come home. Then you 'll cheer.'

[*Christmas Number.*

'Not mysen,' remarked Mrs Bradley. 'T' naybors may, and ah 'st be fain to hear 'em; but not mysen. He 's my awn lad.'

'Wheear 's t' base?' asked Daniel.

'Rouen, I think,' said Ben. 'They deal with hospital cases there, and at present he 's in hospital. These official communications are always brief. He 'll write himself probably in a day or two, and we shall know more. We must keep a sharp look-out in the newspapers. They 're certain to record it.'

'What?'

'The winning of the medal.'

'You 've forgotten t' white 'n,' put in Mrs Bradley.

'So I have;' and he tore it open. They watched him. He controlled himself with a visible effort as he read it.

It was his letter. They had no right to ask him what was in it—no right to show any inquisitiveness even; but, as it had been delivered at the same time as their own, and bore the mark of the censor, they surmised that its contents concerned the winner of the D.C.M. Neither Daniel nor his wife could read well. To spell out a letter was a slow process for them, and by no means a sure one. Long words and carelessly formed characters tripped them up, and often gave them a wrong impression.

'Yes, he 's at Rouen,' said Ben. 'One of the nurses has written.'

'And what does she say?' asked his mother.

'He 's progressing,' returned Ben. 'He sends his love to both of you. He 's told the nurse to say that you needn't worry about him, and he hopes to see you before long.'

The same thought assailed the minds of both —why hadn't the nurse written directly to them?

The wife turned to the husband with a tearful smile. 'We 'll pray for him, Daniel, and for t' other two as well—Jim and Caleb. And,' as she dropped upon her knees, 'we 'll not forget that there 's lots o' aching hearts besides thine and mine.'

The nurse had written to Sidney at Phil's request. Phil wanted Sidney to pass on part of the news—as much of it as he considered desirable—not to alarm them, and to prevent them, if possible, from brooding over his disablement. The flesh-wound in the thigh was a mere trifle. The bullet had gone clean through it, missing the bone and sinews, and cauterising the perforation in its passage by its own heat—a wound he could laugh at. But the right arm, the arm he earned his living by, had been ploughed up from the base of the palm to the elbow by the jagged fragment of a shell. The elbow-joint had been shattered. The nurse wrote at Phil's dictation, 'It 's made a mess of it;' and she added, without Phil's knowledge, 'A case for amputation, the surgeon says, and soon.' There was no reference to the official recognition of his bravery, and no explanation as to how the wounds had been incurred.

Was it wise to suppress any part of the news? Daniel and his wife might have slept better if they had known all. Sidney, notwithstanding Phil's request, felt like a culprit. Both Daniel and his wife understood perfectly well that Sidney had not revealed the worst. They understood, too, why the news had been sent to him, and not to them. Suspense is a doubtful cure for anxiety. They said nothing. But Daniel went to his work next morning sad-eyed, and Sarah stayed her busy hand many a time as the day went on to think about and to pray for her youngest.

CHAPTER VI.

SELDON was far from pleased with the squire's request that the negotiations for the sale of the wood should be continued and possibly completed by his clerk. He demurred inwardly to an arrangement that seemed to relegate him, the manager, to a secondary place; and, but for the risk of losing the wood—a risk he did not care to take—he would have demurred outwardly. An invitation to the Manor, on business even, was a social distinction he secretly coveted.

His displeasure was mingled with irritation. The clerk was a mystery. He scarcely knew how to deal with him. He was afraid of committing a blunder worse than the loss of the wood. The settled tone of the squire, and the slightly ironical hesitation when he said, 'Send Mr Sidney, your—clerk,' had left him no option.

'There is very little to report, Mr Seldon,' said Ben in response to his inquiry. 'The squire accepted the sum we offered him.'

'Readily?'

'There was no bargaining.'

'At our own valuation?'

'No. He had engaged a valuer, and his estimate was the same as ours.'

'Exactly?'

'Just the same.'

'H'm! That 's strange.'

'We must provide the labour; that is the sole condition.'

'The felling, and sawing, and cartage?'

'All. We buy the wood as it stands.'

'Did the squire mention a solicitor?'

'No; he said nothing about a legal agreement. But he 'll naturally expect one. He evidently means to leave the preparation of it with us.'

'Your transactions with the squire seem to have been unusually simple and very brief.'

'They were.'

'I will write to Angold, your old master'——

'My old master!' Sidney was surprised into a spirited interpolation, and his eyes flashed

dangerously; then, recovering himself, he smiled, and said, 'I beg your pardon, Mr. Seldon. I ought not to have interrupted you.'

'Wasn't Angold, the solicitor, your old master?'

'He permitted me to give you his name as a reference.'

'That is no answer to my question.'

'The question is the preparation of an agreement for the purchase of the wood,' Sidney reminded him, with an access of quiet dignity.

'This is unpardonable rudeness!' the manager blazed out.

'Not unpardonable, I hope,' returned Ben, as quietly as before, and fixing his clear, steady eyes on the manager's empurpling face; 'and not rudeness. But, if you take it as rudeness, I can only express my regret, and assure you to the contrary. I am your servant, Mr Seldon, for the time, and my only desire is to serve you faithfully.'

'For the time?' repeated the manager, not yet appeased.

'So I said. What I was before you engaged me, what I may be when I retire or am—dismissed'—the pause was significant, and disconcerted the manager—'is my own affair, so long as I serve you faithfully for the time.'

'That is an extraordinary view of the relations between master and servant. A master generally judges of the worthiness and efficiency of a servant by a personal knowledge of his past, or by a knowledge acquired from the testimony of others.'

'After he has engaged him?'

'Before.'

'It is too late now, Mr Seldon. You must judge of me by what you know of me while I have been with you. Are you satisfied?'

'Quite.' The manager was calm again now. 'I don't want to part with you. But a man cannot cut himself adrift from his own past.'

The shaft went home. Ben bowed assent, and said, 'You were speaking about writing Mr Angold when I unfortunately interrupted you.'

'Yes, about the agreement. He'll draw it up; he's the company's solicitor. Then, when the document is signed, we'll start in with the felling. We're running short of props. They're needed.' Swerving suddenly from what he felt had been rather a critical conversation, Seldon said, 'What is this I hear about Phil? You're lodging with his people, aren't you? Is it true that he's been severely wounded?'

'I am sorry to say it is—in the right arm'—Seldon whistled sympathetically—'and slightly in the leg. But he's come out of it with honour, and the company—ours—should be proud of him. He's won the D.C.M.'

'What! Phil?'

'My s'—I mean, your old clerk.'

'Glorious!'

'I'm glad you appreciate it.'

'Appreciate it! I should think so, indeed. We'll decorate the pits when he comes home, and give him an ovation.—Phil!' mused the manager. 'I always said he'd something in him.' Then, raising his head, 'Let me know how he goes on. You'll be sure to hear;' and he nodded towards the door to indicate that the interview was at an end.

Later, when he reviewed the conversation, he remembered that Ben had never once used the word 'sir,' but always the name 'Mr Seldon.' He rarely, if ever, addressed him as 'sir.' He had noticed it in previous conversations. The omission again impressed him as peculiar. How sensitive the clerk had been about the reference to Angold as his old master! And—yes—he, the manager, had forgotten himself. But, having accepted Angold as a reference, he had naturally concluded that Ben had once been in Angold's employ.

There were other points in the conversation that puzzled him. Ben might have used the word 'ours' to distinguish between the colliery company and Phil's regimental company, but it dropped familiarly from his lips—*ours;* and, on his own confession, he was only a temporary clerk. He was a little embarrassed, too, and quickly corrected himself, in referring to Phil, when he began, 'My s'—— What did the sibilant stand for? The more Seldon thought of it, and of the whole conversation, the more mystified he became.

'The directors meet on Monday,' said the manager on the Friday following, 'and I want you to go with me and take charge of the books and papers.'

'But,' demurred Sidney, 'it is not my place. It is Mr Bryce's place.' Mr Bryce had been longer in the company's employ than the manager himself. Sidney liked him. But he had never attempted to break through his courteous reserve. Bryce was always courteous, but his reserve ringed him in. He was an excellent servant, silent, sedate, industrious, and much more keenly observant than either Sidney or the manager gave him credit for. He was sensitive, too, and Sidney thought he might secretly resent his displacement at the directors' meeting by a recently engaged junior clerk. So, sensitive for him, as well as for a reason of his own, Sidney concluded, 'Mr Bryce is more conversant than I am with the company's affairs.'

'But not more conversant,' returned Seldon, 'with the purchase of the timber from Squire de Lisle.'

'That can only be a small part of the business which will be brought before the directors,' objected Sidney.

'It ought to be sufficient,' said Seldon, annoyed, 'that I want you to go with me. You have no right to raise the question as to whether Mr Bryce's presence is necessary or not. I am the manager.'

'And, as the manager, you order me to go; is that it?'

'Certainly. You have strange ideas of our relationship if you think otherwise.'

'An order leaves me no option except'——

'Except what?'

'A week's notice. I draw my wages weekly.'

'Don't be a fool, Ben!'

'Thank you for the advice. I'll consider it.'

'You'll consider the advice?'

'In connection with the order.'

'No! I cannot allow that. The order is an order.'

'I'll let you know to-morrow.'

'If you can obey the order? No!' Seldon thundered in justifiable exasperation. 'I'm not accustomed to be parleyed with by a subordinate. You can go at once. Mr Bryce will pay you a week's wages in lieu of notice;' and he stretched out his hand to ring the bell.

Sidney had to decide on the instant. He said to himself, 'I'll risk it;' and to the manager, 'Don't ring, Mr Seldon. I'll go with you.'

'And'——

'Yes?'

'I think you owe me an apology.'

'I am sure of it. I apologise, Mr Seldon. You see, it is difficult for me to accommodate—that is,' for he felt he was on the verge of a disclosure, and he reddened unpleasantly, and bit his lip, 'I was betrayed into objections which a subordinate has no right to make.'

'And still less right to urge,' added the manager. 'However, the matter is ended, and I shall expect you to attend me on Monday;' and with that he dismissed him.

There was still a chance to prolong the play—one chance only. Sidney thought it over, and decided not to take it. It involved a reopening of the conversation with a confidential excuse that would bring Seldon into the play.

Sidney smiled, and said to himself reflectively, 'The play is approaching its end—comedy, as Angold hoped it would be, and not tragedy.'

At the directors' meeting he would have to face not only Angold, but the chairman and two others, who all knew him. It would be impossible before them to play the clerkly rôle. Seldon was springing a surprise upon himself unawares with which Sidney was disinclined to interfere by a previous and voluntary disclosure.

CHAPTER VII.

ON Saturday morning, soon after ten, Sidney raised his head from the desk, and glanced through the window. A few men, with grave faces, were gathered about the mouth of the shaft; others were running towards it; and others again, near and far, had stopped work and turned to look wonderingly at the group and at the runners.

'There's something amiss, Mr Bryce,' said Sidney.

The cashier stepped across the room, and, after deliberately viewing the scene, replied slowly, 'I fear there is.'

'Not an explosion, I hope?' Sidney continued.

'No. It cannot be an explosion,' returned the cashier. 'We should have heard it, and the smoke of it would be rolling up the shaft. An accident, probably, or the cage has jammed.'

'Shall I inquire?' asked Sidney.

'Please,' replied the cashier, quietly resuming his work.

Sidney hurried out and up the incline. 'What is it?' he panted, arriving breathless, and addressing the winder.

'Water,' said the winder laconically.

'Water? Where?' persisted Sidney.

'Beyond the long dip,' answered the winder.

'The water's always there,' said Sidney, who knew the place.

'But this is a reg'lar rush of it—a swampin' rush,' explained the winder.

'Who's gone down?' asked Sidney.

'The manager, and Mr Riley, and Burdett, the overman; and, of course,' continued the winder, 'the men are there, working at the face and on the road.'

'Is it serious?'

'I fancy so.'

Sidney ran back, informed Mr Bryce, seized a safety-lamp, slipped into his overalls, and, returning, was ready to step into the cage with the first batch of descending men.

The cage dropped into the darkness, dropped and then seemed to rise. The sensation was illusory. He stepped out with the others eight hundred feet below the surface. The customary muffled quietness of the mine was broken by the ominous sound of water, faint, because of the distance it had to travel, but distinctly perceptible. And yet the long dip was nearly two miles away.

He started with the men. He was fairly familiar with the way. The sound increased with their advance until the gallery was filled with it. They had to turn and shout to each other to make themselves heard. Every man trod on the heels of his fellow. The lights they carried were like a procession of glow-worms. They burned but dimly behind the protecting gauze. The men were shadows, moving in single file, the sound of their feet drowned in the sound of the cataract.

The man leading stopped suddenly, his feet in the water, and Sidney, who was second, bumped into him. The other five avoided the bump and came forward in a cluster. Before them was the long dip, submerged; murky wavelets were breaking at their feet, rising, too,

so that they stepped back involuntarily; and the seven lights were reflected in wavering, and dissolving, and reuniting gleams upon the troubled surface of the water.

Sidney yelled into the ear of the man beside him, the man who had led the way, 'The pumps must be got to work, and a length of hose paid out from the bottom of the shaft. Can you hear me?'

'What?' bawled the man.

By short repetitions Sidney dinned it into him.

'Cannot you see to it?' the man asked.

Sidney shook his head, and pointed across the water, indicating that he meant to go forward. The man thought it was rather a mad idea, but he did not attempt to dissuade him. He went back to report, with two of his fellows, and to convey Sidney's suggestion to the loaders at the bottom of the shaft, and to the engine-man and mechanics on the surface.

Sidney shed his overalls, divested himself of part of his garments, tied them together, slung them round his neck, and ventured on. The three who had stayed with him watched him curiously. Two of them shouted, but their voices were lost in the tumult of the waters. The third, perceiving his intention, followed him, and soon came up with him. The flood deepened. Where the running waters met with submerged obstructions swirling eddies threatened to sweep them off their feet. They had much ado to keep their lamps alight by holding them high above their heads. As for their garments —those they wore and those swinging from their necks—they were saturated. The man, Crabtree by name, a powerful fellow, full-fleshed, wide-shouldered, long-limbed, gripped Sidney as he stumbled into a depression, and drew him, spluttering, to the side. Here the water was a little shallower, and the protuberances of the rough wall gave them a measure of support. Sidney struggled on. Crabtree aided him. In comparison with Sidney's efforts, Crabtree took it easily and almost made a child's-play of it. They passed the lowest part of the curve and began to rise. The sound of the waters, confined in a space so small and hollow, drummed upon their ears, and, increasing in intensity, nearly deafened them.

'Look out!' shouted Crabtree at the pitch of his lungs.

Sidney barely heard him. In a moment they were both beneath the water-spout; their lamps were extinguished instantly, and they were drenched through and through. It is doubtful whether Sidney would have succeeded in edging his way up the incline but for Crabtree's support. When they had passed the inrush of the water—an inrush from the roof, which, with the constantly resounding and commingling echoes of the gallery, accounted for the deafening sound—the going was easier. They reached the top of the incline. Farther back a lamp shone dimly—only one lamp, resting on a ledge of rock, with a man's shadow standing beside it.

Sidney, exhausted, stumbled toward the shadow, and against it, and found it to be articulate and solid enough to resist his weight.

'Hallo!' shouted the shadow, wheeling about, and with a note of alarm; and Sidney recognised the voice of Riley, the underground manager. His back had been turned toward them, and he had thought he was quite alone until Sidney's stumbling figure suddenly touched him. 'Where have *you* come from?'

'Through the long dip,' answered Crabtree.

Sidney's gasps were unheard.

'Ben too?' inquired Riley.

'Both of us,' bawled Crabtree.

'Then it's passable,' declared Riley, but with an anxious query in his tone.

'Well,' commented Crabtree dubiously, 'we've done it; but it's fillin' up fast; and'—— The comment lapsed into a significant silence.

Sidney, who had recovered a little, drew them farther away from the resounding inrush.

'Where is Mr Seldon?' he asked.

'Gone forward with Burdett to collect the men,' answered Riley.

'Are there many of them?' inquired Sidney.

'A score at least—maybe more,' said Riley.

Crabtree resumed his comment. 'And no way back except through the long dip. Golly! We're in for it.'

Sidney said nothing. He sat down and waited. Every minute lessened the chances of a return through the long dip. If the water filled it to the roof, an expert diver, with a cultivated sense of direction and unusual staying-powers, might possibly manage it; but a crowd of colliers—no! The filling of the long dip would cut them off from the other workings, and not only increase the difficulty of their rescue, but render it extremely problematical.

Notwithstanding his drenched condition, Sidney felt no chill. At that depth underground it was very warm. From the bottom of the shaft, the workings descended in the direction of the long dip, and the rise toward the coal-face did not bring the workings anywhere near the level at which they began. In one way this was fortunate; for it would retard the flooding of the mine long enough to start the pumps and to reduce the depth of the water. In another way it was unfortunate; for it would drive them back toward the coal-face, and interfere seriously with the ventilation.

The men began to drop in. Seldon came with them. Burdett brought up the rear. Penned together like sheep, they were ready like sheep, most of them, blindly to follow the lead of the first among them who would take upon himself the responsibility of an adventurous initiative.

[*Christmas Number.*

'Are we all here?' shouted the manager, running his eyes rapidly over the bunch of dusky figures revealed by the glimmering lamplights.

'Every man Jack, sir,' responded Burdett, who had collected them, and checked them one by one as they passed from the face and the few side-roads into the main gallery.

'Keep together,' the manager warned them, 'and I'll see what we can do.' He went forward towards the inrush.

'Be careful, Mr Seldon!'

'Who is that?' he demanded, his footsteps arrested instantly. 'Ben Sidney?' In the indistinguishable cluster he had not observed him. 'How came you here?'

'Through the long dip,' answered Sidney.

'Why?' the manager asked sharply.

'To help, if I can,' said Sidney.

'It was a fool's errand,' retorted the manager.

'Then I'm a fool, too,' Crabtree struck in, 'for I came with him.'

'You?' questioned the manager, whose nerves were on edge. 'How many more are there?'

'Fools?' queried Crabtree ironically. 'Only two. The others stayed behind or went back.'

'What others?' shouted the manager.

Crabtree told him. He mentioned the pumps, and the paying out of the hose, and gave Ben the credit for the suggestion. And he finished by saying, 'T' long dip's full, chock-full, mayster; and, until they get them pumps at it, and lessen t' watter a bit, I reckon we shall ha' to mak' t' best on 't, and stay where we are.'

There was no need to verify Crabtree's final statement by a personal investigation. The water was already lapping about the manager's feet. He stepped back, and summoned Riley and Burdett to attend him; the three, pressing through the men, retreated out of earshot, and discussed the situation. Presently Burdett returned and asked Sidney to join them.

Sidney's reply was a resolute shake of the head.

'Mr Seldon's sent me,' urged Burdett.

'Mr Seldon?' said Sidney. 'I thought'—— and there he paused, and asked, a trifle sarcastically, 'Cannot Mr Seldon come himself?'

'We're in a hole, Ben,' continued Burdett.

'Evidently,' said Sidney.

'And likely to be drowned in it like rats,' Burdett went on.

'And I with you,' added Sidney, 'having come on a fool's errand;' for the manager's remark rankled deeply, and he resented it.

Burdett was about to go back, when Seldon appeared.

'I spoke hastily, Ben. I'm sorry,' said Seldon; and all the men heard him.

Sidney was instantly appeased. 'You were not aware, Mr Seldon,' said he, 'until Crabtree told you, that we had brought you word through of what they were doing on the other side. Perhaps I *can* help you;' and, without further parley, he joined them.

The deafening rush continued; the water steadily rose; the men were gradually forced back nearer the place where the four were still engaged in anxious consultation.

'Have you brought your tools with you?' shouted the manager.

Quite half the men responded, 'Ay!'

'We may need them,' said the manager. 'Listen! You have heard that pumps are being rigged up, and hose paid out. But the water's rising, and, to judge by the sound of it, there's no diminution of the inrush. It will take them a long time—how long not one of us can say—to cope with the water, to lessen the depth of it sufficiently to allow us to venture through. There's no connection between this section of the mine and the other workings except by way of the long dip. While we are waiting for the rescuers we must not be forced back to the face. The water might win. So'——

He was interrupted by a tremendous fall of rock. The thundering roar of it covered for a moment the hoarser sound of the plunging water. The air, displaced, rushed by them, sucked out, then in. The lights wavered uncertainly behind their gauze protections. The water increased in volume, pouring through a huge rent in the roof, and beneath the rent, blocking the way to the long dip, was a mass of stone and débris.

'That is what I feared,' said Sidney.

'When you warned me a little while ago?' returned Seldon. 'I might have been caught by it.—So,' he continued, turning to the men, who had instinctively huddled together when the crashing interruption came, 'we have decided to risk a passage, long disused and little known, connecting this pit with Number 3. Bring your tools along. Don't straggle. What food you have, use sparingly. Ben will lead the way.'

'A cheer for Ben!' cried Crabtree.

And they gave it lustily.

CHAPTER VIII.

SIDNEY'S memory acted like an acid, and etched in upon his mind, as upon a waxed metal plate, the details of any plans in which he was vitally interested. He had pored frequently over the map of the whole group of mines. Their relation to each other, and their depths, varying according to the inclinations of the seams, were as clear to his mental vision as if the map were unrolled before his eyes.

He led the men back half-way to the face. Here, on the south side of the gallery, was a narrow opening used as a dumping-place for all kinds of unwanted or worn-out materials. The men had always regarded it as a recess. It had

never been explored within living memory. It was indicated on the map by dotted lines. Riley and Burdett had an idea that it had once communicated with Number 3, but that it had been abandoned years ago, and, to save timber, and to prevent the inevitable draw upon the surface, tightly packed with 'gob,' or refuse from either side. As an outlying part of the underground workings, now unprofitable and finished with, Seldon, since his appointment, had given little thought to it, and practically dismissed it from his mind.

The supposed recess was quickly cleared out. Sidney went forward, accompanied by Seldon and Riley; Crabtree came next; and Burdett remained in the rear. Any man dropping too far behind might have been lost.

For a thousand yards or so the way was fairly open, and they had nothing worse to contend with than a low roof, causing many of them to bend double-fold, and bad ventilation. The lamps burned dimmer. The air was heavy. The shuffling feet of the men raised the hitherto undisturbed dust in powdery clouds which filled the eyes and nostrils, and, adhering to their perspiring hands and faces, made them ten times blacker than they were before.

Sidney went slowly. The stooping position and the powdery clouds distressed him. The dust was worse for those behind than it was for him, except that they were stronger men, and more accustomed to liberal doses of it. Leading the way, and unwarily raising himself, he received many a hard knock; he grew weary, and began to wonder whether he could keep up even that slow pace, when, to his relief, he met with an obstacle which compelled the whole company to halt.

'I'm no use here, Mr Seldon,' said he, as he sat down, and leaned his back against the side of the gallery.

'What's in the way?' asked Seldon, peering past him.

'A big dump of some kind,' answered Sidney. 'It's the turn for the picks and shovels.'

'If'—— interjected Riley.

'Why *if*?' inquired Sidney, glancing up at Riley's shadowy form as he stepped over his outstretched legs.

'Because picks and shovels are poor tools against the packing in of the "gob,"' responded Riley. 'Pressed together by a settling roof, it hardens into adamant.'

'Are you sure it's "gob," Riley?' Seldon said, moving forward to examine it.

'I fear so,' answered Riley. 'I've been expecting it.'

'This isn't "gob,"' asserted Crabtree, who was also examining it.

'What, then?' asked Riley.

'Roof stuff,' replied Crabtree. 'It's too loose for "gob." Raise your lamps! There! Cannot you see? There's a long gap aboon it. It's roof stuff—rock, and shale, and earth. If we get t' picks and shovels at it we s't sooin win through.'

'Thank you, Crabtree,' said Sidney.

'Eh?' queried Crabtree.

'I said, "Thank you,"' repeated Sidney, 'and I mean it.'

The obstacle might be serious. It might delay them too long. Still, there it was, and it had to be tackled. Sidney, seated before the obstacle, had felt ashamed at his relief. The relief had been spontaneous; and the shame was dissipated, somehow, by Crabtree's encouraging words.

He was very weary. His body was aching with the unusual strain. His throat was parched, dry and hot as an oven, and filled with irritating particles that impelled him to cough incessantly, and so to weaken himself further. He heard the cataract sounding in the distance. He wished he were under it. How refreshing its pelting coolness would be! And there he might ease his cough and slake his tormenting thirst.

The men had closed up. Seldon pushed his way through them. Burdett was still at the back, unaware as yet of what was arresting their progress. Seldon told him, and said, 'Return, and ascertain whether the water is still rising, and how far it has run back toward the face. In the meanwhile I will set the men to work, and keep them at it, clearing the way. Report privately to me.'

'Can we get through?' asked Burdett anxiously.

'I hope so,' returned the manager; then, decisively, 'We must. It is our only chance, unless the water has ceased to flow.'

Burdett slipped away. The men, under Seldon's orders, ranged themselves along the passage; two of the strongest—there was no room for more—swung their picks against the barrier and loosened it; and those behind passed the stuff back from shovel to shovel and strewed it thinly along the uneven floor.

Sidney found a recess large enough to squeeze his body into, and crouched there, coughing, and awaiting the result of the men's efforts. The recess was dark. He could only see the feeble glow of a single safety-lamp in the long line of similar lights that marked the positions of the sweltering men. He was nearly choked with the dust. He was almost dazed by the din. Presently the one light was blotted out by an intervening shadow.

'Sup!' invited Crabtree, passing him a bottle, uncorked.

Sidney moistened his lips with the beverage, and handed the bottle back, smiling. Needless to say, the smile was unseen.

'I said sup, not sip,' protested Crabtree, refusing the bottle. 'Sup!' he reiterated emphatically.

Sidney drank of it, and remarked gratefully, 'It's innocuous, but refreshing.'

[*Christmas Number.*

'Nockywes? What 's that?' asked Crabtree.

'The cup that cheers—I mean, the *bottle* that cheers, but not inebriates,' answered Sidney.

'I 've heard it called that afore,' returned Crabtree. 'But nockywes is a new name to me—a classy name, too. I 'll remember it, and get my wife to order more o' t' same brand. Now you 'll be ready for a bite.'

'But what about you, Crabtree? You 'll want it.'

'Shall I? Not as much as you. Feel here, Ben;' and he drew Sidney's soft hand over the thick muscles of his upper arm. 'What do you think o' that? And if you felt me all ovver you 'd find 'em laid across me like whipcord. Ay! There 's plenty more o' t' same sort.'

Sidney laughed, and said, 'I 've had ample evidence of it, Crabtree, and I believe you 're the happy possessor of a frame that corresponds.'

'Corresponds?' echoed Crabtree dubiously; then, as he grasped Sidney's meaning, 'I see—a frame 'at fits in? So it does, Ben. It 'll tak' some wastin'. A man feeds on hissen when he 's nowt else to feed on.'

'A commendable form of cannibalism,' commented Sidney.

'And you 'd be done for quickly if it came to that,' responded Crabtree. 'Here! Tak' these sangwidges, and put 'em away—inside. It 'll be more to your credit if you have to turn cannibal.'

Sidney could not refuse. 'The tea was nectar, Crabtree, and the sandwiches are ambrosia.'

'By gum, Ben! you 're t' rummest chap I 've ever met wi' for inventin' jaw-crack names.'

'And you are one of the most generous, Crabtree. I 'll finish them even to the crumbs.'

While the crumbs were being eaten, Seldon, far back, was listening to Burdett's report. It was not encouraging. Burdett told him that he stepped directly out of the tunnel into the water. Splashing through, he visited the face. The water was lapping against it. The rapidly contracting space resounded with the booming of the cataract. He could hear nothing beyond it.

'No sound of the pumps?' inquired Seldon.

'No,' answered Burdett; 'and no shouts of the men.'

'Then we must do our best here,' said Seldon, adding, after a slight pause, 'God help us!'

The men toiled on far into the night; and at last, after clearing a hundred yards or so, and seeing no signs of an exit, they flung down their tools in utter weariness, and refused to do another stroke.

Many sank exhausted just where they were, and lost the sense of their desperate situation in merciful sleep. Others, more imaginative, squatted upon their haunches, and stared into the darkness, fearful lest the flood should follow them and slowly end their misery. The lights in the lamps waned, and several flickered out, a symbol of the waning and flickering out of their hopes. They were ready to abandon the digging and to resign themselves to their fate.

Seldon was keenly alive to a peril more threatening than the obstacle. If the *moral* of the men failed, if the heart went out of them and they gave way to a sullen despair, they would be lost indeed. He did not disturb the sleepers; but he gathered about him the men who were awake. He told them that every rock rolled back, every spadeful of shale and earth removed, was a step nearer liberty. Their rescue depended entirely upon themselves. The roof could not have fallen in along the whole length of the gallery. They would meet with places where the débris was less plentiful and much easier to tackle than that which had been already strewn behind them. He proposed that they should work in three relays, each relay taking two hours on and four hours off; and he volunteered to lead the first relay. Riley would lead the second, Burdett the third, and they would keep going incessantly until the barrier had been broken through.

'What do you say, men?' he demanded.

'We say like you, sir,' answered Crabtree, amidst a chorus of assents.

'You must leaven the relays, Mr Seldon,' put in Sidney from his recess.

'Leaven them? How?' asked the manager.

'Let those who are here, and have assented to your proposal, be divided among the three,' said Sidney. 'Their spirit, the willing spirit, will favourably affect the remainder.'

'And stiffen them,' added Crabtree.

'Or leaven them. It matters not which,' said Sidney, 'so long as the end is gained.'

Seldon accepted the suggestion. The sleepers were roused, and the proposal explained to them. The men told off for the first relay silently acquiesced. They shook the sleep out of their eyes, joined their fellows, and set themselves again to the attack of the barrier. The others settled down, some for the two and some for the four hours' rest.

Relay after relay, they worked on, and the morning came, with no light, and no sign that they were any nearer the end of their task. Another hundred yards of the barrier had been broken through, but the obstacle still faced them. They had finished their food long since. Hunger pinched them. Weakness began to tell upon them. The removal of the débris did not proceed at the same pace.

Sidney, sleepless, moved up with the advance, and cheered all the three relays. He handled the shovels of weary men, relieving them briefly, although he was weary himself, and tremulous through lack of food. They acquired the habit of appealing to him when a heavier rock than usual barred the way. If they could not remove the rock, they went round it, or over it, burrowing onwards through the softer and more yielding mass.

By the afternoon they had cleared another hundred yards. And now they were groping their way, for the last of the lamps had gone out—groping feebly, for but few of the men were equal to the continuance of the task. The end of it seemed to be as far off as ever.

Riley's relay came on, with Crabtree as foreman. Riley was the only one of the imprisoned company who carried an electric torch. While the lamps burned he concealed it, purposely, for the battery was nearly exhausted. He and Crabtree led the attack. The men were ranged behind them with their shovels. The second man, the one immediately behind Crabtree, groaned, and then dropped, declaring weakly that he was past it.

'My good fellow,' said Sidney cheerily, 'you 're not past it. You only think so. Give me your shovel!' But as he seized it and thrust it under the loosened earth he staggered, and almost fell.

Crabtree's pick rang musically on a hard rock.

'Hallo!' shouted Crabtree, on a falling inflection.

'Knock again,' counselled one of the men.

'Hallo!' repeated Crabtree, the inflection rising, and the pick ringing musically as before.

'There 's nobody in,' said the counsellor.

It was a respite for the men. They leaned upon their shovels and awaited investigations. Crabtree felt at the rock, and found it bigger than any they had yet encountered. Riley felt at it also, from the top to the base, or as near to the base as the ground would permit. Then, considering it an emergency for the use of the torch, he switched the light on, and revealed a narrow slit, the entrance to the cavity left by the rock's displacement.

'That 's our way,' said he.

'And I 'm the slimmest,' added Sidney. 'If you 'll oblige me with the torch, Mr Riley—thank you—I 'll use it sparingly.'

Crabtree lifted him bodily to the rock's upper edge. He drew himself through the slit slowly, and cautiously crept forward, feeling his way inch by inch, until he reached its outer edge. It had evidently fallen whole, a huge rock, impossible for the men to move, or even to break up in their present enfeebled condition. At its outer edge he held the torch at arm's length and switched on the light. Earth and shale sloped away at an easy gradient beneath him, and beyond him a timbered gallery opened up as far as his eyes could see.

The immense relief of his discovery subdued him to a thankful quietness. For a full minute he gazed intently into the dimness to assure himself that the way was really free. Then he thought of his fellows. He began to push himself back, feet foremost, for in that manner he could best negotiate the slit. He was suddenly arrested by an ominous crackling of the roof. Immediately an overwhelming shock bereft him of all consciousness, and he lay inert, face downwards, upon the rock.

CHAPTER IX.

TWO hours later the cool air from the shaft of Number 3 helped to revive him. It played upon his pale face. It ruffled his dark hair. It coaxed him back to consciousness. He was laid upon a couple of outstretched coats, and another couple covered his legs and body. First-aid had been rendered him. His legs were fastened with splints and swathed in bandages. Pick-handles had been improvised for the one, and to supply the other some of the men had almost stripped themselves naked.

Seldon was bending over him.

He opened his eyes.

'When is the directors' meeting? I think you will have to excuse me, Mr Seldon, after all.'

The manager was taken aback, and answered lamely, 'Of course—of course. How are you?'

There was no reply. A spasm crossed the thin face. The perspiration stood in drops upon Sidney's brow. He had fallen back into a death-like swoon. He lay motionless except for a slight flickering of the eyelids. His face was an ashy white; his lips were blue. Seldon was alarmed. Most of the men were already on the surface. A surgeon had been summoned, and Seldon awaited his arrival anxiously. He might come too late.

Sidney had been saved, temporarily at any rate, by the backward movement on the top of the rock, and the brief pause when he had heard the roof crackling. The loosened shale might have caught him across the head or body; as it was, it had caught him across the legs, smashing them.

Crabtree, when he heard the fall, guessed immediately what had happened. He sprang at the slit, dug his fingers in, and dragged himself through. Riley followed him, then two of the men. Sidney was half-buried. The concussion had flung the electric torch clean out of his nerveless fingers and sent it rolling to the bottom of the slope; so, for the first few minutes, they had to work in the dark. Another of the men, feeling his way forward, and slithering down the slope, touched the torch accidentally with his open palm, clutched it, and switched on the light.

By this time the manager and Burdett and the rest of the men, roused from their uneasy slumbers, had rushed up; and soon the whole party, with Sidney swinging hammock-like between them, pushed their way forward to the foot of the shaft.

To the manager's surprise, Squire de Lisle

descended with the surgeon, and betrayed the greatest concern in the surgeon's superficial examination.

'Well, Blyth, what do you think of him?' asked the squire.

'He's not past help,' replied the surgeon diplomatically, 'but very near it.'

'Can he stand the journey?' the squire inquired eagerly.

'Up the shaft? He must. I can do nothing with him down here.'

'Home, I mean? To the Manor?' explained the squire. 'The car is ready.'

'I'll go with you,' responded the surgeon, without committing himself. 'I must get these things off, and see what his injuries are. It's a pity, too; for, considering the appliances available, the fellows have made a neat job of it. But'—— and he shrugged his shoulders.

'But what, Blyth?'

'He's suffered from strain, dampness, lack of food and air; and—there's not much of him, squire. He's weak constitutionally.'

'Or he wouldn't be here,' said the squire. The surgeon stared at him. The manager wondered what he meant. But neither of them asked for an explanation. Indeed, he gave them little or no opportunity, for he went on at once, 'There isn't much of him—that's true; but every bit there is of him is worth saving.'

'I quite agree with you, squire,' returned Seldon.

'And you would be sorry to lose him?' the squire put in.

'I should,' confessed Seldon.

'As a clerk?' queried the squire.

'As a man,' said Seldon.

'So should I—as a man,' repeated the squire. 'The news of the flood reached me this morning. I heard that you were cooped up, dammed in, unreachable, about thirty of you; and I ran over to ascertain the facts. I have kept the car about all day. But no one suggested that you could find a way into Number 3.'

'Ben did it.'

'Ben?'

'Sidney.'

'Oh! I had forgotten for the moment that his name was Ben. Here's the cage!'

The last batch of men, under the surgeon's supervision, lifted Sidney into the cage, and when they had reached the surface, carried him to the squire's waiting car. Boards were fixed within the tonneau, from seat to seat, to accommodate Sidney's bandaged legs; the surgeon sat beside him, and steadied his swaying and apparently lifeless body; the squire slipped in beside the chauffeur; and, amid the silent commiseration of a group of villagers, the car glided away.

Phyllis came to the door as the car drove up.

'What's the matter, dad? An accident?' she inquired.

'Your first patient, my dear,' he replied.

'Not from the war?—Oh!' for she had caught sight of the patient—the death-like pallor showing beneath the grime, the limp form leaning inert against the surgeon's shoulder, the closed eyes, the blue lips—and it distressed her.

'No,' responded the squire. 'From a nearer battle-ground, Phyllis—one of the Ryeburn pits.'

'But—but—why have you brought him here?'

'To give him a chance, my dear—a bare chance—to recover.'

'And to give me a fighting chance, Miss Phyllis,' the surgeon seconded, 'to beat back the enemy who has gripped him, and who has refused so far to loosen his hold.'

'Is it—is it—Mr Sidney, dad?'

'Disfigured, Phyllis, and injured, I fear, desperately; but—yes, it's Sidney.'

He called for two of the gardeners, and they, with the chauffeur and the butler, stood ready to carry him in.

'On the boards,' said the surgeon. 'The squire and I will support his body. Gently, now! Don't shake him. Gently! There!' and they rested in the hall.

'Where shall we put him?' asked Phyllis. 'We are not ready yet. Our soldier patients are not due for a week or more.'

'Jack's room is always ready,' replied the squire. 'Put him there. And, I say, Phyllis, gather a few of Jack's things together, all that Sidney is likely to need when Blyth has finished with him.'

Phyllis hastened to obey.

In an hour or so Sidney was much more presentable. The disfiguring grime had been cleansed away. Jack's clothing had replaced his own. The pick-handles and the strips torn from the shirts of the men had been removed, and the shattered limbs set between properly shaped splints and swathed in surgical bandages. Blyth had found a compound fracture of the thigh, a simple fracture of the shin-bone, a crushed ankle, and a mass of bruises, now discolouring badly. But the bruise that troubled him most, a slight one outwardly, overlooked and unsuspected by the men, was at the base of the skull, where the flat side of a flying piece of shale had struck Sidney without cutting the skin. He remained oblivious to his surroundings, still inert, but plastic, yielding to the surgeon's touch and to the handling of the squire and his men, and breathing softly. The blueness left his lips; but he never once opened his eyes, or gave any sign whatever that he knew what was happening to him.

'Will he pull through?' asked the squire when he and the surgeon were together in the library.

'The bones will knit,' returned Blyth, 'and the bruises will heal.'

'Answer my question, Blyth, candidly,' persisted the squire. 'Will he pull through?'

'I cannot say. No one can. In my opinion, it is doubtful, squire—very doubtful,' admitted Blyth.

'Why, if the bones will knit and the bruises will heal?'

'You heard what that fellow told us who helped him through the water?'

'Crabtree?'

'That's the man. The patient's feverish—a complication not very desirable, squire, and uncertain in its development—feverish, the outcome of his wet clothes clinging to him, and steaming in a hot and foul atmosphere. And that is not the worst.'

'Then what is the worst, Blyth? Tell me. I must know.'

'Concussion.'

'Concussion?'

'Of the brain, squire. I suspected it. He's so limp, so unresponsive, and, mercifully, so unconscious of his pain. There's no abrasion, and very little swelling; but the shale must have struck him smartly between the base of the skull and the top of the spine.'

'He spoke to Seldon.'

'For a moment or two.'

'And that's a good sign.'

'Perhaps. It depends upon what he said.'

The squire, after a pause, altered his previous pressing question to an urgent and appealing demand. 'You must pull him through, Blyth.'

'I will, if I can.'

'You've no idea who he is?'

'A lodger in the village who took young Bradley's place, and so released him for military service; that's what I've heard. I suppose it's correct. And,' said Blyth, wondering the while why the squire was so deeply interested in him, and, notwithstanding the squire's reply to his daughter's inquiry, and his own addition thereto, why he had kept the car waiting for him, and why he had brought him straight on to the Manor, 'it was a fortunate release, for Bradley's done good service, and won the D.C.M.'

'And Sidney's done good service—an exchange of places, Blyth, that neatly fits in. Ben Sidney—that's the name he's known by as Bradley's substitute; but, a word in your ear;' and the squire whispered another name, not dissimilar, which caused the surgeon to start visibly, and stare at him. Question and answer followed. The wonder passed away. The squire's exceptional behaviour was satisfactorily explained. 'Not but what I would do it for any other man if it would give him a better chance of recovery,' the squire went on; 'but, you see, Blyth, he's one of us; and you simply must pull him through.'

'As I would pull through any other man, squire, God helping me,' responded the surgeon. 'I was a little puzzled, I confess, by your special interest in him. Now I understand. Thank you for your confidence.'

'It's a guess, Blyth, and unconfirmed.'

'But a very shrewd guess, squire, and as near correct as a guess can be.'

Before a fortnight was over the small medical staff had arrived, including a few nurses, and the Manor was occupied by soldiers, many of them maimed, all of them convalescent. Their rooms were at the other end of the building. Sidney was undisturbed and unaware of their advent. A rumour spread among them, and was passed on to new-comers during the next two months, that a member of the family was ill; the nurses knew little more than this; and neither Phyllis nor the squire enlightened them. It would not have made the slightest difference to Sidney, however, if he had been in their midst. For he was mentally immersed in a subconscious world of his own.

But it would have made a great difference to Phyllis. She had engaged a trustworthy and capable housekeeper. Supervision was reduced to a sinecure. The nurses worked under a matron; Blyth attended Sidney; and Phyllis, fairly free from other responsibilities, took Sidney under her own wing, and scrupulously carried out all the surgeon's orders. The matron offered to relieve her. But she did not need the relief, and therefore courteously declined it. For, almost from the start, she was assisted by a servant who came unexpectedly and quietly assumed the duties; who soothed Sidney by his touch and awakened a response to his initiative; who attended to his wants as to the manner born, with a devotion so tireless and a serenity so unruffled that Phyllis could always leave him in his care.

'Dad,' she said one day, in an outburst of confidence, 'he's a treasure—a perfect treasure.'

During the first fortnight Sidney never spoke an intelligible word. From the second day onward his face twitched at times, and was occasionally drawn as if with conscious pain. An inadvertent movement would sometimes wring a groan out of him. But this phase of his recovery subsided with the knitting up of the fractured bones. He gradually grew easier. He would lie quiet, gazing steadily, but dream-like, at Phyllis. She was not disconcerted, nor did she turn her face away, because his eyes had in them no conscious recognition. He was living in another world. This phase subsided also, or, rather, merged itself into another. Memory stirred. Speech began. It lacked consecutive relation. He spoke about things of which she had no knowledge—happenings of his childhood and of his later life, mentioning names that were mostly strange to her; not all, for, to her surprise, a few of the names were familiar. His memory was uncertain. He was feeling his way forward, slowly, and with lapses more or less frequent, to the time of his arrival at Ryeburn. It was like the recovery of personal possessions suddenly snatched from him and

scattered over a wide area. He had to wander aside from the straight line to collect them. But bit by bit they were collected. Recent happenings were referred to. He spoke of the pines, of the Lady of the Pines—confessions unconscious, but tender, affectionate, worshipful; and she listened, absorbed, wondering, a little afraid, beholding herself in the wavering mirror of his mind; until a day came when, as she fancied, his eyes changed. A new light seemed to be dawning in them. He was coming to himself. And, unprepared to meet the flash of recognition after what she had heard him say, blushing, a trifle annoyed, not with him, but with herself, and more than a trifle excited, she summoned the assistant, and left the room abruptly.

CHAPTER X.

'HALLO, Poppleton! Is it late?'

'Not very, sir—about a quarter past four.'

'A quarter past—Poppleton!' reproachfully. 'Have you allowed me to sleep all day?'

'Sleep is good for you, sir. I'm glad you know me.'

'Know you! Why shouldn't I know you? I say, Poppleton, where am I?' raising himself upon his elbow, and looking around him curiously. 'This isn't the flat. And what's amiss with my legs?'

'No, sir, this isn't the flat. This is Mr Jack's room, sir, at Brockwell Manor; and your legs are mending.'

'Brockwell Manor?'

'Squire de Lisle's, sir.'

'Oh!' and he began to think. After a while he said, 'Poppleton, I've been dreaming.'

'Two months, sir.'

'As long as that? Is it two months since I was brought to Brockwell Manor?'

'Two months yesterday, sir.'

'And how long have you been here, Poppleton?'

'Two months to-day, sir.'

'Nursing me?'

'Helping, sir.'

'Whom?'

'Miss de Lisle.'

Again Sidney was silent, thinking, recalling the incidents of the flood, and all that had occurred up to the time of the roof falling; and then he said, 'How did you hear of it, Poppleton?'

'By wire, sir, from Mr Angold.'

'And you came at once?'

'Immediately, sir. My sister's is not far away.'

'Your sister's? Ah! I remember. You were having a holiday, Poppleton.'

'A long one, sir.'

'I hope Angold sent you the cheques regularly, Poppleton.'

'To the day, sir; I might almost say to the tick. He never failed.'

'It seems to me, Poppleton, that I've a lot of leeway to make up, considering the drift of my dream.'

'Very likely, sir; but you'll make it up easily, now that the dream is over. It's a pleasure, sir, if you'll excuse my saying so, to hear you speaking like your old self.'

'Quite rationally, Poppleton?'

'Quite, sir. Not that you spoke irrationally. You were very quiet, sir, for the first month, and since then you have only said what a sane man would say.'

'You shall tell me some day, Poppleton, what I did say, and I will test the sanity. The sanest thing I can do now is to fall asleep.'

'It is, sir—sleep!' And, as Sidney closed his eyes, Poppleton whispered to himself, 'Thank the good Lord, he's through it!'

With his continued progress Phyllis left him more and more in Poppleton's care. She took a larger share in the entertainment of the convalescent soldiers. Poppleton was quite equal to the discharge of Dr Blyth's orders. Sidney was not aware of the lessening frequency of her visits, for Poppleton had not told him how sedulously she had attended to his needs during his prolonged 'dreaming.' He could not discuss her with Poppleton. He asked no questions about her. He accepted her absences as natural. The convalescent soldiers had a prior claim. His eyes brightened when she came in, and her eyes met his frankly, without a suggestion of shyness; and yet, if he had only known, shyness had much to do with the absences, and with the brevity of the visits also; for she could not forget his unconscious confessions about the Lady of the Pines.

Except for his dress, not khaki, but civilian, he might have been mistaken for one of the soldiers, as he made his first tentative efforts towards walking again within the limits of his room. He had not yet left his room. Blyth would not hear of it. He could sit by the window and watch the men; but until he was stronger, and better able to use his crutches, the surgeon peremptorily forbade him to join them.

'Cannot I have some of them up here?' he pleaded.

Blyth laughed, and said, 'Ask your nurse.'

'Poppleton will agree.'

'I meant Miss de Lisle.'

Sidney mentioned it when she came again.

'Would you like to see Jack?'

'Jack? Your brother? I should be delighted to see him. Is he here?'

'He came yesterday.'

'I must thank him for the use of his room. And I must clear out of it. I wonder if Mrs Bradley would take me in again.'

'With Poppleton?'

'I hadn't thought of Poppleton;' and he made a wry face. 'Poppleton could prolong his holiday.'

'Mrs Bradley has one patient already.'

'Phil?'

'So you will have to stay here—with Poppleton. Jack will tell you about Phil. I have a letter for you;' and she placed it in his hands.

He saw the address, and, before he opened it, he said, 'Miss de Lisle, this is not my name. I am Sidney Bentham.'

'I know,' she replied simply. 'Father told me.'

'Before Poppleton came?'

'The day before.'

'He guessed it?'

'When he met you first at the top of Brockwell Hollow.'

The back of the envelope was impressed with the stamp of the Ryeburn Collieries. He opened it, and drew forth a letter signed by the chairman of directors and Seldon, as manager, and a cheque for fifty pounds. The letter was eulogistic; the cheque was a token of appreciation and gratitude.

'May I borrow your pen?'

'Certainly,' said she, drawing off the cover, and shaking the ink down to the point.

He endorsed the cheque, and passed it to her, saying, 'That's the last time I shall sign myself Ben Sidney.'

'But,' she protested, 'the cheque is yours.'

'No, Miss de Lisle; it's yours. Write your name under mine, and use it for the soldiers.'

To refuse it would have been ungracious; so she thanked him, and said that the men would welcome the extra comforts provided by the gift.

He wrote to Angold, releasing him from his promise of secrecy, and telling him he had resumed his proper name; and Angold replied, saying that he had kept the secret under stress—kept it even at the meeting of the directors, when, on Seldon's proposal, the directors had generously voted him fifty pounds. 'I smiled inwardly,' penned the solicitor, 'and wired Poppleton. The latter, I agree, was risky, considering my promise; but what could I do?'

Jack de Lisle limped in, his arm in a sling, his other arm resting on his sister's shoulder, only a little less lame than Sidney himself. Phyllis left them together.

'I've heard of you, Bentham,' said Jack cheerily. 'Oh yes, I have, from several sources—dad, and Phyllis, and the men, and one or two chaps out there who know you, and say it's pretty hard luck for you that you are left at home. They'll alter their tale now. You've had your scrap here.'

'I'd no idea you were wounded.'

'Hadn't you? I should have left my bones in Flanders but for you.'

'You're joking.'

'Am I? Ask Phil. We'll have him over, and he'll tell you. No, he won't; he's too modest. So I'll tell you. He was one of my lot. We were raiding. The star-shells were going up, and a sniper got me twice—once in the thigh, and down I dropped; and once in the arm as I lay in the open. Phil brought me in. I was nearly done for. I lay there, between the trenches, seven mortal hours. Phil had brought four in already. He came out for me, dragging his leg with him, perforated; and as he flung his arm about me a shell burst, and he caught a fragment of it in his open palm—caught it, but couldn't hold it, for it ran up to the elbow. He thrust the other arm under me, and rolled me over, and over, and over, until he tumbled me into the trench, the shots spitting viciously all around both of us, and, fainting, he tumbled in after me.'

'And they gave him the D.C.M.'

'Yes. He won the disc.'

'And you were joking.'

'No. Ask Phil. You took his place. He took yours. You're quits—both convalescent together.'

'I'm proud of him.'

'And he's proud of you.'

Phil came over. An empty sleeve was pinned across his breast. Before he left, while he and Sidney were alone, he quietly placed a small packet upon the table, and said, 'Mother sent it.'

'What is it, Phil?' asked Sidney, fingering it, and finding it heavy.

'Your wages. Bryce brings them up every pay-day. And,' Phil went on, for Sidney was silent, 'Bryce always says, "For Mr Bentham, madam," gravely, then raises his hat and walks away. He knew your father. From the start he knew you. But he kept the knowledge to himself.'

'I am greatly obliged to Mr Bryce,' returned Sidney slowly. 'I must write him, and prevent the further payment of wages I am not entitled to. In the meanwhile'—— and he pushed the packet of coins across the table.

'Aren't you going back?' asked Phil.

'Not as a clerk,' Sidney replied; 'that has become impossible. I may, as a director. In the meanwhile,' he continued, picking up his interrupted thought, 'Mr Bryce has placed me in a delicate position. What must I do with this? I cannot send it back to your mother.'

'That would never do,' asserted Phil.

'I am afraid not,' mused Sidney. 'Your mother might resent it. And yet—— Oh, I have it! Will you do me a favour, Phil?'

'Gladly.'

'Then pass it on to Crabtree. Tell him I have sent it, with my compliments, in exchange

—not in payment—in exchange for the nectar and ambrosia.'

His acquaintance with Jack ripened into intimacy. The squire was the same as ever—genial and free. But Phyllis retired behind her shyness. He saw her frequently. She never avoided him. He was not aware that it was shyness. But he was aware that between them there was a barrier of some kind. It was indefinable. She was very courteous, almost too courteous; she was specially considerate, almost too considerate. He could go so far; then he was checked, held up, by an inflection of the voice, by a contraction of the brows, by a clearness of the eyes, by the slightest possible straightening of the figure.

'Poppleton,' said he, 'the time has come when I must test the sanity of what I said in that dream-like state. What did I say?'

'Lots of things, sir.'

'Did I mention any names?'

'Sometimes, sir.'

'Whose?'

'People you knew, sir.'

'And people you knew, Poppleton?'

'Most of them, sir—not all. You spoke, sir, toward the end of the dream, about some people in Ryeburn; and you mentioned particularly a Lady of the Pines.'

'Oh! A Lady of the Pines? Did I mention her frequently, Poppleton?'

'Fairly often, sir.'

'In what way?'

'Well, sir, if I may say so, commendably, as a lady you had been taken with, sir, and had a deep respect for.'

'Did I say anything foolish, Poppleton—anything I have any cause to regret?'

'Not in the least, sir. You were as sane as you are now.'

Sidney reflected upon it. He decided to push at the barrier, and, if possible, to break it down. 'Phyllis,' he began, and immediately, by some subtle communication, he knew that she was on her guard. It was the first time he had so addressed her. 'In my wanderings through the woods I came across an artist, painting. She seldom saw me. I did not disturb her. We never spoke to each other, not even that once when I stood behind the manager of the mines, a clerk, socially unworthy of an introduction. But I never forgot her. And I was accustomed to think of her as the Lady of the Pines.'

She unbent a little, and her eyes softened, as she waited for him to proceed.

'In my wanderings through the other woods, the woods of my dream,' he went on, 'I came across the same gracious lady, the Lady of the Pines. What I said I know not. I only know what Poppleton has told me—that all I said was sane. And so, whatever it was, Phyllis, I shall not withdraw it. I would repeat it if I knew what it was. Shall I ask Poppleton? He may remember.'

Her colour rose. She bent toward him, and whispered, 'There is no need.'

The barrier had gone.

THE CHRISTMAS GUEST.

LITTLE feet that came unheeded,
Helpless hands that knocked in vain,
Eager guest who stood and pleaded,
In the winter storm and rain!
So they tell the old, old story,
Of the gracious gift of love;
Dim reflection of His glory,
Shone the radiant star above.

Mothers, with a shelter o'er them,
Rocked the babies on their knee;
Surely never child before Him
Was as shelterless as He.
Driven from His kingly splendour,
To the cruel world's unrest,
To the children, young and tender,
Came the children's Christmas guest.

Still, as in those distant ages,
Through the wintry wind and sleet,
Where the power of darkness rages,
Come those soft and shining feet.
Peace, the herald, goes before Him,
Where the fiercest perils are,
And within the darkness o'er Him
Shines the solitary star.

With the angry world unheeding,
And the clouded sky above,
On the thresholds stands He pleading
For the little homes of love!
Peace is shorn of light and glory,
Unacknowledged—dispossessed—
But, as in the old, old story,
Christ is *still* the children's guest.

G. R. GLASGOW.

CUTE M'CHEYNE.

By JOSEPH LAING WAUGH,

Author of *Robbie Doo*, *Betty Grier*, *Thornhill and Its Worthies*, &c.

CHAPTER I.

JOHN M'CHEYNE was a tall, lantern-faced, narrow-shouldered man, with a pawky, wheedling way, a parochial outlook, and an easy, quiet confidence born of the knowledge of a good bank-account and an extensive thriving joinery business.

As members of Shinnel School Board and fellow-parishioners in a not over-populous glen, we had often met, and I had had many opportunities of noting his peculiarities, but never had he seemed to me so gaunt, out of place, and ill at ease as he did one July evening sitting in the low basket chair in my little sanctum.

Only once before had he been within my manse gates. He called to offer his services in connection with any joinery repairs needed, and I remember he left very wroth and disgusted because the work had been already entrusted to his brother-in-trade, James Mouncey. But that was shortly after I came to the parish—nearly two years before—and as we sat talking spasmodically and smoking assiduously, I wondered what his motive could be in visiting me now.

We had discussed the weather and crop prospects—a subject in which he was interested, for, as a hobby, he farmed the hundred acres or so round his house; lamented the uprooting of Auchengibbert fir-wood by a recent storm; and eulogised the laird of Craigbank, who had been buried the previous day.

So far, our crack had been forced and scrappy; but the funeral was productive of much easy comment, for M'Cheyne had been entrusted with all the arrangements, and everything, to the smallest detail, had gone off without a hitch.

'Yes, Mr Crosbie,' he said as he held his pipe aloft and leisurely blew bogey-roll smoke towards me, 'though I say it myself that shouldn't say it, it was an orderly, well-arranged affair—a—what I would call an—an unqualified success. An unqualified success, sir, it surely was. But, as you know, I gave it my personal attention; saw to everything myself, even to the distributing of the cords; and—well, "if you want a thing well done"—you know the rest, Mr Crosbie.'

I noticed he discarded the Doric when he began to speak about the funeral and the part he had played, and his talk was deliberate and restrained; but when he had thus elevated his subject and impressed me sufficiently, he gradually slipped into more homely forms and let himself go.

'But I was due the laird personal supervision, Maister Crosbie,' he continued. 'Mony a hunner pound I got from him—ay, mony a yin. When he fell heir to Craigbank he applied to me for plans for the new steadin'—never thocht o' employin' a Dumfries architect—no, sir—not he!—an'—an' I set to, prepared plans, gave him a probable estimate, an' got the job withoot opposition. You see, he had confidence in me; an' though I say it mysel', it wasn't misplaced, for I feenished the contract in sic a wey that he never efter gaed by me. It was me, sir, that detected dry-rot in the drawing-room o' the big hoose, and it was me that cured it. Every gate on the lairdship cam' oot o' my workshop, an' the storm windas on the Shinnel Brig cottages were thrown oot by M'Cheyne & Son—a' laird's work; never a price speired; an' peyed on the nail, sir—*peyed on the nail.*'

The memory of these prompt cash transactions evidently afforded him keen enjoyment, for he smacked his lips as if he were eating sugar, and repeated the last four words with an accompanying tattoo of emphasis on the arm of the chair.

'As regards the funeral, Mr Crosbie,' he continued, 'I don't mind tellin' you that I would as lief had nothing to do wi't; for ever since I launched oot in the big contractin' line I have gi'en the undertakin' the—the go-by, as it were. It was different in my faither's time, for the business was sma' then, an' the black trade wasna to be sneezed at, I assure you. But circumstances hae altered, and as I am noo, it's no' juist exactly what I would ca' a dignified branch, Mr Crosbie; no, it is not; an' I can well afford to let it slip. But the laird's funeral—well, it was no ordinary occasion—zinc shell, polished oak box, hearse and sixteen coaches a' the way frae Thornhill, forby the issuin' o' three hundred and fifty intimations and invitations. Oh, it was a by-affair, and, more than that, I had aye dune a' his work, as I've said, and I was sweir to let that ploitterin' body Jeemes Mouncey into Craigbank even at the eleventh oor.

'Then there was anither consideration,' and he gave me a sly side-look; 'I had a polished oak misfit on my workshop laft which I judged wad juist fit the laird to a T. It was eye-measurin', of coorse; but every time I lookit,

what ye micht ca' professionally, on the laird I thocht o' that box, and when I was assured that death was in the cup, so to speak, I made a point o' ca'in at Craigbank just in a neibourly wey, ye understaun', an'—an' it cam' off a' richt. Ay, it cam' off; and the box—well, he couldna hae been neater nested if I had measured him to the sixteenth o' an inch wi' my ain fit-rule. Imphm! They say, keep a thing for seven years and ye'll find a use for it; an', faith, Maister Crosbie, there's some truth in it, for it's just within a cat's jump o' that time since I mistook five-feet-three for five-feet-eicht; an' as the Glesca firm that supplied it wadna tak' it back, it lookit lang as if I wad be the loser by my stupidity. Hooever, it's away noo. Eh—did ye notice it, Maister Crosbie?'

'Notice what?'

'The—the box.'

'No, not particularly. Why?'

'Oh weel, it disna maitter. Ye wad never hae kenned it wasna new if I hadna tell't ye. That's the warst o' me. I'm aye sae open an above-board wi' my affairs, Maister Crosbie. It disna aye pay, but it's gran' to be honest. Imphm! I was wunnerin' a' the road frae Craigbank to the kirkyaird if Jeems Mouncey wad spot it. Bein' in the trede, he kens its weys, an' he likes me sae weel that he wad juist glory in a handle against me o' that kind. Efter a', what aboot it? Certainly the colour had darkened, and the polish wasna juist what you wad ca' skinklin', but for the purpose it was as guid as new—och ay, better.'

'You'll make some allowance on the price probably?' I ventured.

He looked at me sharply and keenly. 'What's that ye say?'

'You'll take your own time to tell the widow, and make an allowance.'

He gave a short, dry cough and stroked his beard. 'Are you juist sayin that, or askin' a question?'

'Oh, any way you like, Mr M'Cheyne—say as a question.'

'Imphm! Weel, it's—it's awfu' like the kind o' unbusiness questions a minister wad ask. It's so—so'——

'Stupid. Eh?'

'Stupid. Ay, man, that's the very word. Allow you—faith, ye ken the crack o' the whup, Maister Crosbie;' and he chuckled and laughed to himself. 'Seriously, though, sir,' he said after a pause, 'do you really think I wad be justified in sayin' ocht aboot it to the weeda? The thocht o' ocht second-haun' wad juist hurt her feelin's, an' in the dark oor o' her adversity she has plenty to thole. No, no! I'll juist—imphm!—just so. By-the-by, Maister Crosbie, are you takin' ony interest in this singin'-class that's practisin' in the schule the noo?'

The basket chair in which he sat was very low—so low, indeed, that when he sat forward his knees touched his chin, and when he lay back and stretched out his legs, from where he sat in the middle of the floor he could easily have rested his heels on the mantelpiece. I thought he was about to do that, but on asking the question he contented himself with putting his toe between the ribs of the grate.

The conversational tangent amused me, and the drift of the question was not quite clear; but I answered shortly that as it was a local venture and the musical as well as the moral and spiritual well-being of my parishioners was my consideration, I was very wishful it would turn out a success.

He puffed thoughtfully for a little; then, drawing in his meandering limbs and sitting forward doubled up like a Greek E, he looked sideways at me.

'It's what they ca' a cantata, I'm tell't.'

'Yes; the cantata of *Ruth*. My musical education is quite rudimentary,' I continued, after a pause, 'but it seems a nice composition.'

'Just so—a nice composition—imphm!—of the play-actin' order. Eh?'

'Well'—and I laughed good-naturedly—'I wouldn't say it is exactly of the play-acting order.'

'But there are characters in it—a' takin' different pairts. Is that not so?'

'Oh yes,' I said. 'The principal singers take parts, and in song and chorus bring out the story.'

'But they sing what's no in the Bible,' he persisted.

'Well, that may be; in fact, I know they don't sing the exact words as they are written in Ruth; but in a composition of this kind license is permissible, you know, Mr M'Cheyne.'

'Is it permissible to tak' a license wi' the Word o' God, Maister Crosbie?'

'Come, come, now!' and I laughed again; 'you know'——

'Come, come, yoursel', sir. It's no a lauchin' maitter. I look upon it in a serious licht. Of course, you're a young man, Maister Crosbie; you're a stranger in a mainner, an' you bring toun's notions wi' you. You mebbe think you're doin' richt in countenancin' this affair, but I wouldna be actin' a freen's pairt if I didna tell ye you're—you're wrang. This cantata is an innovation, sir—an innovation. We never had ocht o' the kind in the parish before, and we've lived langer withoot doctors and died as happy withoot ministers as parishes that have. The whole affair is play-actin', pure and simple. Liberties are ta'en wi' the Word o' God. Young lads and lasses are brocht thegither wi' naebody richt to look efter them, an'—an'—weel, ye never can tell what'll happen. An' this teacher o' music frae Dumfries'——

'One moment, Mr M'Cheyne,' I interposed. 'Before we go further let us know where we stand. You know as well as I do that this

class is not under the auspices of the church. It is a venture by a very deserving man who, on account of ill-health, has had to leave his work in Dumfries and take up a temporary residence in our health-giving glen. I never advised him; all I did was to move at our board-meeting that he should have the use of the school, and the vote was unanimous. If you are so jealous of the good name of Shinnel, why did you give your vote in favour of my motion?'

'I didn't know it was to be a cantata.'

'And, in the name of goodness, how do you imagine a cantata is likely to corrupt the morals of the parish?'

'Now, Maister Crosbie, I didna come here to be cross-examined. I cam' to warn you an' advise you, an', if possible, get you to use your influence to bring the meetin's to an end. They 're upsettin' the whole young community. There 's my son Robert, noo—a better all-round joiner never lifted a jack-plane; he 'll draw a plan, mak' oot a specification, or keep a job gaun like a lever-watch—never took up his time wi' ocht but his wark. Noo, he 's a buddy ca'ed Boaz—a Jew buddy, of coorse, and he roars and sings nicht and mornin' aboot a family o' the name o' Elimelech. Nae workin' at the books noo efter oors. No, no! Then there 's that gabbin', hallockit dochter o' Mary Fraser's. I daur say she spends as muckle on lavender-water in a week as her mither spends in soap in a twalmonth—and she 's Naomi—michty! Wad she no be better employed, think ye, at her sewin'-machine, daein' something to help to pey her faither's doctor's bills? Ruth, they tell me, is Jeems Mouncey's dochter. Imphm! Him or his maun aye be in the eyes o' the public. I say nocht 'gainst the lass. She 's maybe a' they say o' her, but I ken her kind, an'—weel, the least said the sunest mended.'

'James Mouncey is one of my elders,' I quietly said, 'and a finer man I never met in my life. Since you came into this room you 've never let slip an opportunity of disparaging him. No more of it, please. Though you happen to be in opposition to him in trade, that is no reason why you shouldn't be friendly towards him.'

'Friendly towards him—friendly towards him! Maister Crosbie, was it friendly o' him to start opposition to me efter bein' in my employ for over forty years? Was that, I ask ye, friendly?'

'It 's every man for himself in this world, Mr M'Cheyne, and James Mouncey was quite justified in taking steps to better himself. But we 're wandering from our subject. You didn't call to tell me about the laird's funeral, or to—or to unburden your mind regarding the second-hand coffin'——

'Stop, sir!'

Before the words were formed on his lips I felt I had said a wrong and an unkind thing, but the temptation was great. 'I—I take that back, Mr M'Cheyne,' I quickly said. 'I presume you told this to me in confidence, and you may rest assured'——

'I did, sir. It was between you and me, and I trust it 'll gang nae further. But ye nippet me up very sharply aboot Jeems Mouncey. I wad juist like to say that he 's'——

'I refuse to discuss James Mouncey with you.'

'But, mercy me, man, he 's doin' his best to tak' the bread oot o' my mouth!'

'Are you not doing your best to take the bread out of his? Besides, you can afford to allow him a few crumbs without a grudge. You employ a lot of hands'——

'Fourteen journeymen an' five apprentices—three o' the apprentices in their last year; an' that 's no the whole squad, for there 's twae cairters an' my son Robert an' me mysel'.'

'Well, dear me, why should you talk about the bread being taken out of your mouth? James Mouncey has only one man'——

'An' he 's a gomerel—canna tell pitch-pine frae white.'

'That may be; I don't know the man's capabilities. But James is in a very small way, and I know he talks very respectfully of you.'

'He might well do that, Maister Crosbie. He had one pound a week—twenty shillin's upstaunin' a' the time he was wi' me. He micht weel speak respectfully, as you ca' it.'

'He worked for that pound per week, at any rate; and, from what I know of him, he would serve you honourably and conscientiously. But enough. We are still wandering from our subject. Your object in visiting me to-night is to ask me to use what little influence I have to stop the singing-class?'

'That is so;' and he solemnly nodded his head.

'Solely because in your opinion this cantata will have a demoralising effect?'

'Well—yes; an' for ither reasons. I 'm against play-actin', an' the congregatin' o' young men an' women on ploys likely to be o' little service to them in the battle o' life. Then this singin'-maister 's an incomer. I understaun' he canna sing to keep himsel' warm, an' that he hasna the voice o' a peesweep. Oor ain precentor, Rory Rorrison, could sing him blin', they tell me. A'thegither, I honestly think it was a big mistake to gi'e him the use o' the schule. You talked very glibly on your motion, an' on thinkin' back I 'm no sure that we werena, in a mainner, hustled. Onywey, it wasna discussed as it should hae been, an' it strikes me the only wey to rectify it is to refuse the use o' the schule for ony future meetin's.'

I looked at him as he complacently smacked his lips and turned his eyes to the ceiling; but I was too astonished for speech. And, taking my silence for acquiescence, he continued: 'I 've been takin' note o' you, Maister Crosbie, since

ye cam' to Shinnel, and often when I hear you speakin' at meetin's the thocht strikes me, "Dod, if I had that man's gab an' eddication I wad mak' the Shinnel folk toe the line." Mind you, I can see as faur aheid o' me as the next man, but the want o' learnin' keeps me frae gettin' a' the plooms I wad like to pu'. Man, you an' me between us could rule the board—ay, rule the haill parish. As for this wee bit business we 're talkin' aboot, the twae o' us, by pu'in' the richt strings, could hae the motion rescinded as easy as A B C, an'—an' in that wey do the trick.'

'You 've used the proper word. It would be a trick, but one in which I shall take no hand; and more, Mr M'Cheyne, I 'll oppose you tooth and nail in any endeavour you may make to harm the project.'

'You 're croose, Maister Crosbie.'

'And candid,' I said promptly; 'and that 's more than you are with me.'

'Have I no been candid?'

'You haven't; and you know it. There 's something behind all this palaver about play-acting and demoralisation. Of that I am sure. But probably it 's a way you have, and we have all, I dare say, our peculiarities.'

'Imphm! Well, there 's nocht mair to be said. Only, they 'll have to look out for anither Boaz. I 'll put my foot doon where my ain 's concerned. Robert will have to obey me or look oot for anither job. That 's a' I hae to say.'

And as he got up from his chair and rose to his full height, I imagined his tousled hair screeved the whitewash on my study ceiling.

The interview had left a nasty flavour in my mouth, and I was nothing loath to be rid of my visitor; but, as was my unvarying custom with all my callers, I convoyed him to my avenue gate. It was a beautifully quiet July evening. A refreshing shower had fallen during the early afternoon, and the fragrance from my herbaceous borders, mingling with the pungent aroma from boxwood and yew, was a welcome exchange for bogey-roll smoked through a briarwood pipe. We were walking noiselessly on the turf, for the gravel had recently been raked, and were just nearing the gate, when my companion suddenly stopped.

'Shish!' he said in a whisper. 'That—that 's surely Robert's voice on the ither side o' the hedge. What 's he daein' here at this time o' nicht? And whae 's wi' him?' And he clutched me by the arm and pulled me behind a laurel.

A moment later young Robert M'Cheyne and James Mouncey's daughter passed the gate, and his arm was round her waist. A faint murmur of blithesome words like the distant tapering cooing of a cushat—a rippling laugh, sweet, low, and girlish—and a happy couple passed on, leaving behind them, and with me, a suddenly summoned memory. . . . A mist before my eyes blotted out the gate, and in its stead uprose a silver birk on an auld quarry knowe. In the twinkling of an eye, a lassie figure, in a blue print gown, glided forward to me. I felt the glamour of her presence, the touch of her hand, her breath on my cheek. In the gloamin silence I heard the familiar drip-drip of the oozing water from the red sandstone crevice above, and saw the sunset glow catch each drop as it fell. . . . Like a lightning-flash it had come; like a lightning-flash it passed.

As suddenly wakened from a dream I looked up to my companion. With fixed, glinting eyes he was staring straight in front of him, and his clasp on my arm was pulsing and unrelaxed.

'My God!' he said slowly and painfully; 'juist as I jaloused. John M'Cheyne's son wi' Jeems Mouncey's dochter! Has it come to this?'

He flung aside my arm as he would a circling pine-wood shaving. Then he turned to me.

'What did I tell ye? *That 's* your damned cantata!'

CHAPTER II.

I NEVER knew what Matthew Hird, my Shinnel beadle, thought of me as a preacher, but I know he had the most supreme contempt for me as a gardener.

When work in the manse garden and grounds was getting behind, and my parish duties were not many or pressing, I sometimes volunteered to give him a hand. He never, of course, actually refused my help, but he took his own way of repressing my ardour by putting me to what he called 'the very job for ye'—that is, push-hoeing gravel-walks, or picking out weeds with a table-fork from between causeway-stones—work not at all to my liking, but which, after volunteering, I couldn't very well refuse.

And while I was perspiring over the drudgery of the former or racking my back stooping at the latter, Matthew, from amongst the roses and geraniums, was wont to encourage me in well-doing by reminding me that 'an acquaintance wi' weeds was as necessary to a gairdner as a knowledge o' flooers.'

At other times, when he was engaged at grave-digging—which was infrequent, as our glen was a veritable sanatorium—or when attending to the stable, I seized the opportunity, and sallied out with a pruning-knife, cutting here, or with grass string tying up and staking there. And I derived great satisfaction from the result of my labours, until Matthew levelled my castles by telling me that 'thae deevils o' boys frae the Brig En', that made ower free wi' their gullies on ither fowk's property, deserved to come by a bad en',' or that 'the man *or woman* that staked thae carnations wad be better employed blawin' saep-sud bubbles through a clay cutty-pipe.' His observations, levelled, of course,

at some one unknown but suspected, were not generally encouraging; but my zeal was not lessened, and, prompted by the desire to help, I started one morning with a light heart to nail to the wall the Gloire de Dijon which the recent storm had wrenched from the side of the front-door porch.

Matthew wasn't about. If he had been, I should probably have continued the study of my sermon; but, as ill-luck would have it, no sooner had I placed my ladder against the wall than he appeared round the corner with a scythe over his shoulder.

It was the morning following my interview with M'Cheyne, and my mind was still much disturbed by what I had seen and heard. Matthew, too, was connected, or at least remotely concerned, for he was brother to Mrs Mouncey, and being a widower, with no one left to look after a house, he had, some time before I came to the parish, taken up his abode with my respected elder and his wife. He was thus Mary Mouncey's uncle—yea, her guardian and protector, for he wouldn't allow the wind to blow upon her if he could help it. In his estimation there was no lass in the countryside like Mary—no one to take her place in the choir, or to grade the colourings of a garden border as she could. I'll never forget the glow of pride that lit his eye when she got the first prize at the great Thornhill Show for oatmeal-cakes and soda-scones, and with what importance and zealous care he hovered all day near her little exhibit.

And as I stood on the ladder in the early morning sunshine, I wondered if he knew that young Robert M'Cheyne could without fear of rebuff put an encircling arm round Mary's waist, or if—— But my cogitations were suddenly cut short. Speculative meditation on a shaky nine-foot ladder surmounted by twisted prickly branches that 'turn and rend you' is not an exercise of easy accomplishment, and I soon found out that the work I had tackled demanded my undivided attention.

It had seemed a very simple job as I had viewed it, pipe in mouth and hands in pockets, from the gravel-walk; but now, with the thin rung of the ladder pressing painfully into the ball of my slippered feet, in my hand a hammer that, from my awkward position, I couldn't wield, and weighted to one side by a pocketful of three-inch nails which I couldn't get at for jaggy branches, I felt downright sorry I had made the attempt. Time and again I shoved that Gloire de Dijon from over my head and shoulders, and for a short moment looked out distractedly from the shadowy gloom of foliage and bloom upon a sunlit world, and as often it swung itself down and around again, clawing at me as if with steel-tipped tentacles, and flinging me into a shadow deep as night. I wrestled long and manfully, for I was, in a way, determined, and I also had the feeling that Matthew was critically watching me every time he stopped to hone his scythe. But progress was impossible, and after exhausting my vocabulary of permissible imprecations and others perilously near the forbidden, I gave up the struggle, and lustily called up my old stand-by.

'Was that you, sir, cryin' "Damn you"?' he asked, peering up at me through the leaves.

'Matthew Hird! how dare you—— It was "Matthew"'——

'Oh, I beg your pardon, sir. I'm no sae gleg o' hearin' as I used to be; but if it had been me that was up there rivin' an' fecthin' wi' that "Glorydeyjohn," I'm thinkin' I wad hae been tempted to say what I thocht ye said;' and, catching hold of the entangling branches as if they were privet, he made a way for me, and, flurried and torn, I stepped to the ground.

'Matthew Hird,' I said, with as much dignity as I could command, 'you're a very clever gardener and you know a lot, but allow me to tell you you haven't got the correct way of pronouncing the name of this particular rose. It is Gloire de Dijon—pronounced thus, Matthew, "Glaur dae Deeshong."'

'No in Shinnel, Maister Crosbie.'

'Perhaps not; but the Shinnel way is wrong.'

'Ay—well, mebbe, sir; but we'll no argue the point. Glaur or no glaur, it has ruggit ye terr'le;' and he laughed—rather unfeelingly, I thought.

'There's not much to laugh at, Matthew,' I said, as I wiped my scratch-scored face and put the breast-tab of my clerical collar inside my vest.

'I'm no lauchin', sir; but—I mebbe smiled.'

'Oh! And what might you be smiling at?'

'Nocht parteeclar, Maister Crosbie—nocht parteeclar; juist—juist something that crossed my mind.'

'Out with it, then, Matthew, and let me smile too.'

'Weel'—and he slowly drew the back of his hand across his mouth—'weel, sir, if ye will hae it, an' beggin' your pardon, Maister Crosbie, I was juist thinkin' that if ye hadna been a better preacher than you're a gairdner ye wad never hae smelled Shinnel;' and without more ado, and with indifference to my opinion of his summing-up, he lifted the ladder from against the wall, and, placing it underneath the main stem, he carefully and slowly pushed it upwards until the leading branches were pinned against the wall. 'There, sir, it's noo as through-gaun wark as suppin' parritch. Work your wey up an' roon aboot ye, an' the nearer the tap the lichter 'll be your haundlin'; only, you 'll hae to change your tool. Ye canna drive a three-inch nail into cement between ashlar wi' a carpet-tack hammer; mair than that, your rhin' should be clippit into lengths and bored ready, an'—— Ay—imphm! Weel, my job can staun' a wee.

I see I'll hae to gi'e a haun'. Every man to his trade, sir. Whaur 's your nails?'

I emptied my pocket into his hand, and together we started. For a time we worked in silence, for I was disappointed and not a little aggrieved, and it wasn't till Matthew had chipped his thumb-joint with the hammer and set free some of the old Adam within me that I spoke.

'How 's the cantata getting on?' I asked. 'Is Mary pleased with her part?'

'Oh, brawly, I think. I 'm no' a musicioner mysel', but Mary tells me things are gaun fine, an' she got her bit up like A B C. She can play the haill rick-ma-tick on the peeany, an''——

'The piano! I—I didn't know Mary possessed one.'

'Auch, dod, dash it! I've gi'en the show away, sir. No, I daur say ye dinna ken she 's got a peeany; few, if ony, in the parish ken, an' I was a bletherskite to mention the name o't; but it slippit oot before I thocht. Ye see, we keep it quate, for Jeems, her faither, thinks it what ye wad ca' uppish, an' he canna abide ocht o' the criestin' order. She keeps it ben in her ain room, no in the parlour, so orra veesitors see nocht o't, an' as we hae nae neibours within ear-soun', she can rattle it up like hie-ma-nanny whenever she has the mind. She 's a forby lass is Mary, though I say it that 's sib to her. Her mither an' faither an' me wad be puir thowless sowls withoot her, for she looks to everything aboot the hoose, an' has aye a cheery word an' a happy e'e. An' as for singin'—weel, she has lilted sin' she could walk, an' when she was nearin' her teens her mither an' me made up a pack between us that she should learn the peeany. But Jeems had to be consulted, an' a terr'le job we had talkin' him ower. Dod, he was stubborn! As I've said, he canna staun' criestin'. An' then he took it into his heid that the parish wad think he had been overchairgin' them in their accoonts, when he could launch oot into a peeany an' him only a year or twae sterted on his ain, an' that he was cancie, an' tryin' to bring up Mary abune her station—as if ony station was ower high for her—humph! Hooever, to mak' a lang story short, we managed oor point. Mary gaed for a lesson yince a week to the Toun o' Scaur, an' Jeems an' me traiket to Dumfries a'e Setterday an' bocht the—the instrument. It wasna yonder for twae hauf-croons, Maister Crosbie, I assure ye. Faith, there 's siller in yon polished affair. But what 's the guid o' money if ye dinna use it? An' then, *it was for Mary*. Then, sir, we got the len' o' Rab Linn's cairt, an' brocht it hame—efter dark, I may tell ye, which was very stupid; but Jeems was feart the neibours wad see it, an', faith, he peyed for his stupidity, for in the dark we couldna weel see what we were daein', an' in takin' it oot o' the cairt we dunted it terr'le in some wey, an' it lost the soun' o' three o' its teeth. Ay, weel, sir, that 's on for six year sinsyne, an' mony a happy nicht we 've had. Mary 's noo what ye wad ca' a flooery player, she 's by-ordinar' nacky at the fingerin', an' can play a' the music that thae lang-haired, ferocious-lookin' foreigners make. She has an awfu' job, though, pleasin' us a'. The mither 's keen on the himes—"Abide with Me," "Rock of Ages," "Little Pilgrims," an' sic-like. Jeems, he sweers by St Asaph an' Martyrdom an' Dundee. As for mysel', gie me "The Lea-rig;" an', dod, sir, she plays and sings that well. An' she 's improvin' in it every day, for the nicht afore last, nae faurer gane, she was at it, withoot me askin', an' the way she said, "My ain kind dearie o'"—the he'rt she put into it, an' the kin' o' sweet low trimmle in her voice—gosh, sir! as shure as—as you 've a scart along the brig o' your nose, I—I grat like a wean, for it brocht back to me a time lang, lang bygane, when I gaed through the darkest, dunkest bit o' Shinnel Glen as croose as a spunkie, on my wey to meet a lass that was a' the worl' to me. . . . But, michty me! I 'm—I 'm haverin'. A gabbin' gairdner an' a Muscovy tam-cat 's rare, they say, an' so they should be.'

'Oh, I don't know, Matthew,' I said. 'Conversation lightens work, and what you tell me about Mary and her music is quite interesting. I must take a walk down some evening and hear her play.'

'Weel, you 're no' everybody, an' ye 'll be made welcome. But if ye want to hear Mary sing at her best, gang quately up, as I gaed, to the end winda o' the schule some nicht when they 're at the practisin'. Her an' young Robert M'Cheyne sing thegither—juist by their sel's, an' if it disna dirl your he'rt-strings, I 'm a Dutchman. Frae what I can learn the twae o' them are supposed to be in a cornfield amang a wheen sheaves. Robert 's a man in the Bible ca'd Boaz, an' Mary 's Ruth; an' they hae a great cairry-on between them, singin' nice things at yin anither; an' then, betimes, the shearers come in, in the chorus, singin' as cheery as if hurdy-caikle was a thing unknown in the Holy Lan'. Oh, ye maun gang doon, sir, an' hear them at it.'

'I surely will, Matthew, if for nothing else than to hear young M'Cheyne and Mary sing their duets. I didn't know he was a singer. He 's not in the choir.'

'No. His faither wadna alloo him to join because at the last election o' elders—six year bygane—he didna get on. Dod, sir, he was mad aboot that—couldna forget it—and gaed aboot for lang efter glum an' moody as a wat Setterday. The young lad used to be very feart for his faither—mony a wallopin' he got for daein' deil a'; but he 's grown-up noo an' has mair smeddum. He 's a nice, decent laddie is Robert, aye cracky an' blithe when ye meet him, an' there 's an honest, strechtforrit look in his

e'e that a'maist mak's yin doot his paternity. He takes efter his mither—*she* was a fine woman, an' he lost a guid freen when she dee'd.'

'And who is the second Mrs M'Cheyne?'

'Oh, she's an incomer—frae the Galloway side, I unnerstaun'. A very ambitious woman she is, they tell me. She's airtin' M'Cheyne on to be a somebody in the locality—no that he needs much airtin', for he has grabbit a' he could lay his haun's on, an' wad like to crack the whup ower a' oor heids. God help ony puir sowl that has M'Cheyne's heel on his neck! Ay, he sits on his ain property—a bonnie place it is—an' he micht weel be content, but he has cuist an envious eye on the land o' Croftmains that mairches wi' him. There's no much in't, an' I dare say he could buy it withoot bein' obleeged to his banker, but he disna mean to pey for it—oh no, not he! It belongs to a bit simple, delicate lass that comes north for a month or twae every year, an' it's said that faither an' stepmither are movin' a' abune an' below to get young Robert to step in an' hing up his hat. He could dae sae, they tell me, for the lass is ta'en wi''m; but'——

He stopped short, and grasping one of the rose-branches, he put his rhind round it and began fixing it to the wall.

Never before had I discussed parish folk and their doings with Matthew, or, for that matter, with any one else; but, following so closely on M'Cheyne's visit, the subject of our conversation was so particularly significant and interesting that I had no scruples of conscience in continuing it.

'And will Robert M'Cheyne oblige his parents by marrying this young lady?' I asked, after a pause.

Matthew looked at me for a moment, and a smile played round his mouth.

'No, I dinna think he will,' he slowly said. 'There's nocht queerer than fowk, but if young Robert's the man I tak' him to be, he wad suner leave his faither's hoose than be forced to gi'e his haun' where his he'rt can never be.'

'I'm glad to hear you say so, Matthew. He seems a very honourable, straightforward young fellow, and though I don't know him well, I have a very high opinion of him. Unlike his father, he seems to be everybody's body in Shinnel, and when it comes to choosing a wife I trust he'll not go outside the parish.'

All at once Matthew had started to work with a great birr, and was hammering nails with tremendous energy, and pulling and twisting the Gloire de Dijon branches with more violence than care.

Suddenly he flung his hammer on to the gravel-walk and came down from his perch on the ladder. 'Dash it, Maister Crosbie! I canna keep it in ony langer. I really believe the Almichty tak's tent to airt a crack in the same wey as He airts the wun'—aye in the direction that's best for us. Ay, He does. At ony rate, what we've been speakin' aboot has paved the wey an' made it easier for me to say what I've on my mind to tell ye. Oor Jeems—that's Jeems Mouncey—had a very waukerife nicht last nicht, an' I dinna think he'll be in what I wad ca' full bloom this mornin'. This is oor auld Fast Day; but it's a holiday noo amang tradesfolk an' merchants, an' he could have had a lang lie if he had wanted, but he was oot afore I got up, so that I didna see him to get his permission to acquaint ye wi' what I've to say. Hooover, my sister Marget an' me talked it ower at oor breakfasts, an', kennin' that Jeems thinks the worl' o' ye, an' that if advice was needed he wad suner ask it o' you than ony man in the parish, we arrived at the conclusion that it wad be better to gi'e ye an inklin' o' what happened, an' then leave it to yoursel' to consider whether or no ye shouldna daunner doon the day an' see Jeems.'

He stopped for a moment to adjust his cravat. In a flash it came to me that probably M'Cheyne, after leaving the manse, had gone directly to James Mouncey's with an angry, bitter heart and a biting tongue; but before I could say a word Matthew resumed.

'Last nicht, juist aboot the darkenin', Jeems an' me were sittin' thegither in the gairden on the simmer-seat amang the ramblers, takin' a quate blaw o' the pipe before gaun in for the nicht. We had howkit tatties, cuttit cabbage, snippit parsley, an' pu'd turnips, a' for the morn's denner, an' were puffin' away, no sayin' muckle, but—but enjoyin' oorsel's. Ay, sir, we were enjoyin' oorsel's, for, mind you, to them that work among flooers an' vegetables an' ken every yin o' them, a gairden's a pleasant place at ony oor o' the day, but mair sae juist about nichtfa', when ye canna weel see to dae ocht mair, an' ye're contentedly tired; when the souns that are lounest are sweetest, an' when the smell o' the clean, fresh mools mixes wi' that o' roses an' sweetbrier an' aipple-ringie. Dod, sir, it's graun'! Weel, as I say, we were sittin' cheek by jowl, an' Jeems was juist daudin' oot the ash o' his pipe on the airm o' the seat, when he happened to turn sideways an' look doon the road. He gi'ed his pipe a'e jerk that sent the heid spinnin' an' left the stapple in his haun', an' he never lookit to see where it gaed, but keepit starin' before him.

'"Mattha," says he, "that's oor Mary. I ken her walk, but—but whae's that wi' her?"

'Dod, sir, it was young Robert M'Cheyne, prood-like, wi' his heid in the air, airm-in-airm wi' Mary, an' she was walkin' like a very queen, an'—an' a smile on her face that tell't me something I had till then but hauf suspeckit.

'"That's Robert M'Cheyne," I said as unconcerned as I could.

'Jeems raise to his feet; then he sat doon again, an' he lookit at me as much as to say, "What dis this mean?" I put my haun' on his knee, but I said nocht. By this time they were

juist aboot the gairden-gate. Then Jeems got up again.

'"I juist want a word wi' him, Mattha," he said; an' as he gaed, switherin' like, doon the walk, I slippit away, an' gaed into the hoose by the back-door. In a meenit or twae I heard Mary comin' in her lane, so I jaloused that Jeems had sent her into the hoose, so that he could freely say to Robert what was on his mind. Never wi' disrespect, but aye wi' dread, was the name o' M'Cheyne mentioned by Jeems an' his wife to me, an' never in Mary's hearin' was a word said o' his ill-will an' persecution; so, puir lass, she wasna likely to ken o' ocht that wad come frae Robert's side to damp her happiness.

'I wanted to say guid-nicht to her as I aye had dune, but thocht better o't; an' for the first time feelin' fremit in a hoose that had been sae lang my hame, I gaed away ben to my ain room.

'It was lang ere Jeems cam' in. What he said to Robert, an' what Robert said to him, I dinna ken; but o' this I 'm shure—Jeems needs a helpfu', freenly word this day, an' you 're the only man in Shinnel that can say it.'

CHAPTER III.

I DIDN'T consider it either judicious or necessary to tell Matthew what I had seen the previous evening, nor did I say anything about the visit Robert's father had paid me. It was very evident my beadle had a keen eye for evidences of the tender passion, and I wasn't sure, so far, at least, as he personally was concerned, that in thinking of Mary Mouncey and young Robert M'Cheyne as lovers the wish wasn't father to the thought.

But I couldn't understand how James Mouncey had so quickly arrived at the conclusion that there was anything between the young couple. According to what I had just heard, he had seen them together only once—arm-in-arm, it is true; but did that justify the inference? I thought not, and said neither yea nor nay to Matthew's appeal at the end of his story, but left him to wrestle alone with the Gloire de Dijon while I took a walk round the garden, turning the matter over in my mind as I sauntered slowly along. But much thinking made the point no clearer, and I returned to the scene of our labours.

'Matthew,' I said, 'within your own mind are you quite sure that Mary and Robert are truly in love?'

'Ay,' he readily replied; 'as shure as—as the sun 's shinin'.'

'But what you have just told me is not, in my opinion, sufficient ground on which to base the belief.'

'Maister Crosbie,' he said impressively, 'a lassie 'll no sit doon, withoot bein' asked, and sing "The Lea-rig" as Mary sung it withoot love—love o' the very best—in her he'rt. Nae man 'll gang three-quarters o' a mile oot o' his road in splashin' wat weather and when he 's pushed for time juist on the off-chance o' seein' a lassie's face at a winda. Na, na, "a wink 's as guid as a nod to a blin' horse." You 've only to hear them singin' their sangs thegither in the cantata to ken; an, forby a' that, michty me, sir! did the twaesome no come up the road linkin'?'

'I ve no reason to doubt your word, Matthew; but surely a lad and lass may walk arm-in-arm and yet not be in love with each other.'

'What say ye? Airm-in-airm an' no—— Dod, sir, in Shinnel here that wad be coonted rank heresy. Na, na; that 'll no haud water.' He paused for a moment, and, taking off his old straw hat, thoughtfully scratched his head. 'Hereaboots,' he continued—'for ither places I canna speak—but hereaboots, when a lad and lass gang linkin' on the public road, they 're—they 're what we ca' booket.'

'Oh, indeed?' I said with a smile. 'I 'm surprised to know that. But if it is viewed locally in that light there 's nothing more to be said, and I 'll go down after dinner and have a chat with James.'

Shinnel Glen, like Matthew's garden, is a pleasant place at all times. Its charms, whether of hill or meadow—wreathed in snow or basking green in summer sunshine—are always present. Everywhere has nature showered her favours with a lavish hand—silver birks of the silveriest, lissome and graceful, wave their sheeny, wispy branches above the purple foxglove and fronded mountain fern; spreading oaks, gnarled and hoary, mark the byways to green hillside or flower-flecked meadow-land. Far from the madding crowd, fanned by the tangy, free hill air, unspoilt by the handiwork of man, solacing and sweet as if fresh from the hands of the Creator—such was my Shinnel home. And as I walked down the loaning this late July afternoon, under the grateful shade of the leafy canopy overhead, preceded by chirping linties and shilfas, and within ear-sound of the rippling stream, I closed my eyes and thanked God from my heart that my lines had been cast in such pleasant places.

It was a holiday in the glen, as Matthew had reminded me, and M'Cheyne's woodyard was silent and the workshops closed. The faded green gimp blind in the merchant's shop-window was lowered almost to full length, hiding from view the usual roll of bacon, fancy-biscuit boxes, and white-capsuled bottles of his famous 'Shinnel Blend.' A corner had, however, caught on the bottom shelf and left a space exposed, in which reclined an old shop mouser blinking in the sunshine, and doubtless wondering how another Sunday had come round again so soon.

Standing in front of the little shop was a dusty pedlar, with an empty mutchkin bottle in his hand, a square tin box at his feet, and a surprised, disgusted eye fixed on the barred and padlocked door. On noting my approach he slipped the bottle into his pocket, and slowly lifted the box. Reluctantly and resignedly he limped across the road to the village pump, and in passing he smiled and said woefully, 'Hivin help me, sorr! it's any port in a storm.' I know I ought to have been glad he was forced to substitute wholesome Shinnel water for unwholesome aqua-fortis, but I really wasn't; and though I didn't say a single word to him, I turned the corner leading up to James Mouncey's cottage with the wearied pedlar's words in my ear—'Thank yer riverince for yir sympathy.'

I could smell jam-making in progress—late strawberry, I surmised—as I went up the garden walk, and I also intuitively knew that a baking of cottage bread and soda-scones had already been put through. In common with country ministers in general, I had acquired a wonderful facility in diagnosing certain domestic conditions, and not wishing to trespass on the valuable time of Mrs Mouncey and her daughter, in whom, moreover, I had no immediate concern, I turned to the right and made for the workshop, thinking that although it was a holiday James might be within. One-half the door was open—a door streaked and dimpled by innumerable brushfuls of multi-coloured paints—and as I peeped in a big rooster from the top of a half-finished chest of drawers gave a gurring, warning cackle. A dozen hens raised their heads from unprofitable food-prospecting among sawdust, and looking steadily and inquisitively at me, asked me what the blazes I wanted. It was rather disconcerting, for a hen, when suddenly disturbed, can put a question very plainly in an unblinking look, and, my vocabulary of chuckie phrases being limited, I retired without deigning a reply, and continued my search in another direction.

I went round to the back of the house, through his modest woodyard, and ultimately found him, where with ordinary forethought I ought to have made for first, in his little rambler-covered bower at the south side of the garden. A large envelope, on which was a foreign stamp, was lying on the seat beside him, and a letter, which was evidently giving him much food for reflection, was tightly stretched across his knee. I made an apology for disturbing him, but James would have none of it.

'Na, na, Maister Crosbie, your veesit's no ill-timed, an' you're no disturbin' me. I'm ayegled to see ye, but—but, as it happens, mair sae the day than usual. Come your weys, man; come your weys an' sit doon here.' He lifted the envelope and carefully inserted the letter. Then he flicked the dust off the seat with a large red handkerchief. 'Black braidcloth's bad for showin' the dust,' he said, 'but'—giving the boards an extra rub—'ye'll tak' nae scaith noo. Dod, sir,' he continued with a smile, after I had seated myself beside him, 'it's queer that you—yin o' the best freens I hae in the parish—should ca' the day, an' that no hauf-an-oor bygane I should hae had a veesit o'—weel, I was gaun to say my warst enemy, but I maunna say that noo'——

'Has M'Cheyne been here?' I asked with surprise.

'Noo, Maister Crosbie, I mentioned no name. Kennin' hoo he has treated me in the past, it's only naitral ye should think o' him. An' ye've guessed richt. Maister M'Cheyne was here, an' he's no lang oot at the high yett there.' I looked keenly into my honest elder's face. There was lacking his usual placidity and repose, but I could detect no evidence of simmering agitation and excitement such as I reckoned a visit from M'Cheyne would leave behind. 'Ay,' he continued, 'it's lang, lang since him an' me spoke face to face. We've never opened mooth to yin anither for years, though we hae lived in the same parish, breathed the same air, an' drank the same watter, an'—an' it's kin' o' queer that on this, oor auld simmer Fast, he should come as he did to me'——

'James,' I interposed, 'before you go any further I wish to tell you that Matthew, with your wife's concurrence, told me to-day about what took place last night. I didn't come to you out of curiosity or to interfere in what is a very personal and delicate matter. I—I only wish to assure you of my loving interest, and to offer you what advice I may be able to give.'

'It's—it's very kind o' ye, sir—very kind indeed. But it's juist like ye, an' what I wad expect at your haun'. I've said it often ahint yer back, an' I'll say it again afore yer face, that if the lave o' ministers were to tak' as much what you weel ca' lovin' interest in their fowk's concerns as ye dae, not only wad they please the Almichty better, but they wad be shuttin' the mooths o' mony that hae ower muckle cause to cry them doon. Ay, an' as for Mattha's story, man, puir soul, I think he's mair put aboot than I am mysel'. Where Mary's concerned he's a'maist weanish. Ay, him an' me hae watched her growin' up, an' to baith o' us it seems but yesterday since she was in daidlies playin' wi' a gruesome-lookin' rag-doll, hushin' it to sleep in a bit creddle I made, an' trundlin' it up an' doon the walk in a shauchlin' wheeled perambulator. It seems, as I say, but yesterday, an' we can hardly believe she's come to the time o' takin' ony man-body's e'e except his an' mine. She's my ain. I'll say nocht aboot her looks or her character binna that whaever may be her choice—be he the highest in the land—she's worthy o' him. That's a' I'll say. As for young Robert M'Cheyne,' he continued after a pause, 'I've no objection—none in the world. He's a wice-like, respectable, an' respected lad, an' I

dinna think he has an ill-wisher in the parish o' Shinnel; only, of coorse, he 's young—in fac', they 're mebbe baith ower young to ken their ain minds or for serious thocht o' the future. Last nicht, though, when I saw them thegither for the first time, I—I got a he'rt-stoun' sic as I 'll no forget, an' a thoosan' queer, conflictin' thochts struck me a' at yince—my ain bit lassie, that never kenned ocht but a peacefu', happy fireside—that I 've guairded frae a' approach o' strife an' envyin' an' ill-will, linkin' wi', nae less, an' smilin' into the face o' yin whase faither swore he wad rook me to my last stick till there was nocht for me an' mine but the puirhoose. An' then, the persecution I 've had to staun', an' the slichts. But I needna tell ye, Maister Crosbie; ye ken an' ye unnerstaun'. Weel, I thocht too that the young lad should ken what my feelin's were; so, as Mattha wad tell ye, I gaed doon an' met him when he cam' up wi' Mary to the gate. Efter she had said guid-nicht to him, him an' me took a daunner up the brae, an' I was switherin' an wonnerin' hoo to begin, when, dod deavert, he sterted first—tell't me that he was gled o' the chance o' speakin' wi' me, that he had liket Mary a' his days, hoo vexed he was at the dispeace between his hoose an' mine, an' what he wadna gi'e to ken his faither's he'rt softened to me. Maister Crosbie, he juist took the breath frae me, an' it wad be unfair to the lad to tell ye what else he said; but my he'rt warmed to him Man, I put my haun' on his shooder, and says I, "Robert, I believe a' ye say an' a' ye profess. I 've nae objections to you gaun efter Mary—that 's if she wants you—but ye maun first tell your faither. I dinna want," says I, "ony hole-in-the-corner wark; everything," says I, "maun be above-board an' approved o' where my lassie is concerned. Tell him the nicht whenever ye gang hame. Mebbe he 'll oppose ye. If he does, he 'll gi'e his reasons, an', as his son, you 'll hae to consider them, an' then act as the honourable lad I ken ye to be." He promised he wad do as I asked him, but couldna speak to his faither that nicht, as he was juist stertin' to walk ower the hills to the Tarnie Loch for an early fishin', had left his rod an' creel at the merchant's hoose, an' was liftin' it on the by-gaun, but that he wad tak' the first chance whenever he cam' back. An' we left it at that. Noo, that 's hoo maitters staun', Maister Crosbie, between Robert an' me.'

'Well, James,' I said, 'I think you gave him very good, sound advice, and that you have acted very wisely and honourably under trying circumstances. But what, then, brought his father to you to-day?'

'Ah'—and James laughed cheerily—'that 's anither story. It had nocht to dae wi' Mary an' Robert; though when I saw him at the gate, it struck me that mebbe his son had come hame suner than he expectit and had spoken to him, an' that he had come—fresh off the erns, as it were—to me in either peace or war. Bein' an off-day, I had little to dae but sit at the winda, an' was daein' sae when he stoppit at the gate. So I said nocht to the wife, but hurried oot, so that if there was ony ill-will on his mind I wad catch him ower far doon the walk for his voice to cairry the length o' the hoose. But, dod, sir, he cam' up to me smilin', haudin' oot his haun', an' ca'in me Jeems, as he used to do when him an' me were 'prentice boys thegither in his auld faither's time—true as ye sit there, Maister Crosbie. "Jeems," says he, "your hoose is on the brae-face here an' in view o' the haill community o' Shinnel, and I come to ye wi' a contrite he'rt an'—an' ootstretched haun'. Will ye tak' it?" Dod, sir, ye could hae knocked me doon wi' a strae. Surprised! I was dumfoondered; but I looked forgi'en, for as I turned an' cam' slowly up the walk he followed close ahin' me till we landed where you an' me are sittin' the noo. We baith sat doon, an' I looked at him, an' as I did sae auld times an' auld faces cam' back to me—the ploys him an' me had in oor boyish days—pentin' his mither's black hens pink, mixin' his faither's snuff wi' pepper, nailin' auld Mary Frizzel's door up, blawin' shavin'-reek in an' cryin' "Fire!" an' sic-like daft ongauns; an' d' ye ken, Maister Crosbie, the speerit o' forgiveness cam' ower me an' gruppit me ticht, an' I held oot my haun', an', says I, "If ye come to me wi' a contrite he'rt, as you say, John, an' want the sclate wipet clean, it couldn't be weshin' on a better day than oor auld simmer Fast. What, John, what, I ask ye, airted you to come to me the day?" An' he tell't me he didna ken, but that it had been on his mind for a long time to come an' see me, but he had held back, no kennin' hoo I wad receive him; but the Lord had wrestled wi' him a' nicht, as He did wi' Jacob, and had prevailed. Ay, sir, he sat for a long time deplorin' a' that had come between us. He acknowledged that mony a time he had cut below cost prices, juist to keep me oot, but that it wad never happen again. "Fair hornie, Jeems," says he, "the richt stuff an' a conscionable price efter this" These were his very words, Maister Crosbie. An' then he asked kin'ly for the wife, an'—an' praised Mary—praised her till my very face flushed—said he had often ta'en notice o' her walkin' up the aisle o' the kirk, an' been sorry he hadna sic a dochter to set him an' his off as Mary did me an' mine. Oh, what a come roun, sir—what a come roun! I could scarcely believe it. Truly, "God moves in a mysterious way His wonders to perform." An' then we got on the crack aboot the rise in the price o' yella-pine, an' screw-nails, an' aboot a new mortisin'-machine that was on the market; and efter a wee he raise, an' said he wad hae to gang, for that Robert was away fishin', and the dug at the wudyaird wad be wearyin' on a bite o' meat. Man, when he mentioned aboot Robert no bein' back I kenned he was still in the dark

aboot him an' Mary, an' it made the Almichty's weys o' workin' a' the mair mysterious. It did that, sir. "By-the-by, Jeems," said he, juist as he was gaun oot at the yett, "the postman delivered this letter to me this mornin' in a mistake, an' I opened it withoot lookin'; but I saw at yince it wasna for me, an' withoot readin' mair than the first line I faulded it up, an' here it is." "Oh, that's a' richt," says I, an' I thanked him, an' shook haun's warmly wi' 'm, an' saw him through the yett wi' an uplifted feelin' I haena experienced for years. So that's that, Maister Crosbie, an' isn't it a great come roun?'

'It is, James,' I said thoughtfully. 'It's a great come round, as you say. Did he appear to be sorry for all the pain and anxiety he has caused you?'

'Nae man could hae been mair sae, sir; an' nae man could hae promised mair faithfully to make amends.'

I was quite perplexed, and on the horns of a dilemma. John M'Cheyne had certainly not learned from his son's lips of his love for Mary Mouncey, but he had seen what I saw, and had formed his own conclusions. 'Has it come to this?' he had said with alarm and disgust. And now, the very next day, he calls on James, protesting friendship, deploring past differences, promising fair future treatment, and, above all, praising Mary. What had brought about the sudden change?——

'An' noo, Maister Crosbie,' James continued, interrupting my flow of thought, 'as ye 've been made aware o' this buryin' o' the hatchet, as it's ca'ed, I maun tell ye aboot the letter. It 's frae Ameriky—the toon o' Washington—tellin' me that Gavin, my only brither, has dee'd. He was six year aulder than me, an' has lang been abroad —aye daein' weel, but no botherin' to write very often. He never was mairret, an'—an', puir fella, he 's gone, an' he 's left everything to me.'

He handed me the letter, and this is what I read.

'WASHINGTON, *June* 25, 18—.

'MR JAMES MOUNCEY,
Carpenter,
Shinnel, by Thornhill,
Dumfriesshire.

'DEAR SIR,—We regret to inform you that your brother Gavin died here on the 24th.

'Under the will, which is dated 1st June 18—, his whole estate personal and real has been left to you. We are not yet in a position to let you know the amount of the estate, but, from a perusal of the papers and documents in our possession, we would put it approximately at one hundred thousand dollars ($100,000).

'We shall be glad to receive any instructions which you may forward.—We are, very truly yours, KINDER & BLAINE.'

'James,' I said, 'I congratulate you with all my heart. This is a most extraordinary windfall, and you are taking it very complacently. Hang it all, man, why should you worry about contract prices and feel elated because M'Cheyne is going to play fair hornie with you? Do you realise what this letter means?'

'Oh ay, it 's a fell lot o' money. Dod, the wife 's lang been kerkin' at me for a new dolman. There 's hauf a chance o' her gettin' it noo. An Mary 's wantin' to get her photographs ta'en at some big Dumfries shop, an' I dare say I 'll hae to fit that bill as weel; an' I 'm—let me see, noo—I 'm in desperate need o' a new fit-rule. Oh, we 'll sune get through it, Maister Crosbie.'

'But, goodness me, man! it 's thousands of pounds. Do you know you 're one of the richest men in Shinnel?'

'Maister Crosbie, not only am I yin o' the richest men in Shinnel, but I 've been, an' I ken I 've been, *the very richest* since I mairret Marget Hird. Ay, I could be happy withoot siller if I had Marget, even though I was reduced to sittin' behin' a dike-back makin' besoms. Man, Solomon spoke the truth when he said o' a guid wife that her price was above rubies; an' that minds me I 'll hae to gang into the hoose an' tell them aboot this legacy. Come yer weys wi' me, sir.'

I can mourn with those who mourn, and at times rejoice with those that rejoice, but I didn't accompany James. For I knew that, on his knees before his old arm-chair, he would give adequate heartfelt thanks to his Father above, and that a fremit face, even though it were the minister's, could well be spared from the little family circle.

CHAPTER IV.

SO excited and elated was I over James Mouncey's good fortune, and so engrossed was I in his affairs, that I passed the Brig En', and to this day have no recollection of having done so. But I remember coming to earth when walking up the manse loaning. It was late afternoon, and the sun's rays were striking from westward above the Glencairn hills. Coles of sweet-scented, new-made hay dotted the meadow, and among the ears of corn in the field beyond a faint yellow hue was already stealing, heralding the approach of an early harvest.

It was long past my tea-hour, but I was loath to go indoors, and, leaning on the meadow gate, with the west hill wind on my brow, I gave myself up to a dispassionate review of all I had seen and heard that afternoon in James Mouncey's rambler-covered bower. All the details were recalled, and considered in their proper relation and perspective. John M'Cheyne was long on my dissecting table, and when I had finished with him, and later, when going up the manse avenue, I was fully convinced that he had read the letter from Washington, and

that he had very quickly concluded that Mary Mouncey, as the daughter of a wealthy legatee, was more worth considering as a daughter-in-law than the delicate proprietrix of Croftmains. In making up the peace with James he had taken time by the forelock, and made a swinging stride in the right direction. But, I argued, he had last night's work to undo. In his rage and chagrin he had too clearly shown his hand, and, knave and sanctimonious wheedler that he was, I knew he was no fool, and that he would visit me again before Janet Armstrong called me at nine to 'tak' the Beuk.'

I went round to where Matthew Hird had been working all day, but he was nowhere to be seen. I was sorry I had missed him, as it was grand to be the bearer of good tidings, and, moreover, I was curious to know how a man of his temperament would receive such unexpected and extraordinary news. However, when I entered the manse, and was hanging up my hat, I heard his voice in the kitchen, and was just in the back lobby on my way to him, when I judged it wise to halt for a moment. He was talking to Janet, and the subject of conversation was M'Cheyne, in particular relation to what Matthew called a 'low-doon soople trick' he had played on John Todd, the farmer of Crofts. He was letting himself go, much to Janet's delight, for she enjoyed his quaint beadle ways and his pawky, direct handling of a story.

'An', mind you, it's true, Janet Airmstrong,' I heard him say—'true as you're staunin' in Shinnel Manse kitchen. I kenned "Crafts" weel. Him an' me were at the schule thegither; we—we were in the Toun o' Scaur Volunteers thegither; we curled thegither; ay, an' we should often hae been in the jile thegither, for he was a gallows falla was "Crafts," an' aye made ithers galravitch wi''m. Weel, as I say, I kenned him weel; a guid freen an' a guid fermer he was, but onfortinately his wee finger was ower often cocket in the air, an' his liver and kidneys gaed a' to the mischief. So he took to his bed an' lay lang, an' at the lang hinner en' the doctor tell't him—as nicely an' dacently as he could, of coorse—that he was a—a—a what ye wad ca'—a gone corbie, an' that he would hae to put his hoose in order. He gied him three days—fower at a stretch; an', faith, the auld doctor kens his trede, for "Crafts" slippit cannily away on the mornin' of the fourth. But that's by the wey, an' I'm no at that pairt o' my story yet. It got aboot, of coorse, that "Crafts" was in a bad wey, an'—an' what the doctor had tell't him, an' Jeems—that's Jeems Mouncey—*set to* an' lookit oot some nice wud—deid certain the box wad come his wey, for he had lang dune a' "Crafts'" cairtwricht wark, ye see, Janet. At a'e time M'Cheyne had a' his wark, but he did "Crafts" broun ower a second-haun' cairt that was brawly pented, but had mair putty than wud in the spokes o' the wheels. Dod, Janet, I mind that weel. I met "Crafts" at the Brig En' that nicht efter he had settled the accoont, an' frae what he tell't me he hadna missed M'Cheyne, I'm tellin' ye. There was a terr'le collieshangie in the joinery office, an', to smooth things ower, M'Cheyne got "Crafts" awa' up to his hoose to gi'e him a dram. It was efter he had got it that I met him at the Brig En'; an' when he had tell't me o' the row, I said to him, says I, "'Crafts,' never mind; ye got a guid dram oot o'm." "Crafts" looked at me, and, Janet, I'll never forget his look or his words. "Dram!" says he. "I got nae dram—juist as mony draps as tell't me it was wat. As for yon auld skin-flint, Mattha man, he could first-fit the haill parish o' Shinnel on a twae-gill bottle!" Them's his very words, Janet—but I'm wanderin' frae my point. Where was I? Oh ay. Weel, ye see, Jeems reckoned on gettin' the box. But he reckoned without M'Cheyne. *He* wasna gaun to let the job pass withoot a shie, an' kennin' he had nae chance by fair means, he got haud o' an airm-chair that for some reason had been flung on his haun'; an' when he reckoned "Crafts" was ower far gaen to be consulted or ca' the deal in question, he lugs it up to the "Crafts'," an' sets it doon on the kitchen flaer. "Mistress," says he, "this is the chair at last that the guidman ordered. Ye should have had it lang syne, but we've been very busy." "Chair!" said the puir begrutten woman. "I ken nocht aboot ony chair, an' ye maun juist tak' it away back wi' ye, for I've mair chairs than sitters; an' as for 'Crafts'—puir falla"—— 'Oh, but, mistress," says M'Cheyne sharply, "when a chair's ordered it maun be ta'en an' peyed for. 'Crafts' 'll tell ye aboot the order—— What's that ye say? Dyin'! Sorry to hear that, woman. It's a peety, for a chair's a chair when wudd's dear. Weel, in the circumstances, I'll oblige ye an' tak' it back; but it's a deid loss to me, an' ye maun mak' it up some ither wey when the chance comes roon." Janet Airmstrong, listen to me. The dacent woman thanked him, an' next day the chance cam', an' she made up the loss o' a chair that was never ordered by gi'ein M'Cheyne the burial. An'—an' he's on the Schule Board. What think ye, Janet, o'——

I slipped back without waiting to hear what Janet had to say, and tiptoed upstairs to my study. Long ago I had heard the story of the chair, and refused to give it credence. But I believed it now, and in my mind's eye, placing father and son side by side, I had, like Matthew, my doubt as to young Robert's paternity.

On going downstairs later, I found Matthew had gone home, and my curiosity as to how he would receive my news was not gratified after all.

We had no golf-course in Shinnel; the nearest was at Thornhill, some six miles distant; so, in order to keep my hand in at putting and approaching, I had a few small greens laid out,

about thirty feet apart, on the turf round the laurels, and I was busy with my putter when the gate creaked, and M'Cheyne appeared. I wasn't surprised; in fact, as I have already said, I was expecting him, and I had all my wits about me, but the sudden presence raised my choler, and it nerved me somewhat to repress it.

I greeted him without effusiveness; but I dissembled, and concealed my repugnance, for in him I, as a student of human character, had a most interesting specimen, and I was anxious to analyse him as dispassionately as possible.

'Ay, Maister Crosbie,' he said, 'gowffin', I see. My word, but time works wonders! Ten years ago—ay, and less—if Shinnel minister had been catched playin' a game at gowff—ony game, in fac'—on this blessed Fast Day, he wad hae been brocht afore the Presbytery as shure as a leek 's a leek. Ay, I doot if times are changed for the better. This has been a holiday; the parish has been gallivantin' in Moniaive, Toun o' Scaur, an' as far as Thornhill. But I wad like to ken if that is preparin' them for the sacrament on Sabbath? I doot it, sir—I doot it.'

He shook his head dolefully, and ran his nimble, sensitive fingers along the splicing of my putter.

'What does a thing like this cost, noo?' he suddenly and, in the circumstances, irreverently inquired, looking with a professional eye at the grain of the wood and the tapering of the shaft.

'Oh, about six-and-six,' I replied.

'Ay, sir. Weel, six-an'-six is not oot o' the wey. It 's ash, I see—guid seasoned ash it 'll be, an'—— Imphm! It wad cost ye that here in Shinnel for the shaft withoot the heid, for wud 's dear, an' if Jeems Mouncey has chairged ye that already, he 's only chairgin' a fair price. By-the-by, sir, talkin' aboot Jeems, I 've juist ca'ed to thank ye for the advice ye gi'ed me last nicht.'

'Indeed, M'Cheyne, but—on what did I advise you?'

'Oh, ye mind—aboot grudgin' Jeems Mouncey a crumb or twae. Dod, sir, I didna think much aboot it at the time, but when I gaed hame and considered hoo the Lord had furnished my table, an' hoo leeberally He had provided me wi' a' the comforts o' life, the truth o' your remarks cam' hame to me—it did, sir—it cam' hame to me. Then aboot bein' freenly wi' Jeems, altho' we 're in opposition—that 's another thing that I pondered ower, an' efter deleeberation I own up—strecht, sir—that you 're in the richt, an' I 've been for years in the wrang. You 're a young man b' me, but, faith, there 's something I can learn frae ye. Ay, "Out of the mouth of babes and sucklings hast Thou ordained strength"—imphm!'

'Go on, M'Cheyne.'

'Go on where, sir?'

'I mean, finish the quotation,' I said with a smile.

'Noo, Maister Crosbie, I could splice the shank o' that gowff thing if need be. Ye couldna. Every man to his trede. Feenish it yoursel'.

'I will,' I said, 'with pleasure. Strange how you should drop on this verse, for it is very appropriate—"Out of the mouth of babes and sucklings hast Thou ordained strength because of thine enemies, that Thou mightest still the enemy and the avenger." Now, I would like to give you a little sermon on this'——

'A barley! a barley, Maister Crosbie! I hae nae time to listen to a sermon. A' I wanted wi' ye was to thank ye, as I 've said, for your advice, an' to assure you that the words ye spoke to me last nicht fell upon good soil, an' that the seed sawn will grow up an' ripen. Frae this day forth I 'll be a different man to Jeems Mouncey; an'—an', Maister Crosbie, I'll tell ye mair. I humbled mysel'—put my pride in my pooch, an' gaed up to his hoose this very day, an' begget his pardon. I did that, sir.'

I wanted to laugh, but dared not; and having to say something, I ventured the remark that I trusted the change would be a lasting one. 'Your—your conversion, you know, M'Cheyne, has been sudden.'

'A' conversions are that, Maister Crosbie.'

'But has yours not been unusually sudden?'

'No, I wudna ca't by-ordinar'. Saul on the road to Damascus—ye min', Maister Crosbie. Ay, they 're sometimes swiftish, but they 're convincin', a' the same. Ye see not a'e thing, but everything, in a different licht. There 's the cantata, for instance. Nae faurer gane than last nicht I objected to it—objected to it very strongly, an' wanted to stop it. Noo I dinna. Ye see it 's like this. I 've mebbe been ower auld-fashioned, an' wantin' things to be as they were, but when I think hoo a gallivantin' holiday has ta'en the place o' the blessed Fast Day, an' we seem nane the waur, I needna be alairmed at a cantata bein' played in the parish. I maun juist try to conform wi' the times, Maister Crosbie.'

'Then you are not now afraid of the young folks becoming demoralised?'

'Oh no! Let us houp they 'll no be—we 'll juist trust that they 'll no be, Maister Crosbie.'

'And you 'll allow your son to—to'——

'To what, sir?' he asked sharply and eagerly.

'Well—to continue being Boaz?'

'Oh ay! I 'll no seek to hinner him. I thocht ye were gaun to ask if I wad alloo him to—to gang wi' the lassies, as he was, the rascal, last nicht. My word, but I was angry when I saw him gaun by the gate there; no because he was wi' Mary Mouncey, mind you, but for bein' oot when he should have been makin' up a very important estimate. "Work first, play efter;" that 's my motto, sir. Dod, but I *was* angry; an' I 'm no shure but I swore. Mebbe you 'll mind, sir.'

'Yes, you forgot yourself, M'Cheyne; you were in a great rage, and to me it seemed it was

because your son Robert was in Mary Mouncey's company.'

'Ye never were faurer wrang, sir. As I've already tell't ye, it was because he was mislippenin' his work. Why should I be angry wi''m because he was wi' Mary Mouncey, yin o' the best-faurt, best-behaved lassies in the parish? Dod, man, if ye only kenned, I was pleased—delichted, I should say. Faith, Robert has good taste—eh, Maister Crosbie?'

'Yes,' I said, 'he has, if Mary Mouncey's his choice. But is he not young enough to be thinking of matrimony? Ought he not to be in some larger centre gaining experience, and, by learning how work is carried out in other places, making himself thoroughly proficient in every line of his business?'

'No, no. He has already learned frae me a' that's necessary. It wad only unsettle him gaun frae hame. He'll be better here in Shinnel, settled doon wi' a decent lass that he's kenned a' his days. And tho' she be a puir man's dochter, it'll no maitter a strae. A' that I hae will be his some day, an' what I leave will be plenty for baith. Ocht new aboot the parish the noo—eh?'

Going off at a tangent when the conversation was drifting into unwelcome grooves was evidently one of his peculiarities.

'Oh yes,' I said with alacrity. 'James Mouncey received a letter to-day telling him his brother in Washington had died and'——

'Oh, I ken. Before ye gang further, I maun tell ye that letter was handed in among mine in a mistake, an'—an' I opened it—never thinkin', of coorse. A' that I read was that his brither was deid. I gaed nae faurer, because—weel, it wadna be honourable; an' mair than that, I juist thocht that, as Gavin had been a ne'er-dae-weel here, he wad be the same foreign, an' that, havin' left nocht, the lawyers wad be writin' Jeems to repey what they had laid oot on buryin' him.'

His astuteness and finesse were standing him in good stead; but I was more suspicious than ever.

'Then, M'Cheyne, you're quite wrong. His brother Gavin died worth a great deal of money, and everything is left to James.'

'Megstie me! Maister Crosbie, ye're—ye're no—— Come away noo, sir, ye're jokin'.'

He was overacting, and I was beginning to feel myself bemeaned by having further converse with him, but, given a little more rope, I thought, he'll trip himself.

'What I tell you is true,' I said shortly. 'I read the letter.'

'Well, well, if that disna beat a'—an' me to bring the letter! I—I can hardly tak' it in. My word, but that is guid news! Jeems will be very uplifted, an' so weel he micht be. A hunner poun', or mebbe twae hunner, will come in michty handy. It will that. Some fowk tak' guid fortune very quately an' modestly. I mind, when Wattie Carmichael, the hedger, got a hunner an' fifty poun' left him, a' that he did oot o' the ordinar' was to pit a crimson cushion alang his kirk seat—that was a'—imphm! Weel, we'll see what Jeems dis. Dod, sir, juist when the fresh flush feelin's on him ye should touch him for a stained-gless winda for ahin' the pulpit. I'm in the wey o' daein' business wi' a gless-stainin' firm in Glesca that maks a speciality o' that kin' o' wark, an' I'll see ye get it cheap. What say ye to that, Maister Crosbie?'

'Certainly not, M'Cheyne. I would never dream of such a thing. "Touch" is rather a good word to use in the connection. Is it common in Shinnel?'

'Eh, Maister Crosbie! ye will hae your joke, an' ye will mak' me oot in earnest when I'm juist in fun. A' jokin' aside, though, Jeems should remember you through the kirk in some wey, for ye've been a' alang a guid freen to him. Ye've gi'en him a' the jobbin' aboot the manse—time an' stuff, I dare say, nae price asked or gi'en; an' noo he'll be abune joinerin', so ye ken where my warkshop is. Ay, wi' a hunner thoosan' dollars he'll'——

'A what?' I exclaimed.

He stared at me for a moment with wide-open eyes, his teeth denting his lower lip, and a flush spreading across his lanky cheek. Then he fumbled nervously in his waistcoat-pocket for his pipe.

'How do you know, M'Cheyne, that James Mouncey has been left a hundred thousand dollars?'

'Did—did ye no tell me yersel'?' he asked, turning his back on me and facing the wind to strike a light.

'No,' I said emphatically, 'I did not. I took good care not to mention the amount, thinking you'—— But it doesn't matter. I've work to do in my study to-night, so I'll walk down to the gate with you now.'

'Oh, indeed—imphm! Ye'll—ye'll walk to the gate with me now. Just so, an'—an' you took good care not to mention the amount? Jer-ooslem! you're a sicht ower clever for Shinnel, Maister Crosbie, an' you're on the dooble cute side for a minister. Damn ye, man, ye wad shine in the cheap furniter line!'

In silence we walked to the foot of the avenue, and, without looking at him, I stood aside to let him pass through the wicket. I watched him slouching down the loaning till the gathering dusk obscured him; then I closed a gate upon him which he never opened again.

THE BRONZE IDOL.

A NATURE STORY.

By F. ST MARS,

Author of *On Nature's Trail*, *Feuds of the Furtive Folk*, &c

THERE walked a golden sovereign in the sunshine, and it was worth only half-a-crown. Moreover, to get it you would have to expend a cartridge, which cost twopence. Nay, more, for already cartridges had been expended upon it, but it was still there. In all the pride and pomp of its uniform it flashed there; metallic helmet gleaming green, blue, and purple; scarlet cheek-guards; tunic, orange-red, purple, yellow, brown, black, and green, reflected and positive; long train of eighteen divisions, of which the middle one was the longest; and snow-white necklace, the whole effect being generally of bronze surmounted by a green 'winged hat,' as Mr Kipling would say, such as the Vikings wore. My, what a regalia for a king! And he was a king, too, in his way—ruler, with other kings, of many thousands of acres of the greatest empire in the world, though really only a bird, the above being, on my word, simply and truly the colours of a fine old cock-pheasant, who had cost a pound to rear, under a hen, and now was worth a bare half-crown of any man's money.

Kings, however, have enemies; assassins are abroad at every hour of night and day, and though big, bronzed, six-foot police with guns, and in their livery of velveteen, were patrolling this king's realm night and day, they could not always keep him shadowed, he being a wayward and capricious monarch.

With proud, haughty stride, he strutted across the clearing, and all the little erring sunbeams that had escaped through the branches combined together to make him a wonder and a glory under his palace roof of amber and pink and purple and bronze, supported by a thousand gray columns and carpeted with gold. Yet in such a setting our king was not conspicuous. Rather he harmonised in his robes with his surroundings, for every hue in his magnificent robes was duplicated somewhere or other in his palace, save one. There was no white there, not a touch of marble anywhere; and the white circlet on his neck, which was the Order of the Dragon and proved his ancient Chinese descent, was conspicuous therefore. *It*, and not the bird, caught the wandering eye on the instant and held it. There lay the danger. That white was a fine mark for the assassin's eye.

Suddenly there rang through the shaded chambers of state the quick, sharp challenge of a sentry. Another took it up, and a third, till the silent, columned halls fairly rang with the thrilling alarm, as, one after the other, they hurried by the blackbird guards of the outer gates, in uniforms of jet with daggers of pale yellow, to the place of the original challenge.

At the first sound the king among the bushes turned to a carving in bronze—head up, one foot up, tail up, immovable, rigid. Once he blinked an eye in that odd, wise way some birds have. It was necessary. Otherwise you would not have known he was alive.

Meantime, the guards of the outer gates increased the racket and drew nearer. The alarm, whatever it might be, was approaching.

The king, without moving, glanced up; but the bushes met overhead in a thick basket-work. Even he, past-master at the game as he was, could not rise—though he might come down—through that. He would have looked behind—for even a king may run, and few as well as he—but the sudden soft chiding of a little wren told him there was danger there also. Nothing remained, therefore, but to 'freeze' where he was, and trust to luck. He 'froze' accordingly, and as he did so he noticed that, whereas there had before been three rabbits in sight, feeding off hazel-leaves, now there were none. They had vanished like smoke.

Like smoke, too, came the assassin, soundless, sinister, almost seeming to swim along. Only its eyes, the cruel yellow-green orbs with the vertical black slit, showed at all plainly. The rest was a shadow. But shadow or not, it was a cat, and the king knew it.

Then the king did a clever thing, but you must please yourself whether you call it intentional or not. Very gradually, so gradually that I would have defied any one to see that he moved, his head sank. His neck shut down telescope-fashion, after the manner of birds, and the white collarette, the Order of the Dragon, the one conspicuous thing about him, faded and went out. As a matter of fact, the other neck feathers had shut down over it.

What followed was strange and awkward. Although he was bolt-upright, save for his neck, the cat did not see him. She walked up to him, and, suddenly, within twelve inches, started, and crouched, motionless. She had *smelt* him.

The king was wonderful. He moved as much as a stone. He kept his head grandly, though the strain must have been almost unbearable.

[*Christmas Number.*

The guards of the outer gates were cursing aloud overhead, and a page in doublet of salmon-pink and white, and soft leaf brown, which was a chaffinch, rushed up to help them. I don't know whether they saw the king. I doubt it. The cat certainly didn't; though she was so near, and looking straight at him, she didn't see him.

Then she did. The king had moved, blinked an eye, tightened a feather, or something. It was ever so little, but enough. The spell was broken, and the cat drew back and flattened, without saying anything.

Next moment, with a rush, she charged, and then—and then. I like to think of what the king did then. I should have liked some members of Parliament to see what the king did then.

The cat was aware of something resembling a shrapnel-shell, with feathers and legs *and* spurs, bursting in her face; but she was aware too late. It was so utterly unexpected that she had no fraction of time to prepare against it, and those who misjudge character in the wild, like the beloved of the gods, die young. She felt as though an electric spark touched her twice on the face and once on the chest. Then she invited herself out of that attack gone wrong, by the undignified but quick expedient of rolling over sideways—while the king danced a royal highland fling on her ribs, it seemed—up on to her feet, and—away. She had no wish to go back and renew the argument. She had reasons, two on her face, one on her chest, and some small affairs along the ribs, red, angry reasons, growing redder and more angry every instant, though you never would have believed, if you had not seen them, how hard a pheasant's spurs, with a good lusty old cock behind them, can strike.

As for the king, he ran to clear ground—where, be it whispered, I guess he knew as well as you and I that he could rise if the cat came again—and flapping his wings, crowed like the boastful old rascal he was, crowed like a good un; whilst, in the silent intervals, from afar through the woods, the black guards of the outer gates could be heard escorting, not at all quietly, the assassin from the precincts of the palace.

Thereafter the king stalked to his banquet. Among a horde of blue and gray wood-pigeons, but newly arrived from the Continent, he scrambled in most unkingly fashion for beech-mast and acorns.

After that the king, being a very thirsty king, repaired to a stream to drink; but was careless, and forgot to look behind him when his beak was down. The result was a long, lean, leggy, reddish body, shooting across a last copper bar of sunshine near at hand; a blow that knocked him head-over-heels into the shallows, and a madly desperate leap upwards on whirring wings—mind, he had had no warning to prepare him to act—out of reach of a grinning lurcher dog, across whose slobbering jaws he could see one of the most beautiful and cherished of his own tail-feathers reposing.

From a great height he volplaned, on his short, rounded wings, down the length of the serried pine hangar, crashed into the dark depths of the wood in a manner that seemed sheer suicide to an outsider, and came to rest on the scented carpet of generations upon generations of pine-needles beneath. For three minutes he remained like a bird carved out of lacquer; then he walked away, moving quietly and by devious paths, to a certain oak, paused a moment, crouching, and, with a whir and a shout that told all the wood where he was, flew up to roost on a low bough.

A lean, dark snout, with glistening nose, the reddest of lolling tongues, and fangs that shone like new-worked ivory, shot out of a bramble tangle close at hand, regarded him with keen, intelligent eyes for a moment, and shot back again. The snout had come forty seconds too late. Its owner knew the fact; but, being a fox, its owner also made a mental note of the place, pheasant kings being, as he knew, rather conservative about selecting the place for their royal couch.

Then night came sweeping westwards over the tree-tops, and an owl hooted far away in the gloomy depths of the hangar.

How long the pheasant had been asleep I know not, but he was not half a wink getting fully awake again. Something had done it, though. There was a sound of claws scratching upon bark. He heard it plainly, and felt it too, I think, through his body, for trees carry sound as vibrations throughout their length.

A half-moon hung poised high above beyond the gaunt branches. Not a thing moved. The stillness was the stillness of a well—dank and cold.

Beyond taking his head out from under his wing, the pheasant had not moved. He knew better. He looked like a bunch of leaves as he was, and that was his best protection.

The sound came again—scratch, scratch, scratch. It was coming up, working towards him. If it was merely a squirrel—no odds. But what if it was not?

He craned his neck. He peered over. The gray columns of the tree-bole, lit on his side by the moon, ran straight down into a sea of darkness, and up out of the darkness, slowly, very quietly, came a head. He saw the reflection of the moon in its amazingly bright eyes. He beheld the flash of a sulphur-yellow shirt-front. And no more was needed. He knew the title of that gentleman in evening-dress who called during the dark hours. They had met before once or twice. The visitor was a butcher by trade, official slaughterer to dame Nature, one not to be trusted by night or day—a long, cruel stoat.

Up went the pheasant's head, out went his

neck, down dropped his tail, and the stoat, startled by the movement, flattened instantly to the rough bark against which he clung. His eyes told him now what his nose had been telling him all along. The question was, was he seen?

There was no need to ask it, however. As a rocket bursts, the king launched himself, terrified, into the night, and with almost that hopeless *abandon* in the dark affected by fowls.

There are few things more terrible than the grim determination of the stoat when once he has set his heart on a victim. Risking death by many nasty ways is a trifle to him. Also, all stoats, weasels, and ferrets seem to accept falling as part of their daily life, like washing. And this explains how the stoat came to kick himself off from the trunk of the tree in a last reckless effort to reach the pheasant as he flew. What is more, too, he did reach him, or part of him, anyway. And for a few seconds the spectacle of a cock-pheasant blundering crazily along through the branches, towing a stoat, pinned to his long tail, behind him, astounded the night and the moon.

Then a feather of that useful long tail—specially designed, I take it, to attract the eye of an enemy and cause him to spring short, and to come out conveniently, like the tail of a lizard, when required—gave way, and down went the stoat, all claws abroad, teeth set, grimly silent, still gripping the feather, crashing headlong through the twigs, till he fetched up in a larch-tree, and hung on, dazed, and on the borders, it seemed, of a heart attack.

The king's rest was, however, short-lived. Another sound awoke him an hour later, the crack of a dead twig, which sounded like a pistol-shot in the utter silence. Already unstrung a little, he was awake in a flash, peering down furtively. Not at all anxious to move in the horrible darkness, but half-afraid to stay.

He saw a dark form pass underneath. It kept carefully to the shade, and it was followed by another. No eyes were needed to tell the pheasant what *they* were. No wild creatures made so much noise going through the wood. They were men, and not only men, but poachers, one of them the poacher who had watched him fly up to roost.

He saw them make straight for the tree he had just left, and, halting exactly beneath the bough that had formed his royal couch, produce a tiny kind of stove. To this they fitted a chimney, a telescopic one, which, when extended and manœuvred into position, would have come close beneath his sleeping form. When, with guarding hands and a coat to hide it, a match was struck, something within the stove, that spluttered, was lit, and a most infernal, acrid smoke poured out of the top of the extended telescopic chimney. They intended, though he did not know it, to asphyxiate him while he slept, and cause him to drop incontinently and helplessly into a sack held ready open beneath for his reception. A plot, this, worthy of even his rank, and needing but one thing for its successful completion—the pheasant—easily seen by getting him against the moon—and—he wasn't there.

He heard the men curse suddenly, moving about to place each branch of the tree between them and the moon.

'I'll swear any money ye like as I seed 'im a-roostin' on that very branch, Bill.' The voice sounded plainly enough in the damp, chill silence, though no more than a stage-whisper.

Then, 'Well, 'e ain't there na', anywhichways abart it,' came the angry reply, and then, 'Oh lor! Look!' A pause; then, 'It's 'im as 'as done it. Th' beggar!'

They had brought the enraged and amazed stoat, who had returned to the tree to see if the pheasant had had a bedfellow, in silhouette against the moonlight, and he, transfixed with horror at his position and the acrid, sulphurous fumes hurting his sensitive nostrils, glared down at them, motionless. But only for a moment.

Came a swift drumming of feet on the hollow earth, a lean lurcher dog shot up panting, and——

'Billo! Some blighter's abart. The dawg sez so,' quoth one of the men, and they vanished back into the darkness that gave them birth, just as a keeper's whistle blew shrilly among the arched aisles, and the report of a gun sounded, crashing thunderously, from somewhere in the heart of the wood. Followed that, till dawn, only the whispering, mysterious silence of the night, and the old cock-pheasant slept undisturbed, as he—but not we—could.

The day had long since broken; the raw, red sun was up, and the mists were peeling off the hollows like smoke, when the old cock-pheasant arose, flew down, flapped his wings—you could hear 'em a quarter of a mile away in that wonderful morning air—and crowed harshly. Dozens of other cock-pheasants were doing the same thing, had done the same thing every morning; but how were they to know that this morning was to be different from all other mornings to some, one not to be forgotten easily by all?

The king passed, creeping cautiously and wonderfully low and self-effacingly for so large and gorgeous a bird, to the stream. He was never very far away from water of some sort, by the way, for he was, as has been said, a thirsty king.

He drank, with the clear, limpid, crystal water that had come, unpolluted, straight from the chalk downs, flashing like strings of diamonds from the tip of his dainty beak, and his shadow frightened those other shadows, the speckled trout, as he did so.

Then his right eye fell upon something swim-

ming across the stream lower down. It might only have been a water-rat, of course; but, on the other hand, it might not. In the wild, those who leave anything to chance are not desirable applicants for a life insurance policy, so to speak. Moreover, do water-rats follow one another in line across a stream? He crouched.

Next thing he knew was some beasts flinging themselves upon him in a long wavy line. He cut one flying with his spurs, and fled, running —there was no room to rise—through the undergrowth, and the enemy, which were small, chased him like a pack of yapping terriers. But they soon gave it up. They were only a family party of weasels on the war-path, and had not the slightest intention of attacking a full-blown cock-pheasant; only, this one happened to be in their path, and they thought he was asleep.

Beech-mast, in company with the polite, blue, foreign wood-pigeons, 'eggs' from an ants' city of pine-needles and easily scratched over, and some buckwheat—of which he was inordinately fond—spread by the hand of one of his velveteen slaves in a sunlit well-trimmed 'ride,' completed his breakfast. Then for an hour or so he indulged in a sun-dust-Turkish bath at the side of a dry bank, with other royalty for company.

After this he made his way to a little, old woodland farmyard, where were stacks of corn; but he had the foolishness to dispute rights of feed with a mangy, scarred, old buck-rat, who suddenly slashed upwards with his yellow chisel teeth, in that shark-like way rats adopt, and cut several bronze feathers, to say nothing of half-an-inch of skin, out of the king's breast.

Then the whistle came. From far out across the blue-gray, gold and brown, and dark-green fields it sounded—a long, shrill, metallic whistle. It was answered by another near, another, and yet others, until at last the very field in which the king's pæan of victory was waking the echoes resounded to its alien note, causing every one of the wild folk to evaporate back into the landscape, and the domestic ones to stare stupidly.

It was nothing—only the gamekeepers driving the pheasants back into their own coverts, in order that they should not wander too far from the guardian angels in velveteens, and foolishly get themselves shot by farmers out rabbiting, make a free meal for the wandering gipsy, turn themselves thoughtlessly into cats' meat, or save the innocent shepherd's dog the necessity of stealing the butcher's bones.

He had been used to those sounds lately, our king, and rather despised them, but he had never known such furious whistling as that morning brought forth. He turned superciliously, and strutted—entirely unhurried, mark you—back into the covert. There the cave-like silence, broken only by the tap-tap-tap of a woodpecker hammering his breakfast from wood, and the raucous voice of a jay on the look-out for trouble, was more to his liking. Here for the next hour or two he amused himself frightening the life out of any young cock-pheasant unfortunate enough to get in his way—the covert seemed strangely swarming with them this morning; ignoring the sedate crouching hens with a fine contempt; delving for roots and tubers of rare taste; watching a grinning, agony-twisted stoat extended on that modern rack, a steel-jawed trap, set for *his*, the king's, good, by those modern inquisitors of his, the gamekeeper guard, to exterminate his assassins —beautiful forms of life all, whose only fault was that, being flesh-eaters, like ourselves and the men who slew them, they had to live somehow. Corn he found in an outlying woodland-enclosed corn-rick, the grubs by scratching under an oak-tree, where the wood-eating caterpillars had dug vaults in the ground wherein to become mummy-like chrysalids, and there was a tiny lonely field of mangel-wurzels wherein he—hem! —quite considerably lowered the population of the grubs of Messrs *Argiotes lineatus* & Co., that precise beetle whose young are better known in the vernacular as wireworms.

Then a man and a big black dog and a double-barrelled gun appeared all together and quite suddenly, and the king, picking up his train, so to speak, crouched and ran low, with proud head well down, all along the row of mangel-wurzels in which he found himself, to the wood; and mighty pleased he was to get there, too. He never rose on wing when dealing with men if he could help it, for, mind, he was an old bird, and could give you one or two reasons why, if you are a pheasant, you shouldn't.

But the king was no sooner in the wood than his quick sense of suspicion and his ripe experience warned him of a difference. (He hadn't liked the look of that man-dog-gun trio, anyway.) The wood was not at all still, as it should be. Away up the hill (it ran up a steep hill, that wood) the pigeons were rising one by one and hurrying away high over the valley, with that staccato clap-clap of the wings which all the wild knows is a sure sign of danger; the rabbits were beginning to move about restlessly, as if something were forcing them where they didn't want to go; the jays had given one wild exhibition of foul language, and shut up absolutely; a hare—what was she up to in a wood, I wonder?—with ears flat and eyes astare, bolted past, going like the wind; more than one hen-pheasant showed like a wraith of the woods, creeping unobtrusively in the same direction; and an old cock came by, crouching, working off to the right as one seeking a private way out.

Not till our cock saw that other cock there did he show alarm. Then he did. He stood for a moment motionless, erect—listening, and what he heard settled it: tap-tap, tap-tap-tap, tap-tap, tap, tap, tap, tap-tap. It came from everywhere up the hill, that ceaseless, quiet

tapping, and from nowhere down the hill. Twigs cracked. Some one whistled on a dog. Somewhere to one side a single outlying pheasant rose like a rocket; there was a pause, during which the whir of its wings could be heard, growing fainter and fainter, out over the valley below; then, from far down at the end of the wood, the single report of a gun, and—the whir stopped.

About this time our old cock-pheasant began to run. All running that we have seen him do before counted for nothing; it was slow by comparison. He raced, fairly raced, like a long bronze streak, head and body and tail all in the same line, not downhill away from the mysterious approaching tapping, but across-ways, towards the edge of the wood.

He knew perfectly well what to do, for this wasn't the first pheasant battue at which he had attended officially, though it was the first that year, and he had almost forgotten the experience he had learnt, though it came back into the little, tiny bird brain of him, under his metallic green Viking helmet, in streaks.

The others, save for a few very quiet and cautious old cocks, didn't seem to know what to do a bit, especially the young 'this year's' cocks and hens; they were running all ways at once, so to speak, losing their heads with panic—which among sheep, horses, and men is so infectious—and getting in anybody's and everybody's way except the beaters', whose terrifying tap, tap, tapping was drawing slowly nearer at every second, pushing the crowd steadily, almost, one might say, stealthily, before them.

The king knew from bitter experience—he had a scar on his right thigh to this day to remind him—that anything was better than letting himself be thus driven to the bottom end of the wood, outside which would be drawn up the waiting line of 'guns.' He dashed for the side. He could see it. The light shining through from the fields without was plainly in sight. There was nobody there. He charged on, hope rising within him at every stride, and—stopped so utterly instantaneously that his head and neck seemed to have been literally telescoped through his resplendent body. At the same moment he appeared to have evolved out of thin air a most infernal jangling of bells—the wild folk loathe a bell—and dancing of bunches of golliwog-like feathers, suspended apparently in space.

It must be admitted that the way that king picked himself up in that instant—all shaken as he was—and fled frantically in the opposite direction, was worth seeing; only, there was nobody there, in that place, to see him, save for two perfectly daft rabbits, and they were past noticing anything. As a matter of fact, he had simply run into what is known as a 'stop-net,' which, as its name explains, was placed there to prevent cunning old cock-pheasants like himself from sneaking away in the direction they were not wanted to go.

By the time our pheasant had got to the other side of the wood—he collided with one terrified stoat, one rabbit, and a half-crazed young hen-pheasant by the way—the beaters and their infernal eternal tapping-sticks were not fifty yards away. Then he made a bolt for it, and—almost ran into the legs of a boy tapping with a stick there too. He had been placed at that spot to act like the net on the other side, and prevent the cunning old pheasants from breaking away there too, because you cannot place your guns all round a covert, you know.

That last shock rather did it with the king, and he felt sickish, I fancy. He blundered off into the undergrowth, and stood blinking and looking half-dazed. His brain didn't work very quickly, and this last shock had rather cornered him. For a minute or two he did not know what to do, and all the time those unspeakable tap-tapping beaters were drawing nearer and nearer, and the denizens of the wood, pheasant and rabbit and weasel and jay and stoat and rat, were tearing past him, half-crazed with fear and dismay.

Then he took his courage in both claws, so to speak. He was always a high-spirited bird at any time, and he had not got victories single-handed over a cat, a weasel, a rat, a pet dog, and goodness knows how many domestic cocks and undomestic cock-pheasants to his credit for nothing. Moreover, go down to the 'guns' he would not.

He put his head down, and running low and keeping out of sight as much as possible, he *charged straight at the line of beaters* as hard as he could go. It was splendid, and I like to think of him then, as he tore along, his little feet fairly winking, his tail streaming out behind. And as he ran he heard the first whir of the rising pheasants below, and the first crashing fusillade that met them.

Then he hit the right-hand legging of one of the beaters—smack. It was only a glancing blow, and would not have mattered, but the man put his hand down among the brushwood, to see what it was, and the king hurled himself at it, spurring like fury. The hand was removed quickly, nicely gashed by his spurs, and, with a flutter and a crash, up rose the grand old cock-pheasant, right out of the amazed beaters' line.

Bang! Bang!

He saw the little wicked stabs of flame, he heard the hail of small shot whimpering and hissing all around—a keeper had remained with the beaters, in case of anything of this kind happening—but he kept on and on, unscathed, rising and gathering speed every instant, till, going like a cannon-ball, and far out of the reach of any gunshot, he hurtled down-wind, above the crashing 'holocaust' where his foolish fellows were being wiped out as they rose close to the line of 'guns,' away and away to safety.

[*Christmas Number.*

'HIGH EXPLOSIVES.'

BY 'ÆSCULAPIUS'

I.

OF course, it pleased the men immensely when the ship's cook opined they were going home. Sailors are always longing for somewhere thousands of miles away, and in this case the galley had it right for once. Their lordships did order H.M.S. *Alcibiades* back from Pitagora.

All the same, west-country voices were raised in loud protest a few weeks later when she passed Plymouth Sound, and went on to Portsmouth instead. The *Alcibiades* being a Devonport ship, many of her complement failed to appreciate the reason for her not nipping in there. Besides, it lacked only a few days of Christmas, and they wanted to eat dinner in the bosom of their adjacent families. As it was, these otherwise jolly tars mourned the leave that could not now be arranged in time for them to have their hearts' desire.

Whitehall made an exception, however, in the case of Lieutenant-Commander Shirley C. Faulconbridge, R.N. His new appointment came off shortly after mooring.

'The Lords Commissioners of the Admiralty hereby appoint you to His Majesty's depot ship *Ptolemæus* at Port Royal, Jamaica,' that officer read. 'You may proceed on leave until informed concerning passage out.'

'What do you think of it, Deans?'

'Damned fine,' answered that Royal Naval Reserve lieutenant, who had just come down from the bridge, and was warming himself by the wardroom fire. 'Wish I could get a billet like that myself for the winter. Goodness knows where we'll go after the dockyard maties are done with us!—Steward, bring two cocktails.'

'I suppose it's better than the North Sea again,' Faulconbridge admitted doubtfully.

'Here's luck, No. 1,' Deans proposed cheerily. 'When are you shoving off?'

'Now,' the first-lieutenant replied, seeing his servant coming forward to tell him his gear was in the picket-boat.

'Good-bye, old man.' Deans gripped him. 'Take care of yourself.'

'I'll do my best,' Faulconbridge responded. 'Good-bye, everybody,' he sang out to the others in the mess, who were busy reading their mail, and there was a chorus of answering 'Good-lucks.'

II.

'He might have taken this with him,' the captain complained, affixing his signature to the thin sheet of paper the clerk put before him. It was known in the navy as a 'flimsy,' and spoke in commendable terms of the service of Lieutenant-Commander Shirley Cantacuzenus Faulconbridge.

'Thank goodness I'm clear of that name!' the clerk of H.M.S. *Alcibiades* muttered, posting the certificate on to the first-lieutenant; 'it's the worst in the whole Navy List.'

That fastidious young gentleman was not alone in his opinion. Writers disliked having this lengthy cognomen on their ledgers; post-captains frowned at its appearance on a memo; admirals questioned the accuracy of it on documents, and their secretaries fumed with rage at the suggestion.

When young Faulconbridge received his commission as a sub-lieutenant, the parchment had to be returned for rectification. The clerks would get as far as Cant, and after that it was hopeless. As one waggish scribe said, 'Why didn't his people let it go at Cant and be done with it?'

The trouble started long before his people's time, however, when Henrietta Fanariot married Richard Faulconbridge, a yeoman-farmer of Gloucestershire. Miss Fanariot was Russian, claiming descent from John Cantacuzenus, emperor of the Byzantines. In this way, perhaps a millionth drop of the illustrious blood was transmitted to their Birmingham descendants.

At any rate, John Fanariot Faulconbridge called his manor-house at Fair Oaks 'Byzantium,' and filled it with reminders of his exalted lineage. Indeed, when Shirley was born, the steel magnate revived the imperial idea of 'porphyrogenitus' by having that notable event take place under a canopy of antique purple.

The ripple of merriment with which his father's friends greeted this foible was nothing to what Shirley experienced on entering the navy. Fun was poked at the Cantacuzenus element in his name in ever-widening circles of gun and ward room acquaintances, until an *opera-bouffe* climax was reached when the young lieutenant's ship visited the far-flung Pitcairn Island, in the South Pacific. Councillor Adams came on board, and so bounteous was the mess's hospitality that their guest was carried ashore on a stretcher. There was an awful row over the affair. Alcohol is strictly prohibited on the island, and in this case the incident was particularly unfortunate, because Bill Adams, as the mess called him, died of apoplexy next day. Lieutenant Faulconbridge was summoned to give evidence before an elaborate tribunal. Decorum prevailed up to the time the punctilious but stuttering Tahitian policeman attempted to

call out his name in full. Then judge, jury, and simple Pitcairn Islanders generally 'chucked in their hands,' and gave themselves up to uncontrollable shrieks of laughter. The court had to be cleared, and rather than risk such a noisy session again, which, in the case of a highly emotional and divided people, was fraught with feudal dangers, it was decided to give out that Bill Adams died from natural causes; and there was an end of the affair.

III.

Not so, however, the blatant pulling of the lieutenant's leg; and perhaps it was the reaction from 'born-in-the-purple' ideas that made him unduly susceptible to Jessie Parsons's charms. Jessie was a fair, soft, pretty little thing from Cornwall, studying music at the Plymouth Conservatoire. She paid her own way by taking on the piano at the Globe Restaurant three nights a week, and when the other orchestral instruments were silent, played with a great deal of expression. After Faulconbridge, who was very fond of music, heard her solo of Liszt's *Liebestraüme*, Jessie spent her off-evenings in the lieutenant's two-seater. That was before the war, when he had a shore billet at Mount Wise. Their courtship, like nearly all naval ones, was short and sweet. One June evening they leaned over the rail at Plym Bridge. The purling sound of the stream was as music to their ears. A skylark sang its sweet yet wistful song, and there was a certain wildness about the scenery which suggested remoteness. Certainly, when the naval officer kissed that sweet young girl, with cheeks telling of the rarest of fruits ripe for plucking, he must have thought his imperial ancestors far too remote for consideration. At any rate, he popped the question entailing further dilution of the Greek prince's blood.

Mount Wise hoisted no nuptial wreath for the wedding. There was instead a quiet ceremony at the registry-office. Faulconbridge got ten days' leave, and they spent their honeymoon anywhere between Plymouth and Land's End. They stayed a couple of nights with Jessie's mother, who was the widow of a marine engineer. Mr Parsons lost his life in the *Titanic*, and the pension allowed by the White Star Line barely enabled the widow to make both ends meet in her little cottage near Penzance, to say nothing about bringing up a ten-year-old boy named Billy. Mrs Parsons gave them Jessie's old room, fragrant with the scent of meadow-sweet, and showed her son-in-law the harmonium on which she learned to play. 'She's been drumming away ever since she was a child,' Jessie's mother said, half-smiling, half-crying. 'Of course, I hadn't means enough to give her a proper musical education, and I'm glad she's come to no harm.'

Billy, too, was ambitious. He told his big brother-in-law he wanted to be a midshipman, and the lieutenant, cranking his car, assured him he would bear the fact in mind.

The newly married couple had scarcely returned to Plymouth, when Lieutenant Faulconbridge was appointed to H.M.S. *Cytherea* for manœuvres. These peaceful naval evolutions lengthened into war; and by that time Jessie's husband was steaming for the Falkland Islands.

IV.

Faulconbridge had anticipated going to sea in any case, so his plans were fully prepared. Conscious of his wife's talent, he gave her a bank draft on Dresden, whither she went to study under the celebrated Dr Liedbourg. As was his wont, the great master scoffed at her technique, and said she had no real gift; but this 'cold water' did not damp the Cornwall girl's ardour. 'What odds,' she smiled, 'so long as I make my husband happier?' The famous man shrugged his shoulders, but nevertheless took a great deal of pains with his English pupil; and she was doing well, when war suddenly interposed. The Berlin Government interned Mrs Faulconbridge, and subjected her to a lot of unnecessary bullying on account of her being the wife of a British naval officer. The brutes even hinted at Jessie being a spy, and confiscated all her music in case some of the notes should make up a secret code. The little woman, too, suffered from lack of the nourishing food she had been used to in Devonshire, and developed a cough which left crimson stains on the delicately woven fabric of her handkerchiefs. Her censored and much-deleted letters did not mention these things in so many words, but the anxious Mrs Parsons read between the lines, and warned Jessie's husband accordingly. That officer, however, was not in touch with the General Post-Office, and when the distraught mother could stand it no longer, she appealed to her son-in-law's father, who was now making a princely fortune out of munitions. The Birmingham gentleman asked for particulars regarding his son's surprising marriage, and was furious when he heard Shirley had contracted an alliance with what he called a 'band girl.' There was a motherless Miss Faulconbridge, who might have mollified the old man's resentment had she been at home, but she was away taking lectures at Cambridge, and by the time she returned the feud had become chronic. In her absence Shirley was disowned, and Jessie's mother informed that bold, designing hussies like her daughter were better out of the country.

Belated tidings of these misfortunes reached Faulconbridge, who was now a lieutenant-commander, although a young one, and nearly drove him frantic. His ship was returning, however.

In the meantime the compassionate Dr Liedbourg had been interceding for his quon-

dam pupil, and finally succeeded in having her included in an exchange that was being effected.

The lieutenant-commander arrived at Southampton in time to see Jessie come off a hospital-ship, the shadow of her former self.

'Take me back to Penzance,' she pleaded. 'I'd like to die there.'

V.

When the end came Lieutenant-Commander Faulconbridge was again at sea, this time in the *Alcibiades;* nor did he see the tiny boy Jessie had borne him until the little chap was several months old. Billy was godfather, and insisted on christening the infant Rodney, after the great admiral. The would-be midshipman was overjoyed when, fondling his son during a snatch of leave, Faulconbridge told Billy he would find himself at Osborne yet if he paid attention to his books.

Even when the much-buffeted officer arrived home from Pitagora, he was not allowed to linger long by the blustery, Christmas fireside at Penzance, where he spent most of the time admiring his now chubby-faced Rodney. The Admiralty's transportation department could not always find accommodation for officers taking up western appointments, and as the *Luneville* sailed in a few days, the lieutenant-commander was ordered to join her at Barkershead. Before leaving for that port of embarkation, however, Faulconbridge posted a lengthy letter to his friend Deans.

VI.

The *camaraderie* of these two officers had its inception a long time back, and was never marred by any of those bouts of acrimony which are apt to occur at times in the happiest of wardrooms. As boys, they had danced with each other's sisters in the Town Hall at Sutton Coldfield, and drifted apart when Deans's father moved up Wolverhampton way. In addition to his coal holdings, the paternal Deans was a big shareholder in the Yellow Funnel Line, and very much annoyed he was, too, when his son insisted on going to sea in the merchant service. However, somewhat of a compromise was effected, when that obstinate youth consented to take out a commission in the Royal Naval Reserve, which brought him in contact with Shirley once more during manœuvres, and led to his being called up for service at the beginning of war.

In the case of Lieutenant Deans, however, he had been detained on board the *Alcibiades* at Portsmouth. That is one reason why he happened to be dining under the lofty rafters of the *Victory* dining-hall early in the new year.

VII.

The president of the evening sat in the middle of a long table, and the muffled rap of his hammer silenced the incipient murmur of a hundred voices. The chaplain offered grace; and before the most eager talker could get in a verbal thrust, two clicks, almost simultaneous in time, broke the stillness. One of them extinguished the hall lights; the other brought into being the more agreeable candlestick lights of the table. Naval flunkeys with calves that might have adorned My Lord Steyne's entertainments served the soup and passed the sherry. When the band had struck up 'Entry of the Gladiators,' all the trappings of a Royal Naval Barracks dinner were in full swing.

Indeed, these fresh-featured naval officers, taking life with such smiling easiness, were gladiators in their own way. Not that their wordy 'kags' suggested sea-battles on a scale far more colossal than the paintings on the walls, or epoch-making events ranking with the golden-lettered records of the entablatures.

Seriousness is not tolerated at a naval dinner, and on this particular night they would not have missed for worlds the discussion which the loud-voiced commander was carrying on across the table with Staff-Surgeon O'Brien. The versatile three-striper would keep on insisting there was an ideal drug which induced a sort of artistic but conscious coma, making painful childbirth a thing of the past. The staff-surgeon hotly opposed the theory, and had just about convinced his hearers that it existed only in the facile brain of magazine-writers, when the head-waiter reported, 'Table cleared.' The president rapped. 'For these and all His mercies'—— the chaplain murmured.

'Moreover,' the staff-surgeon perorated, 'it's a mighty good thing we haven't such a drug.'

'Why so?' the commander asked.

'Because woman would lose the greatest thing marriage brings her—the humanising effect of an avalanche of pain that puts her head and shoulders above the wisest spinster who ever lived.'

'Nevertheless'——

'Wine passed, sir,' the clear-cut voice of the super-flunkey insisted.

The autocrat of the dinner-table, as if brooding over the impending finale, thoughtfully replaced the stoppers in the cut-glass decanters before applying the gag of his office to the irresponsible babble.

Contrary to the custom on board ship, there was a general sliding back of chairs, and the whole mess rose, glasses in hand.

'Mr Vice, the King,' the president said.

The vice-president paused until the band had played the first part of the National Anthem before responding, 'Gentlemen, the King.'

'By the way, Deans,' his friend the secretary remarked as they sat down again, 'the *Luneville's* been mined off the Irish coast, and Faulconbridge is among the missing.'

Deans, in the act of lighting his cigarette, repressed a tendency to cry aloud for vengeance

on the sowers of these cruel tares of the sea, and asked if there were any particulars.

'The boats cleared the sinking ship's side all right, but in a howling gale. Some of them were blown out to sea; others reached land stiff with frozen bodies.'

The words slipped out of Secretary Carew in the unemotional way that naval people have of mentioning such things, but which Deans's mood bitterly resented. He felt an almost uncontrollable desire to hit this man, who had the pale, æsthetic look many of the paymaster branch develop owing to the sedentary nature of their duties. Yes, a smashing blow might make him feel a modicum of the anguish Deans was experiencing, or, better still, serve him up with an avalanche of pain. That's what some of his sort needed to make them human. Bah! this air of smug-faced nonchalance in the presence of things that mattered was being overdone almost to the point of priggishness. . . . Then Deans got entangled in the confounded Puccini music the band was playing, and its *motif* kindled others within him, and he lost track of his laughing, puffing messmates, and found himself back with Faulconbridge in the loch-like harbour of Pitagora. . . . They had got to like this fortress city, with its wondrous skies, and old and new towns on either side of the cleaving river. 'What about a last drop of *vino* on the beach?' Faulconbridge had suggested before coming away; and after quarters they left the ship in the steam-pinnace. They were just in time to get a table outside the Ristorante Moderno, commanding a fine view of the sea, with its gentle surf breaking softly on the battlements beneath them. What a sea they had to look at! It left the tops of the Moorish houses over the bridge aglow with colour, and there was a trail of glory extending across the sea as far as the glooming mountains. When it was quite dusk, their attention had been diverted from a hospital-ship, creeping along like a huge glow-worm of the sea, to a belated funeral-party. Masked pall-bearers, carrying lighted tapers in their hands, walked on each side of the hearse. What was that sputtering on the pavement? *Misericordia!* one of the pall-bearers had dropped his taper! In their ignorance, they had started up to stamp it out; but an Italian naval officer restrained them, for, said he, touching it meant bad luck! How concerned he had been when the reckless Faulconbridge, pooh-poohing the superstitious idea, not only touched the blessed thing, but lit his cigarette with it before returning to the ship!

'Bah!' Deans reflected, as the music came to an abrupt end; 'it's nonsense thinking a waxy light at Pitagora could send a ship to the bottom of the Atlantic.' All the same, he was unable to repress a slight shudder when somebody touched him on the shoulder.

'I say, Deans,' he finally heard Staff-Surgeon O'Brien murmur, 'have you been having a drop of "twilight" on your own? I've been trying to get your eye for ten minutes. Besides, it's being very rude to your host,' he chided.

'I'm afraid we were both under the spell of *La Bohême*,' Carew smiled; 'they play it awfully well.'

'Well, whatever it was, I've brought this for you, Deans. It came after you left.'

Here was another *motif* for Deans to carry away from that dinner. There was something for him to do that might mitigate the calamity of his friend's death. The knowledge braced him, and he re-read greedily the letter Faulconbridge had written from Penzance, but which had been several days adrift. 'From what I have told you,' it concluded, 'you will see how the land lies; and I hope you haven't gone on leave yet, because, if the *Luneville's* submarined, I'd like you to do something for me, seeing that it's not much of a run down to Birmingham from where you'll be. Try to have my father take up Rodney,' the off-hand lieutenant-commander wrote.

'Have another glass of port?' Carew asked, looking at him curiously.

'No, thanks,' Deans said, rising. 'I'm sorry, but I must get back to the ship.'

VIII.

'Mr Faulconbridge's place is a long way out, and he *will* not have a telephone in his house. Besides, he's almost sure to be at the munition-works this time of day,' smiled the chatty telephone-girl at the Queen's Hotel when Deans finally arrived in Birmingham. 'Why not take a run out there? It's well worth seeing. Shall I get them on the line and say you're coming?' she asked.

'Please don't trouble,' Deans said; 'I'll take my chance.'

It was gloomy enough in the busy thoroughfares, but it got worse as the taxi moved along toward Sward End. The murkiness in the vicinity of Peppery Docks was awful, and depressed the lieutenant, especially as he had not the faintest idea how he was going to approach the old man. It was all very well making up his mind at Portsmouth to see the thing through, but up here it looked a different sort of proposition. These Birmingham business men had the reputation of being as hard as flint, and how was he, a guileless sailor, to bring about Mr Faulconbridge's capitulation? Had not Shirley's sister been unsuccessful? He wondered whether she was at home now, and if he would have a chance of seeing her.

The taxi turned up a hilly street. Ravished fields made up its ulterior view. Stone walls, enclosing low-lying buildings, formed its near aspect. The driver stopped in front of one of several ponderous gates, and Deans was admitted

by a policeman, who waved him toward an atrium-like entrance.

'Mr Faulconbridge's out of town, and 'll not be back for a day or so,' the hall-porter informed him.

'Wish I had taken the telephone-girl's advice,' Deans muttered gloomily. 'Seeing I'm out here, I'd like to have a look round,' he said to the porter.

'Have you a pass, sir?'

'No.'

'Then I'm afraid it can't be done,' demurred the man.

Deans recognised the symptoms, and gave him half-a-crown.

'Of course, there's no harm in letting you go as far as the corridor,' he apologised.—'Look out for me, Jim, while I take this officer along,' he told his opposite number.

Through a marvellous glass partition, Deans had the opportunity of seeing for himself the smooth working of the new industrialism, where smiling gusto, light-blue caps and smocks, and hygienic surroundings play a leading part.

Five thousand female munitioneers were busy getting ready the dread necessities of war on a vast scale.

'The girls come from every part of England,' the omniscient porter volunteered, 'and many of them are ladies.'

There was one in particular who caught Deans's eye, and the more he looked at her, the more he was convinced he was face to face with one of the many posers of the present conflict, a rich girl working in her father's works.

The observant porter seemed to divine his thoughts. Certainly, he followed the direction of his gaze. 'Her brother was a naval officer, too, sir. Poor fellow! he was lost at sea the other day. Of course, you know she's the proprietor's daughter?'

'I thought I recognised Miss Faulconbridge, in spite of her uniform,' Deans answered calmly enough, although he could have shouted for joy at his discovery,

'And a very plucky girl she is,' the man went on. 'Our young women are constantly losing near relations at the front, and the example of a lady like that steadies and encourages them to stick it out no matter what happens. I call that the right spirit, sir,' he concluded proudly.

'I say,' Deans asked, 'could you take a message to Miss Faulconbridge? Say I'm from the same ship as her brother, and I'd like to have a word with her.'

The man hesitated. 'It's dead against the rules. You see, sir, we're under Government control, and the Department of Munitions is responsible for our regulations.'

This time Deans gladly slipped him a couple of two-shilling pieces, and waited his answer in the lobby.

'It's all right, sir,' the porter beamed on him a moment later. 'She wants you to dine at Fair Oaks to-night.'

'Thanks, very much,' Deans said excitedly; 'and if you have a chance of whispering in her ear again, assure her I'll be there all right.'

IX.

Deans's luck continued. He ran into Nancy Faulconbridge in New Street late that afternoon. Over a cup of tea at her club he broke the ice of what might have been a constrained discussion under less informal circumstances. The outlook for Penzance was not altogether without hope. Before her father left for Harrogate to take the baths Nancy had said to him, 'After all, Jessie's playing in that orchestra was no worse than my working at Sward End,' and he did not bite her head off, as nearly happened on several former occasions. Nancy, too, had taken the biology lectures at Cambridge, and held her own theories on the subject of heredity. 'Father dear,' this charming young lecturer expounded, 'our bodies are only temporary billets for this potent something which is transmitted from generation to generation, and what does it matter whom we make its custodian so long as there is purity and love? Ought we not to be ever so grateful to Jessie for continuing the line?' she asked, the tears welling up into her eyes, which were as big as ever.

The old man flared up, and declared hers were the views of a scientific blue-stocking.

'That may be,' the intrepid Nancy had answered, 'but if you value the Cantacuzenus blood, you ought to look after one who at least possesses it.'

X.

But other factors far more forceful in their nature were at work. The great munitions explosion occurred at Silvertown, and a few hours later rumour had it at the Cairn Hydro, Harrogate, that there had been another one at Sward End. Without daring to make further inquiries, the grief-stricken master of 'Byzantium' hurried back to Birmingham. In the course of that melancholy train journey what an avalanche of suffering fell upon the old man! He was shaken to the core a thousand times by the violent end he fancied for Nancy. Indeed, his heart-rending cry of 'My poor Nancy! Why did I ever let you come into the works?' frightened a quiet looking woman out of the compartment. He thought of Shirley's effacement, and felt all the helpless rage of a Laocoon at his family being snuffed out of existence in this awful way. He had never figured on these sudden calamities. He had got into the habit of regarding life as something in which every action could be planned out logically and consistently. That was why he had been intolerant of Rodney. He was beginning to think that things had a way of adjusting themselves without much

respect for clap-trap conventionalism. Nancy was right. He ought to have worshipped Jessie for what she had done. What an unfeeling monster he had been! After all, didn't the Rodney touch mean more to him than all the Cantacuzenuses that ever lived? The Greek prince's people had lost their country owing to parsimony. They had buried gold rather than use it defending their capital. He, Faulconbridge, would at least show people he possessed enough largeness of mind to acknowledge and make good his mistake so far as was in his power. The train stopped half-way, and he sent a telegram to Mrs Parsons. There was something of his old arrogance in the wording of it. 'It is my direction,' he wired, 'that Rodney, Billy, and yourself should come up to Fair Oaks immediately.'

XI.

Nancy was safe enough. Was she not with the gallant sailor? In the good old Yellow Funnel days, how many pretty girls had he protected east of Suez!

But why ring in a longitude suggestive of so many things? In truth, events had been moving fast in Birmingham. These young people, who had met again only a few hours ago, were in no less a place than 'Bagdad'!

The lieutenant nearly had a fit when this fascinating munitioneer, whom the rites of the dressing-table had transformed into a sort of very young Madame Le Brun, proposed the expedition. 'Where's the magic carpet?' he asked lamely.

Miss Faulconbridge pointed to the broad stairs of 'Byzantium.' 'My "Bagdad" isn't far off,' she explained. 'It's really an extension to the house.'

'I'm glad of that,' Deans said with a sigh of relief. 'I've dined far too well to undertake much of a journey.'

She led the way to a wonderful domed apartment. 'This is what we call "Bagdad,"' she smiled, holding silken hangings aside for him to enter what seemed to be a little corner of the East; 'only, instead of the call of the minaret we have the clatter of the dumb-waiter to tell us that coffee is on the way.'

'How pleasant it is to feel softness everywhere!' Deans murmured, sinking into a rich divan. 'Up to the present hardness has been the dominant feature of my life. However, I hope it'll be different after the war.'

'After the war,' Nancy repeated, passing him the cigarettes, 'what wonderful things are going to happen! What's it to be in your case?'

'My father's giving me a shore billet in the Yellow Funnel Line,' he told her. 'I've done my bit at sea.'

'I wish Shirley had never taken it up as a career,' she sighed; and as she listened Deans's story of their life together her eyes g softer and softer, until they almost seemed melt. 'It's a pity he ever touched the beastl thing,' she grieved over the ill-omened incident

There was that infernal taper again, Deans thought. Why had he been tactless enough to mention it? Something always happened whe it lurked in the vicinity. Even going off to the ship that night at Pitagora, they nearly sank the admiral's barge. This time it took the form of a wailing, intense and heart-breaking, making the whole house resound with its awfulness, and penetrating even the confines of 'Bagdad.'

'What's that?' Nancy gasped, starting up.

'Nancy! Nancy!' she heard the anguished voice of her father cry out; and there was no relief for the old man until he held her close.

'You poor old thing,' she soothed the broken spirit. 'So they had us blown up, had they? Why, dear, it was nothing at all, a mere handful of flames at the most, and we were sent home more as a precautionary measure than anything else.'

'They're coming up,' he sobbed. 'You can have the name of the house changed to "Rodney." It'll please Shirley when he hears of it.'

'What do you mean, father?' she asked agonisingly, fearing the strain had been too much for him.

'That,' he faltered, handing her a folded-up copy of the *Birmingham Evening News*. They gave it to me at the railway station.'

They read the 'Stop Press' item. 'Barquentine *Subrosa* has been spoken in tropical Atlantic, *en route* for Antigua,' it stated. 'She has on board eleven survivors of the ill-fated *Luneville*, picked up from their open boat far out at sea. Among the saved is Lieutenant-Commander Faulconbridge, R.N., of this city.'

'Hurrah!' they shouted, and in the excitement of the moment it seemed natural for them to fall into each other's arms, although they had some difficulty in explaining this curious phenomenon to the old man.

The kisses that Deans snatched after they had had a bite of supper with Mr Faulconbridge were another matter.

'You caught me at a weak moment,' Nancy protested; 'and, in any case, what use was it resisting a strong person like yourself? And perhaps we're not intended to resist too much,' she consoled herself, in his arms, just before they parted.

Nancy's philosophy, however, is not always so sustaining. Now that Lieutenant Deans is at sea again, she is a bit shaky at times; and no wonder, with all these rumours of another naval engagement in the air, not to mention the illustrated weeklies.
